## ABSTRACT

DEATH IN ANONYMITY: POPULATION DYNAMICS AND THE INDIVIDUAL WITHIN THE MILWAUKEE COUNTY POOR FARM CEMETERY, 1882–1925

by

Brooke L. Drew
The University of Wisconsin–Milwaukee, 2018
Under the Supervision of Professor Dr. Patricia B. Richards

Prior to hospital construction in late 1991 and early 1992, and again in 2013, archaeologists were called upon to excavate 1,649 and 831 burials, respectively, from the unmarked Milwaukee County Poor Farm Cemetery. The individuals disinterred during these field seasons represent what remains of a much larger indigent population buried by Milwaukee County between 1882 and 1925 in what has been designated as Cemetery II. Long before the expanding facilities at Wauwatosa's Milwaukee Regional Medical Center threatened these graves, however, the very nature of pauper burial grounds caused the identities of these disenfranchised individuals to be systematically obliterated.

The research presented here is one component of the collaborative Milwaukee County Poor Farm Cemetery Project. My contribution to this important work is a project with the following complimentary goals: first, production of a comprehensive demography for the original burial population based on primary archival sources; second, the utilization of this demographic data and statistical testing to identify under- and overrepresented groups and provide contextual explanations for the relative frequency of these cohorts; third, contribution of aggregate data and procedures to the Milwaukee County Poor Farm Project's burial identification efforts; and finally, construction of life history narratives for a small sample from the underrepresented groups to both demonstrate the utility of the archaeology of the individual approach and take small steps towards reversing the anonymity of this disenfranchised population.

For many of Milwaukee's late nineteenth- and twentieth-century residents, the pauper's burial was an all-too-real possibility and a dreaded fate. If burial in a potter's field was so loathsome, why were 7,226 individuals interred in the Milwaukee County Poor Farm Cemetery II? Poverty alone cannot be the answer, or this number would be even greater. Milwaukee's lower class was substantial, but clearly most found the means to bury their dead elsewhere. A central theme in modern mortuary studies is that "the dead do not bury themselves but are treated and disposed of by the living" (Parker Pearson 199:3), so if we are to understand why an individual was buried in the poor farm cemetery, we must first have a sense of the social network in which he or she lived. What networks, then, could the deceased have relied upon to ensure a proper burial, and why did these fail?

To elucidate these questions and satisfy the goals stated above, this project executes a multi-scalar research program. I first developed a full accounting of the MFPFC burial population utilizing various documentary resources. Second, I ran numerous goodness of fit chi-squared tests, comparing a temporally-controlled sample of City of Milwaukee death figures against the cemetery demography to determine which categories of individuals were under- or overrepresented in the burial population. Contextualizing these results within the city's population history revealed the various social networks in which the dead participated during their lives and began to explain why these failed at keeping individuals from a pauper's grave. The next step, matching the names from the documents to excavated burials, required a reduced scale of analysis and a synthesis of archaeological, osteological, and archival data. Finally, I constructed three life history narratives that highlight the archeology of the individual approach's efficacy in illuminating failing social structures. Each case is unique and demonstrates that real value can be found in "seeing the trees through the forest."

## ACKNOWLEDGMENTS

After spending a decade completing a project this complex, it is a daunting task to acknowledge all of the people who contributed to this endeavor and supported me along the way. First and foremost, I must thank my committee—Dr. John Richards, Dr. Pat Gray, Dr. Robert Jeske, and Dr. Thomas Malaby—for their advice and guidance throughout the dissertation process. Each offered his own unique expertise and perspective, and the final product is better for it.

Of course, I cannot overstate my appreciation for my doctoral advisor, Dr. Patricia Richards. It has been a roller-coaster ten years, but her unwavering support (both educational and personal), encouragement, and occasional (much needed) kicks in the rear were instrumental not only in my degree completion, but also in my ability to finish with a dissertation I am proud to send out into the world.

So many others deserve to be named. Everyone from the MCPFC field and lab crews contributed to this project, and all continue to be vital to the continuing work on this important population. Unfortunately, there are far too many to name individually, but Dr. Shannon Freire and soon-to-be doctors Catherine Jones and Brennan Charles must be singled out. All three were always willing and able to share data or paperwork and brainstorm ideas about burial patterns and lot identifications. Fellow MCPFC scholar Dr. Emily Epstein was very helpful in this regard as well, but her most important role was that of rock solid friend. Her constant yet gentle nagging and words of encouragement were always welcome in times of doubt (and there were many).

Though he was not on this committee, my Oregon State University master's advisor, Dr. David Brauner, had a profound effect on this work. Anyone who has had the good fortunate to work with him will recognize his influence throughout, especially in my concern for

the individual in archaeology and the inclusion of Walter Taylor in Chapter 2 in my theory discussion.

This project has outlasted the tenure of a number of Milwaukee County Historical Society archivists. All were helpful to varying degrees, but it was my good fortune that Dr. Kevin Abing and his assistant Steve Schaffer took over during the last few years of the project. They pulled so, so many coroner's inquests and other records for me without complaint, and even after I moved four hundred miles away, they patiently responded to every emailed research request quickly and enthusiastically. (And Kevin was right, the best dissertation is a done dissertation!) Milwaukee County Register of Deeds John La Fave and his staff were also wonderfully accommodating, not only providing unfettered access to the historic death certificates but providing me with my own workspace in their busy office. Financial support for a large portion of that documentary research was provided by the Golda Meir Library Scholars Award.

My sister, Dr. Taylor Boulware, and aunt, Dr. Susan Boulware, were ever-present examples of strong female PhDs; it feels good to finally join the other doctors in the family. And speaking of family, there is no way I would be here today without the tremendous support of my parents, Rebel and Tevis Boulware. They have always encouraged my educational pursuits, but their support has gone above and beyond the call of duty in so many ways. Not only has there been financial assistance through the years, but they uprooted their own lives multiple times to follow my family and myself from Oregon to Wisconsin to Indiana so they could be close to help with childcare (both of the human and dog variety) and whatever else I needed. There is no way I will ever be able to repay them for everything they have done. I would also like to thank my daughters, 17-year-old Savannah and 8-year-old Esme. Neither has ever had a mom who wasn't a student (I started back to college while pregnant with Savannah) and both have been exceptional

children—not only well-behaved beyond anything a parent could ask for, but endlessly patient and understanding about mommy always being busy, stressed out, or more often than not busy and stressed out. Not surprisingly, both claim they will *never* write a dissertation.

Last but definitely not least, I want to thank my husband Dr. Christopher Drew. I could not have asked for a more supportive and loving spouse. He took on the Herculean task of copy editing every portion of this manuscript, but more importantly he was the unwavering foundation I needed to push through the oftentimes exhausting and soul-crushing doubt that comes with dissertation research and writing. He was never going to let me give up, and he did everything possible to bolster me when I felt like taking the path of least resistance and walking away. As I was still stressing on the day I finished the last revisions, he told me for the hundredth time that he had more confidence in me than I had in me. I rarely responded when he said things like that, but he should know I wouldn't have been able to do this without him.

# Chapter 1

## Death in Anonymity and the Milwaukee County Poor Farm Cemetery

> *Peering into the face of a skeleton while picking dirt from around its teeth with all the care of dentist, an archaeologist cannot help but be aware that he is eyeball to eyesocket with someone who knew the answers to many, if not all the questions he is asking. For my part, I know that although the bones may be those of a person whose culture rendered him superficially different from me, a cold wind still made him shiver, liquor fuddled his senses, and in the night a woman's arms made yesterday and tomorrow unimportant. In these, and in virtually every other human emotion, we are alike. Our hands touch, but the silence of eternity holds us apart.*
>
> — Ivor Noël Hume, *Martin's Hundred*

> *Death in anonymity is the ultimate insult to human dignity.*
>
> — Kathy Reichs, *Break No Bones*

Prior to hospital construction in late 1991 and early 1992, and again in 2013, per administrative rules implementing s. 227.11 (2) (a) Wis. Stats., and interpreting s. 157.70 Wis. Stats, archaeologists were called upon to excavate 1,649 and 831 burials, respectively, from the unmarked Milwaukee County Poor Farm Cemetery (Figure 1.1). The individuals disinterred during these field seasons represent what remains of a much larger indigent population buried by Milwaukee County between 1882 and 1925. Long before the expanding facilities at Wauwatosa's Milwaukee Regional Medical Center threatened these graves, however, the very nature of pauper burial grounds caused the identities of these disenfranchised individuals to be systematically obliterated. In fact, only eight years after the lot was abandoned due to reaching maximum capacity, the already-paltry monuments to these lives were razed to make room for a new nurses residence. Though it was reported the remains themselves had been moved, archaeological evidence suggest that many were similarly destroyed (Richards 1997).

The research presented here is one component of the collaborative Milwaukee Poor Farm Cemetery Project, the mission statement of which is "to reverse the anonymity and neglect that has characterized the history of this cemetery, fulfilling the dual missions of ethical science

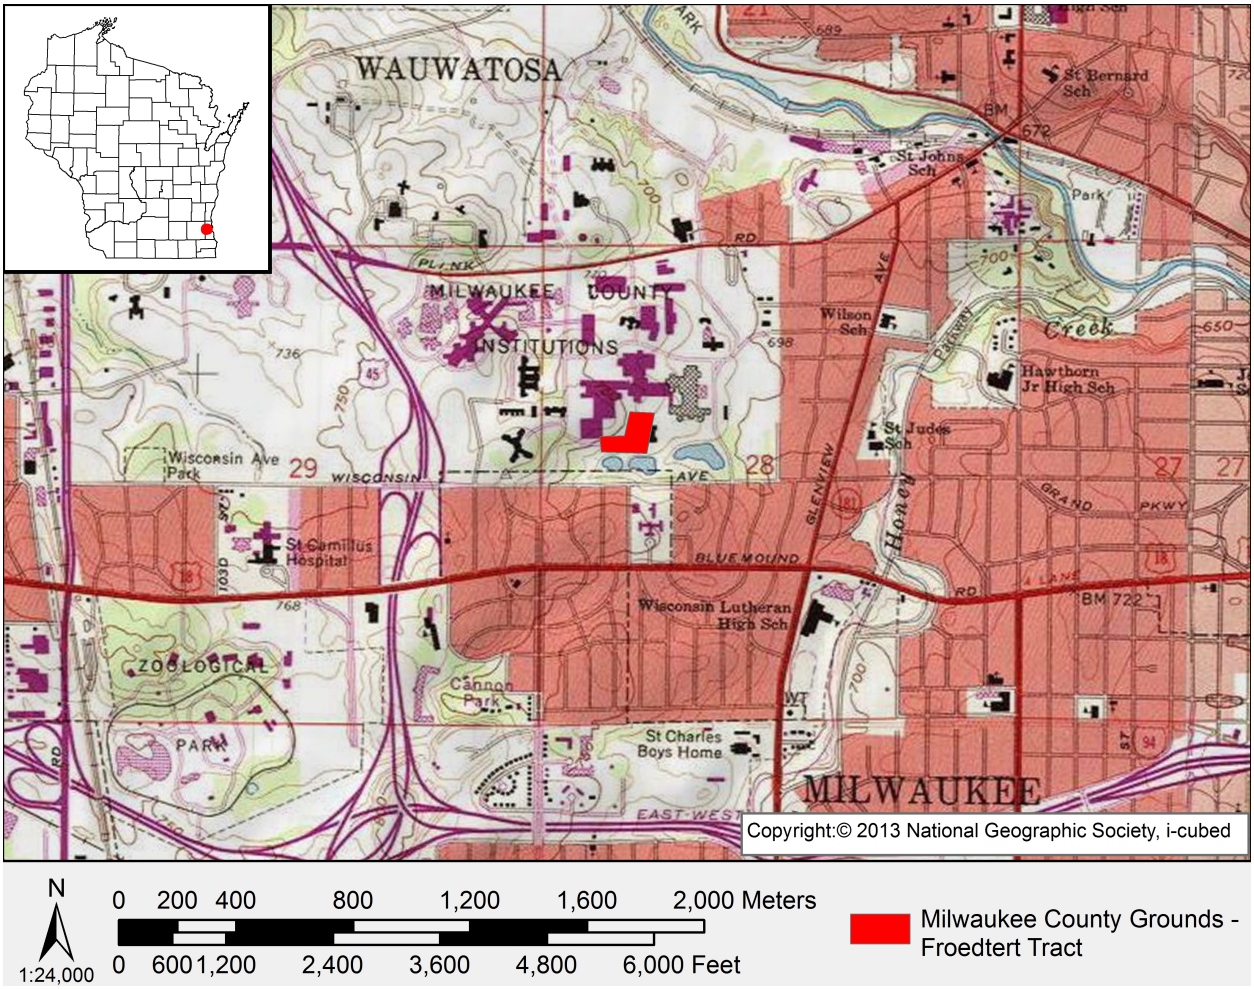

Figure 1.1 Location of Milwaukee County Poor Farm Cemetery (Adapted from Richards et al. 2016:55; reprinted with permission).

and social justice for those once interred," (2016). My contribution to this important work, situated in an archaeology of the individual framework, is a multi-scalar project that endeavors to meet several complimentary goals: first, to produce a comprehensive demography for the original burial population based on numerous primary archival sources; second, to utilize this demographic data and statistical testing to identify under- and overrepresented groups within the population and provide contextual explanations for the relative frequency of these cohorts; third, to contribute aggregate data and procedures to the Milwaukee County Poor Farm Project's burial identification efforts; and finally, to construct life history narratives for a small sample

from the underrepresented groups to both demonstrate the utility of the archaeology of the individual approach and take small steps towards reversing the anonymity of this disenfranchised population.

For many of Milwaukee's late nineteenth and twentieth century residents, the pauper's burial was an all-too-real possibility and a dreaded fate. A potter's field funeral, if it could be called that, incorporated none of the elements central to a proper Christian burial—no religious rites, no beautifully adorned coffin, no elaborate tombstone (Curl 2000), only a wooden marker without a name, merely a number. As McGuire observed, "the poor had little power to protect the sanctity of their graves and the nature of their burials did not accord them sanctity in the popular mind. The burials were rarely marked, often abandoned, and seldom traceable to particular families" (cited in Richards 1997:34). Compounding this fear of identity obliteration was the possibility of medical dissection, an anathema concept in a Judeo-Christian society that believed an individual's earthly remains must stay intact even after death. The King James Bible many of the immigrants knew well provided a good deal of contextual evidence for this belief, repeatedly linking the deceased mortal body with its eventual resurrected perfection:

> 23 And not only they, but ourselves also, which have the firstfruits of the Spirit, even we ourselves groan within ourselves, waiting for the adoption, to wit, the redemption of our body.
>
> (Romans 8:23)
>
> 20 For our conversation is in heaven; from whence also we look for the Saviour, the Lord Jesus Christ:
>
> 21 Who shall change our vile body, that it may be fashioned like unto his glorious body, according to the working whereby he is able even to subdue all things unto himself.
>
> (Philippians 3: 20-21)
>
> 2 Beloved, now are we the sons of God, and it doth not yet appear what we shall be: but we know that, when he shall appear, we shall be like him; for we shall see him as he is.
>
> (1 John 3:2)

35 But some man will say, How are the dead raised up? and with what body do they come?

36 Thou fool, that which thou sowest is not quickened, except it die:

37 And that which thou sowest, thou sowest not that body that shall be, but bare grain, it may chance of wheat, or of some other grain:

38 But God giveth it a body as it hath pleased him, and to every seed his own body.

39 All flesh is not the same flesh: but there is one kind of flesh of men, another flesh of beasts, another of fishes, and another of birds.

40 There are also celestial bodies, and bodies terrestrial: but the glory of the celestial is one, and the glory of the terrestrial is another.

41 There is one glory of the sun, and another glory of the moon, and another glory of the stars: for one star differeth from another star in glory.

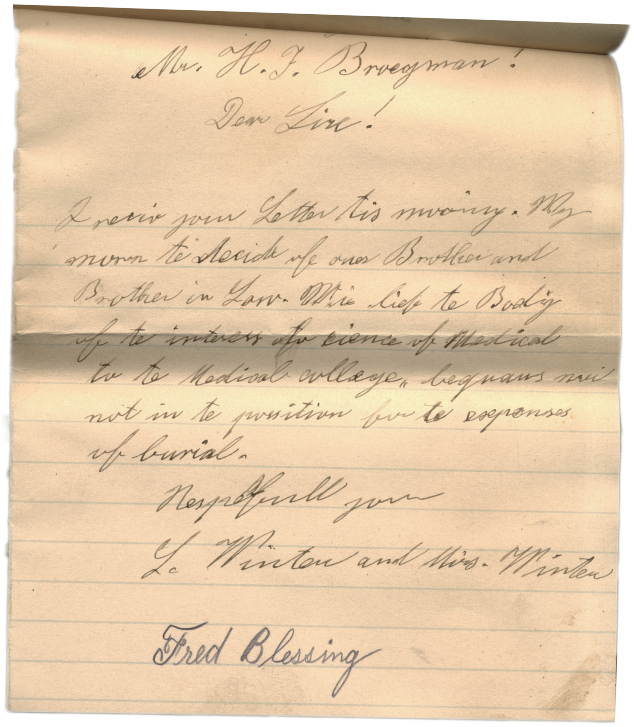

42 So also is the resurrection of the dead. It is sown in corruption; it is raised in incorruption:

43 It is sown in dishonour; it is raised in glory: it is sown in weakness; it is raised in power:

(1 Corinthians 15:35-43)
Holy Bible (2012)

Grieving families articulated these fears over and over in testimonials and letters preserved in the Milwaukee County coroner's inquest files. Many expressed despair that a family member might become a medical cadaver, while others described shame due to a lack of financial means to arrange a proper Christian burial for a loved one. Often the authorities played upon these anxieties in their death notifications, stressing the likelihood of dissection if the family did not claim the body or make arrangements for burial somewhere other than the county cemetery. A note written by the brother-in-law of FREDERICK BLESSING (d. 1 February 1906), a German-born tanner who hanged himself "with suicidal intent," typifies the grief, shame, and resignation felt by many impoverished families in their responses (Figure 1.2):

If burial in a potter's field was so loathsome, why were 7,226 individuals interred in the Milwaukee County Poor Farm Cemetery between 1882 and 1925? Poverty alone cannot be the answer, or this number would be even greater. Of the 3,476 men[1] buried in the MCPFC between those years with an occupation listed on their death certificate, 3,183 (91.6%) held jobs that could be classified as wage labor. However, in just one year, during the height of Milwaukee's

Mr. H. J. Broegman!
Dear Sire!

I receiv your Letter this mwoing. We
mwon te Aecide of our Brother and
Brother in Law. Wie liefe te Body
up te interes of ience of Medical
to te Medical college, because wir
not in te position for te espenses
of burial.

Respectfull your
L. Winten and Mrs. Winten

Fred Blessing

*Mr. H. J. Broegman!*
*Dear Sire!*

*I receive your letter this morning. We mourn the suicide of our Brother and Brother in law. Wir[We] liefe[leave] the body up to the interess[interest] of science of medical to the medical college, because were not in the position for the expenses of burial.*

*Respectfull yours*
*L Winten and Mrs. Winten*

Figure 1.2 Family's response to death notification for FREDERICK BLESSING, 1906 (Courtesy of Milwaukee County Historical Society).

industrial boom when 3,342 manufacturing establishments were operating, 37,836 men were wage laborers; an additional 7,501 women and 2,991 youths[2] were also wage earners, bringing the total to 48,328 in 1900 (Still 1948:576). Milwaukee's lower class was substantial, but clearly most found the means to bury their dead elsewhere.

A central theme in modern mortuary studies is that "the dead do not bury themselves but are treated and disposed of by the living. Archaeologists seek not only to document [past] rituals by recovering the evidence of past funerary practices but also attempt to understand them within their historical contexts and to explain way they were enacted in the ways that they were" (Parker Pearson 1999:3). Given this, to understand why an individual was buried in the poor farm cemetery, we must first have a sense of the social networks[3] in which he or she lived (Richards (1997). What social networks, then, could the deceased have relied upon to ensure a

proper burial, and why did these fail?

To elucidate these questions and satisfy the goals stated above, I executed a multi-scalar research program. I first developed a full accounting of the MFPFC burial population utilizing various documentary resources including the *Register of Burials at the Milwaukee County Poor Farm Cemetery* (RBMC) and Milwaukee County coroner's inquests (MCCI). Second, I ran numerous goodness of fit chi-squared tests, comparing a temporally-controlled sample of City of Milwaukee death figures against the cemetery demography to determine which categories of individuals were under- or overrepresented in the burial population. Contextualizing these results within the city's population history revealed the various social networks in which the dead participated during their lives and began to explain why these networks failed at keeping individuals from a pauper's grave. The next step, matching the names from the documents to excavated burials, required a reduced scale of analysis and a synthesis of archaeological, osteological, and archival data. Finally, I constructed three life history narratives that highlight the archeology of the individual approach's efficacy in illuminating failing social s. Each case is unique and demonstrates that real value can be had in "seeing the trees through the forest." This phrase, a fragment of the second chapter's title, is meant to draw a distinction between my approach and more traditional cemetery analyses in which consideration of the individual is often eclipsed by population-level descriptions. Here, I will provide a brief introduction to mortuary archaeology as it pertains to historic cemeteries and discuss the limitations of single-scale investigations. Additionally, the archaeology of the individual approach that guided this project will be outlined.

The historical background presented in Chapter 3 provides the necessary contextual framework for the cemetery population demographic analysis as well as the individual

narrative constructions. My account of Milwaukee's population history is a survey of seminal works by Commons (1920), Conzen (1976), Nugent (1992), and Gurda (2008). The county's involvement in sick and poor relief programs, as well as the Cemetery II timeline detailing its 1882 establishment through the last archaeological excavation in 2013, draws heavily upon the work previously conducted by other MCPFC scholars including Richards (1997), Richards et al (2016), and Freire (2017). However, the cemetery population data and demography presented in Chapter 5 is based solely upon the primary research I conducted between 2008 and 2017. This archival study incorporating complimentary investigations of the *Register of Burial at Milwaukee County Poor Farm*, Milwaukee County death certificates, Milwaukee County coroner's inquests, Milwaukee County General Hospital patient ledger, and the *City of Milwaukee Annual Commissioner of Health Reports* is detailed in the preceding chapter (Chapter 4).

Chapter 6 recounts attempts to identify individual burials, but more importantly contains life history narratives for teenage runaway Emilie Bannovski, carnival "fat lady" Gertrude West, and the five Rosche siblings who succumbed to diphtheria in July 1894. The closing chapter, "The Archaeology of the Individual and the Milwaukee County Poor Farm Cemetery," summarizes this project while situating it within the larger Milwaukee County Poor Farm Project specifically and historic cemetery archaeology more generally.

*Endnotes*

1 These figures were generated to be consistent with data presented by Still (1948:576), where "men" are defined as males older than sixteen years of age.

2 Males and females under 16 years of age (Still 1948:576)

3 Social network is used here to avoid confusion with the term social structure in the Giddensian sense (an important component in the relationship between agency and structure discussed in Chapter 2), though when discussing social relations between individuals the latter is often used. Radcliffe-Brown noted, "the term 'social structure' is used in a number of different senses, some of the very vague," (1940:3). Here, social network is equivalent to Radcliffe-Brown's conception of social structure, "I regard as part of the social structure all relations of person to person. For example, the kinship structure of any society consists of a number of such dyadic relations...I [also] include under social structure the differentiation of individuals and of classes by their social role. The differential social positions of men and women, of chiefs and commoners, of employers and employees, are just much determinants of social relations as belonging to different clans or different nations. In the study of social structures, the concrete reality with which we are concerned is the set of actually existing relations, at a given moment of time, which link together certain human beings," (Radcliffe-Brown 1940:3-4).

