ACKNOWLEDGEMENTS

I acknowledge the teaching and support of Dr. Joseph B. Wiederholt who has guided me through my graduate studies. I also would like to thank Drs. David H. Kreling and Robert W. Hammel for their insights into my learning. Many people contributed ideas during this project and their help is appreciated. I am grateful to my parents for their love and support.

ABSTRACT

The goal of this research was to identify the drug elements of care for a given disease classified by Diagnosis Related Groups (DRGs). There are two objectives for this research: 1) identify and classify drug elements of care used for a primary, secondary, and tertiary drug package within a DRG category and 2) determine if there are similarities among drug elements for the primary drug package across DRG categories.

The research design is exploratory and retrospective. A total of 28 DRGs were selected based on the number of patients in the DRG and the homogeneity of the DRG. This provided a total population of 4,605 patients who had been discharged between July 1, 1984 and June 30, 1985 at the University of Wisconsin Hospital and Clinics.

The drug elements of care were obtained from the hospital formulary and were divided into Schedule (those drug elements taken according to a set time schedule) and PRN (those drug elements taken as the patient needs the medication). Each DRG was divided into three drug packages based on the ratio drug orders per patient. The three drug packages were described as the drug elements greater than 0.7 drug orders per patient, primary drug package; 0.7 or less and greater than or equal to 0.2 drug orders per patient, secondary drug package; and less than 0.2 drug orders per patient, tertiary drug package. DRGs 82 (Respiratory Neoplasms), 182 (Esophagitis, gastroent + misc digest dis Age > 69 &/or c.c.), 203 (Malignancy of Hepatobiliary system or Pancreas), 239 (Pathological fractures + musculoskeletal + conn. tiss. malignancy), 243 (Medical back problems), 296 (Nutritional + misc metabolic disorders Age >69 &/or c.c.), 298 (Nutritional + misc metabolic disorders Age 0-17), and 404 (Lymphoma or leukemia Age 18-69 w/o c.c.) had no drug elements used greater than 0.7 drug orders per patient for Scheduled drug elements. The PRN drug elements of care had 18 DRGs with no drug elements used greater than 0.7 drug orders per patient.

There are few primary drug package elements of care that are common among DRGs, except in some of the surgical DRGs. However, there were no drug elements of care common across all surgical DRGs to make a surgical drug package.

Chapter One

Introduction

In 1983, the federal government introduced a new prospective payment system (PPS) for medicare hospital patients.[1] This payment system is referred to as Diagnosis Related Groups (DRGs). A Medicare patient is placed in one of 470 DRGs when admitted to a hospital. DRGs are based on the following six factors: 1) primary diagnosis, 2) secondary diagnosis (comorbidity), 3) age, 4) gender, 5) discharge status, and 6) operating room procedures.

This new PPS required hospital administrators to reevaluate how costs are managed. For example, if the costs of treatment are less than the reimbursement the hospital keeps the difference. However, if the costs of treatment are more than what the hospital receives for DRG reimbursement, the hospital assumes the responsibility for the extra cost from that case. Thus, the hospital must manage its patient case mix correctly in order to be financially stable.

Diagnosis related groups provide one method for classifying patients into meaningful "product lines" on the basis of clinical condition and level of resource consumption.[2] The redefinition of hospital output as patient cases rather than individual items and services is the most important change in the Medicare prospective payment system. Revenue per case limits means that there is more financial incentive to manage the cost of pharmacy services. For

pharmacy, this means defining output in terms of services used per case.

The DRG classification does not allow hospital pharmacy management to have control over the resources being used from the pharmacy at the microeconomic level. Diagnosis related groups are not considered a method to manage drug use and drug costs. Instead hospital pharmacy directors have used other methods to manage drug use and drug cost. These methods include: **1**) reduced price per unit purchased, **2**) increased use of bid prices, **3**) decrease in the size and dollar value of drug inventory, **4**) drug formulary restrictions, **5**) prescribing sanctions, **6**) physician education on the relative cost of alternative therapies, **7**) drug use review, **8**) use review applied to drug serum assays, **9**) controlled access for drug industry representatives to hospital physicians, and **10**) dispensing and drug distribution efficiencies.[3 4 5]

There have been some pharmacy managers who have tried to use DRGs to manage pharmacy costs.[2 6 7] These managers have described the 20 most expensive DRGs for a hospital pharmacy, the ten major diagnostic categories that account for 80 percent of all pharmacy charges and a method for describing resource use for each DRG using a regression equation. Unfortunately these three methods take a narrow view of DRGs or tend to be cumbersome for pharmacy management to use.