## Chapter 2

## Seeing the Trees Through the Forest: An Archaeology of the Individual Approach to Cemetery Research

*Introduction: Historic Cemeteries and Mortuary Theory*

In *Unknown Man No. 198: The Archaeology of the Milwaukee County Poor Farm Cemetery*, Richards asserts:

> The questions asked of historic burials must be questions concerning the presence and place of the individual within social structure, Historic burials represent rituals performed for the living. How rituals can be understood is dependent upon historical contextualization, recognition of the roles of the individual, and an understanding of the individual's active participation in the social structure. (1997:35-36)

This statement is rooted in Giddens' (1979; 1984) significant influence upon the post-processual archaeological paradigm, as is the definition of social structure as "the norms defining roles and rules that make up the relations of power, deference, duties and rights. This structure is visible in the patterns and activities in a society" (Richards 1997:35).

Elucidating social structure in this manner is contingent upon recognizing that mortuary behavior reveals as much about the living and their relationship with the dead as it does about the deceased. As Heilan writes, "Mortuary ritual thus does not unambiguously express the identities maintained by an individual in life but instead is an affective expression of social ties" (2012a:37; see also Cannon et al. 1989; Parker Pearson 1982; 1999). This contrasts markedly with the earlier Saxe-Binford program, which suggested that burial practices were dependent solely on the social persona of the deceased, and therefore, through the comparative study of mortuary variation, archaeologists could uncover past social organization (Binford 1971; Goldstein 1976; 1981; Saxe 1970).

The expectation that historic cemeteries are reflections of the societies that utilized

them fits well within the Saxe-Binford approach, and it is true that, at least demographically speaking, many cemeteries mirror their parent population. Support for this can be found in the similar mortality, age, and sex profiles generated from documentary data, as well as church and public cemetery excavations (Blakely and Rankin-Hill 2009; Heilan 2012a; Saunders et al. 1995; Ubelaker and Jones 2000). However, institutional cemeteries like MCPFC typically have significantly different compositions (Elia and Wesolowsky 1991; Phillips 2001; Sirianni and Higgins 1995), leading to the question, how are past social structures reflected in these unusual contexts?

Population-level analyses of historic cemeteries of all kinds allow for the recognition of patterns that represent broad social structures of the past. I argue, however, that the application of a multi-scalar archaeology of the individual approach, particularly to institutional cemetery populations, provides a new perspective that uncovers not only these social structures but also a fluidity and complexity that is often overlooked.

*Archaeology of the Individual Theoretical Heritage*

This framework is deeply embedded in the post-processual archaeology of the 1980s and 1990s:

> by challenging the reality of a larger cultural system, the determinism of material conditions, and the existence of totalizing theories based on universal principles, the postprocessualists have focused on active individuals as the creators of history. This approach has assumed an important place within historical archaeology, and the terms 'agency,' 'individual,' 'identity,' and 'choice' have been common in the literature. (McGuire and Wurst 2002:85-86)

The shift in focus from the systems theory, evolutionary determinism, and functionalism of the processual archaeologists to a more "bottom up" archaeology has been attributed to feminist

scholars within the field (Denis 2008; Hodder 2003). Most scholars agree that interest in feminist or gender archaeology blossomed out of Conkey and Spector's "Archaeology and the Study of Gender" (1984). Their call for a less androcentric view of the past led to the recognition of the varied experiences of individuals with different social identities; women were not their only concern, but also individuals with different ages, class statuses, ethnic backgrounds, and sexual preferences. Additional advancements in this vein have recently been driven by feminists of color, who also stress the importance of intersectionality (Crenshaw 1989). McGuire and Wurst emphasize this point when they write that "an individual may be an African-American, a gay, a male, and a lawyer, but he is not simply the sum of these identities" (2002:89). They go on to note that this multivariate identity is shifted and reconstituted in different social situations in relation to those around him. This argument is reminiscent of Moore's (1975) writing on indeterminacies and inconsistencies in social situations.

The fluid nature of social identities within disparate social settings is part and parcel of discussions on the recursive relationship between agency and social structure. As with Moore, considerations of structure and agency in North American archaeology generally rest up on the foundations laid by Giddens (1979, 1984) and Bourdieu (1977). In her acknowledgment of their influence, Gillespie writes:

> These theories typically posit a dynamic recursive relationship linking structure and agency. They contend that human action creates or reproduces "structure" …such that society is always in process. However, actors are constrained and conditioned to act…by their sociocultural circumstances. Structure is thus both shaping of and shaped by actors, who are both producers and products of structure. (2001:74)

The interwoven nature of agency and structure is highlighted by several authors (e.g., Johnson 1989). In fact, McGuire and Wurst argue against the oppositional dichotomy in which

the two are often placed, emphasizing that they are always dialectically related. By accepting this dialectic relationship, one recognizes that society and the individual are not independent of each other and that "these terms summarize a complex web of social relations that bring these 'things' into being" (2002:89).

Rooted in the framework of the agency/structure debate is the acknowledgment that to truly understand how individual actors exercise agency within the confines of social structure, the individual must be situated within his or her own historical context. Erickson and Murphy, while discussing Bourdieu's practice theory, state that "the wellspring is the *habitus*, or the ways in which *personal history and social positioning* [emphasis added] allow individuals to improvise or innovate," (1998:144). Gardner (2011), Hodder (2003), and Scott (1994) echo this need for specificity in agency interpretation. Emphasis on the contextual interpretation of individual actors has led several authors to assert that archaeology is an historical as well as anthropological discipline (Deetz 1988). Hodder argues,

> Because of the emphases on context and on the continual process of change which is implicated in material practices and symbolisation, archaeological enquiry is of an historical nature. Artefacts and their organisation come to have specific cultural meanings as a result of their use in particular historical contexts…. The enquiry is also historical because the intended and unintended consequences of action affect further action (1982:10).

A staple in archaeological theory discussions, Walter Taylor's (1983) chapter "Archeology: History or Anthropology" in *A Study of Archaeology* tackles anthropological archaeology's relationship to history directly. After a detailed exposition of the definitions of history, historiography, ethnography, and ethnology, Taylor concludes that "one may 'do' historiography by interpreting the written record…or by interpreting 'non-verbal documents' [artifacts]. The important fact is that the moment cultural data are synthesized into a context representing past

actuality, the result is historiography" (1983:43).

If one accepts the connection between archaeology and history, then the archaeology of the individual approach can be closely associated with the recent microhistorical trend in social history. Microhistory is often defined in opposition to the *longue durée* framework of the French Annales School of history; it is the "intensive historical investigation of a relatively well defined smaller object, most often a single event, or a village community, a group of families, even an individual person" (Ginzberg and Poni 1991:3). A strong proponent of the microhistorical approach, Magnússon (2016) argues that the extensive focus on a small scale subject, especially an individual, allows for great precision and nuance in not only historical descriptions but interpretations of the social context of everyday lives. In addition, he notes, "such efforts often open doors to unexpected connections and 'voices,' which may offer competing explanations of the study" (Magnússon 2016:198). The relationship between microhistory and archaeology is explicitly discussed by Orser, Jr. (2016:179), who argues that the "singularization" of history as proposed by the microhistory school is applicable to archaeology because its source of data is inherently micro as well—an artifact, an individual feature, or structure floorplan. Both microhistory and the archaeology of the individual approach employ the "bottom up" approach championed by the post-processual movement.

*Construction of Narratives in Archaeology*

Another similarity between microhistory and the theoretical framework applied during this project is an emphasis on narratives (Hodder 2003; Yamin 2000). Narrative writing in archaeology is not a new phenomenon (see Deetz 1996; 1995; Hume 1982; Spector 1991), but one that is associated with both the growth of feminist archaeology (Wilkie and Hayes

2006) and Geertz's (1973) "thick description" (Hodder 2003; Magnússon 2016; Whitehouse 2011). However, in recent years there has been considerable discussion concerning its place in archaeology, and particularly historical archaeology (Deetz 1998). A foundational argument supporting its use—one that comes directly from post-processual thought—is that all archaeological writing, and by extension historical writing, is subjective and a construction of past actuality. As Taylor points out, this is true on a practical level—to recount the past in its totality "would take as long as the happening themselves" (1983:29) Therefore, when a historiographer or an archaeologist writes about the past, he or she chooses what to include and what to omit. This process can never be wholly objective because the scholar's political ideology and past experiences, as well as research agenda, will always color his or her choices (Erickson and Murphy 1998; Deetz 1988; Kessler-Harris 1997).

Many of the authors concerned with the subjective nature of archaeological writing, and particularly narratives, are quick to point out that this does not mean their interpretations are totally invalid or works of fiction (even when written in fictive form). An immersion into all available data sources—an involvement akin to that of microhistorians—gives the archaeologist unique insight into his or her area of study (Beaudry 1993; Ryder 1998). A practiced narrative writer, Praetzellis writes, "After all, if archaeological interpretation is no more than opinion, then the speculations of supermarket tabloid writers would be as valid as those of the trained professional in matters archaeological…. The fact is, an experienced archaeologist will have insights about their site that he or she cannot entirely justify on the basis of 'data'" (1998:1) These sentiments echo those of Geertz who stated, "I have never been impressed by the argument that, as complete objectivity is impossible in these matters (as, of course, it is), one might as well let one's sentiments run loose" (1973:30).

The different forms that archaeological narratives can take are explored in a 1998 special issue of *Historical Archaeology*. Entitled "Archaeologists as Storytellers," this compilation is the result of a highly successful conference symposium from the previous year's annual meeting. Examples of narrative writing include first- and third-person fictive prose of various styles (see Beaudry 1998; De Cunzo 1998; Ryder 1998), as well as more traditional life history approaches (see Cooke 1998). While no cemetery studies were included in this issue, the life histories are stylistically similar to those produced through osteobiographical approaches (Robb 2001; Saul and Saul 1989; Stodder and Polkovich 2012).

Perhaps the most effective use of narrative style in archaeological interpretation is Wilkie's (2012) *The Archaeology of Mothering*. This publication, written as a first-person exploration of one nineteenth-century woman's life through material culture and documentary records, demonstrates all the benefits of a narrative archaeology of the individual: (1) holistic synthesis of different types of resources as well as integration of data within interpretation (Johnson 1989; Stodder and Polkovich 2012; Yamin 2000); (2) contextual constructions of lived experience, especially for those "of little note" (Kessler-Harris 1997; Scott 1994; Voss 2006); (3) complete transparency in both research and interpretation allowing for the forfeiture of a positivist authoritative voice (Gardner 2011; Joyce 2008); and (4) production of a thoroughly accessible manuscript (Deetz 1998; Praetzellis et al. 1997; Yamin 2000). All these elements will be present in the narratives constructed during this project.

*Large-Scale, Small-Scale, and Multi-scalar Cemetery Analysis*

The methods and theoretical approaches adopted for this research are unique to cemetery projects of this size. Several instances exist in which single graves or small burial plots have

been excavated (Connolly et al. 2010: Dudar et al. 2003; Larsen et al. 1995; Little et al. 1992; Lovell and Dublenko 1999; Ross et al. 2009; Rudolph 2010; Spence 1996; Thomas et al. 1977; Williamson 2005), but in these cases, the remains are often associated with specific individuals and life histories, or osteobiographies are presented (Crandall and Harrod 2014; Jenkins 1981; Handler 1996; Katzenberg et al. 2005' Owsley et al. 2006; Winchell et al. 1995). The innovative edited volume *The Bioarchaeology of Individuals* (Stodder and Palkovich 2012) highlights the interpretative value of the latter approach, but out of the fifteen contributions in this anthology, only one examines a North American historic period burial (Katzenberg and Saunders 2012).

While there have been various large-scale cemetery excavations in the United States, few have taken an archaeology of the individual approach to the analysis or identification of the remains. Most are population-level material culture or osteological reports (Buikstra et al. 2000; Bell 1987; Blakely and Rankin-Hill 2009; Collins 2009; Corruccini et al. 1982; Elia and Wesolowsky 1991; Louis Berger Group 2005; Osborn 1997; Owsley et al. 1990; Saunders et al. 1995; Ubelaker and Jones 2000), or aggregate analyses focusing on health (Saunders et al. 1993; Phillips 2001), nutrition (Crist 1995), trauma (Brickley and Smith 2006), or postmortem activity (Nystrom 2017). The scholarly works conducted on this cemetery prior to the collaborative Milwaukee County Poor Farm Project are consistent with these classifications (Charaus 2010; Dougherty 2011; Florence 2007; Hutchins 1998; Milligan 2011; Ozga 2009; Polli 1997; Rodriguez Pons 1998; Schrubbe 2005).

However, the archaeologists in charge of two recent and extensive cemetery excavations display a similar level of concern for the individual as demonstrated here. The Third Street Cemetery in Dubuque, Iowa, not unlike the cemetery at the center of this project, endured a number of abandonments, periods of community forgetting (or "misplacing"), disturbances,

misled claims about past burial removals, and contentious legal battles. Over the course of four field seasons, archaeologists—working on the behest of a landowner who desperately wanted to develop a condominium on a lot once occupied by a Catholic cemetery—excavated 939 graves; almost all of these burials were thought to have been removed a century ago, but, like the MCPFC (see Figure 3.2), oral histories and archaeological evidence suggest quite a few have been destroyed in the past (Lillie and Mack 2015).

Also like the MCPFC Project, the archaeologists directing the Third Street Cemetery excavation and analysis chose to work beyond the limited scope of most salvage cultural resource management projects and endeavored to tell the stories of the people buried and forgotten in this bluff cemetery. In the introduction to their chapter "Humanizing the People of Third Street, Lillie and Mack write,

> While all the analyses involved in studying the Third Street Cemetery resulted in data and counts and specifics about coffins, hardware, and grave goods, it is only by combining these details that we can begin to glimpse the stories of individuals in the cemetery. The following portraits do just that, allowing us to see everything at once and gain a greater understanding of some of the people of Third Street. (2015:101)

The vignettes that follow, concerned with both identified and unidentified burials, share not only the same goals, but also the narrative style I employ in Chapter 6. Because this was not a pauper's cemetery in which so many of the interments are unknown or unclaimed, the archaeologists were also able to connect burials with living descendants who ultimately became involved in the reburial process (Lille and Mack 2015).

The second example is the Alameda-Stone Cemetery in Tucson, Arizona (Heilen 2012). Part of the Joint Courts Complex Archaeological Project, this late nineteenth-century cemetery, like the MCPFC, required excavation prior to new city construction. Unlike the Milwaukee

County cemetery, however, Alameda-Stone was a public place of burial. Consequently, the cemetery's population of approximately 2,000 individuals mirrored the complex and heterogeneous character of nineteenth century Tucson; Heilen notes,

> Based on the demography of Tucson at the time, burials would have included Hispanic individuals from Mexico, the southwestern United States, Spain, and South America; non-Hispanic Euroamericans from many parts of the United States, Canada, Europe, the Caribbean, and the Middle East; Native Americans including Tohono O'odham, Akimel O'odham, Yaqui, and Apache; and a small number of African Americans. Religious affiliations varied among the populace as well. Many of the Hispanics using the cemetery would have likely been buried according to Protestant, Catholic, or Jewish traditions. Native Americans and African Americans buried in the cemetery may also have been buried according to a variety of traditions, including Christian or syncretic Christian traditions, given the public nature of the cemetery within a largely Christian cultural context. Burials of individuals associated with the U.S. military also occurred in the cemetery (2012:23).

Associating individual names to individual burials and constructing life histories was not their goal. Each of these distinct groups had decedents who wanted a stake in deciding where and how their predecessors were to be reburied. To facilitate this complicated process, the cultural or ethnic affiliation of each burial was determined through combined archaeological, osteological, and material culture analyses (Goldstein et al. 2012).

Despite the similar scale and multidisciplinary nature of the Dubuque Third Street Cemetery project and the Joint Courts Complex Archaeological Project, there are two important distinctions to note between them and the Milwaukee County Poor Farm Cemetery Project. First, the diverse nature of the Catholic Third Street Cemetery and the public Alameda-Stone Cemetery is in sharp contrast to the relatively homogeneous MCPFC population (Chapter 5). This further supports the argument that non-institutional cemeteries tend to reflect the community that utilized them, while institutional cemetery populations are the product of more complex social structures. Second, the presence of descendant communities in Dubuque and Tucson, which invested in the

final disposition and reburial of the excavation remains, as well as the absence of similar groups in Milwaukee, underscores the disenfranchised status of the MCPFC population.

## Chapter 3

## The City of Milwaukee and The Milwaukee County Poor Farm Cemetery

A prerequisite for understanding this unique cemetery population is to situate it within its historical, demographic, and archaeological contexts. This background is fundamental to my first two research goals: identifying which groups may be under- or overrepresented in the population and explicating why these differences are observed. Additionally, in conjunction with these contextual backgrounds, the narratives presented in Chapter 6 satisfy my other objectives: conveying the personal stories of a select few whose fate was to be buried in a pauper cemetery and demonstrating how a concern for the individual in archaeological interpretation can illuminate deviations in expected patterns.

It is tempting to begin our discussion of Milwaukee's history at the beginning, before white settlers displaced both the local indigenous tribes and Native refugees from the east who settled in the Menominee Valley and along its various rivers, and before the three independent villages founded by Solomon Juneau and Morgan Martin (Juneautown), Byron Kilbourn (Kilbourntown), and George Walker (Walker's Point) came together and united under one civic authority. However, these (admittedly fascinating) earlier periods are less central to our understanding of the Milwaukee County Poor Farm Cemetery than the later years, when wave upon wave of immigrants set their sights on the growing metropolis, forcing the burgeoning city and county to create institutions to deal with the least fortunate of these masses. For the earlier periods, one can reference influential works by Flower (1881), Still (1948), and Gurda (2008).

### *Late 19th and Early 20th Century Transatlantic Migration*

Between 1820 and 1920, over 33 million migrants[1] found their way to the United States, and up to seventy-five percent ended their transatlantic journey in cities like New York, Boston,

Philadelphia, Chicago, and Milwaukee (Ward 1971). The Middle Atlantic states, where nearly all transatlantic migrants first disembarked, retained the highest proportion of foreign-born residents throughout the latter portion of the nineteenth and first half of the twentieth centuries. The North East Central states, which include Wisconsin, maintained a comfortable second place throughout the same period (Table 3.1).

Table 3.1 Foreign-born† population, 1870-1920 (Adapted from Thompson and Whelpton 1933, p. 57).

| Region | 1850 | | 1870 | | 1890 | | 1900 | | 1910 | | 1920 | |

† Thompson and Whelpton (1933) made a distinction between "foreign-born whites" and "negroes." For all intents and purposes, "foreign-born whites" is synonymous with European migrants, though they do note that "All Mexicans are classified as whites prior to 1930" (p. 57).

Milwaukee contributed more than its fair share of the region's foreign-born population. Still (1948) notes that, though native-born individuals dominated the city's populace between 1870 and 1910, their majority was a slim one; forty-seven percent were foreign-born in 1870, and Milwaukee was deemed the most "foreign" US city in the 1890 federal census. Natural increase[2] apparently did not lessen this impression: "by 1910 the essence of Europeanism was to diluted to the point that foreign-born constituted only a third of the population; but even at that date more than three-fourths of the total population were classified by the census-takers as 'foreign white stock'" (Still 1948:258).

The forces spurring this unprecedented flow of humanity are often viewed within a

dichotomous "push/pull" framework (Conzen 1976; Gurda 2008). The "push" was diverse political, social, religious, and economic pressures in Europe that motivated millions to uproot themselves and flee to a new land that promised an improved existence. Demographers Taeuber and Taeuber explore North American migration in *The Changing Population of the United States*:

> Dissident sectarian groups sought religious freedom in a land remote from princes of church and State. Armies conquered in battle were transported across the Atlantic. Families fleeing severe deprivation or famine managed somehow to get to coastal cities and across the ocean. The lowly and the disadvantaged were not the only groups who came, for the new land offered opportunities to younger sons and less nobility, to hard-pressed gentry, and to professional and technical people. There was the lure of fortune for investors, traders, and businessmen. Idealists found a powerful attraction in the virgin lands and the new culture beyond the seas. (1958:48-49)

With few exceptions, the migrants who came to Milwaukee did so for economic reasons. Additional reasons, like those of the Irish during the Great Famine, were rooted in life or death—emigration was the only means to escape a hopelessly meager existence in the Old Country. Others' situations may not have been as dire, but even then, migration meant giving up mediocre but stagnant prospects for the chance to improve one's lot (Diner 1983; Nugent 1992).

The "push" influences, whether political and religious intolerance or the more common economic motives, would have been irrelevant had there not been a new country willing to accept the migrants. Several immigration laws were passed throughout the early period to bar "undesirable" newcomers (paupers, convicts, lunatics, and the weak-bodied) and later legislation, through quota regulations, worked to mitigate the deluge of aliens from "undesirable" countries (mainly those from Southern and Eastern Europe) (Commons 1920; Daniels 2002). Despite this, however, throughout the nineteenth century various municipalities and industry leaders made concerted efforts to attract farmers to the western frontier and laborers to the ever-increasing

number of factories dotting the new urban skylines. Commons contends:

> While incentives and inducements have always worked together, and it would be rash to assert dogmatically the relative weight of each, yet to one who has carefully noted all the circumstances it is scarcely an exaggeration to say that even more important than the initiative of immigrants have been the efforts of Americans and shipowners to bring and attract them. (1920:107)

In Milwaukee particularly, the businessmen steering the city away from its early status as the Midwest's agricultural trading capital to its industrial manufacturing center (a status it would eventually lose to Chicago) actively sought the cheap unskilled labor new migrants offered. This shift in economic focus, and by extension the shift in workforce demand, is illustrated in the number of manufacturing establishments in the greater Milwaukee area: in 1859 there were 558 factories in all of Milwaukee County; thirty years later, in 1889, there were 2,879 in the city alone (Gurda 2008).

For those who may have initially resisted these recruiting efforts or had reservations about leaving their homelands, correspondence from expat friends and family lauding the almost mythical virtues of the Unites States convinced them to take the plunge (Diner 1983; Nugent 1992; Gurda 2008). This "chain" or "serial" migration accounted for a large portion of nineteenth and twentieth century transatlantic trips. Not only could the newer migrants rely on preexisting social networks to assist them in housing and job placement, but often the enticing letters sent home came with remittances or prepaid ship tickets (Commons 1920; Conzen 1976).

The form taken by the inaugural and subsequent chain migrations varied significantly. Some groups, like the early German settlers, uprooted entire families, bolstering the relatively small proportion of women and children among the foreign-born population. Often, those traveling with families favored rural regions where land was plentiful and, with a small amount

of capital, a reasonably-sized farm could be purchased. These groups came to America with every intention of settling permanently. Others were single men (and in the case of the Irish, single women) who migrated to the growing industrial centers in the Eastern states and Upper Midwest seeking wage-labor and permanent residence. Still others, especially those participating in the "new" immigration of the twentieth century, viewed transatlantic migration as simply an extension of the intra-European seasonal migrations they and their ancestors had been practicing for generations. These "birds of passage" (Nugent 1992), like other wage-seekers, were drawn to the unskilled labor positions in the cities, but they never intended to stay long, instead planning to return to their home communities after a year or two with a comparatively sizable cash infusion that would elevate their status both economically and socially. Commons (1920) and Nugent (1992) both attest that many were successful in this endeavor, but as noted in Chapter 5, many were not so fortunate and had their hopeful migration cut short by disease, accident, or suicidal despair.