The previous authors have made the assumption that the method to increase the net revenue for a hospital under DRG reimbursement is to

decrease the costs in the pharmacy department. This is the view pharmacists and hospital administrators have used to cope with DRG reimbursement.

Management of Cost

Before DRG reimbursement, the pharmacy department worked to maximize revenue within the department, but since DRG reimbursement the pharmacy works to maximize profits outside the department, for the hospital in general. The question is, does newer more expensive drug therapy decrease patient length of stay? If the answer is yes, the pharmacy department's costs, that is personnel and goods, probably will increase, but the hospital's costs could decrease because patient length of stay has decreased. Thus there appears to be a dichotomy of goals. Lower costs for the hospital and higher costs for the pharmacy department become part of the same goal, making the revenue and profit that a hospital generates more important than the revenue that an individual department generates.

How does one manage costs? A method is needed for hospital pharmacy managers to manage drug costs in a format that pharmacists, physicians, and administrators can use under DRG reimbursement. One possible way to achieve a manageable format is to place a hospital's formulary into drug packages. A drug package is one or more drug products used in a DRG category. This is the primary drug package for a DRG. A drug package

identifies the drug elements of care and the frequency of use of those elements for each DRG. The result could be that DRGs are no longer 470 unmanageable definitions of disease states.

Grouping a hospital's formulary into drug packages could allow the pharmacist, pharmacy and therapeutics committee, and hospital management to have a better understanding and control over managing inventory, cost of pharmaceuticals and labor. The pharmacist will have better control of inventory because drug packages allow for prediction of use based on the activity for each DRG. The pharmacy and therapeutics committee will have more control over costs because drug packages will identify the change in the average cost for a DRG due to a change in the formulary. The hospital management will be able to manage pharmacy labor costs because drug packages allow management to set cost standards for physicians, pharmacists, and pharmacy and therapeutics committees to follow. Such information might be used by physicians to modify their prescribing habits and thus the patient's resource consumption.

Goal of Research

Previous studies have focused on one aspect of DRG reimbursement. The focus has been on the pharmacy aggregate drug costs of a DRG using cost to charge ratios. However, there has not been a systematic analysis of drug elements for each DRG. Therefore this research was done to identify the drug

elements of care for a given disease classified by DRGs.

Chapter Two

Literature Review

The literature review is divided into three parts. The first part is a description of the reimbursement systems used before and after the early 1980s. The second part is about the management of supplies in a hospital pharmacy department. The third part is a summary of studies done relating charge data to DRGs.

Reimbursement Systems

Until the early 1980s, hospital reimbursement was made primarily on a retrospective basis.[1] Reimbursement took two forms, fee for service and per diem. The hospital pharmacy department used three variations of fee for service and one variation of per diem. Retrospective reimbursement was the only type of payment system used prior to implementation of DRGs.

The first fee for service system is called the percentage markup system. This system ties drug charges directly to the acquisition cost of the drug used. By using this system, one makes an invalid assumption that total operating expenses are directly related to the cost of pharmaceuticals.

The second fee for service system is called the dispensing fee. The dispensing fee is added to the acquisition cost of the pharmaceutical and determines the total price charged to the patient. The advantage of this system

is the lack of a direct relationship between the price charged the patient and the acquisition cost of the medication.

The third fee for service system is the markup fee system. This system is a combination of the first two systems. A percentage markup is added to the acquistion cost of the drug and then a dispensing fee is added. The disadvantage of this system is the same as with the percentage markup system.

The per diem system is a more recent method of calculating the price of goods and services in the pharmacy department. The per diem is calculated by adding the annual operating cost of pharmacy services and dividing by the number of patient days. The disadvantage of this system is that the exact cost for each patient is not determined.

Now with DRGs in effect, hospital pharmacies are faced with the task of having to cut expenses while still providing the same quality and level of care. Supplies and labor are the focus of the federal governments new cost-cutting measures (i.e., DRGs). Managers have two major expense categories under their supervision - personnel costs and nonwage costs.[8] Personnel costs are managed by top management.[8] The nonwage costs, which include supplies (i. e., drugs), is an area in which pharmacy managers have some control.[8]

Management of Supplies

Traditionally managers have managed supplies with the application of the

ABC inventory classification, economic order quantity (EOQ) analysis, total cost formula, inventory turnover rates, inventory days on hand, and a formulary. The ABC inventory classification allows for control over three specific groups of items. The ABC classification enables the manager to readily identify those items that should be closely controlled.[8] The A items are 10 percent of line items that constitute 70 percent of the dollar value of the inventory. The B items are 20 percent of line items that constitute 20 percent of the dollar value of the inventory. The C items are 70 percent of the line items that constitute 10 percent of the dollar value of the inventory. This categorization of the inventory into A, B, and C items allows the manager to focus attention on high-cost high-volume items. The ABC inventory method allows the ranking of inventory items, but does not determine the quantity that should be ordered.