Whether the reasons for leaving were more "push" or "pull," or whether the migration was meant to be permanent or not, few would have had the means to migrate without improved and cheaper transportation, both within Europe itself and between continents. In particular, the mid-nineteenth century evolution of steamship technology was a major facilitator of mass migration (Taeuber and Taeuber 1958). Prior to 1870, when the relative trickle of migrants became a flood, the voyage from Western Europe took four to six weeks. This extended period onboard a densely-populated and often unsanitary vessel allowed more than enough time for contagious diseases to take their toll on the passengers and crew. Nugent (1992) reports that in the 1840s, during the height of the Irish Famine migration, it was not uncommon for ten to twenty-five percent of those onboard a sailing vessel to succumb to typhus and cholera, among

other deadly pathogens. While these figures improved after 1850, when health and sanitation regulations were enacted by both European governments and the shipping companies, it was not until steam powered engines cut the journey to ten days or less that embarking travelers could feel relatively certain they and their loved ones would survive the crossing. These advancements in sea travel would have been for naught, however, without the ever-expanding railways and road networks in Europe that allowed those with the will to migrate from the inland regions the means to inexpensively reach seaports (Nugent 1992).

The effects of these migratory patterns can be observed in census data presented in Still (1948:570-571). The city's population increased dramatically between 1840 and 1920, especially during the decades when transatlantic migration was at its peak (Nugent 1992); one of the largest increases occurred between 1880 and 1890 when the population ballooned from 115,587 to 204,468–an almost seventy-seven percent increase. When compared to figures for the state during the same periods, the magnitude of Milwaukee's "pull" is underscored; when Milwaukee's population increased by seventy-seven percent, Wisconsin added only twenty-nine percent (Table 3.2). Beyond illustrating this general trend, however, Still's (1948) data also emphasize the diverse contributions of distinct migrant groups to the city's growth. In 1850, when sixty-four percent were foreign-born, Germans constituted thirty-eight percent of the migrant population. The remainder was made up of much smaller numbers of Irish, English, and French. Fifty years later, in 1900, the migrants represented only thirty-one percent of the city, and this portion not only included Germans, whose dominance had declined considerably, but also Polish, English, Irish, Bohemians, Norwegians, Austrians, Russians, Italians, Swedes, and Swiss (Figure 3.1).

Examination of individual migrant group histories and social structures is reserved for

the Chapter 5 discussion, but it is important to note that while individuals or families each had their own motivations for coming to America, generalizations can be made. Ferenczi and Willcox argue that European emigration was the product of "the spontaneous decision of individuals on the grounds of personal motives. Even when the current appears to a collective whole, it is seen on closer investigation to be only a loose association of interested individuals.... The typical representative of mass emigration...is the proletarian" (1929:81-82). Understanding these trends—particularly as they varied depending on country of origin, timing of peak migration, and the influence of such factors on those who chose to settle in Milwaukee—is a critical component of elucidating the Milwaukee County Poor Farm cemetery population.

*The Breadless[3] of Milwaukee and Milwaukee County Poor Relief*

Propelled by transatlantic migration, Milwaukee's nineteenth and early twentieth century population boom greatly influenced the timing of, and manner in which the community dealt with, the city's breadless[3] population. The system that would come to define Milwaukee's poor relief efforts began in 1838, when the territorial government mandated assistance for the indigent in Act 22 "For the Relief of Poor." (1838 Wis. Terr. Laws 22; Avella 1987; Freire 2017). This early rule placed the burden on county commissioners, but in actuality both municipal and county authorities enacted some type of poor relief. Unsurprisingly, these dual systems often worked at cross purposes. In discussing this "mixed" system, Avella writes,

> What ensued was confusion over such issues as eligibility for poor relief (length of residence in the county/city to receive public assistance), who cared for the transient poor, and finally what were the precise boundaries of city and county relief efforts. This lack of clarity was aggravated as Milwaukee began to emerge as a major trade depot on the Great Lakes. The attendant rise in population accelerated demands for assistance to the poor and sick and taxed the social welfare system to its limits (1987:198).

A solution to these inefficient and redundant systems arose in 1849 when the new Wisconsin State Legislature determined that cities could officially pass care of all poor, resident or transient, to the county (Avella 1987; Richards et al. 2016).

During this early period, Superintendents of the Poor were responsible for providing outdoor relief to any breadless not supported through private or evangelical channels. Outdoor relief provided bare necessities like food and firewood to the needy in their own homes. This was in sharp contrast to the indoor relief system prevalent in the Eastern states, which often took the form of almshouses or working poor farms. This approach was the natural extension of Elizabethan England's Poor Law of 1601. Summarizing Tratner (1974), Richards et al. note,

> This law recognized the government's responsibility for poor people and its legal requirements for the relief of the poor were incorporated into the charters and laws of various North American colonies. Furthermore, strong religious beliefs motivated individuals and municipalities to provide relief for the poor. the Puritans believed that the poor were provided to society in order to offer the opportunity to perform charitable acts. Conversely, the Puritans also believed that a lack of moral character was responsible for individual poverty, this dual and conflicting attitude toward the poor continued into the twentieth century and was characteristic of writings and policies dealing with the poor in Milwaukee. (2016:10)

For some time, Milwaukee County resisted indoor relief, finding their outdoor method sufficient, but a cholera epidemic between 1848 and 1850 taxed the system to the breaking point (Avella 1987; Freire 2017; Richards et al. 2016). The first major wave of German and Irish migrants, fleeing European agricultural famines, arrived in Milwaukee in the same years, compounding the strain on outdoor relief.

In 1852, searching for cost saving alternatives and following the Eastern models, the County Board purchased the 160-acre farm of fellow member Hendrik Gregg with the intention of establishing indoor relief away from the urban center. Located in present day Wauwatosa, this

property came equipped with all the necessary components for a working poor farm: livestock, crops ready for harvest, outbuildings, and a large domestic structure (Avella 1987; Freire 2017).

Though seemingly having everything needed to support a reasonable number of breadless, it became readily apparent not long after opening that this poor farm was ill-equipped to cope with the number or diversity of Milwaukee's poor population. Less than four years after its opening, the number of residents living on the old Gregg farm had more than doubled—from twenty-four in November 1852 to fifty-three in May 1856. Overcrowding was not the only problem; Richards et al. report that "at this time, the poor, the sick, the orphans, and the insane shared the same living quarters" (2016:11). Segregating the contagiously ill from the almshouse population was one of the first changes made the county system, with a separate infirmary wing added early. However, as Avella (1987) notes, the number of poor, especially sick poor, continued to rise.

This situation was untenable, especially as the continual waves of migration brought more and more poverty-stricken individuals to the city. The county was forced not only to expand its institutional poor relief, but also to diversify. Of immediate concern was mitigating the negative influence of indigent adults on impressionable minors. The establishment of a schoolhouse separate from the almshouse in 1858 was the first step towards this end. Many of these children found themselves living at the almshouse because their family was so poverty-stricken they could only rely upon indoor relief. Many others, however, were brought to the poor farm because one or both of their parents were incarcerated or because they were orphaned; both unfortunate situations made them wards of the county. (Avella 1987). Increasing numbers of dependents eventually necessitated a temporary home for children in 1882 and finally the permanent Milwaukee County Home for Dependent Children in 1898 (Figure 3.2) (Avella 1987; Richards et al 2016).

Figure 3.2 Milwaukee County Home for Dependent Children, 1920s (Courtesy of Milwaukee County Historical Society).

In 1860, shortly after the schoolhouse opened, the separation of the sick poor was made possible with the founding of a thirty-one bed county hospital. Prevailing attitudes at the time viewed hospitals as deplorable institutions utilized by the lower classes that could not afford at-home care, therefore the county hospital catered only to charity cases. For example, hospitals were tainted by the presence of lying in or maternity wards. Commenting on this negative attitude, Avella writes, "Because most 'respectable' childbirths took place in homes attended by midwives, those who were forced to bear their children in hospitals were often unwed mothers who had come to 'hide their shame," (1987:202).

When this original building filled over capacity, an expansion was added in 1868. However, a devastating fire in 1880 destroyed the building and took the lives of two patients, requiring the construction of a much more substantial structure (Figure 3.3); the expansive Milwaukee County General Hospital was built in 1929 (Figure 3.4). Also in 1880, the Milwaukee County Insane Asylum was built on land purchased on the adjacent 70-acre Hart farm (Freire 2017). Prior to this institution, mentally-ill inmates of the almshouse were simply quarantined in a separate wing. The inadequate nature of this arrangement is underscored by the fact that the new 275-bed asylum was filled to capacity almost immediately.

Figure 3.3 Second Milwaukee County Hospital, c.1880 (Courtesy of Milwaukee County Historical Society).

Figure 3.4 Milwaukee County General Hospital, c.1940s (Courtesy of Milwaukee County Historical Society).

The addition of the Milwaukee County Asylum for the Chronically Insane alleviated some of this overcrowding by providing a separate facility for those patients who it was believed were beyond treatment. Avella notes that this new facility "provided custodial care for cases of incurable insanity, severe retardation, and senility," (1987:216). The older building was renamed the Milwaukee County Hospital for the Acute Insane and was reserved for individuals who could potentially be released back into society after rest and rehabilitation; the latter often included some form of labor on the county grounds (Figure 3.5) (Avella 1987; Richards et al. 2016).

Avella notes that "tuberculosis was one of the chief killers of children and young adults in

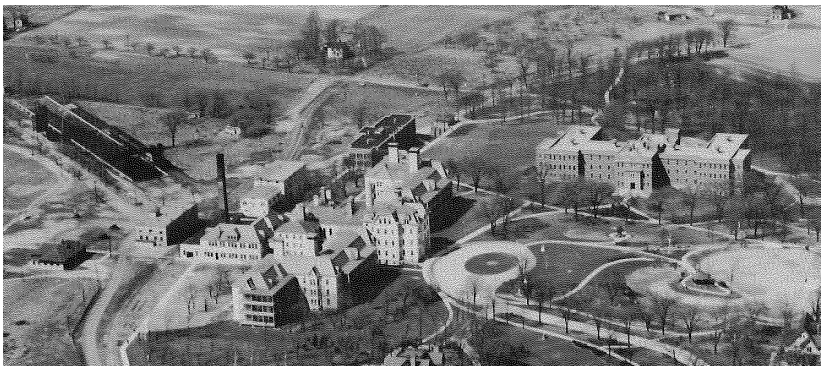

Figure 3.5 Aerial view of Milwaukee County Hospital for the Acute Insane, date unknown (Courtesy of Milwaukee County Historical Society).

human history" (1987:224), and the demographic data provided in Chapter 5 certainly supports this claim in Milwaukee County. However, despite the recognition of the contagious nature of this disease, the county only established separate wards for tubercular patients at the various county institutions while private and municipally funded sanitariums were being built. Not until 1913 did the county add Muirdale, their own tuberculosis isolation facility, to the county grounds. (Avella 1987).

While this expansion and diversification occurred around it, the earlier almshouse also continued to evolve. The original farmhouse was replaced with a new, larger structure built-to-suit in 1890, with additions constructed in 1907 and 1932. Furthermore, in a 1917 attempt to alleviate some of the negative public attitudes toward the various poor relief institutions, the county Board of Administration decreed that the term "almshouse" be replaced with "Milwaukee County Infirmary," a shift in vocabulary that better reflected the nature of the elderly resident population. The Infirmary, however, was not the facility to be renamed at this time. Avella notes,

> So, too, other institutions reflected changes in their purpose or public image by different nomenclature. The Milwaukee County Home for Dependent Children became simply the Milwaukee County Home for Children; the Milwaukee County Hospital for the Acute Insane became the Milwaukee County Hospital for the Mentally Diseased; the Milwaukee County Asylum for the Chronic Insane became known as the Milwaukee County Asylum for Mental Disease." (1987:220) (Figure 3.6)

*Milwaukee County Poor Farm Cemetery*

The transition between these evolving institution titles can be observed in the various residences and places of death listed for the MCPFC population on vital documents. While adapting to the changing demands of the living breadless, the county also devised strategies for burying not only those who died in their care and whose remains were unclaimed by friends or family, but the unknown and unclaimed dead from the coroner's office and those whose families could not afford to bury them in a proper cemetery. In the latter cases, individuals who were without the means to arrange for a burial would contact the police who in turn notified the county grounds superintendent. An undertaker contracted by the county would then retrieve the deceased and they would be taken to the county poor farm for interment. This legal obligation in regards to burial can be traced back to the original territorial government act that relegated poor relief to the county; it also included language mandating "decent burial" for the poor (1838 Wis. Terr. Laws 22). Neither this act nor the similarly composed state statue that followed a decade later (Wis. Stat. § 49.785) defined what a "decent burial" entailed. (For a more detailed discussion of the acts, laws, and statutes related to institutional burial, see Freire 2017).

Despite this ambiguity, indirect evidence suggests that the Milwaukee County Board of Supervisors did attempt to adhere to the letter of the law. In 1848, they authorized the construction of coffins to be delivered to the coroner's office for unclaimed remains (*Proceedings of the Milwaukee County Board of Supervisors* 1848). This order was placed four years prior to the establishment of the indoor relief in Wauwatosa, so it is unclear where these early burials took place (Freire 2017). It is likely that interments took place at the newly established poor farm soon after it opened; however, the earliest official indication of a formal cemetery on the county institution grounds was not until 1872, when the poor farm was identified as the place

of burial on the death certificate for the INFANT OF ROSA FLYMANN. Six years later, this burial ground was mentioned in the minutes from the Milwaukee County Board of Supervisors Proceedings (1878):

> The immediate attention of the Board is directed to the present condition of the cemetery of the Poor Farm. It is situated on the Southeast coroner of the premises, and contains less than two and a half acres of land. One third of which is comparatively high ground and nearly filled up with graves. Most of the remainder is low meadow and as certain seasons of the year digging a grave the water will rise to within six inches of the top and even overflow portions of the land. There is at present some ten or fifteen buried in this low land.
>
> Even on ground sufficiently dry they are not as they should be. Six or seven were dug on such a spot in readiness to receive candidates for immortality. Thinking the empty graves looked rather shallow, a tap[*sic*] measure was applied and their depth was ascertained to be two feet ten inches. Allowing sixteen inches as height of a full sized coffin, the corpse rest only eighteen inches below the surface of the earth. This truly is "granting little earth for charity." (qtd in Richards et al. 2016:18)

It would take the county another four years to rectify this grisly situation; in 1882, a second cemetery was placed on more suitable ground.

*Cemetery I, III, and IV*. The moniker Milwaukee County Poor Farm Cemetery in reality encompasses four discrete burial locations (Figure 3.7). The earliest, described above, is designated Cemetery I by the Milwaukee County Poor Farm Cemetery Project. Its location and boundaries were confirmed by above-ground testing in 1992 (Overstreet and Sverdrup 1992; Richards et al. 2016). The second cemetery, Cemetery II (47BMI0076), was utilized between 1882 and 1925 and was twice excavated by archaeologists; this is the main focus of my research, as well as that of several other MCPFC scholars (Chapter 7). Located north of Watertown Plank Road, Cemetery III was put into operation in 1925 after the closure of Cemetery II and was utilized by the county until 1974, when indigent burials were contracted out to private cemeteries (Richards 1997; Richards et al 2016). The exact dates and function of Cemetery IV are still

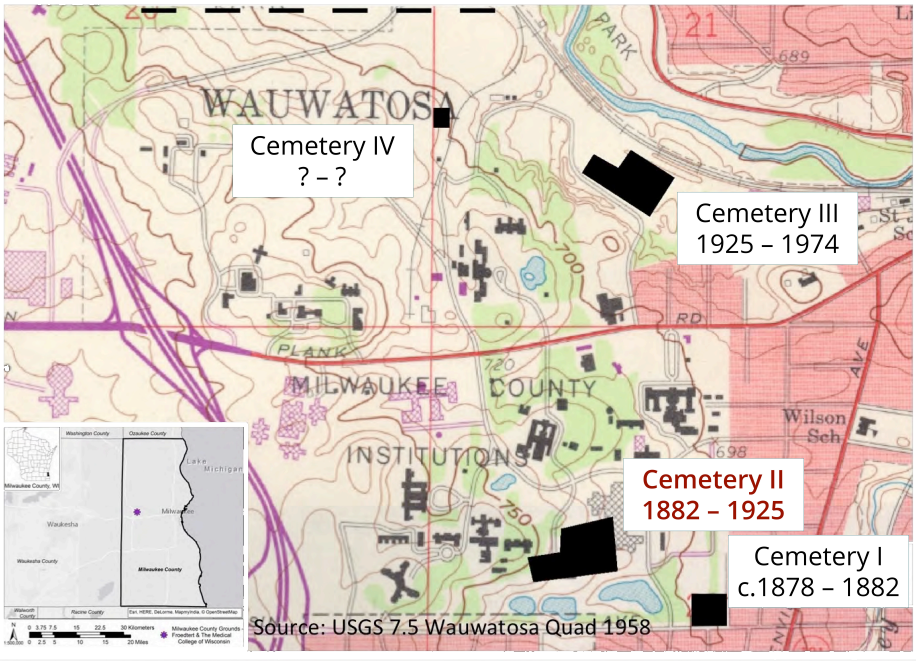

Figure 3.7 Locations of Cemeteries I, II, III, and IV on the Milwaukee County Institution Grounds (Adapted from Richards et al. 2016:17; reprinted with permission).

unclear, but its location near the Milwaukee County Hospital for the Acute Insane, later the Milwaukee County Hospital for the Mentally Diseased, suggests it may have been alloted for that facility's patients who died on-site (as opposed to residents who were transferred to the county hospital before expiring). Several death certificates transcribed during my Milwaukee County death certificates survey provide further support for this hypothesis (see Figure 4.12). This particular facility was listed as the place of death on two hundred and seventy-two documents dating between 31 January 1885 and 3 October 1912, but place of burial was variably listed as "Asylum cemetery/grounds/plot," "Hospital for Insane cemetery," "Hospital Plot for Milwaukee County Hospital for Insane," or simply "Hospital plot." These phrases are distinct from those used for burial in the contemporaneous Cemetery II—the most common being "County Cemetery," "County Farm," "Potter's Field," or "Poor Farm."

*Cemetery II.* In discussing the dates and distribution of these cemeteries, Richards et al. note that "three of these cemeteries, 1, 3, and 4, are located on the periphery of the Milwaukee County Grounds and remain undisturbed.... Cemetery 2 is located in one of the most densely used portions of the [Milwaukee] Regional Medical Center and has been disturbed multiple times" (2016: 17). The first of these disturbances occurred in 1932, only seven years after its closure, when Cemetery II was razed and a nursing school and residence hall erected in its place (Figure 3.8). Institutional memory of the cemetery faded, and the cemetery was uncovered during construction in the summer of 1991. This "deliberate forgetting" (Freire 2017:25) is difficult to comprehend; archaeological evidence suggests that human remains have been disturbed multiple times during utility work at the site (Figure 3.9).

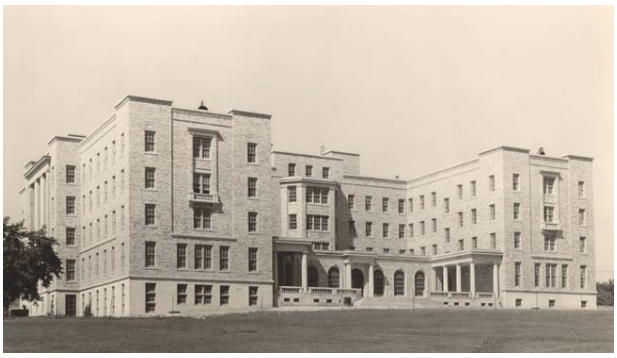

Figure 3.8 Nurses residence constructed on Cemetery II in 1932 (Courtesy of Milwaukee County Historical Society).

Figure 3.9 Burial lot 10632 truncated by water main (UWM-ARL photo on file taken by Emma Richards; reprinted with permission).

In the 1991 case, an unknown number of burials were disturbed prior to the proper authorities being notified, and construction was eventually halted in accordance with administrative rules implementing s. 227.11 (2) (a) Wis. Stats., and interpreting s. 157.70 Wis. Stats. (Richards 1997; Richards et al. 2016). Freire describes the implications of this law in her 2017 dissertation:

> This modern burial law requires reporting of burial site disturbances to the Burial Site Preservation Office, regardless of location on state or private land. Burial sites are divided into two categories, catalogued and

> uncatalogued sites. As described by the Wisconsin Historical Society, a catalogued burial site is a human burial site believed to still contain human remains, is in a known location (recorded with the county Register of Deeds), and is listed in the Wisconsin Burial Sites Catalog, whereas an uncatalogued burial site is a human burial site that has been destroyed, cannot be located, or has not yet been listed in the Wisconsin Burial Sites Catalog. If the Wisconsin State Historical Society determines that an uncatalogued human burial site likely contains human remains and if the site can be re-identified, it may be added to the catalog. Under Wisconsin state law, catalogued sites receive special treatment, including tax breaks for owners, more severe penalties for disturbance, review of disturbance requests by the Registry of Interested Persons, and the possibility of hearings, appeals, and/or denial of requests to disturb. In both cases, any excavation of a burial site requires prior authorization from the Director of the State Historical Society of Wisconsin, and that such excavations must be conducted by archaeologists qualified to excavate human remains, as designated by the Director. (2017:29)

Excavation of the proposed impact areas was carried out by private cultural resource management firm Great Lakes Archaeological Research Center, Inc. (GLARC) (Richards and Kaskell 1993) (Figure 3.10). In total, 1,649 burials were recovered, 987 of which were adults, 586 subadults, and 76 whose preservation prohibited further identification (Figure 3.11). Marquette University was granted conditional disposition of the remains for osteological analysis, but failure to produce a publicly-accessible report led to the transfer of all human remains and excavation documents to the University of Wisconsin–Milwaukee Archaeological Research Laboratory in 2008; final disposition of those remains was subsequently granted to UWM-ARL.

Because Cemetery II was added to the Wisconsin Burial Sites Catalog after the 1990s excavation in anticipation of a second large-scale construction project on the site, the same administrative rules were applied in the summer of 2013. The University of Wisconsin–Milwaukee's Historical Resource Management Services (now UWM–CRM) was contracted by Froedert Hospital to perform the excavation and removal of human remains and associated

Figure 3.10 Overview of 1990s Cemetery II excavation (UWM-ARL photo on file; reprinted with permission).