The EOQ concept assists in determining the quantity of drugs ordered as well as the optimal time for procurement and is intended to minimize the costs associated with order placement and inventory maintenance.[9] The formula for determining EOQ is: $EOQ=\sqrt{2\frac{UA}{IC}}$ where U = annual usage, A = ordering cost, I = carrying cost, and C = cost of drug.

Table 1 - Ordering Cost and Carrying Cost

Inventory Carrying Costs

Step 1-	determine total square footage of pharmacy area	1,861 sq. ft.
Step 2-	determine total square footage of pharmacy area used for storage of drugs	792 sq. ft.
Step 3-	determine (from accounting office) value of indirect expenses (maintenance, utility costs, housekeeping, etc.) allocated to pharmacy	$22,627
Step 4-	determine cost of indirect expenses allocated per square foot of pharmacy are (Step 3 ÷ Step 1)	$12.16/sq. ft.
Step 5-	determine cost of indirect expenses allocated to pharmacy drug storage area (Step 2 x Step 4)	$9,630
Step 6-	determine cost of direct expenses associated with carrying inventory (labor, obsolescence, etc.)	$2,566
Step 7-	determine average inventory	$52,685
Step 8-	determine total inventory carrying costs (Step 5 + Step 6)	12,196
Step 9-	determine inventory carrying costs per dollar of inventory (divide value in Step 8 by the total dollars in inventory - Step 7)	0.23
Step 10-	determine cost of capital (expressed as a decimal - 12% expressed as 0.12)	0.12
Step 11-	determine inventory carrying cost factor as a percent of inventory value (Step 9 + Step 10)	0.35

Inventory Ordering Costs

The easiest way to determine inventory ordering cost is to take all of the wages and salaries expenses associated with purchasing and divide that number by the total number of purchase orders issued per year as indicated below.

Step 1 -	determine total wage and salary expense associated with purchasing (include cost of fringe benefits)	$109,800
Step 2 -	determine other costs associated with purchasing (telephone, supplies, inventory records, purchase orders)	$15,000
Step 3 -	determine total costs or ordering (Step 1 + Step 2)	$124,800
Step 4 -	determine total costs of ordering by total number of purchase orders generated per year (POs per year = 4,800)	$26.00
Step 5 -	determine average number of line items listed on each purchase order	4
Step 6 -	determine average order cost per line item (Step 4 ÷ Step 5)	$6.50

Source: Sok, J.E., Pharmacy Inventory Management(PIM) Strategy, Topics in Hospital Pharmacy Management, 4:33-44, February 1985. Reference #8

The total cost formula is comprised of the ordering cost, carrying cost and the purchase cost. The purchase cost is the actual price paid for the item purchased.[8] The inventory policy is to provide adequate inventory levels when needed at the minimum total cost of ordering, carrying and purchasing.[8]

The formulary system is a method of achieving the safe, effective and cost-conscious use of medications for patients.[10] However, the formulary is not tied to DRGs. This lack of coordination between the formulary and pharmaceutical use in a DRG means that one cannot anticipate pharmaceutical use.

Inventory turnover is a measure of inventory efficiency.[8] The turnover rate is calculated by dividing total inventory purchases by the average inventory for a specified period. The inventory turnover rate is an important ratio to monitor because it will tell you if you are investing funds in inventory and decreasing the hospital's cash flow. Increasing the inventory turnover rate will free up funds that normally would be invested in inventory, and lower carrying charges on the reduced inventory.

Inventory days on hand is calculated by dividing 365 by the turnover rate. The number of inventory days on hand for A items should be less than for B and C items. This provides the pharmacy manager with some idea as to how long it will take to use up the inventory.

A study was done to determine the frequency of inventory control methods used in hospital pharmacies. The method most often cited by respondents was the want book (87.4 percent), competitive bidding (70.3 percent), minimum/maximum levels (65.9 percent), inventory record card system (53.3 percent), and all other methods were reported less frequently than 30 percent.[11] According to the authors of this study the previously mentioned inventory control systems (i.e., ABC, EOQ) are used in hospital pharmacies less than 30 percent of the time. This study was done in 1981. Now it is likely that more hospitals are using these inventory control methods.