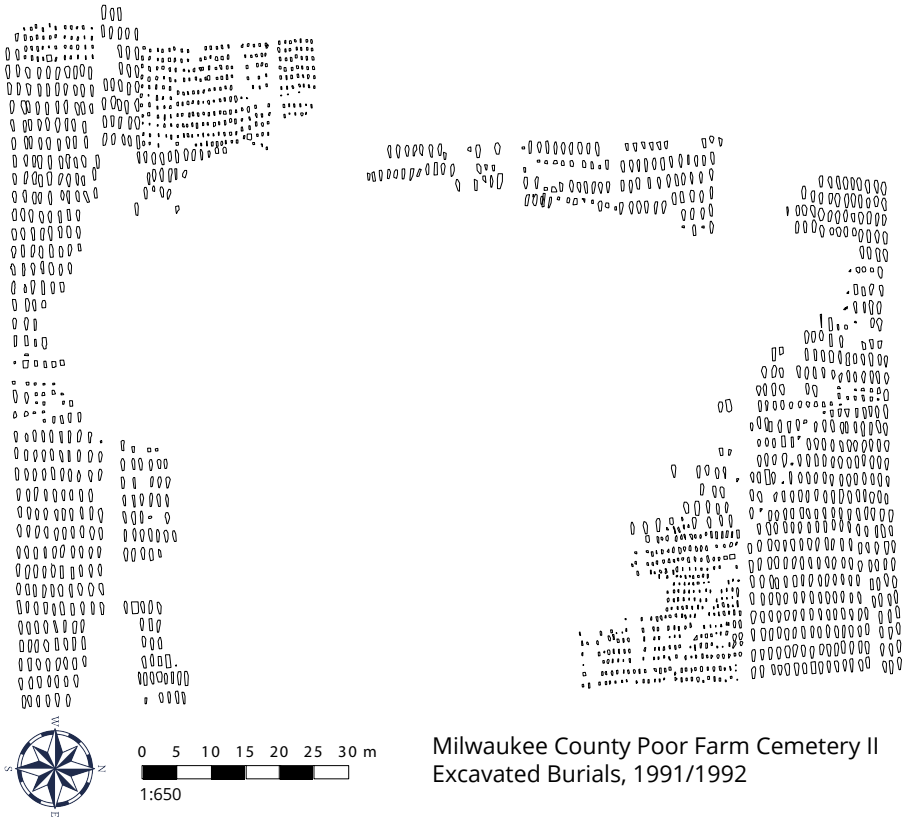

Figure 3.11 Burials excavated from Cemetery II during 1991 and 1992 (Map generated by author from GIS data complied by UWM-CRM; reprinted with permission).

grave goods, as well as comprehensive osteological and archaeological analyses (Figure 3.12) (Richards et al. 2016). At the completion of the excavation, a minimum of 665 individuals were recovered: 294 adults and 256 juveniles in individual coffins, 91 adults and 19 juveniles from coffins with multiple individuals, and an additional MNI of 166 individuals from commingled coffin contexts. The addition of the commingled remains brings the total potential number of individuals recovered during the 2013 field season to 831 (Figure 3.13). Osteological and material culture analyses were completed by UWM–CRM staff in March 2015 and made available in the report *Nine For Mortal Men Doomed To Die: The Archaeology And Osteology Of The 2013 Milwaukee County Poor Farm Cemetery Project (Froedtert Tract - 47 Mi 0527)* (Richards et al. 2016).

During the analysis of the 2013 remains and associated artifacts, several procedures were developed and implemented to facilitate standardized inventorying of both adult and subadult remains; recordation of taphonomic processes; analysis of a single, multiple, and commingled burials; and material culture preservation and analysis (Richards et al. 2016). The success of these methods prompted a reanalysis of the burials from the 1991/1992 excavation. At the time of this writing, this work is on-going (Freire 2017), but the narratives presented in Chapter 6 have greatly benefited from the data produced thus far.

In total, the number of burials excavated during all MCPFC projects is 2,281. While this is a staggering figure, it represents only thirty-two percent of the original burial population as deduced from archival data (Richards et al. 2016; Chapters 4 and 5). A small number of the remaining sixty-eight percent are still located on county grounds. Richards et al. report:

> Calculations for grave density describe a density of 0.03 adult-sized graves/sq. ft. (i.e. three graves in every 100 square feet) and a density of 0.07 juvenile/infant graves/sq. ft. (i.e. seven graves per each 100 square

Figure 3.12 Exterior (top) and interior (bottom) views of 2013 MCPFC excavations (Photos by Emma Richards on file at UWM-ARL; reprinted with permission).

Figure 3.13 All burials excavated from Cemetery II during 1991, 1992, and 2013 (red)(Map generated by author from GIS data compiled UWM-CRM; reprinted with permission).

> feet). Extending the pattern of adult and juvenile/infant burials observed in the southeast corner of the former GLARC excavations to the western boundaries of the site limits determined by the 2013 excavations, it is estimated that roughly 209 adult-sized graves and roughly 671 juvenile/infant-sized graves remain intact under and along the southern edge of Doyne Avenue. (2016:5)

Even if this is a conservative estimate, the greater part of the Milwaukee County Poor Farm Cemetery burial population has been destroyed, and the identities of those buried there have been lost. The demographic profiles and individual narratives presented here are small steps towards correcting this injustice.

*Endnotes*

1 Nugent asserts, "So much back-and-forth movement took place, both within Europe and across the Atlantic that the terms 'immigration' and 'emigration' are cumbersome; historians find themselves better off with simple 'migration'" (1992:29). Following his lead, in most instances the simpler migrant/migration will be used in lieu of immigrant/immigration and emigrant/emigration.

2 Hollinsworth defines natural increase as it relates to migration rates: "Because demographers wish to measure population at more than one moment, the idea of change of population is naturally next.... The simple population change is divided first into natural changes and mechanical changes. Natural changes subdivide births and deaths.... The difference between births and deaths is known as the natural increase (or decrease) of the population. Similarly, the mechanical changes consist of immigrants and emigrants, and annual rates can be calculated for each (1969:15).

3 In his thesis on the history of poor relief in Milwaukee, Dykas writes, "The Milwaukee County 'breadless' were those people who required private or public relief during the 1890s. They were called 'sturdy vagaboundes' in the fifteen century England and 'tramps or 'vagrants' in nineteenth-century America, among other things. The term 'breadless,' as used here, encompasses all of these people, no matter what they were labeled. Also, it pertains to both sexes, all ages, and to anyone who was in need of poor relief, regardless of the reason for relief application. This would include dependent children, the aged, the sick, and even the criminal classes who might become a public charge, one way or another" (1974:1). The inclusivity of the term is appropriate when discussing the wide range and type of individuals Milwaukee County took charge of and will be used through this discussion.

# Chapter 4

## Historical Method, Data Integration, and Burial Identification Procedure(s)

> *Historical methodology, as I see it, is a product of common sense applied to circumstances.*
>
> — Historian Samuel Eliot Morison

The simplicity of the sentiment expressed in the opening quote belies a complexity that should be addressed. First, the information presented in this chapter is not an "historical methodology" but a description of the methods utilized throughout the project. The epistemological differences between *methodology* (the study of methods) and *methods* (actual procedures followed) are often overlooked, resulting in scholars using the terms interchangeably. A strong aversion to this confused verbiage by a past graduate advisor has made me hyper-aware and intentionally explicit about the presentation of my methods, not methodologies. Second, despite the general acceptance of "common sense" as something that is common, in reality it is often quite subjective. Instead of assuming the reasons behind my approaches are clear or obvious, I will attempt to explain why certain archival resources were utilized or why certain procedures were attempted and then abandoned for others. Finally, the last aspect of Morison's statement worth considering is an emphasis on "circumstances." In this case, it is appropriate to use another term interchangeably—context instead of circumstances. A single method or approach is rarely appropriate for every context; it is important that researchers are mindful when selecting and implementing their methods to ensure their suitability for the specific project in question.

### *Historic Period Demography*

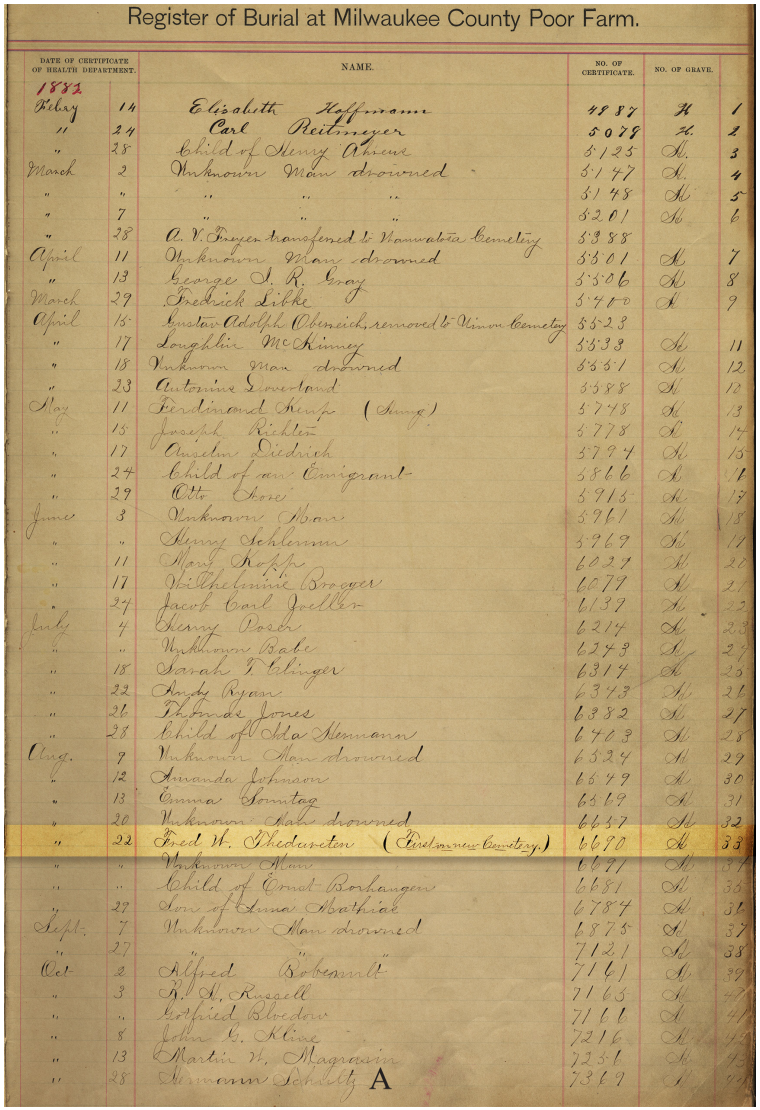

Archaeologists have long used demography and demographic principles to better understand the populations they study. In his book *Demography is Archaeology*, Chamberlain

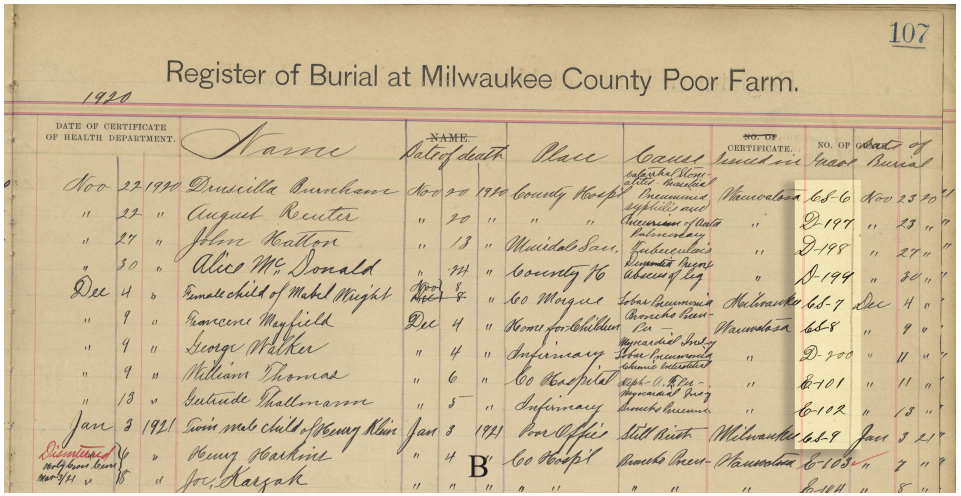

(2006) lists seven attributes central to demographic analysis: population size; population structure; population dynamics; population density; fertility; mortality; and migration. The first three are the main concerns in demographic analysis conducted for this project. Population size measures "the number of individuals in the population," structure "the distribution of the individuals across designated categories, principally those of age and sex," and dynamics is "the growth or decline in the size of the population or of its component parts over time," (Chamberlain 2006:2).

In prehistoric archaeology, where no documentary record exists, these population studies often rely on theoretical models, ethnographic analogy, excavated skeletal populations that may or not be representative of the past living population, or proxy archaeological data like house size, settlement size, or site catchment analysis (Chamberlain 2006). Archaeologists interested in historic period populations have the benefit of archival resources that more directly reflect the communities in question (Fliess 2000). Cox reminds us, however, to avoid the pitfall of assuming historical documents all contain "truth" and "facts," (1995:22). It is clear in the following discussion that careful selection, and critical analysis, of the resources used in historic demography is imperative.

*Register of Burials at the Milwaukee County Poor Farm Cemetery*

The archival sources selected during my research were determined by one simple fact: an accurate reconstruction of the MCPFC population demography was predicated on a complete accounting of burials. Initially, it was thought this was reflected in the *Register of Burials at the Milwaukee County Poor Farm Cemetery* (RBMC). The leather-bound ledger, curated at the Milwaukee County Historical Society (MCHS), documents burials on the county grounds between 1882 and the last burial in Cemetery II on 14 June 1974. In total, there were 7,794

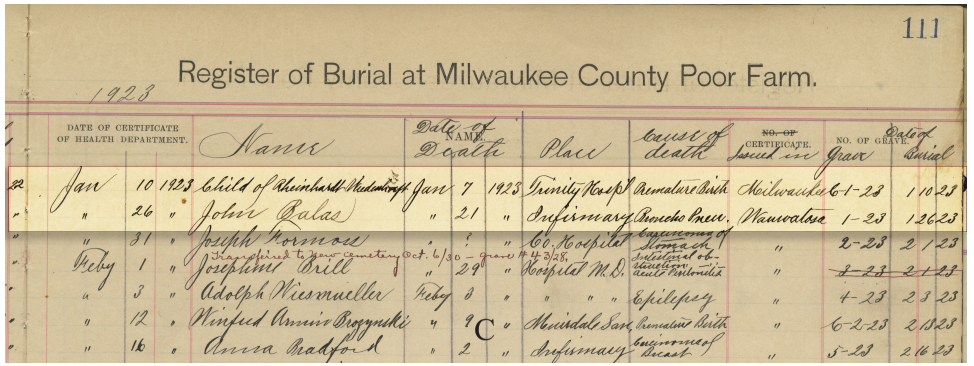

Figure 4.1 Register of burials at the Milwaukee County Poor Farm Cemetery: (A) Page 1 including the entry for FRED W. THEDERAHN and illustrating the alphanumeric grave number system; (B) Page 107 showing the switch to a "CS" prefix for children's graves; (C) Page 111 illustrating the grave numbers of INFANT REINHARDT WIEDENHOFT and JOHN BALAS and the transition to a numeric-year grave number (Photographs courtesy of Milwaukee County Historical Society, edited by author).

entries representing almost as many individual burials, with 5,382 recorded during the years in which Cemetery II was operational.

The data recorded during the register's 92 years varied considerably over time; information in every entry was limited to name of deceased, health department certificate date, and grave number, though during some years age at death, as well as cause and place of death, were also listed. The grave number data, potentially vital to burial identifications, were not internally consistent and changed repeatedly. Beginning with Cemetery II's establishment in 1882, both subadult and adult burial grave numbers were alphanumeric and sequential despite the two groups being buried in different areas; the first Cemetery II grave number, "H33," was listed for 69-year-old FRED W. THEDERAHN (d. 21 August 1882) (Figure 4.1A). This practice continued until the burial of 67-year-old OWEN M. DAVIS (d. 22 January 1904) with grave number Z100. The system was restarted with A1 for the subsequent burial, ultimately resulting in the duplication of many numbers throughout the cemetery.

The simple alphanumeric grave numbers were utilized until October 1920, after which children's graves were singled out with a "CS" prefix. This dual system continued until January 1923 when the first burial for that year, the premature infant of REINHARDT WIEDENHOFT (d. 7 January 1923), was listed as "C-1-23." The following entry for 54-year-old JOHN BALAS (d. 23 January 1923) contains the number "1-23" (Figure 4.1B). While the differentiation between children and adult burials persisted into 1925, there was yet another change in January of that year. The alphanumeric designation with the "C" prefix continued for children's graves, but adult burials were switched to a simple numeric grave number (Figure 4.1C). These appear to have been carried over to Cemetery III when it was established in July 1925.

*MCPFC Documents Database*. Despite the numerous shortcomings found within the RBMC, it is the foundation for all my other documentary research concerning the MCPFC population. To facilitate the analysis of the register and management of related documents, each line entry was assigned an arbitrary identification number, transcribed onto individual hard copy data entry sheets, and entered into an Access database of my design (Figure 4.2). Fields are included that allow for direct transcription of register data, data categorization and summary, tracking of related documents, and variables useful for burial identification.

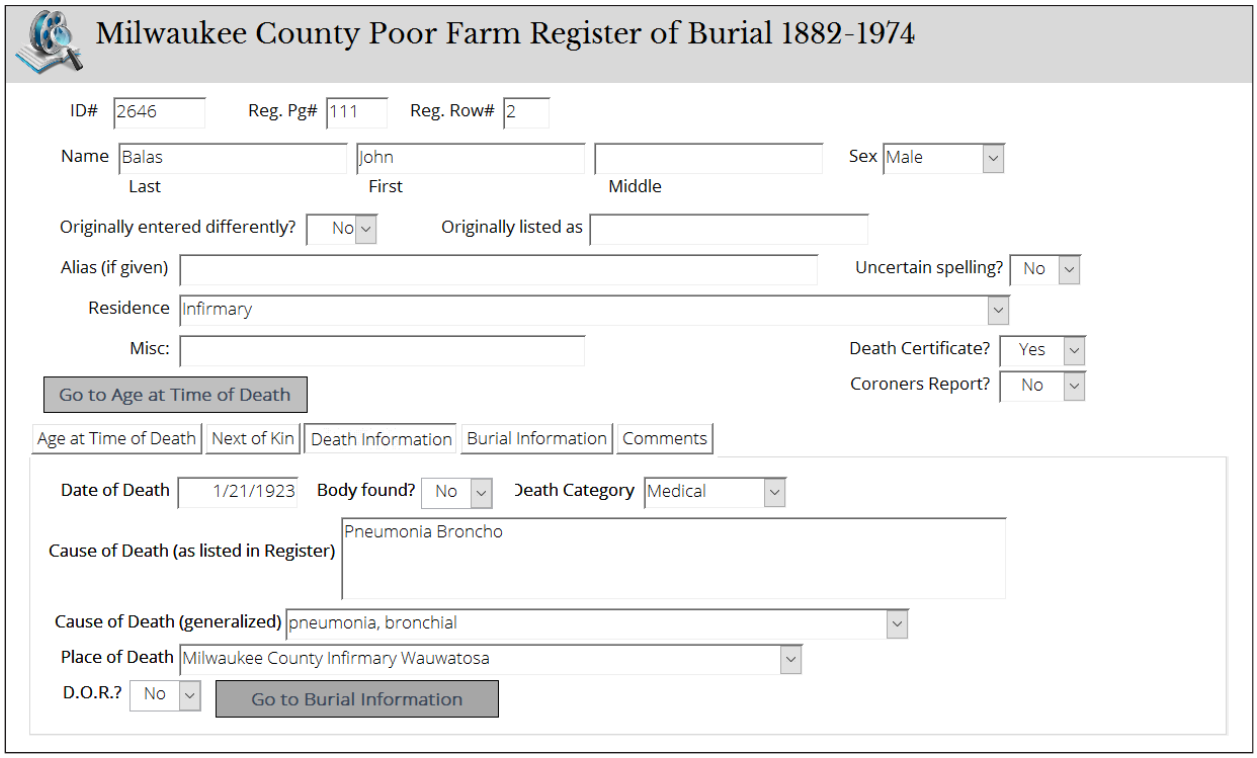

Figure 4.2 MCPFC Register of burials database entry form.

Sex was determined from the first name of the individual; for those unidentified at death, most were listed with gender designations, e.g. “female fetus” or “unknown man.” Specific age categories, entered into a field populated with classifications utilized by the MCPFC osteological analysis team (Table 4.1), could only be assigned to the relatively small number of individuals whose age-at-death was listed in the register. Starting in 1897, age was sporadically recorded

next to the deceased's name, but was not regularly included until May 1898; the inclusion of age ceased in January 1908. Within this roughly 10-year span, 1,203 entries included age. "Prenatal/fetal" was utilized for those listed as fetuses and for those whose cause of death was stillbirth. "Indeterminate subadult" was reserved for those who were entered as "infant of..." or "child of..." and "indeterminate adult" for those whose age was suggested in their register entry, e.g. "unknown man," or whose cause of death was age-related, e.g. senility.

Table 4.1 Age categories utilized in both documents databases and MCPFC osteological analysis.

| Age category | Range |
|---|---|
| Prenatal/Fetal | Non-live birth |
| Infant | Birth — 11.90 months |
| Toddler | 1.00 year — 2.49 years |
| Early childhood | 2.50 years — 5.90 years |
| Late childhood | 6.00 years — 12.90 years |
| Adolescent | 13.00 years — 19.90 years |
| Indeterminate subadult | Less than 19.9 years, but of unknown age |
| Young adult | 20.00 years — 34.50 years |
| Middle adult | 35.00 years — 49.90 years |
| Old adult | 50.00 years + |
| Indeterminate adult | Older than 20 years, but of unknown age |
| Unknown | No data provided indicating subadult or adult |

In addition to the age and sex categories, other useful entries included two cause of death fields. One included the COD exactly as recorded in the register, while the second field provided a generalized cause of death category that allowed for systemization of data and facilitated easy querying. Others, such as Yes/No fields for the variables "Disinterred" or "Multiple Burial," permitted tracking of features that assist in correlating specific register entries with potential excavated burial lots.

The RBMC is a luxury many working with historic cemeteries lack. However, while it provides a starting point, it does not contain the information necessary for demographic reconstruction and burial identification—specifically comprehensive age at death and biological sex data. As can be seen in Table 4.2, the high number of entries designated as indeterminate or unknown makes a demographic profile generated solely from the register data unproductive. Additionally, the substantially high number of unknowns in both the age and sex categories represents a major detriment to individual burial identification. These gaps in vital data, as well

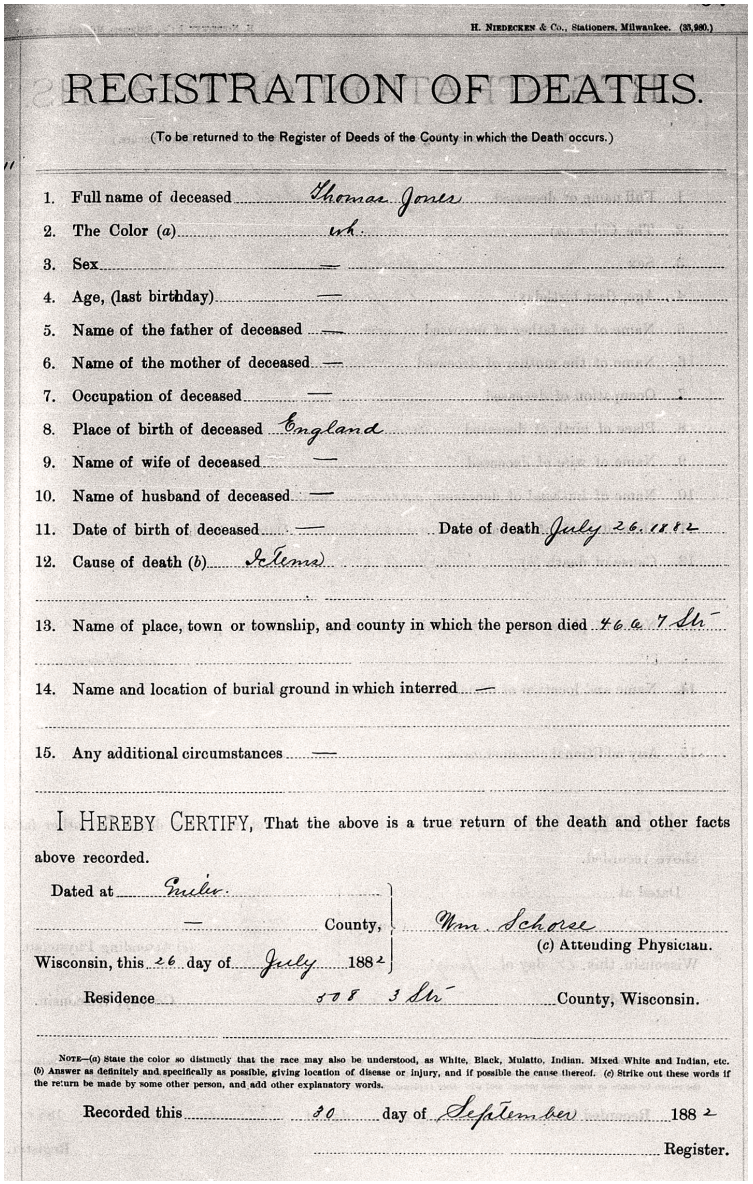

Table 4.2 Cross-tabulation of age categories and sex from RBMC highlighting the high number of indeterminate and unknown individuals.

| Age category | Male | Female | Unknown | *Subtotals* |
|---|---|---|---|---|
| Prenatal/Fetal | 185 | 134 | 209 | *528* |
| Infant | 133 | 89 | 24 | *246* |
| Toddler | 16 | 11 | 1 | *28* |
| Early childhood | 3 | 3 | 0 | *6* |
| Late childhood | 4 | 3 | 0 | *7* |
| Adolescent | 4 | 3 | 0 | *7* |
| Indeterminate subadult | 183 | 136 | 251 | *570* |
| Young adult | 87 | 23 | 4 | *114* |
| Middle adult | 221 | 30 | 6 | *257* |
| Old adult | 331 | 67 | 15 | *413* |
| Indeterminate adult | 339 | 26 | 0 | *365* |
| Unknown | 2140 | 528 | 173 | *2841* |
| *Subtotals* | *3646* | *1053* | *683* | *5382* |

as the previously mentioned inconsistency issues typical of early record keeping, made the process of finding other essential documents a problematic but necessary endeavor.

*Milwaukee County Death Certificates*

The vital statistics critical to a demographic reconstruction were recorded on Milwaukee County death certificates (MCDC); for this reason these and not the RBMC were chosen to be the primary source for population reconstruction. Typically, these documents were filed with the county shortly after an individual's death by an attending physician, county coroner, or the Commissioner of Health. Like the burial register, the nature of these documents changed drastically over time. The earliest examples from the MCPFC period included the following: full name of deceased, color, sex, age at last birthday, deceased's father, deceased's mother, occupation of deceased, place of birth, name of spouse, dates of birth and death, cause of death, location of death, and cemetery in which the deceased was interred, as well as information concerning the issuer of the certificate. However, as can be seen in Figure 4.3, the death certificate for THOMAS JONES (d. 26 July 1882), this information was often unavailable

H. Niedecken & Co., Stationers, Milwaukee. (35,980.)

# REGISTRATION OF DEATHS.

(To be returned to the Register of Deeds of the County in which the Death occurs.)

1. Full name of deceased Thomas Jones
2. The Color (*a*) wh
3. Sex —
4. Age, (last birthday) —
5. Name of the father of deceased —
6. Name of the mother of deceased —
7. Occupation of deceased —
8. Place of birth of deceased England
9. Name of wife of deceased —
10. Name of husband of deceased —
11. Date of birth of deceased — Date of death July 26. 1882
12. Cause of death (*b*) Icterus
13. Name of place, town or township, and county in which the person died 46 & 7 Sts
14. Name and location of burial ground in which interred —
15. Any additional circumstances —

I HEREBY CERTIFY, That the above is a true return of the death and other facts above recorded.

Dated at Euclid, — County, Wisconsin, this 26 day of July 1882

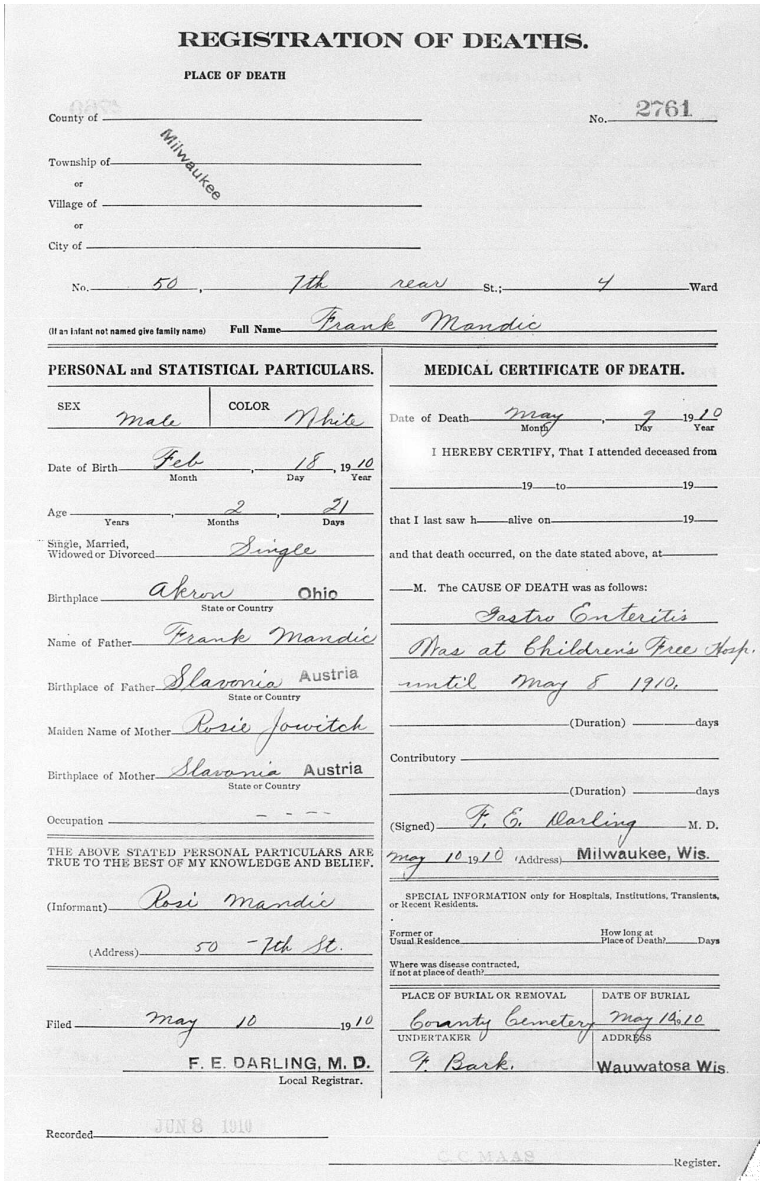

Wm Schorse (*c*) Attending Physician.

Residence 508 3 St County, Wisconsin.

NOTE—(*a*) State the color so distinctly that the race may also be understood, as White, Black, Mulatto, Indian, Mixed White and Indian, etc. (*b*) Answer as definitely and specifically as possible, giving location of disease or injury, and if possible the cause thereof. (*c*) Strike out these words if the return be made by some other person, and add other explanatory words.

Recorded this 30 day of September 1882 Register.

Figure 4.3 Early MCDC for THOMAS JONES issued 26 July 1882 (On file at UWM Golda Meir Library).

or unrecorded. Later certificates incorporated the same information but had additional lines including but not limited to informant, duration of disease, and undertaker (Figure 4.4).

My initial attempts to acquire MCDCs focused on the microtext collection at UWM's Golda Meir Library, where microfilmed copies of the Milwaukee County Register of Deaths are stored for the years 1852 to 1907. Using a list generated from the RBMC, a thorough search was initiated; however, finding the appropriate certificate for those buried at MCPFC was far from straightforward.

One significant obstacle was the sheer quantity of death certificates for Milwaukee County during the period in which Cemetery II was in use. Fortunately, an index to the county death certificate ledgers was generated some time ago and also microfilmed. The finding aid for the collection states that the index covered 1872 to 1916, but ledger reels after 1907 were absent at the time of my research. While the index was useful, some investigating was necessary, as with most historical research, to acquire the relevant documents. Inconsistent name spellings between the RBMC and the death certificates, as well as misinterpretations of handwritten script, complicated the search, as did the old-fashioned method in which the index was constructed:

1. First a temporal grouping—volume I for the years 1872–1894 and volume II for the years 1895–1897.
2. Within each index volume, larger sections are based on only the first letter of the last name; an exception is special sections for names starting with "SCH," a product of numerous German surnames in the Milwaukee area.
3. These alphabetic sections are not segmented similar to modern indices, but into subsections based on the first vowel in the last name, regardless of where that vowel fell within the name; e.g. the names DENIS, DRESEN, DRZECHOWSKA, and DE FIELDS were listed together since "D" is the first letter and "E" is the first vowel.
4. Within these subsections, names were listed chronologically by date of death, a date that was not consistently listed in the RBMC prior to 1907. The health department certificate is available, but it was not uncommon for that date to be several months later than the listed date of death.

An example of a record that caused significant difficulty is HATTIE GRUENEWALD, listed on page nineteen of the RBMC. No age at death, date of death, or cause of death was listed, though the health department certificate date was given as 12 May 1896. No one with a similar name can found in the 1896 "GU" section of the Milwaukee County death index, but after extensive investigation, it was determined that the actual spelling of her name was HATTIE GREENWALT and her date of death was 7 November 1895; the register entry led me to the wrong alphabetical section of the index as well as the incorrect year.

This case demonstrates that if the deceased's name was recorded incorrectly in the RBMC, or was transcribed or entered into the database incorrectly, an inaccurate first letter or first vowel hampered document recovery. Often, a closer investigation into those instances resulted in the identification of the confounding variable. While misspellings in the RBMC were often the culprit, incorrect transcription of nineteenth-century handwritten script was also common. For instance, after the death certificate for a woman apparently named LOUISA LOTZ could not be located, closer examination of the RBMC resulted in the realization that the RBMC clerk's "S" looked similar to a modern cursive "L." Consequently, the MCDCs for SINA SOTZ (d. 6 October 1888) and her stillborn daughter were located. The listing of a completely different first name was also a regular occurrence.

Despite these hurdles, the microtext search at UWM's Golda Meir Library was somewhat successful. In total, 2,911 death certificates for those listed in the RBMC were scanned and entered into the documents database (Figure 4.5); these included a number between 1907 and 1910 that Richards (1997) acquired during her dissertation research. To date, only 329 certificates predating 1910 have not been found. The remaining death certificates dating between 1910 and 1925 needed to be procured from the Milwaukee County Vital Records (MCVR) office

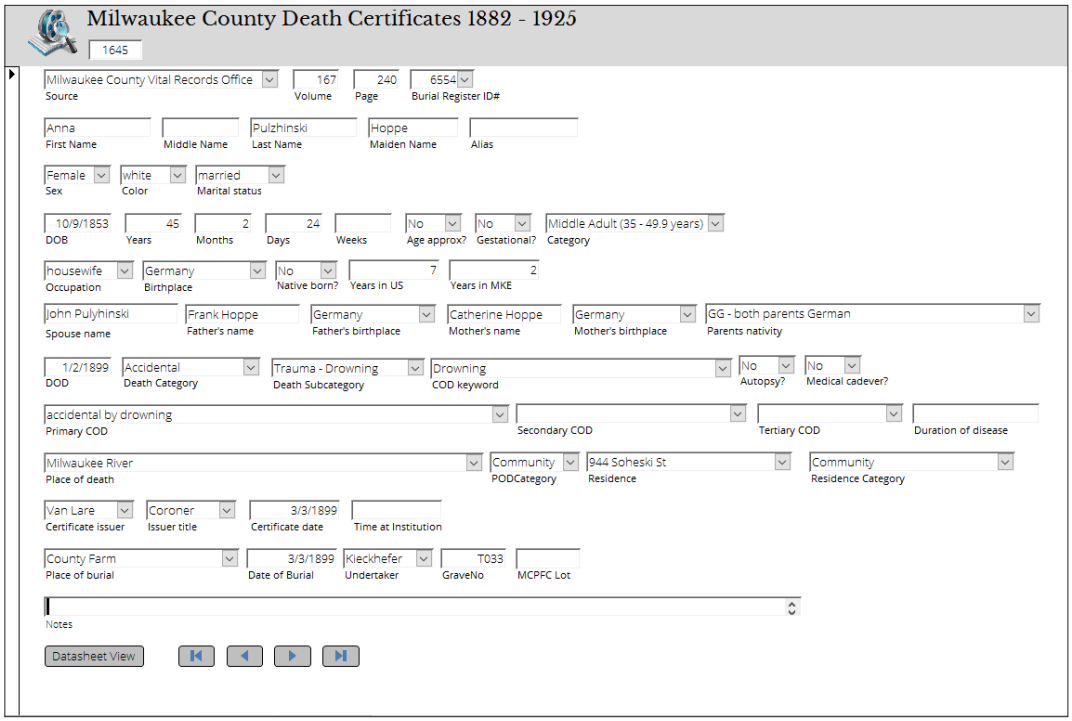

Figure 4.5 MCPFC death certificates database entry form.

located at the Milwaukee County Courthouse. The standard protocol for obtaining vital records is geared toward individuals undertaking genealogical research, i.e. those who need a small number of documents. To view vital records predating 1932, an appointment is required and is limited to a two-hour period. Historical records can be accessed by the public for free in a communal work area, but no imaging of any kind is allowed. Given the unique nature of this project, and particularly the quantity of records required, the Registrar of Deeds was contacted directly in the hope that a special accommodation would be granted for academic purposes. In response to this request, unlimited access to historical records was approved as well as a private workspace that facilitated direct transcription of the documents into the MCPFC database on-site.

Due to the earlier microfilm investigation, only post-1907 death certificates were initially sought. However, early in the search, death certificates for individuals not listed in the RBMC but buried in Cemetery II were inadvertently discovered. The number of these unlisted

individuals grew, and I decided that a total accounting of the MCPFC population required an examination of all death certificates filed with the county between 1882 and 1925. I subsequently inspected approximately 250,000 records, and any whose place of burial indicated the county grounds were recorded in the database. Through this process, 7,226 individuals were identified as being buried in Cemetery II—5,382 were recorded in the RBMC and 1,844, or 26% of the total burial population, were not listed. Of those buried in the cemetery but not listed, 1,088 were medical cadavers. An additional 272 individuals were identified who died at the Milwaukee County Hospital for the Mentally Diseased and were buried in a "Hospital Plot." My current theory is that this group is not interred in Cemetery II but likely represents the burial population in the unidentified Cemetery II (see Chapter 3). The implications of this large number of unlisted individuals will be discussed further below.

*Milwaukee County Coroner's Inquests*

Further demographic and sociocultural data were available in the Milwaukee County Coroner's Inquests (MCCI), curated at MCHS. While the former can be considered supplementary to the primary death certificate data, the latter are an integral part of the individual burial identification process and the construction of life history narratives. Coroner's inquests were typically initiated in cases where an individual died without an attending physician; these included some medical deaths and most accidents, suicides, and homicides within Milwaukee County (Table 4.3). Currently, the MCHS staff have indexed and made accessible to the public all reports between 1874 and 1935. My search of the MCCI collection began concurrently with the UWM microfilm death certificate investigation. At the outset, a list of individuals from the RBMC was generated and checked against the inquest index; as a result, 1,206 reports were identified for individuals buried in Cemetery II. However, a more complete list was compiled

Table 4.3 Frequency of cause of death categories from MCCIs (n=1596), 1882–1925.

| COD category | *n* | COD category | *n* |

after the unlisted individuals were discovered at MCVR and the number of MCCI for the MCPFC population grew to 1,596.

Like the MCVR, some restrictions dictate how documents are accessed and copied. MCHS permits copying of all parts of the coroner's inquests except the death certificate issued by the coroner (they are prohibited from doing so by MCVR); however, each copied page costs twenty-five cents. Given the quantity of reports needed, like the death certificate search at MCVR, the most cost- and time-efficient approach was to transcribe the pertinent information into the database on-site (Figure 4.6).

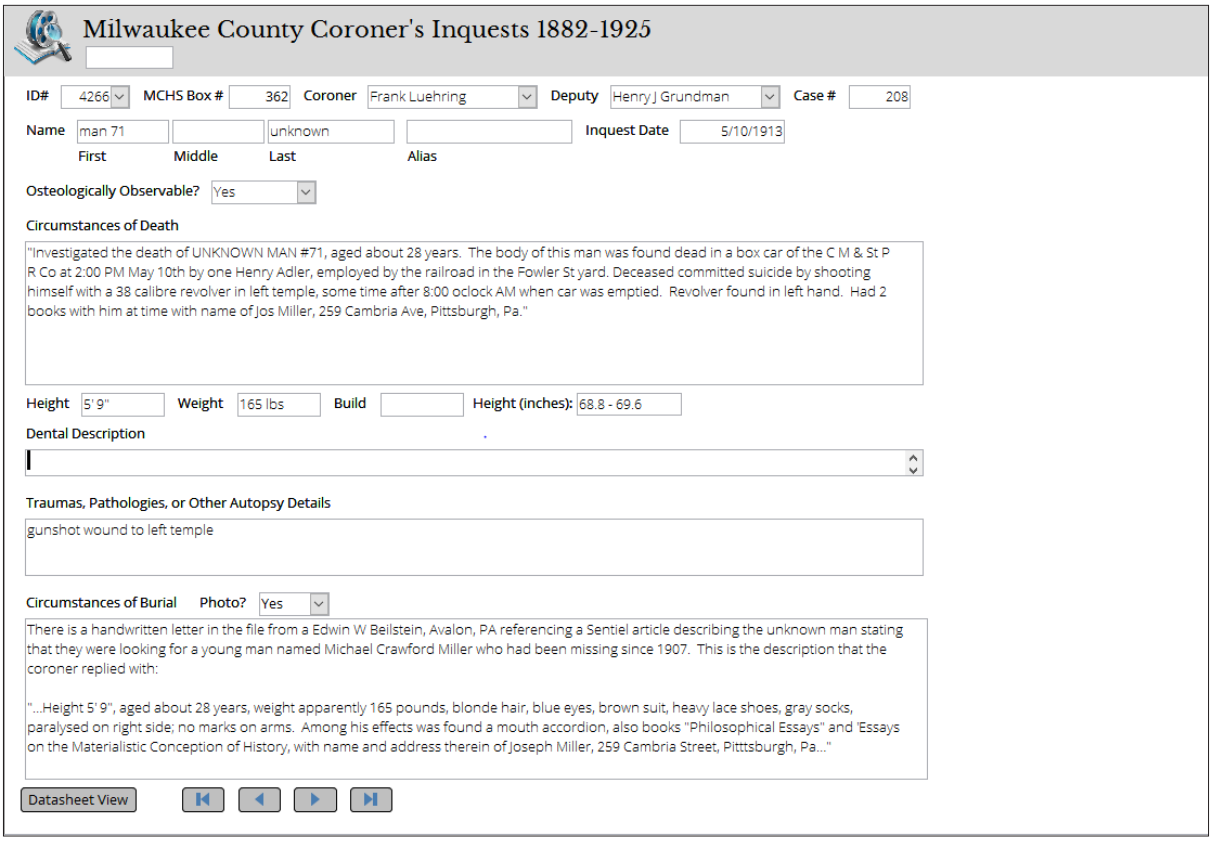

Figure 4.6 MCPFC database coroner's inquests entry form.

The content and amount of detail contained in these reports varied depending on the period in which it was written and/or the nature of the subject's death. Earlier reports tended to have less information, while accidents and homicides generally required more detailed descriptions than medical deaths. In addition to the death certificates issued by the coroner and a COD description, many inquests included autopsy reports that described the physical characteristics of the deceased, listing features like height, weight, coloring, facial hair, and tattoos, as well as injuries and traumas that may be observed osteologically. In the case of many unidentified individuals, samples of the deceased's clothing or small personal items were kept for identification purposes (Figure 4.7 and Figure 4.8); postmortem photographs were also included when necessary (Figure 4.9). If an image had been provided that aided in the identification of an

individual, it was often included in the report as well (Figure 4.10).

In some cases, newspaper articles concerning the deceased were also incorporated. Other elements potentially useful in the construction of individual narratives are notations from the coroner clarifying why an individual was buried at the county farm; testimonials from family members explaining why they could not afford, or did not want, to bury their relative elsewhere; and in some cases of suicide, the final note written in the deceased's own hand (Figure 4.11). The value of the MCCIs in identifying individual burials will be further discussed below.

*City of Milwaukee Annual Commissioner of Health Reports*

Vital statistics from the City of Milwaukee Annual Commissioner of Health Reports (ACHR) were used as comparative data to better understand the MCPFC burial population within the context of the larger community. Like the documents previously discussed, accessing and utilizing these resources came with its own unique set of challenges. The reports had been generated for the City of Milwaukee since 1877 (Commissioner of Health, 1893), but the earliest example found was published in 1892. A complete set of the reports is not curated locally, and therefore several institutions were visited or contacted. Most volumes between 1910 and 1920 are available at the MCHS, while those between 1891 and 1910 had to be requested at the University of Illinois–Urbana Library. Pertinent vital statistics chapters for 1920–1925 were requested through UWM's Interlibrary Loan Department and the National Library of Medicine in Bethesda, Maryland.

Early volumes covered important issues regarding the city's health for a fiscal (not calendar) year, complicating the search for data that covered all years between 1891 and 1925. For example, the mortality chart for January through December 1895 was included in the report published in April 1896. Multiple requests for the 1895 data resulted in copies of the 1894 or

1896 charts. In addition, the type and comprehensiveness of the statistics provided in these and related tables varied during different periods (Table 4.4). For this reason, comparisons between the City of Milwaukee mortality data and the MCPFC burial population will be limited to a twenty-year period between 1901 and 1920. Though not comprehensive, the temporal sample is large enough to uncover several significant differences between the groups.

For the purpose of establishing these differences in a meaningful way, goodness of fit chi-squared tests were run in the statistical program R to determine if proportions of demographic variables like sex, age, marital status, and nativity observed in the burial population varied significantly from the parent city population. The null hypothesis for each test was that the MCPFC population was an unbiased representative sample of the larger city population. A p-value below the standard 0.05 resulted in the rejection of the null hypothesis and the conclusion that the MCPFC population was significantly different from the city for the demographic being tested. Pearson residuals and chi-squared expected values were generated to ascertain specifically which MCPFC categorical variables were statistically different; a Pearson residual with an absolute value greater than 1.96 determined significance.

In addition to goodness of fit chi-squared tests, life tables for both the city population and the MCPFC burial population were calculated for the years in which the reports were available. Moore et al. note, “The life table, through a process of inference, is taken to represent the life processes of a local biological population and often forms the basis for further inference on the relationships between populational and cultural processes,” (1975:57). The variables and equations used to generate these tables, based on methods provided in Ubelaker (1974: 95–96), can be found in Table 4.5 as well as an example in Table 4.6. For each year, the city and cemetery population data was entered into an Excel spreadsheet where formulas were preprogrammed for

each cell. All tables are provided in Appendix A, while comparisons of general trends will be discussed in the Age section of Chapter 5.