Studies of Charge Relationships for DRGs

Magee, et al, analyzed DRGs, Major Diagnostic Categories(MDC), and pharmacy charges using the ABC analysis for a cross section of hospitals represented in the Blue Cross of Central Ohio (BCCO) region and for Riverside Methodist Hospital (RMH).[7] The data base from BCCO included 43 hospitals. The data were for the year 1982 and consisted of 43,969 patient records that were assigned to 465 DRG categories. RMH data were obtained for the same time period and had 6,121 patient records in 371 DRGs. The ABC analysis of pharmacy charges and DRGs showed that ten MDCs accounted for 80.4 percent and 80.1 percent of all pharmacy and IV charges for the BCCO hospitals and RMH, respectively.[7] This is one way to group DRGs.

However, this study used charge data and if you are looking to change the cost of a DRG you should use the drug elements of patient care for a specific DRG.

Catania, et al used pharmacy charges at a 316-bed community hospital to analyze DRGs.[6] There were 10,550 patients assigned to 390 DRGs for the period January 1, 1983 to August 31, 1983. The authors described the 20 most expensive DRGs and also found that long hospitalizations and high hospital charges may not be associated with high pharmacy charges.[6] Again the authors used charge data rather than the drug elements of patient care per DRG to determine the most expensive DRG.

Shaw developed a multiple regression cost model to quantify the impact of drug therapy on hospitalization costs within one DRG.[2] There were 100 patients with usable financial, clinical, demographic and drug utilization data for DRG 108 for the period July 1982 to June 1983. She found that patient demographic, severity, treatment intensity and drug utilization could explain 95.6 percent of the variation in cost of hospital diagnosis and treatment within a DRG.[2] However, in this study the author did not identify the drug elements of care that are to be changed if the cost is to be managed.

Magee, Catania, and Shaw all used cost-to-charge ratios to determine the cost of a DRG. They did not identify the drug elements of care. In order to manage the cost of a DRG, you need to know the frequency of use of the drug elements that make up a DRG. Knowing the frequency of use of the drug

elements that make up a DRG allows physicians, pharmacists, nursing, and hospital management to manage the use and the cost of these drug elements. Identifying the drug elements of care is different from identifying the cost of a DRG.

Summary of Literature Review

Before the early 1980s, hospital reimbursement was made on a retrospective basis. With prospective pricing now in effect, hospital pharmacies are faced with the task of having to cut expenses while still providing the same quality and level of care. Before DRGs managers managed supplies using the ABC inventory classification, economic order quantity analysis, total cost formula, inventory turnover rate, inventory days on hand and a formulary. But since DRGs, studies done have described the 20 most expensive DRGs for hospital pharmacy, the ten major diagnostic categories that account for 80 percent of all pharmacy charges and a method for describing resource use for each DRG using a regression equation. These studies do not allow for prediction of pharmacy drug costs and thus can make it difficult for pharmacy managers to manage drug cost.

Also when the frequency of drug use per DRG is known, pharmacy labor costs can be predicted. Each drug product has a cost of delivery, dispensing, administering, and monitoring. The sum of these costs gives the

cost of a drug package for labor. Thus labor costs can be predicted and monitored, thereby allowing managers to manage department labor costs.

Objectives

A systematic analysis of the drug elements used in the care of a patient for a given DRG needs to be done. Exploring the use of pharmaceuticals for a given DRG will identify the elements of a drug package and allow pharmacy managers to better identify the cost of pharmacy operations. There are two objectives for this research: 1) identify and classify drug elements of care within a DRG to include primary, secondary, and tertiary drug packages and 2) determine if there are similarities among drug elements for the primary drug package across DRG categories.

Chapter Three

Methods

Study Design

The research design is exploratory and retrospective. The study was conducted in 1985 at the University of Wisconsin Hospital and Clinics, which is a 480-bed tertiary care teaching institution. Inpatient services include five intensive care units and outpatient services include over 70 clinics. There were approximately 16,000 admissions in fiscal year 1984-1985. These patients had an average length of stay of 8.4 days. Outpatient visits numbered 268,541 during this same time period, up nearly 10% from the previous fiscal year. In April of 1985, University Hospital began a critical care air transport service, Med Flight, to provide immediate, skilled emergency care during rapid transport of critically ill or injured patients. Med Flight serves a 200-mile radius around Madison.

The pharmacy department at the University of Wisconsin Hospital and Clinics includes inpatient services, outpatient services, and a central production and cart filling area. The pharmacy department uses a unit dose distribution system. The pharmacist transcribes the physician's orders onto a patient profile and makes a copy for the pharmacy technician. The pharmacy technician enters the information into the pharmacy computer. Scheduled and PRN medication are handled this way. Intravenous medication have their own profile and are

not entered into the pharmacy computer. Pharmacy technicians distribute and administer the medications to the patients.

The pharmacy director manages pharmaceutical inventory costs by using ABC inventory classification, EOQ, and turnover ratios. The armamentarium in the pharmacy department is controlled by a formulary system and the pharmacy and therapeutics committee.

Population Selection

A list of 42 DRGs was obtained from the hospital pharmacy director with the number of patients listed for each DRG category. A total of 28 DRGs were selected for the study based on the number of patients in the DRG and the homogeneity of the DRG. For example, DRG 468 (unrelated or procedure) had the largest number of patients (396) but was eliminated because the population was heterogenous. The smallest population chosen was DRG 305 with 89 patients. A total population of 4,605 patients who had been discharged between July 1, 1984 and June 30, 1985 was chosen for the study. The population selected was comprised of all patients admitted to the hospital not just Medicare patients. The sample frame was divided into three- month periods to control for seasonal variations. A random number table was used to select a systematic random sample from each three-month period with a goal of 2,000 patients in the sample(See Appendix A). Each sample population was

calculated based on the proportion of the population in a DRG to the total population. The final sample selected had 1,997 patients.

Data Collection Instrument

One collection form and three data bases were designed for this project. The first profile, the drug profile, listed the patient's name, medical record number, date of discharge, formulary code number, DRG number, whether the drug was given as needed (PRN) or Scheduled, and quantity the patient received. This information then was entered into a computer using Dbase.[12] The second profile, the patient profile, was entered directly into the computer from the medical records and recorded the patient's name, medical record number, admission date, discharge date, DRG number, age of patient and gender of patient. The third profile, the formulary profile, also was entered into the computer from formulary printouts provided by the hospital pharmacy department. The printouts contained the formulary code number, drug name, drug strength, and drug route of administration for all drugs in the formulary.

The drug profile database and the formulary profile database were merged using the formulary code numbers. This provided a database with the patient's name, medical record number, date of discharge, formulary code number, DRG number, drug name, drug strength, drug route of administration, given as needed (PRN), Schedule and quantity the patient received. The

database then was reduced in size. The drug orders were added together by formulary code number for each DRG. This gave each DRG the total number of drug orders for a given formulary code number. The same procedure was followed for the quantity of drugs recieved by the patient. The result was a database that had a total for each different drug used by DRG and a total quantity used for each different drug.

Table 2 - List of Diagnosis Related Groups

MDC[a]	DRG	TITLE

[a] Major Diagnostic Category

Data Collection Procedure

The drug information for each patient was collected from pharmacy medication administration records and medical intravenous records and recorded on the drug profile form developed for this study. Information about IV drugs was recorded but information about intravenous fluids received was not recorded. This information then was coded using the hospital's formulary codes.[13] The patient's name, medical record number, date of discharge, the drug formulary codes, quantity, and PRN were entered into a personal computer using Dbase. The drug profile then was merged with the formulary profile to develop a complete patient record.

This project was difficult to do because the computers were not set up to provide data in a readily usable format. The data were gathered from hard copies from two different sources, which provided three sets of data. These three sets of data had to be typed into Dbase manually which took approximately six months to accomplish. The result was a drug profile database that had 35,472 records, a patient profile database that had 1,997 records, and formulary profile database that had 3,797 records.

Data Analysis

The drug data were coded according to the hospital formulary's primary drug products and divided into two groups, Scheduled and PRN. A Scheduled

drug element of care is a drug that is written to be given at a specific time. A PRN drug element of care is a drug that is written to be given as the patient needs that drug. The drug elements of care includes both legend and nonlegend drugs.

Three ratios were calculated: number of doses per patient, number of drug orders per patient and number of doses per drug order. The definition of doses per patient is the number of doses given to the patients divided by the number of patients in that DRG. The drug orders per patient is the number of drug orders for a given drug element divided by the number of patients in that DRG. The doses per drug order are the number of doses the patients received for a drug element divided by the number of drug orders for that drug element.