*Individual Burial Identification Process*

The first iteration of this project—begun in 2008—focused more heavily on the identification of individual burials and less on the demographic description of the cemetery. Inspired by Richards (1997), my initial goal was to create a comprehensive archival database that, when coupled with unfettered access to the 1990s osteological remains, would allow me to test the identifications she made based on material culture and spatial analysis, contribute to the robustness of those identifications, and expand the number of burials identified to other sections of the cemetery.

Based on Richards' findings that "the spatial arrangement of the undisturbed burials within the excavated portion of the cemetery suggest an orderly arrangement of burials in rows and columns," (1997:105-104) and her success in assigning putative identifications to 190 burials, my incipient method was proposed as follows:

> the age and sex of each documented individual will be recorded and coded in a way that can be logically compared to the age and sex codes being utilized for the osteological data. Using the statistical program R, each will be entered as separate data vectors and then various pattern matching sequences will be run in an attempt to match up excavated portions of the cemetery with sequences in the burial register. For illustrative purposes, suppose there is an excavated row of the cemetery that has been coded 2,5,8,6,9, which represents burials of a juvenile, young adult male, middle adult female, young adult female, and old adult male. If only one place within the burial register exists where that particular pattern of individuals is listed, it can be assumed that section of the cemetery is directly associated with those entries in the register. Identifications can then be tentatively assigned and verified through an integrated evaluation of the historical documents and Richards' grave good study, Milligan's (2010) and Dougherty's (2011) paleopathological and trauma analyses, and any other relevant osteological examinations. (Drew 2012)

While this basic approach has been successful in one specific instance (see Rosche family narrative in Chapter 6), the 2013 excavations proved to the MCPFC research team that the relatively straightforward and systematic manner in which burials were placed in Richards' (1997) Area II may be anomalous within the cemetery. Richards and Kastell (1993) observed an east-west pattern in this later addition where burials were likely placed west-to-east in one row, then from east-to-west in the next. However, Richards et al. state that "no pattern is clear for the burials excavated in 2013 and it does not make sense to extrapolate a pattern from Area II to the larger cemetery as whole.... There is no evidence that burials run east-west or north-south, and the different areas may have used different patterns of burial" (2016:90). Freire (2017) asserts in her more recent publication that an east-to-west burial row program in this section is also likely, but the directionality of these rows has yet to be determined. This uncertainty, coupled with the inclusion of numerous mixed and commingled burials, as well as the possibility of multiple pre-dug rows filled simultaneously, has stymied the identification of burial practices in the southwest section of the cemetery. The likelihood of this last complication was suggested in the Milwaukee County Board of Supervisors Proceedings (1878) referenced in the previous chapter: "Six or seven were dug on such a spot in readiness to receive candidates for immortality" (qtd. in Richards et al. 2016:18). Further support for this burial method can be seen in Figure 4.12, a glass negative uncovered at the Milwaukee County Historical Society featuring a young child standing among a field of mounded interments; a man in the background can be seen preparing multiple rows of graves. Unfortunately, the provenance of the image is unknown and no other photographs in the series appear to have been taken in the same location (Dr. Kevin Abing, personal communication). However, the simple wooden grave markers, densely place graves, and apparently rural surroundings suggests this may be one of the only surviving non-aerial

Figure 4.12 Photo *tentatively* identified as one of the Milwaukee County Poor Farm cemeteries showing multiple rows of graves being pre-dug (Courtesy of Milwaukee County Historical Society).

photographs of the MCPFC (Dr. Patricia Richards, personal communication). The possibility of multiple graves being dug at once implies that there may not be a predictable pattern of internments based on grave number; when a coffin was brought out to the cemetery it may not have been placed in the next sequential grave, but rather the most conveniently-located pre-dug hole. Without a recognizable archaeological pattern, the approach described above is not applicable.

With the realization that the pattern recognition procedure was inappropriate for the data at hand, my focus shifted towards the reconstruction of the cemetery's demography. This refocusing was not, however, an abandonment of the burial identification goal. It became clear that *en masse* burial identification was unrealistic given our current understanding (or lack thereof) of the burial patterns. However, through demographic analysis, certain classes of individuals underrepresented in the cemetery population could be singled out, and therefore those burials could be more easily identified. For instance, as discussed in the next chapter, older children and adolescents constitute a very small segment of those interred in Cemetery II; additionally, the number of comparatively-aged individuals identified in the archaeological

sample is also small. If those atypical burials are identified on a case-by-case basis, then they could act as "keystones," facilitating the identification of nearby graves (Drew 2015). Additionally, idiosyncratic features or osteologically-observable causes of death described in one of the various archival sources allow for identifications of burials, adding to the pool of keystone cases. An example of this technique is the robust identification of Burial 5150—one of the 190 tentatively identified by spatial analysis of Area II—as ERNST GUTSCHKE (Richards 1997). Listed in RBMC as having died at the MCGH on 17 September 1924 from a fractured skull (the result of an automobile accident), GUTSCHKE was buried in grave 29-24. His death certificate indicated that he was 44 years, 10 months, and 20 days old at death, a German immigrant, and an inmate of the Milwaukee County Hospital for Mental Diseases. An autopsy report for GUTSCHKE, transcribed during my MCCI investigation, reads, "In the left temporal region there is a defect in the bone caused by a previous operation, measuring 43 mm in sagital[*sic*] and about 30 mm in horizontal direction" (Figure 4.13a). UWM osteological analysis concluded that Burial 5150 was a middle age male who had undergone a craniotomy and had sustained significant perimortem cranial trauma, including a large trepanation site in the left temproparietal region of the skull as well as a fracture on the right parietal bone. The nature and location of these injuries are identical to the description above (Figure 4.13b).

A more recent example is detailed by Freire (2017):

> Coffin Lot 10707...now putatively identified as Joseph Bogdanis, is located two rows south and west of Coffin Lot 10620, which contains the remains of a male individual of indeterminate age. The atypical formation of this individual's "left talus and calcaneus suggested a clubbed foot," (Richards et al. 2016:1388). Drew, in her examination of death certificates, was able to putatively identify this individual osteologically. (p. 135)

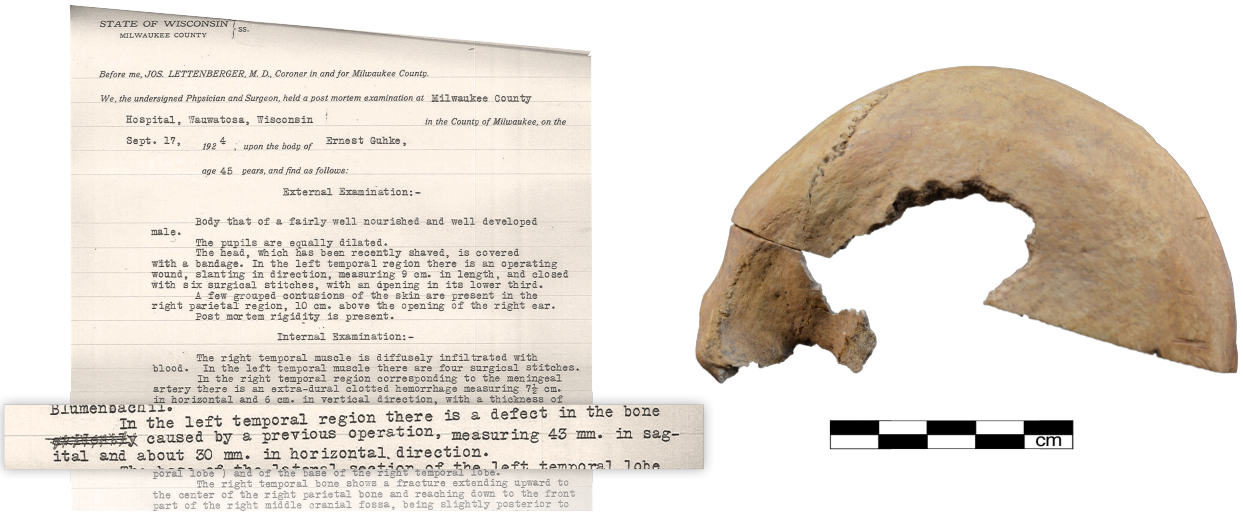

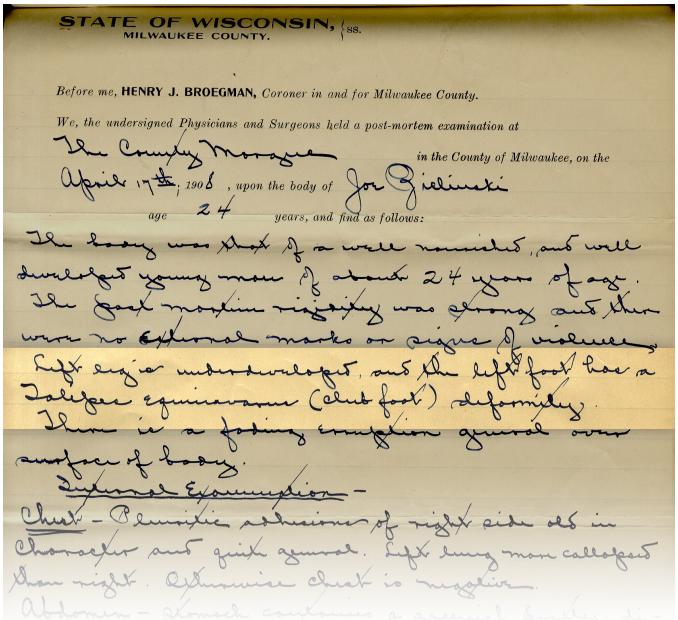

Figure 4.13 (a) Excerpt from ERNST GUTSCHKE'S autopsy (Courtesy of Milwaukee County Historical Society); (b) Fractures and trepanation observed on Burial 5150 crania (Photo by author).

Burial 10620 was identified as JOSEPH ZIELINKSI, a twenty-four year old Polish laborer who died from gastroenteritis on 17 April 1908 at the Emergency Hospital. Typically, establishing a relationship between a specific burial and a young adult male who succumbed to a non-osteologically observable illness would be impossible without first establishing a link through a keystone individual in close proximity; that particular demographic profile is one of the most common in the cemetery population (see Chapter 5). However, because ZIELINKSI, for reasons unknown, was surrendered to the county coroner, I was able to assign a robust identification through the coroner's notation of a clubbed foot (Figure 4.14a) and the osteological identification of a young adult male with the same deformity (Catherine Jones, personal communication) (Figure 4.14b). Additionally, the date of ZIELINKSI'S death and burial is consistent with the suspected temporal usage of this section of the cemetery through material culture analysis, making his identification even more secure (Richards et al. 2016).

STATE OF WISCONSIN, } ss.
MILWAUKEE COUNTY.

Before me, HENRY J. BROEGMAN, Coroner in and for Milwaukee County.

We, the undersigned Physicians and Surgeons held a post-mortem examination at

The County Morgue in the County of Milwaukee, on the

April 17th, 1906, upon the body of Joe Zielinski

age 24 years, and find as follows:

The body was that of a well nourished, and well developed young man of about 24 years of age. The post mortem rigidity was strong and there were no external marks on signs of violence. Left leg is underdeveloped, and the left foot has a Talipes equinovarus (club foot) deformity. There is a fading emphysem spread over surface of body.

Internal Examination -

Chest - Pleuritic adhesions of right side all in Character and quite general. Left lung more collapsed than right. Pulmonic chest is negative.

Abdomen - Stomach contains a small [illegible]

Figure 4.14 (a) Excerpt from JOSEPH ZIELINKSI'S autopsy noting his left clubbed foot (Courtesy of Milwaukee County Historical Society); (b) Lot 10620, clubbed left foot of young adult male (anterior view) (Richards et al. 2016:182; reprinted with permission).

*Demography and the Archaeology of the Individual Approach*

The methods presented here can be viewed as a four-level interdependent hierarchy moving from more general to more focused approaches: data collection from archival resources; demographic analysis of population size, structure, and dynamics; statistical testing to discriminate under- and overrepresented groups; and the keystone individual identification process (Figure 4.15). Each level engages the archaeology of the individual in different but interconnected ways.

A central tenet of this theoretical approach is the recognition of, and concern for, the individual in historical and archaeological investigations. However, uncovering the individual in this cemetery population necessitates beginning at the first methodological level. The data gathered during archival research form the foundation of our understanding of the population as an aggregate of individuals (Chamberlain 2006; Willigan and Lynch 1982). Transcending

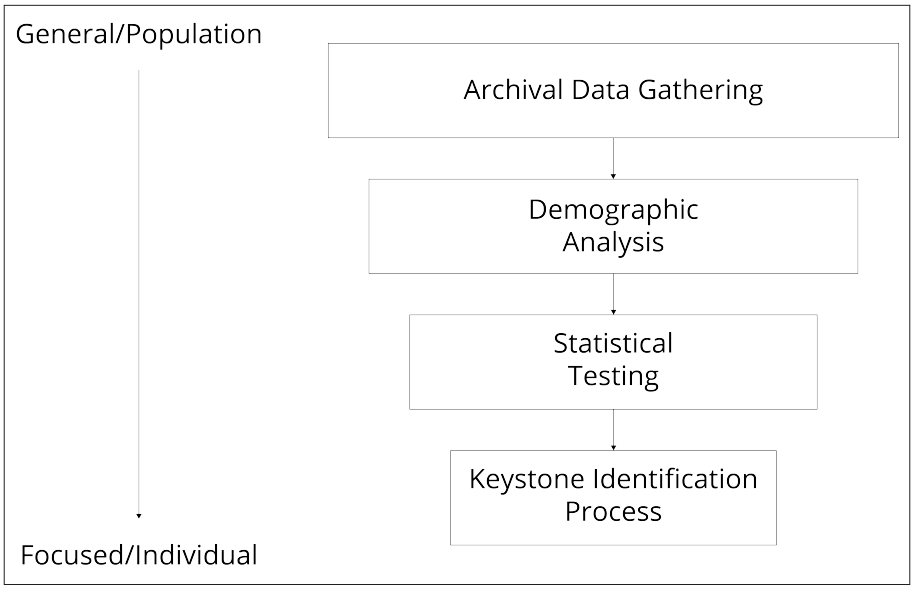

Figure 4.15 Multilevel interdependent hierarchy of methods utilized.

this general understanding and gaining more concrete insights into the specific nature of this aggregate requires elucidating the population structure through a comprehensive demographic analysis (Chapter 5). The chi-squared comparative testing of the demographic variables then facilitates moving beyond the aggregate individual conception of population to a more focused analysis of specific underrepresented cohorts that are more easily recognized archaeologically, and whose members therefore have a better chance being identified as keystone individuals.

A second important component of the archaeology of the individual approach is the consideration of agency and the social as well as institutional constraints that affected individual actors. As previously stated, within cemetery studies this agency reflects actions taken by those responsible for burial arrangements, not the dead themselves; therefore, to reveal agency in the MCPFC, we must have a sense of the social networks in which the deceased participated. These social networks were dependent on the deceased's intersectional identities related to age, sex, occupation, marital status, place of birth, and level of institutional dependency—all variables uncovered and analyzed during the first two methodological levels.

## Chapter 5

### Historical Demography: The Milwaukee County Poor Farm Cemetery Burial Population

> *Not the old or the young on it, nor people with any difference in their color or shape,*
>
> *Not girls or men, Negroes or white, but people with this in common: People that no one had use for, had nothing to do, no place to offer.*
>
> — Kay Boyle, ″A Communication to Nancy Cunard″
> *A Tragedy of the American South*

Many scholars concerned with the nature of historical demography stress the same points: first, historical demography is traditionally defined as the study of the size and structure of past populations; second, historical demographers go beyond reporting vital statistics and demographic figures and attempt to explain the temporal and social phenomena that influenced these variables; and lastly, these explanations draw on theories and hypotheses from a varied range of disciplines, including but not limited to history, sociology, and anthropology (Bogue 1969; Hollingsworth 1969, Willigan and Lynch 1982). This is consistent with Cox's (1995) explanation of the role of historical archive research within archaeology:

> It is a common misconception that the practice of history is concerned with the discovery of "facts" and the "truth." The basic concerns of the historian are in fact threefold. They include an assessment of the place and condition of human beings within an environmental, social, political, and economic framework; change in all of these respects through time; and *the particular and the unique from which to deduce generalizations* [*emphasis added*]. (1995:22)

Despite its definition (like Cox's definition of history) as a population-level study, there is consideration for the individual in historical demography. In tracing the genealogy of the discipline, Willigan and Lynch (1982) assert that,beginning with Malthus' (2012[1798]) *An Essay on the Principle of Population*, an acknowledgment of some human agency within the universal "laws" of population dynamics has been present. As they state, "both Malthus and

Marx conceptualized populations as aggregates of real people, with concrete occupations, values, and class affiliations that make a substantial difference in the regularity with which they, as individuals and members of social groups, 'obeyed' the law they had discovered" (Willigan and Lynch 1982:21) (see also Tilley 1978). It is within this framework—a population as an aggregate of individuals—that the historical demography of the MCPFC burial population is described and explored.

In this chapter, in-depth analyses subdivided into age cohorts will follow a general accounting of the entire MCPFC burial population. Age is not the only important variable in demographic constructions—considerations of related factors like sex, marital status, nativity, cause of death, and postmortem intervention are vital to revealing key age-related trends (Hollingsworth 1969:15). In keeping with the archaeology of the individual approach, as well as the aggregate population framework, I provide descriptions of specific individuals or cases to highlight key points. Additionally, statistical tests comparing these age profiles to those from the City of Milwaukee will demonstrate that this burial population differed significantly from the community in a number of key ways; specifically, these tests will identify which groups were over- or underrepresented in the population. Due to the nature of the comparative data, supplementary examinations focusing solely on sex, marital status, and nativity will follow the age analyses. A final discussion will utilize aspects of the demographic profiles and historical background provided in Chapter 3 to explore the social structures surrounding these individuals and provide possible explanations for why they were buried in the potter's field.

*MCPFC Burial Population*

As previously stated, archival research resulted in the identification of 7,226 individuals buried in MCPFC between 1882 and July 1925. Of these, 25.5% are not listed in the register,

resulting in 1,844 burials originally undocumented; 1,088 of these, or 15.1% of the total population, were medical cadavers. The overall number of interments per year increased somewhat steadily from 79 burials in 1882 to 277 and 274 burials, respectively, during peak usage in 1917 and 1918. An earlier burial spike in 1894 reflected diphtheria and smallpox outbreaks. Interments declined significantly during the last seven years of operation (Figure 5.1).

Burials listed in the RBMC mirror this overall pattern, but the number of non-cadaver interments not included in the ledger fall predominantly between 1882 and 1899. Eighty-three percent of the unlisted non-cadavers were individuals who died at a county institution; listed and non-listed burials may reflect differing landscape usage dependent on place of death—community or county institution. The number of medical cadavers not listed in the register followed a temporal pattern inverse to both listed and other non-listed individuals. No cadaver burials were documented until 1894, after which only a few were recorded each year until 1900. These burials increased significantly beginning in 1904, the year following the codification of an anatomical purposes law, and continued to rise throughout the cemetery's operation. In fact, in 1924, more cadavers were buried in the cemetery than non-cadavers (Figure 5.2).

*Age*

The distribution of age categories within the MCPFC burial population is illustrated in Figure 5.3. At 31.9%, the largest proportion of the population consisted of old adults (n=2,307), followed by 20.9% middle adults (n=1,512), 19.0% infants (n=1,371), 11.2% young adults (n=810), 10.0% prenatal/fetal (n=719), and 1.9% toddlers (n=135). The remaining subadult age categories represented less than one percent each: 0.6% early childhood (n=45), 0.5% late childhood (n=34), and 0.8% adolescent (n=60). The remainder did not have specific age date recorded and were classified as indeterminate subadult (0.3%; n=20), indeterminate adult (0.9%; n=67), and unknown (2.0%; n=146).

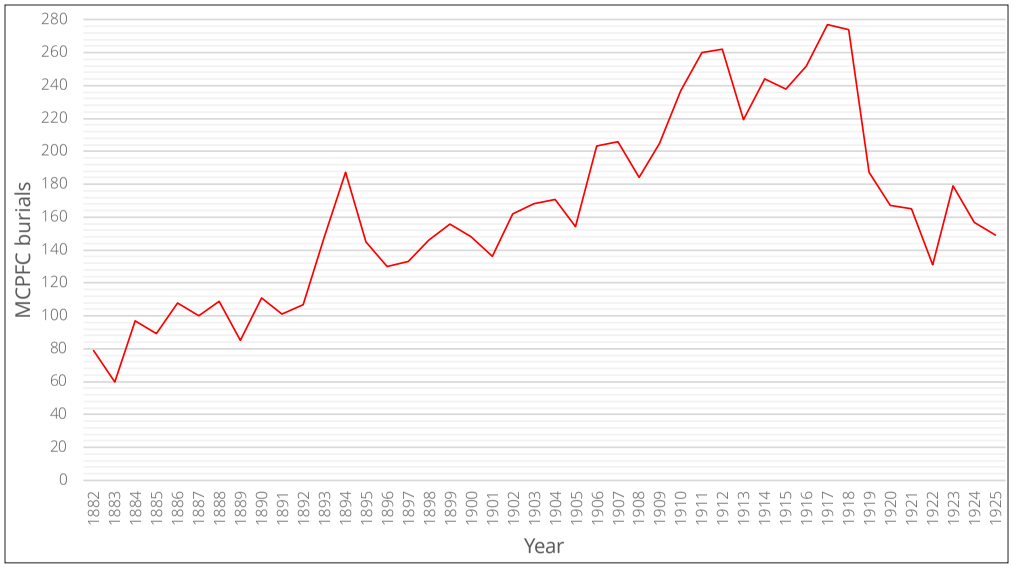

Figure 5.1 Overall frequency of burials at the MCPFC, 1882-1925.

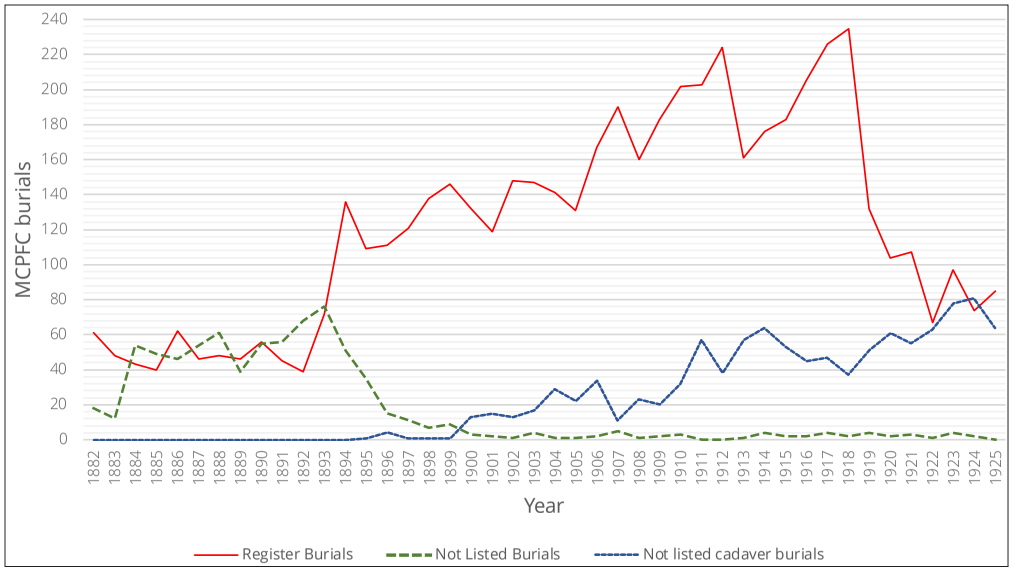

Figure 5.2 Frequency of burials at the MCPFC by documented status, 1882-1925.

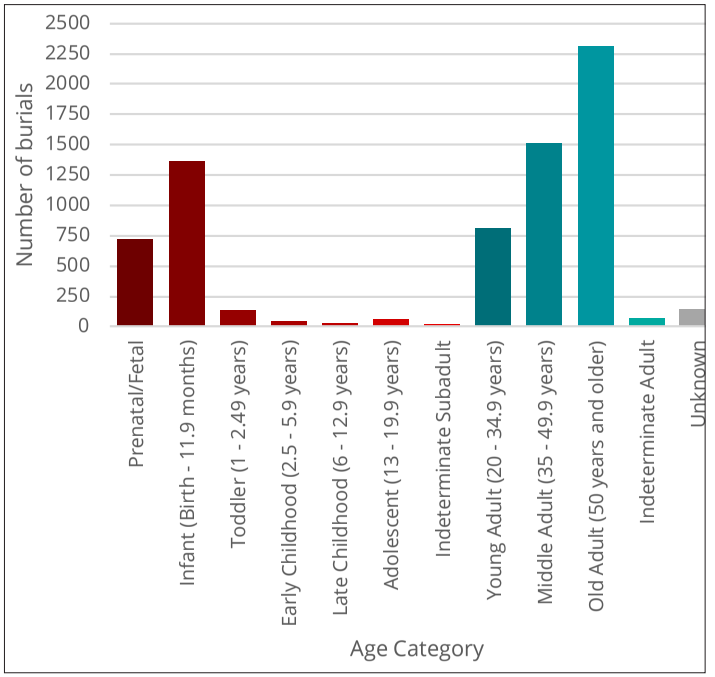

Figure 5.3 Frequency of burials at the MCPFC by age category, 1882-1925.

Without comparisons to the City of Milwaukee data compiled from the ACHRs, it is unclear whether this distribution reflected a normal mortality pattern, or if sociocultural factors affected the ages of individuals typically buried in the MCPFC. Table 5.1 contains the chi-squared results and p-values for goodness of fit tests between the City of Milwaukee and MCPFC burial population between 1901 and 1920. All p-values are significant at α=0.05, clearly indicating that the MCPFC burial population differed significantly from the City of Milwaukee community. A closer look at particular age groups reveals exactly where within the demographic profile significant deviations occurred.

Table 5.1 Results of chi-squared goodness of fit tests for age distribution between the City of Milwaukee and MCPFC.

| Year | $\chi^2$ | *df* | p |
|---|---|---|---|
| 1901 | 20.889 | 5 | 0.0008502 |

* First year stillbirths included in ACHR

Because the age ranges included in most ACHRs did not correspond exactly with the subadult age categories used in the documents database, analytical categories were adjusted. Beginning in 1901, the death statistics provided in the reports included one-year intervals from birth to age five, after which data was given in five-year intervals. Stillbirths, which are equivalent to the MCPFC database prenatal/fetal category, were only included in the ACHRs after 1910. Later reports divided infant data into those under thirty days old and those between thirty days and one year. For ease of comparison to the database infant category, these data were merged into an under-one -year cohort. Older subadult categories proved to be more difficult given the age ranges utilized, which were dictated by osteological classifications (Chapter 4). To facilitate both data sets, a one- to ten-year cohort was used for toddler, early childhood, and the

first part of late childhood categories, while a ten- to twenty-year grouping was employed for the latter part of late childhood and adolescent categories. Because the ACHR data was given in five-year intervals, adult cohorts were divided into the same ranges as the osteological age categories: twenty to thirty-five years for young adults, thirty-five to fifty years for middle adults, and over fifty years for old adults.

*Stillbirths*. Seven hundred and fifteen stillborn fetuses were buried in the MCPFC, representing 9.9% of the burial population. Eighty-eight percent (n=629) of the stillbirths were listed in the burial register, with the remaining twelve percent (n=86) undocumented. Four hundred and twenty stillbirths were male (58.7%), 273 were female (38.2%), and nineteen did not have sex documented (2.7%). This uneven sex distribution may be a reflection of the economic stress or "culling" hypotheses postulated by Catalano (2003) and Bruckner et al. (2014), who postulate that women in populations under socioeconomic stress are more likely to spontaneously abort male fetuses than female ones.

In regards to ethnic background, only 307 (approximately forty-three percent) had any information concerning parental nativity provided; of these, only 236 contained data on both parents. Incomplete recordation typical of these types of documents is partly to blame for this lack of parental data, but in this case the shortfall is also a reflection of the large number of unidentified stillborn remains discarded within the city and taken to the coroner's office. The largest proportion of stillborn infants with known parentage were the product of both native-born mothers and fathers (n=93). Other common origins included both parents from Austria (n=20), Germany (n=19), Poland (n=12), and Italy (n=12). There were also thirteen cases in which the father was German and the mother was a U.S. native. In instances where information was only available for one parent, the majority included the mother's place of birth (n=61) instead of the

father's (n=10).

The CODs for the majority of these individuals were listed simply as "still birth" or "stillborn," making it impossible to determine what might have influenced intrauterine death. However, a number of records did include one or more contributing factors that allowed for additional classification within the document database (Table 5.2). The keyword "reproductive" was utilized for those cases where a difficult or prolonged labor resulted in death prior to birth, e.g. the infant son of FREDRICK and IRINA HORN, who was stillborn on 13 June 1899 due to a shoulder presentation. Congenital defects contributing to stillbirths included twelve cases of congenital syphilis, three hydrocephalic infants, one example of spina bifida, and one deformity described by the attending physician as "7 months fetal monstrosity" (BABY PRITZL, d. 25 October 1923). There are five examples involving unique factors related to the mother's health, including poison/overdose: the infant daughter of MARTHA POKORA was stillborn on 12 July 1913 after her mother had taken carbolic acid with suicidal intent two months earlier.

Table 5.2 Contributing factors listed for MCPFC stillborn deaths (n=159), 1882–1925.

| COD Keyword | n |
|---|---|
| Premature birth | 81 |
| Reproductive | 42 |
| Asphyxia | 14 |
| Congenital defect | 17 |
| Trauma (mother) | 1 |
| Respiratory (mother) | 1 |
| Poison/overdose (mother) | 1 |
| Influenza (mother) | 1 |
| Debility (mother) | 1 |

Fetuses sent to the MCPFC from the Milwaukee community account for 75.2% of all stillbirths. The remainder came from various area hospitals or institutions (Table 5.3). Of the 536 stillbirth remains received from the community, 218 were unidentified fetuses discarded within the city limits and sent to the coroner's office for examination. While the circumstances surrounding

Table 5.3 Place of death categories for MCPFC stillbirths, 1882–1925.

the informal disposal of these bodies was dismal, the condition of some hinted at emotional attachment and bereavement by the unknown parents. For instance, on 19 April 1886, assistant coroner Henry Ott was sent to Forest Home Cemetery to collect the remains of a fetus determined to be only three to four gestational months. He described the remains as "wrapped up in two German papers dated April 4th & 5th 1886 and then in some brown wrapping paper and put in a starch box." The remains were taken to the coroner's office and eventually buried in the county cemetery. This stands in stark contrast to the many fetuses found floating in the river or discarded in empty lots, often with the umbilical cord still attached, indicating little or no emotional investment by the parents.

Death certificates and coroner's inquests indicated that at least seventeen stillborn fetuses were autopsied. Eleven of these were conducted at the coroner's office, with the procedure meant to determine if death occurred intrauterine or after a live birth. For instance, on 26 May 1890 an autopsy was conducted on the female child of JULIA CONROY, a native of Canada:

> Dr Louis G Nolte and Dr Philip Schmitt sworn say: "We, the undersigned physicians, summoned to hold an autopsy on the infant daughter of Julia Conroy, find the following to report: There are no external signs of violence. The lungs were not inflated in the least, and would not float. In our opinion it was a still birth." Lewis G Nolte, MD Philip Schmitt, MD

The remaining six verified autopsies were conducted by physicians, usually after an unusual pregnancy or delivery. In the case of the male child of FRANK BUSALACKI and DOROTHEA TORONTINA, both from Italy, intrauterine death was caused by asphyxia due to placenta prævia, a condition in which the placenta covers the cervix, hindering delivery (Gould 1890:347). After the autopsy was conducted by Dr. RJ Dalton of Marquette University Hospital, the remains were turned over to the university's medical college for anatomical purposes. INFANT BUSALACKI was one of forty-one (5.7%) stillborn infants whose death certificates

indicated they were surrendered to an academic institution for medical dissection. Like those who were autopsied, the stillborn infants used as cadavers often died from unusual conditions, including syphilitic and other congenital defects.

*Chi-squared goodness of fit.* When compared to the 1910–1920 City of Milwaukee data compiled from ACHRs, the frequency of stillbirth burials at the MCPFC is generally consistent with the number of stillbirths buried in other more traditional cemeteries (n=238) (Figure 5.4). The statistical analysis indicated only three years with significant differences between the number of stillbirth burials recorded and the number expected based on chi-squared goodness of fit. In 1914, thirty-one burials within this age group were recorded, but at 2.498 the chi-squared residual ($\chi^2$r) value is well over the |1.96| threshold; the expected number of burials ($\chi^2$e) based on the city population was 19.872. Similar differences were observed for 1915, when twenty-eight stillbirths were buried, but 18.35 were expected ($\chi^2$r=2.253), and 1916, when twenty-four were interred, but 15.16 were expected ($\chi^2$r=2.270). The increased number of stillbirths buried at MCPFC during this three year period was not the result of an influx of discarded remains within the city, but rather unsuccessful home and hospital births in which the family or attending physician arranged for burial at the potter's field.

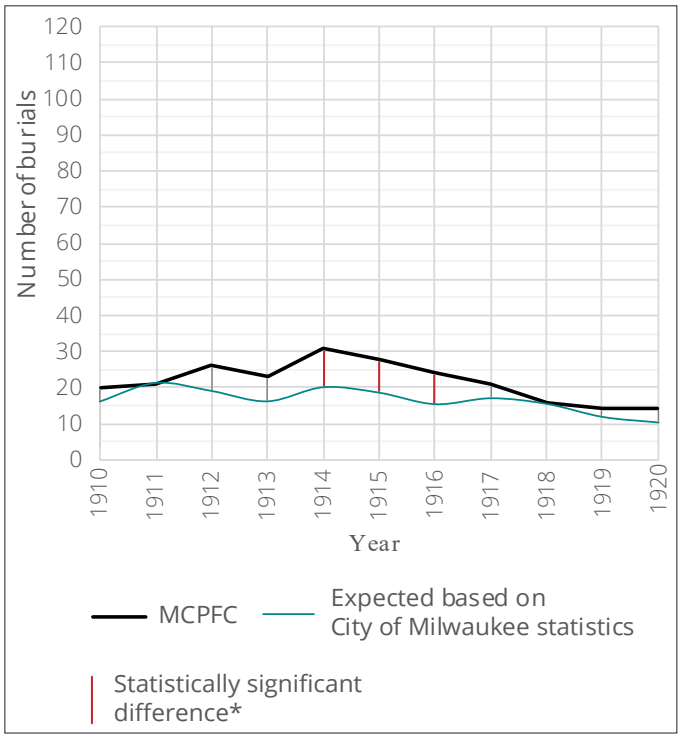

Figure 5.4 Actual versus chi-squared expected MCPFC stillbirths burials (n=238), 1910-1920.

*Under one year*. Between 1882 and 1925, 1,360 infants under one year were buried at MCPFC, accounting for nearly nineteen percent of the total burial population. Similar to stillbirths, only eighty-eight percent (n=1,206) were recorded in the RBMC, while the remaining 154 were undocumented. Of these infants, 760 were male, 593 female, and seven did not have sex recorded (Figure 5.5). At forty-three percent, infants under one month old constituted the greatest proportion of this age group (n=634). As the age intervals increased, the frequency of infant burials generally decreased. Those between eleven and twelve months old represent only 0.8% of the cohort (n=15). The oldest, NICHOLAS CHERUBIN (d. 13 March 1915), the son of Italian immigrants, died at the Children's Free Hospital one day before his first birthday.

Unsurprisingly, the majority of infants were native-born (n=1,223), though no birthplace was available for 127 individuals. Despite their young ages, the remaining ten were born

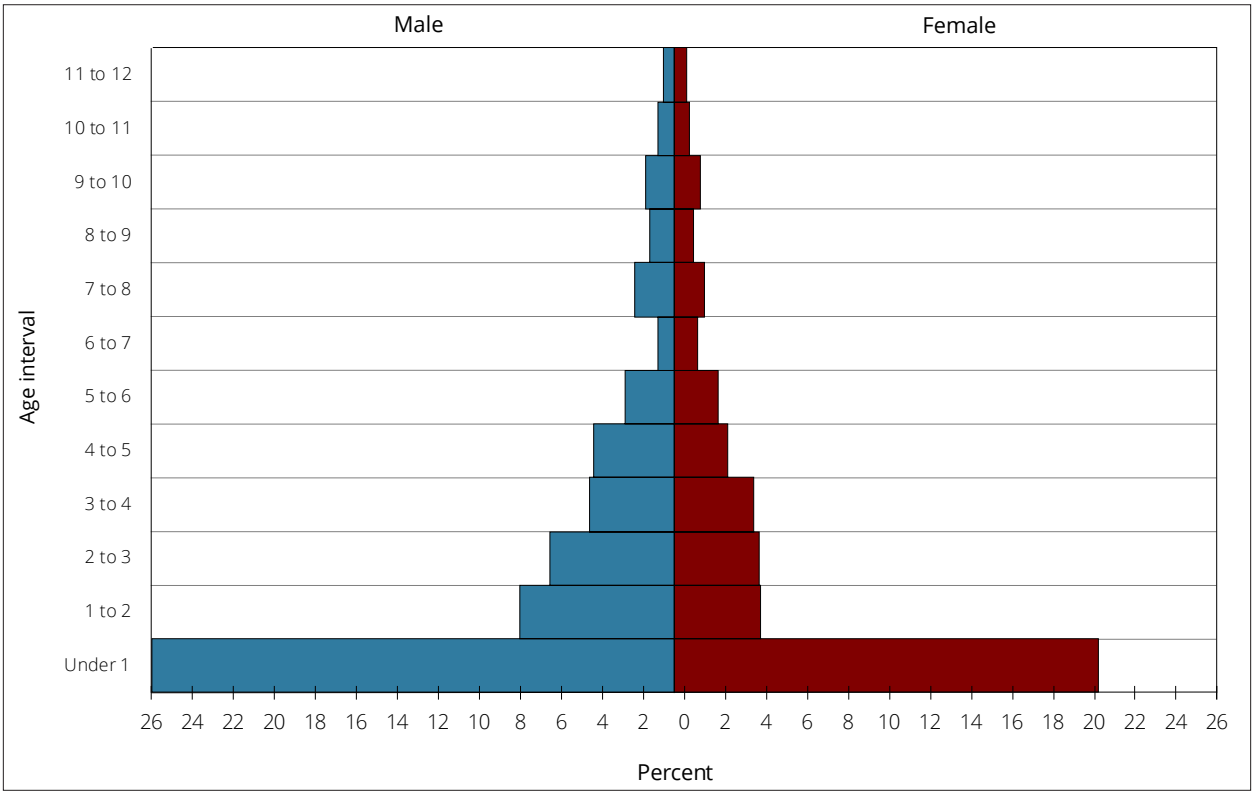

Figure 5.5 MCPFC under one year cohort sex and age distribution (n=1357), 1882–1925.

overseas in Germany (n=3), Denmark (n=2), Switzerland (n=2), Poland (n=1), Russia (n=1), and Sweden (n=1). The sea voyage must have been exceptionally difficult for an infant, as evidenced by the case of MORTEN MAGNUSSÄN (d. 13 October 1882), whose official cause of death was ship fever. Her mother provided the following testimony:

> Marlin Andersen sworn as interpreter. Clara Magnussän sworn in said: Says she is born in Sweden. I am going to Reding[sic] Minnesota where my husband is. I left Sweden the 22nd of Sept 1882.The [baby's] name of Morten Magnussän. It was 10 mos 1/2 old. Died last night at 12 oclock right here in Milwaukee. It was born 17th of Nov 1881. [Husband] left 4th April this summer. He wrote me to come sent me a ticket—August Magnussän. The child took sick on 26th of Sept—the child had hooping cough—caught cold by standing on deck—got black in the face - not since hooping cough [?] [?] child did not nurse. Had milk of me most often not from bottle. Got patent milk on ship—it was poor milk. Borrowed milk when could—always thirsty. It is my wish the child be buried here at expense of county. Has not one cent here. Clara Magnussän.

MORTEN MAGNUSSÄN was one of only eight children with Swedish lineage. While no parental information was provided on 668 death records for this cohort, the remaining 692 did have at least one parent's place of birth listed. Like the stillbirths, the majority of infants under one year had parents that were both U.S. natives (n=186), while an additional 186 had native mothers, but no paternal place of birth documented. German (n=63), Austrian (n=36), and Italian (n=28) parents were the next most common, with many other countries represented in the burial population.

By far the most frequent cause of death for individuals under one year of age was non-infectious medical conditions, especially those under the subcategory "failure to thrive" (Table 5.4). In the nineteenth and early twentieth centuries, this was a catchall diagnosis for infants and children who failed to develop normally. In some cases, it was due to an undiagnosed medical condition (organic failure to thrive), but in most it was believed to have been "psychosocial" or non-organic. According to Jaffe, these terms "were often used as euphemisms to imply that

the child was intrinsically normal and healthy and that the observed growth failure was due to environmental issues, most commonly family factors such as neglect, indifference, or other failures of parenting" (2011:100). Within the failure to thrive subgroup, the most common causes of death listed were marasmus, "a wasting away of the flesh, without fever or apparent disease" (Hooper 1860b:45), and inanition, defined by Hooper as "applied to the body or the vessels, it means emptiness" (1860a:451). Sixty-nine (thirty-two percent) of the infants dying due to failure to thrive were residents at one of the various county institutions, including the Milwaukee County Home for Dependent Children. An example includes the twin boys FRED and CHARLES TIETEL, born two months premature to ANNA and MAX TIETEL, German immigrants. Both boys appear to have been surrendered to the MCHDC shortly after birth and suffered from inanition until their deaths, FRED on 28 January 1901 and CHARLES twelve days later on 9 February. They were buried in graves V86 and V89 with only an unidentified fetus

between them.

While the prevalence of failure to thrive within the under-one-year cohort is bleak, the homicide rate is more so. Only 100 victims of violence were buried at MCPFC, and 67% were infants (Table 5.4). Like the discarded fetal remains, forty of these infants were found unidentified throughout the city. The most common method of violence was asphyxia or strangulation, though many were simply left to the elements and died from neglect. One case in which a mother could be identified is that of MALE INFANT DUNDON (d. 12 March 1892). A postmortem examination and inquest conducted by coroner Fred Leich concluded that "the infant on the 12th day of March 1892 in their opinion according to the testimony died from neglect during delivery." It was revealed through witness testimony that the infant's remains were found in a pillowcase under a rubble pile behind 560 Milwaukee Street. The mother, MARY DUNDON, was a young unwed woman who worked as a servant at that address, but hid her pregnancy from her employers until the boy was found. Similar circumstances likely led to the deaths of many unidentified infants.

Eighty-five confirmed autopsies were performed on individuals within this age category, with fifty-two conducted at the coroner's request; unsurprisingly, homicides accounted for more than half of these. An additional twelve were done at the MCGH, six at the MCHDC, and ten at non-county hospitals. The remaining five were infants who died within the community and were autopsied by the aforementioned Dr. Dalton. All but one of the infants he examined also became medical cadavers at Marquette Medical College. Again, his preference appears to have been individuals with abnormal physical features, like the infant daughter of JOSEPH KOWALSKI and CECELIA KEEBA (d.17 May 1925). The primary cause of death was listed as "dystocia, due to hydrocephalus." Gould defines dystocia as a "difficult labor due to such fœtal irregularities

as displacement of the arm, excessive size, plural pregnancy, *monsters*, etc. [*emphasis added*]" (1890:138). Besides hydrocephalus, Dalton listed the following as contributory causes of death: "prematurity of three weeks, spina bifida, bilateral hair lip cleft palate, club feet and knees (both)." In addition to the INFANT KOWALSKI, sixty-eight other infants were used as medical cadavers, with prematurity and syphilitic conditions the most common causes of death.

*Chi-squared goodness of fit.* During the sample comparative period, 767 infants under one year of age were buried at the MCPFC. The chi-squared goodness of fit test indicates a significant difference between the MCPFC infant population and the City of Milwaukee in only six nonconsecutive years:1903, 1904, 1906, 1907, 1912, and 1916. In each of these years, there were significantly fewer individuals under one year than expected (Figure 5.6). In 1902, the number of burials was roughly equal to the number expected (n=39, $\chi^2$e=38.561), suggesting the age distribution within this cohort was similar to infant mortality within the City of Milwaukee (Figure 5.7). The year with the largest difference was 1916, when twenty-nine infants were interred at MCPFC, but only fifty-three were expected based on the ACHR data ($\chi^2$r=–3.324). (This was also one of the three years in which *more* stillbirths were buried than expected.) Throughout the sample period, the majority of infants in the under-one-year cohort were three months of age or younger. The only year in which the under-three-month group was less than fifty percent of that year's infant population was 1916, the year with the largest discrepancy between the actual and expected number of infant burials.

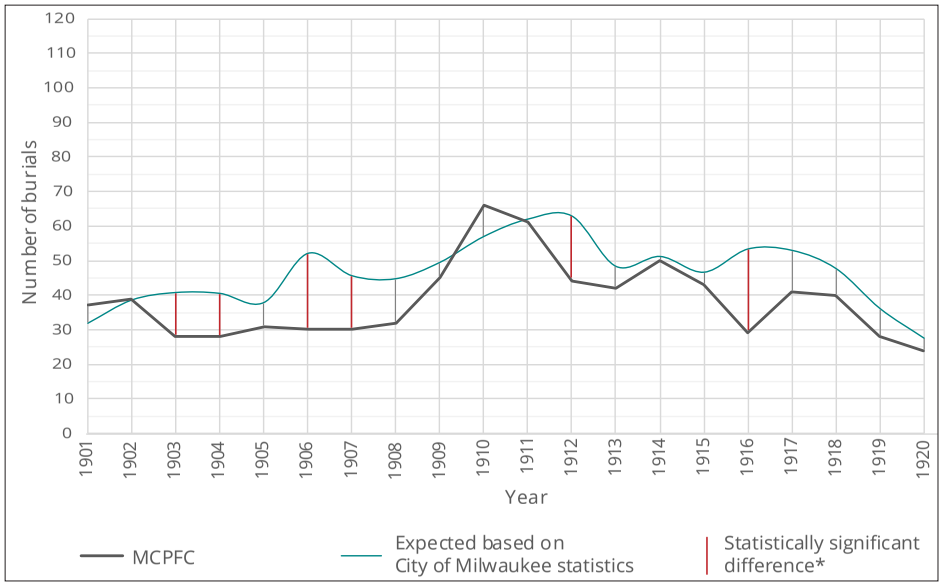

Figure 5.6 MCPFC under one year cohort, 1901–1920.