The number of drug orders per patient was selected as the definitive ratio for both Scheduled and PRN medication because it approximated the frequency of use for a given drug element. A primary drug package includes one or more drug elements used to treat a patient in a DRG category that had the ratio drug orders per patient greater than 0.7. This identifies those drug elements that were used in 70 percent or more of the patients. This translates into approximately 70 percent of patients or more having an order for that drug. A secondary drug package contains those drug elements that had the ratio drug orders per patient for 0.7 or less and greater than or equal to 0.2. The tertiary drug package contains those drug elements that had a ratio of less than 0.2.

There seemed to be a natural breaking point for those drug elements used for less than approximately 20 percent of the patients.

Limitations

Only one hospital was represented in this study. The University of Wisconsin Hospital and Clinics is a tertiary care center in a community of about 200,000. Thus it is possible that other hospitals in other communities may have different patient populations.

The formulary is only applicable to the University of Wisconsin Hospital and Clinics. Other hospitals may have a different formulary. Thus the drug products available for use may not be the same in other communities.

The ratio drug orders per patient may not be the best way to measure this phenomenon. Other ratios such as doses per patient may give a better description of drug element use within a DRG. Doses per patient describes the patient's actual use of drug elements, whereas, drug orders per patient describes the physicians intended use of drug elements.

Intravenous fluids were not included in this study. The reason was that IV fluids were not part of the pharmacy records. Future studies should contain IV fluids because they affect costs in the pharmacy department.

Non-sampling errors such as mistakes transcribing or typing the data into a computer and the patients other medical problems were not controlled

for in this study. Such medical problems may account for the large number of drug elements in some DRGs.

Chapter Four

Results

The results section is divided into three parts. The first section is a presentation of descriptive statistics. The second section contains information about drug elements per each DRG as measured by the ratio of drug orders per patient for the primary Schedule and primary PRN drug package. A presentation of those drug elements that are common among DRGs and MDCs for the primary Schedule drug package is the third section.

Descriptive Statistics

The length of stay (LOS) ranged from one day to 367 days. Diagnosis related groups 1 (Craniotomy Age > 17 Except for trauma), 106 (Coronary bypass with cardiac cath), 108 (Cardiothor proc. except valve + coronary bypass, with pump), 296 (Nutritional + misc metabolic disorders Age >69 &/or c.c.), 298 (Nutritional + misc metabolic disorders Age 0-17) and 405 (Lymphoma or leukemia Age 0-17) for males all had standard deviations greater than the mean for LOS variable (See Table 3). Females had standard deviations greater than the mean for LOS variable for DRGs 10 (Nervous system neoplasms Age >69 &/or c.c.), 125 (Circulatory disorders exc AMI, with card cath w/o c.c.), 183 (Esophagitis, gastroent. + misc digest dis Age 18-69 w/o c.c.), 243 (Medical back problems) and 405 (See Table 4). Patient ages ranged

from 0 years to 93 years for both male and female samples. All standard deviations for age variable were less than the mean.

[a] Number of females in this study

Drug Packages

There is a primary, secondary, and tertiary drug package for each DRG. Many drug elements were used only a few times in the primary drug package but the secondary and tertiary drug packages had more drug elements (See Appendices B and C). Tables 5 and 6 contain the number of drug elements greater than 0.7 for drug orders per patient for the primary drug package, 0.7 or less and greater than or equal to 0.2 drug orders per patient for the secondary drug package, and less than 0.2 drug orders per patient for the tertiary drug package. DRGs 82, 182, 203, 239, 243, 296, 298, and 404 had no drug elements used greater than 0.7 drug orders per patient for the Scheduled drug element list (Table 5). The PRN drug element list (Table 6) had 18 DRGs with no drug elements used greater than 0.7 drug orders per patient.

The Scheduled drug element list contains only three DRGs that had greater than 10 percent of drug elements for the primary drug package. They are DRGs 106 (coronary bypass with cardiac cath), 107 (coronary bypass without cardiac cath), and 302 (kidney transplant). The PRN drug element list contains four DRGs that had greater than 10 percent of drug elements for the primary drug package. They are DRGs 107, 209 (major joint procedures), 222 (knee procedures age < 70 w/o c.c.), and 302.

The Scheduled drug element list contains four DRGs that had greater than 20 percent of drug elements for the secondary drug package. They are

DRGs 75 (major chest procedures), 108 (cardiothor proc. except valve + coronary bypass, with pump), 215 (back and neck procedures age < 70), and 305 (kidney, urter + major bldr proc for non-malig age < 70 w/o c.c.). The PRN drug element list contains five DRGs that had greater than 30 percent of drug elements for the secondary drug package. They are DRGs 39 (lens procedure), 75, 106, 229 (hand procedures except ganglion w/o c.c.), and 305.

The Scheduled drug element list contains four DRGs that had greater than 90 percent of drug elements for the tertiary drug package. They are DRGs 82 (respiratory neoplasms), 183 (esophagitis, gastroent. + misc digest dis age > 69 &/or c.c.), 229, and 243 (medical back problems). The PRN drug element list contains five DRGs that had greater than 90 percent of drug elements for the tertiary drug package. They are DRGs 10 (nervous system neoplasms age > 69 &/or c.c.), 182 (esophagitis, gastroent. + misc digest dis age > 69 &/or c.c.), 183, 296 (nutritional + misc metabolic disorders age > 69 &/or c.c.), and 298 (nutritional + misc metabolic disorders age 0-17).

If DRGs are divided into surgical versus medical DRGs, the surgical DRGs have a higher frequency for the primary drug packages than the medical DRGs. For example, the Scheduled drug elements for DRGs 106-108, and 302 are surgical DRGs and have a higher percentage for the primary drug package category than DRGs 82, 182, 183, 203, 239, 243, 296, 298, and 404 which are medical DRGs. A similar pattern also occurs for the PRN drug elements.

Drug packages had an increasing number of drug elements as the frequency of use decreased. The Scheduled and PRN drug elements ranged from 0 percent to 15 percent for the primary drug package. The secondary Scheduled drug package ranged from 3 percent to 36 percent and the secondary PRN drug package ranged from 4 percent to 37 percent. The tertiary Scheduled drug package ranged from 61 percent to 97 percent and the tertiary PRN drug package ranged from 60 percent to 96 percent.

DRGs 1 and 10 are diseases and disorders of the nervous system. Only atropine sulfate injection 150mcg is common between the two DRGs for drug orders per patient greater than 0.7. DRG 1 had a total of six drug elements and DRG 10 had only one drug element for the primary drug package.

Table 8 - Drug Elements and Ratios for DRG 36, 39, 41, and 42 in the Major Diagnostic Category Diseases and Disorders of the Eye for Scheduled Medication.

DRG	Drug Element	Doses Patient	Drug Orders Patient	Doses Drug Order

42	POTASSIUM CL PWDR 20mEq	2.4	1.2	1.9

DRGs 36, 39, 41, and 42 are diseases and disorders of the eye. There are no drugs common to all four DRGs. However, diazepam injection 10mg is common to DRGs 36, 41, and 42. Azathioprine 100mg tablet is common to DRGs 39 and 42. Aminophylline 250mg injection is common to DRG 36 and 39. DRG 36 had seven drug elements, DRG 39 had five drug elements, DRG 41 had two drug elements, and DRG 42 had four drug elements for the primary drug package.

Table 9 - Drug Elements and Ratios for DRG 75 in the Major Diagnostic Category Diseases and Disorders of the Respiratory System for Scheduled Medication.

DRG	Drug Element	Doses Patient	Drug Orders Patient	Doses Drug Order

DRGs 302 and 305 contained diseases of the kidney. DRG 302 had five drug elements and 305 had only one drug element for the primary drug package. Pseudoephedrine is the only drug element common to both 302 and 305.

Table 18 - Drug Elements and Ratios for DRG 403 for the Major Diagnostic Category Diseases and Disorders of the Blood for PRN Medication.

DRG	Drug Element	Doses Patient	Drug Orders Patient	Doses Drug Order
403	DIPHENHYDRAMINE HCL CAP 50MG	6.6	0.9	7.0

DRG 403 contains diseases and disorders of the blood. DRG 403 had only one drug element for the primary drug package.

Primary Schedule Drug Elements Common Among DRGs

The primary Schedule drug elements that are common among DRGs are few. This is because DRGs are set up to be mutually exclusive. An exception to this are DRGs 106 and 107 which had 18 drug elements in common for the primary Schedule drug package. This is because both include coronary bypass procedure, one is without cardiac catheterization and the other is with cardiac catheterization.

Table 19 shows the drug elements used by MDC, DRG, and surgical versus medical for the primary Schedule drug package. The MDC is how DRGs are grouped together into organ systems. Each MDC is divided into surgical DRGs or medical DRGs depending upon whether the patient has a surgical problem or a medical problem. Notice that only three of the DRGs are medical and the other 15 DRGs are surgical. Only drug elements used in more than one DRG are included in Table 19. Drug elements that are used in more than four DRGs are aluminum hydroxide capsules 500 mg, ascorbic acid one gram, docusate sodium capsule 200 mg, and sultilains topical ointment. These drug elements would not form a drug package for surgery because they are not used in enough surgical DRGs.

Chapter Five

Discussion and Conclusion

Discussion

The drug elements have been identified for 28 DRGs at the University of Wisconsin Hospital and Clinics. The drug elements are divided into primary, secondary and tertiary drug packages. The primary, secondary and tertiary drug packages have implications for the management of drug inventory and labor.

The smallest of the three drug packages is the primary drug package (See Tables 5 and 6). If one divides the DRGs into surgical and medical, the higher frequencies tend to belong to the surgical DRGs and the lower frequencies tend to belong to the medical DRGs. This trend suggests that surgical DRGs are more homogenous than medical DRGs. One reason surgical DRGs may be more homogenous than medical DRGs is that surgery is a well-defined event and medical DRGs may have different levels of severity and drug treatment patterns.

The secondary drug package tends to have higher frequencies than the primary drug package. The trend for surgical DRGs to have higher percent frequencies than medical DRGs is not as obvious as in the primary drug package. The drug treatment pattern of the surgical DRGs may be mimicking the drug treatment pattern of the medical DRGs, which makes the population in a DRG appear to be heterogenous. The cause of this "heterogenous drug

treatment pattern" may be due to the number of different specialties treating a patient within a DRG category.

The largest number of drug elements are included in the tertiary drug package. The reason for so many drug elements in this tertiary drug package may be because there are subgroups within each DRG drug package that this analysis did not identify. The DRG classification scheme is unique but treatment patterns are not as homogeneous as one would suspect.

A problem that is not so obvious is that a patient is admitted to the hospital for one problem; the patient may have other problems that need to be treated. For example, DRG 106, 108, and 125 use thioguanine tablet 160mg. Thioguanine is used for myelogenous leukemia and DRG 106, 108, and 125 are diseases of the circulatory system. This suggests that in order to understand the contents of a drug package, the patient's other problems must be taken into account, not just the problem for which the patient was admitted to the hospital.

A situation that the above information can be used in is the management of pharmacy drug inventory and labor. Assuming that all patients in the hospital are assigned to a DRGs, knowing the patient mix as measured by DRGs pharmacy drug inventory and labor use can be predicted. The predictability of drug inventory and labor has implications for budgeting pharmacy department expenses. The budgeting process will be more accurate as measured by DRG

drug packages. As the patient mix changes from year to year, the change in drug inventory and labor costs can be assessed. The labor costs (cost of delivery, dispensing, administering, and monitoring) will be better anticipated because the frequency of use of drug elements in a drug package is known. Drug inventory costs can be better monitored because drug packages connect inventory to patient mix.

The ABC inventory control method is similar to drug packages because both procedures divide the inventory into three groups. However, that is where the similarity ends. Drug packages allow for the prediction of drug use and labor use in the pharmacy department. Drug inventory can now be set up to meet the needs of the patient as the patient enters the hospital.

Pharmacy needs to look at the drug element use over the patient's length of stay. This project has implications for inventory management. For example, when a patient enters the hospital and is placed in DRG X, the pharmacy is informed and the inventory is ordered to supply the needs of that patient. This way of managing the inventory is similar to "just-in- time manufacturing."

Another project that could be done is to link laboratory tests to drug element use. Laboratory tests could provide a prediction of patient severity. This prediction of severity could impact drug element use.

The tertiary drug package would be a prime place to look for subgroups in a DRG. Identifying the characteristics of these subgroups would help predict

drug element use in a tertiary drug package.

Conclusion

DRGs are a unique way to classify diseases, but the durg treatment pattern in each DRG appears to be heterogenous. This has implications for how costs of labor and drug elements are managed in a hospital. Knowing the frequency of use of drug elements in each DRG allows for the prediction of use of labor and those drug elements.

Hospital pharmacy managers have another tool to use to manage inventory and labor costs. Drug packages provide a framework in which pharmacy costs can be managed. This will allow pharmacy managers to anticipate drug use based on patient mix. Once drug use is known, the labor that goes into dispensing and monitoring can be calculated. This will provide a labor package. Thus, by determining the frequency of drug elements for a given DRG, hospital pharmacy management has another tool to help them in managing inventory and labor costs.