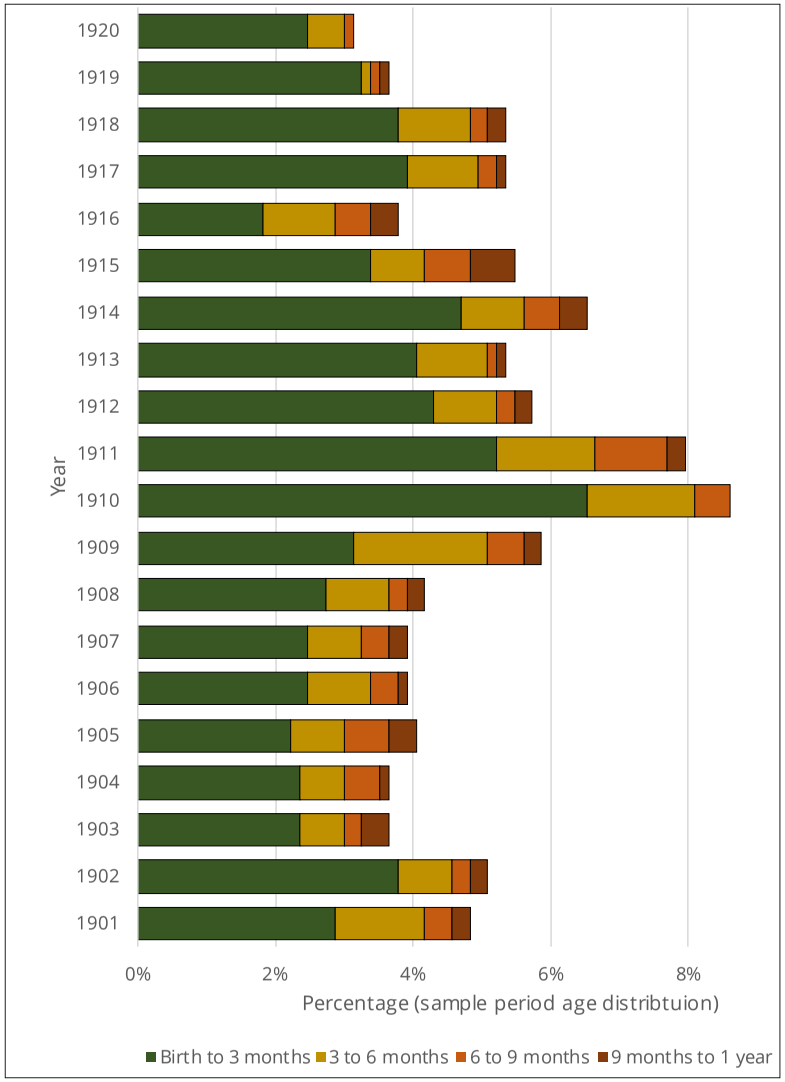

Figure 5.7 MCPFC under one year age distribution in three-month intervals, 1901–1920.

*One to ten years*. Two hundred and one individuals between one year and ten years were buried in the MCPFC; this represents only 2.8% of the burial population. The majority (n=187) were documented in the RBMC, with only fifteen unlisted in the register. The number of burials from this age group was markedly smaller than the previous two cohorts and was similar to the increased survivorship observed during later childhood within the City of Milwaukee as a whole. The life tables provided in Appendix A illustrate that the probability of death decreased after one year of age and did not substantially increase until middle adulthood; this trend has been observed for numerous historic period populations (Hollingsworth 1969:20). At first glance, this same trend appears in the age distribution within the MCPFC cohort; the youngest in the group, one- to two-year-olds, make up almost fifty-eight percent (n=116). However, the statistical testing discussed below demonstrates that these frequencies are significantly different from those recorded for greater Milwaukee's juvenile mortality rates.

The sex distribution within this age cohort is nearly even, with 101 males and 100 females (Figure 5.8). Only one individual did not have sex recorded on its death certificate: a toddler born in Norway listed as EMIGRANT CHILD (d. 23 May 1882). This individual was one of only fifteen from this age category buried at the MCPFC who were not born in the United States, with the others coming from Germany (n=8), Russia (n=2), Italy (n=2), Poland, (n=1), and Austria (n=1). Some, similar to MORTEN MAGNUSSÄN, likely succumbed to illness brought upon by the stresses of a lengthy sea voyage, but there is evidence that others survived the ordeal only to perish years later. The death certificate for MARY LUCO (d. 25 January 1922) states she was born in Italy to ANTHONY LUCO and MARY BUSA and died from pulmonary tuberculosis at Muirdale when she was eight years, two months, and twenty-nine days old. An immigration record search revealed that a MARIA LUCCA, daughter of ANTONIO and MARIA

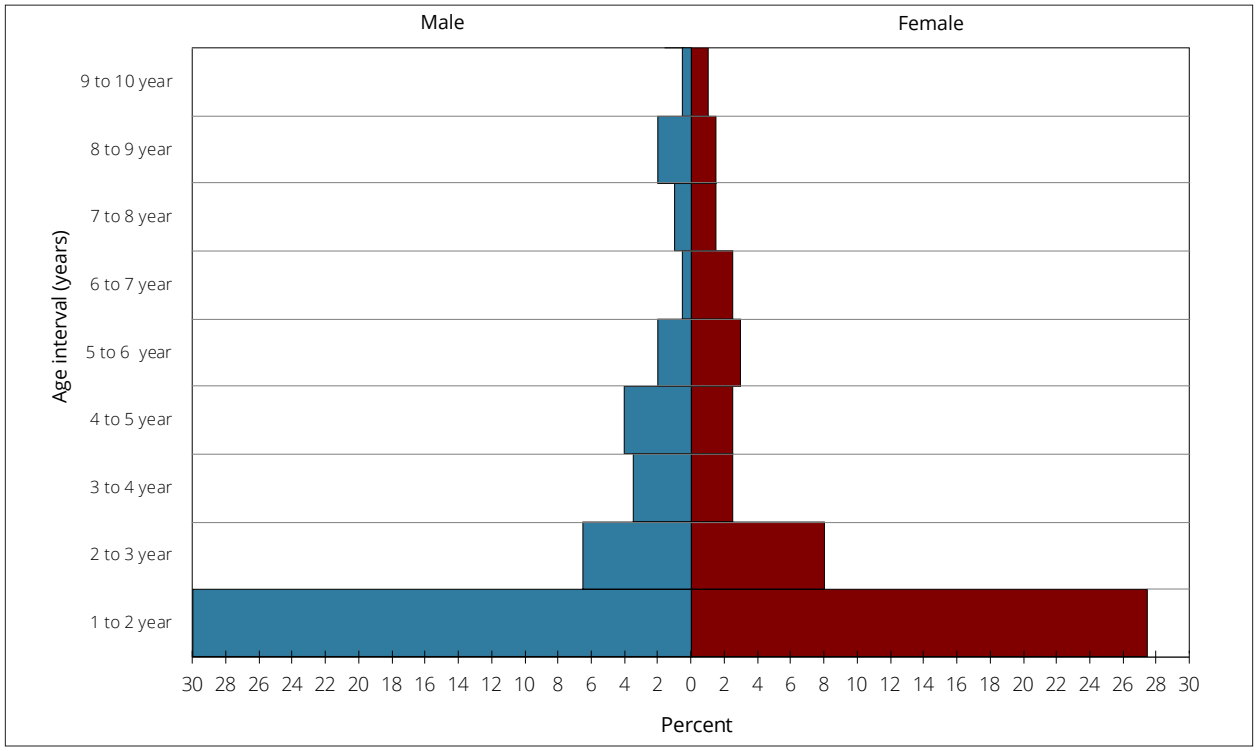

Figure 5.8 MCPFC one- to ten-year cohort sex and age distribution (n=200), 1882–1925.

LUCCA, traveled from the port of Le Havre, France, to New York on the ship *La Savoie,* arriving with her mother on 18 April 1914 when she was only four months old. Her father was listed as already having an Wisconsin address, indicating that he, like so many other migrants during this period, traveled to the states prior to his wife and infant daughter (New York Passenger Lists 2010a). After her death, for reasons unknown, her body was claimed by undertaker Charles Judson and turned over to one of the medical colleges for anatomical purposes.

Sixty percent of the children in this age group did not have parental nativity listed on their death certificates (n=124). Of the remaining forty percent (n=78), sixteen had mothers born in the states, but no information provided about their fathers. Eleven were the product of native-born parents while nine had both German mothers and fathers. As can be seen in Table 5.5, most children had parents with the same nationality, but some had mixed ancestry. The mother of CHRISTINE SAMERITIS (d. 3 Decemeber 1919), MATILDA KOROSETZ, was born

in Croatia, but the man listed as the father, JOHN FARRAS, was a Greek immigrant. It is worth noting that the word "alleged" was listed prior to his name, signaling that KOROSETZ was likely unwed and that the individual issuing the death certificate questioned FARRAS' paternity. It is unclear why CHRISTINE did not share a surname with either of her parents, but it may be because she was a ward of the MCHDC. Her primary cause of death was convulsions, with influenza listed as a contributory factor; she was one year, five months, and twenty-three days old at the time of her death.

Infectious medical conditions were by far the most common general cause of death, with pneumonia responsible in nearly twenty percent (n=39) of cases. In addition, diphtheria appears to have been a much deadlier disease in childhood than infancy, killing eleven percent of one- to ten-year-olds (n=23) but less than one percent of those under one year (n=7) (Table 5.6). Gastrointestinal causes of death were most common within the non-infectious medical category, with gastroenteritis the most frequently listed ailment. Enteritis, an inflammation of the intestines, is described by Hooper as "always attended with considerable danger, as it often terminates in gangrene in the space of a few hours from its commencement; which event is marked by the sudden remission of pain, sinking of the pulse, shrinking of the features, and distention of the belly, and it frequently proves fatal likewise, during the inflammatory state" (1860a:331).

Unlike the under-one-year group, which had a high number of homicides, no individuals between one and ten years buried at the MCPFC were victims of violence; in fact, only two children within this cohort died as the result of trauma. ELIZABETH SAKERSDORFF, aged seven years, five months, and thirteen days died on 2 February 1900 after accidentally burning herself in her home near the MCHDC. The following day, the *Milwaukee Journal* published the following on the front page:

> Cause of the Fatal Burn
>
> Little Louis Sackersdoffer[*sic*], who was burned to death yesterday afternoon while at play with her little brother in their home opposite the home for dependent children ignited her clothing by dropping a match upon it while attempting to smoke her father's pipe (Milwaukee Journal, 10 February 1900:1).

More circumstantial detail was provided in the coroner's inquest witness testimony, where ELIZABETH's mother BERTHA BARTZ stated that she had gone over to the MCHDC—only

200 feet from their home—to get coffee. Her younger son, five years old at the time, ran over and said his sister had accidentally set herself on fire while entertaining him by impersonating their father. Further testimony from the MCHDC's janitor stated that the mother was often at the institution asking for food for her children because they were poor.

Less is known about the second girl who died traumatically. GERTRUDE O'CONNER (d. 14 September 1904), aged 4 years, 9 months, and 12 days, also died as the result of burning. Her death certificate listed the primary cause as "accidental by scalding" with "septicaemia" as a contributing factor; she died at the Children's Free Hospital two weeks after being admitted. The only document in her coroner's inquest, conducted by Henry J. Broegman on 1 November 1904, was the inquiry summation:

> On examination of the body of GERTRUDE O'CONNOR and investigation held, I find that the said GERTRUDE O'CONNOR came to her death on the 14th day of September, 1904, from septicaemia[sic] caused by accidentally being scalded with hot water, at her home 355 Jefferson Street in the City and County of Milwaukee, State of Wisconsin.

While the deaths of both girls resulted in coroner's inquests, only one individual in this cohort had a confirmed autopsy; BETTY JEAN PLEASANT (d. 19 January 1925), also a charge of the MCHDC, was autopsied by Dr. D. Bruins after her death caused by bronchial pneumonia. She shared a surname with her mother, HELEN CHRISTIANSON PLEASANT, but interestingly similar to CHRISTINE SAMERITIS mentioned above, "alleged" is listed after the father's name, WALTER E. LARSON. The remains of only three children, including MARY LUCO [MARIA LUCCA] were used as medical cadavers: JOHN DAMOCHOLSKI (d. 8 February 1895), eight years old, died of epilepsy at the MCGH, and BERNICE SCHULTZ (d. 1 July 1919), aged five years, two months, and two days, succumbed to pulmonary tuberculosis at her home in Milwaukee.

Dying at home was not uncommon in the late nineteenth and early twentieth centuries. In total, sixty-two children between one and ten years died at their Milwaukee residence. In contrast, only thirty-six were taken to one of the various local hospitals prior to death (Table 5.7). An additional fifty-seven children lived and died at the MCHDC. Death certificates for those who died outside of a hospital or county institution were most often issued by a physician called to the residence. Unlike older individuals whose deaths at home often required an investigation, the deaths of only four toddlers prompted coroner's inquests. One of these was for one-year-old MARIA KRUSE (d. 11 April 1884), who died at the Union train depot:

> MARIA KRUSE being sworn states, I am the mother of the dead child. It was born in Germany. We were just over from Germany. On our arrival at New York the child got sick and continued to get sicker as we came along. It died this morning about 6 o'clock in the waiting room of the C. M. St. P Ry [mother's signature]
>
> On examination of the body of MARIE KRUSE and taking testimony, I find that the cause of death of said MARIE KRUSE was worm disease and exposure while traveling. Charles Fricke, Coroner

*Chi-squared goodness of fit*. Between 1901 and 1920, a total of 121 children between one-year- and ten-years-old were buried on county grounds. The results of the chi-squared goodness of fit tests for this age cohort are striking (Figure 5.9), showing a significant difference between the actual and expected number of burials during each year within the sample period, with the exception of 1912 (n=18, $\chi^2 r$=–1.577, $\chi^2 e$=26.047), the year with the highest number of burials within this cohort during the sample period and the second highest during the cemetery's entire operation. In 1894, twenty children between one and ten were buried in Cemetery II, most of whom died as a result of diphtheria and smallpox epidemics. The 1912 spike in juvenile burials, however, can be attributed primarily to a measles outbreak at MCHDC; half of the eighteen children buried that year were residents at the home when they died from this infectious disease, while two others from MCHDC died from bronchitis and scarlet fever. The eldest of

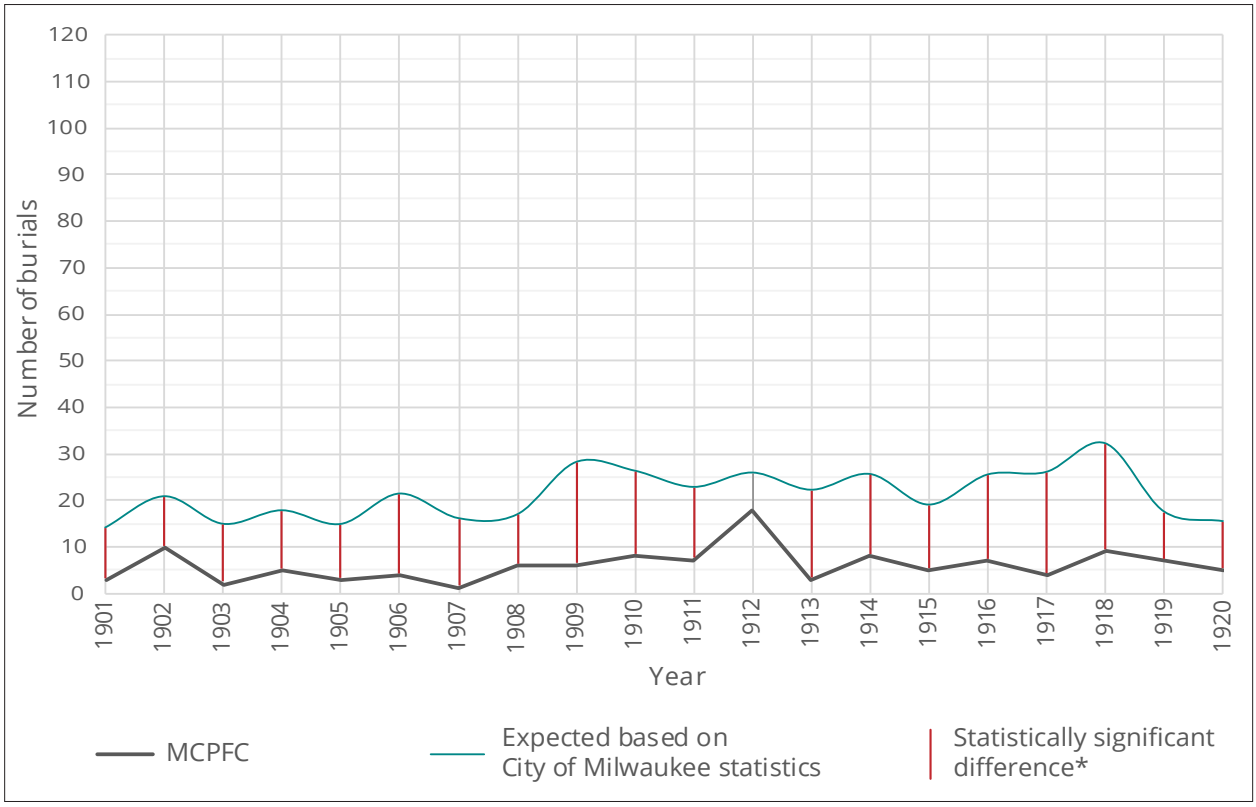

Figure 5.9 MCPFC one year to ten years cohort, 1901–1920.

these was FRED WAGNER (d. 9 May 1912), only three years, four months, and twenty-five days old. The majority of burials within this age group were toddlers between one and two (n=76), though 1912 also had a much higher frequency of two- to three-year-olds than any other year in the sample period (n=6) (Figure 5.10).

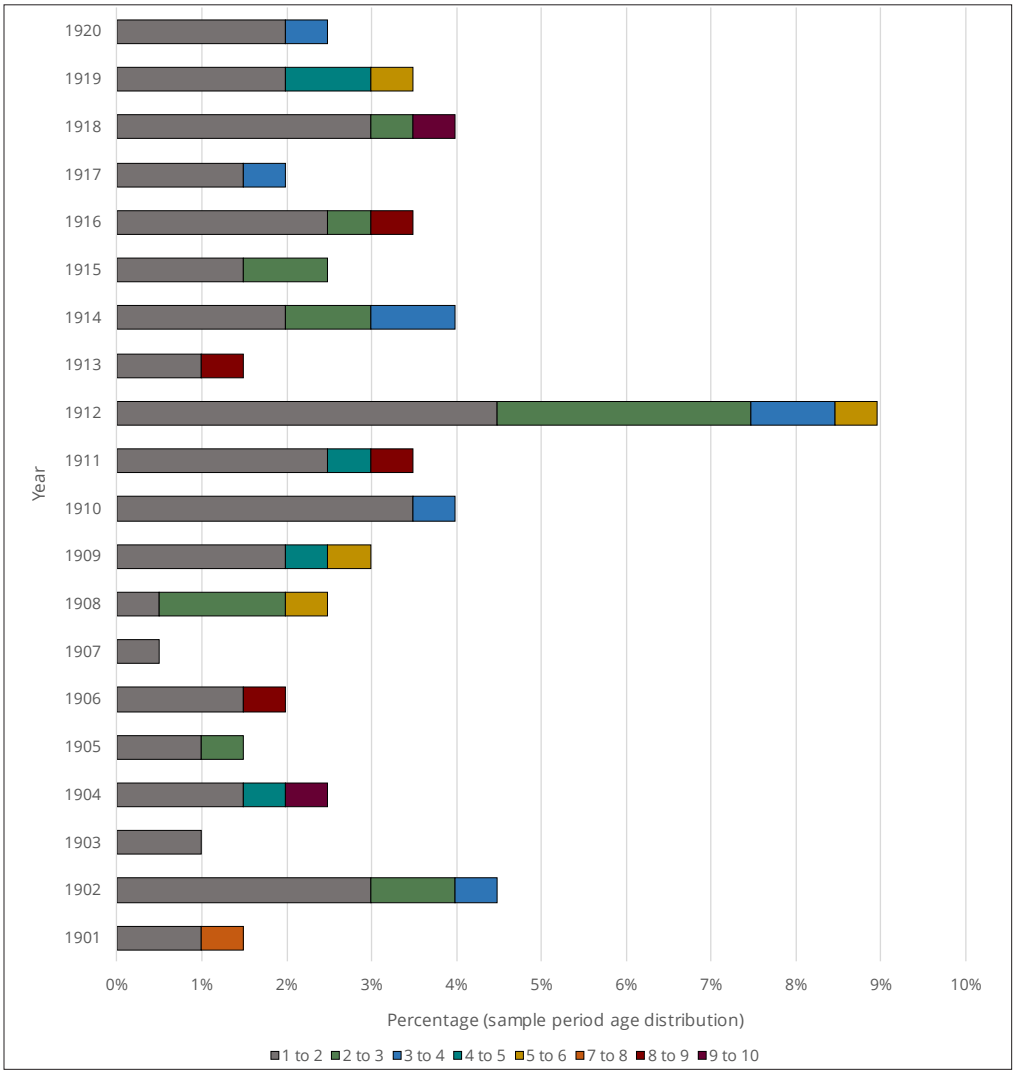

Figure 5.10 MCPFC one- to ten-year age distribution in one-year intervals (n=121), 1901–1920.

The year with the largest difference between actual and expected burials was 1917 ($\chi^2$r=–4.336); statistical testing resulted in twenty-six expected burials when only four children within this age group were interred. HARRY MARCUS (d. 9 October 1917), age one year and

twenty days, died as the result of lobar pneumonia while living at MCHDC. Two others from the community, STEVE MALKEWITZ (d. 2 March 1917), age one year, two months, and nineteen days, and JOHN BOSLER (d. 27 October 1917), age three years, also succumbed to this respiratory condition. The fourth buried that year, PETER KOROSEZ (d. 15 February 1917), age two years, six months, and one day, contracted diphtheria and died at the city's South View isolation hospital.

*Ten to twenty years*. The increased survivorship after infancy was also demonstrated in the ten- to twenty-year cohort. Only seventy-three late childhood and adolescent individuals were buried at MCPFC, constituting only 1.0% of the burial population. Fifty-five were listed in the burial register, but almost twenty-five percent (n=18) were not documented in the ledger. Four were older adolescent medical cadavers who died after 1908 (discussed in more detail below), but fourteen were non-cadaver individuals who died between 1884 and 1896, suggesting that during the period when recordation was more likely to be incomplete, mortality rates for this cohort were higher than in later years. This is supported by the life tables in Appendix A, where in 1894 the probability of death between ten and twenty years for the residents of Milwaukee was $qx_a$=0.114. Twenty years later, in 1914, it had dropped to $qx_a$=0.023 for ten- to fifteen-year-olds and $qx_a$= 0.032 for those between fifteen and twenty.

However, while the lower frequency of burials is similar to the previous cohorts, the age and sex distributions differ greatly (Figure 5.11). First, while in the earlier groups the younger age intervals dominated, here the older individuals, those eighteen to twenty years, constituted the larger proportion. Second, the ratio here was skewed heavily towards males; fifty-three males (72.6%) between ten and twenty years were buried in MCPFC, but only twenty females (27.4%). This uneven distribution continued into the adult age cohorts (see below).

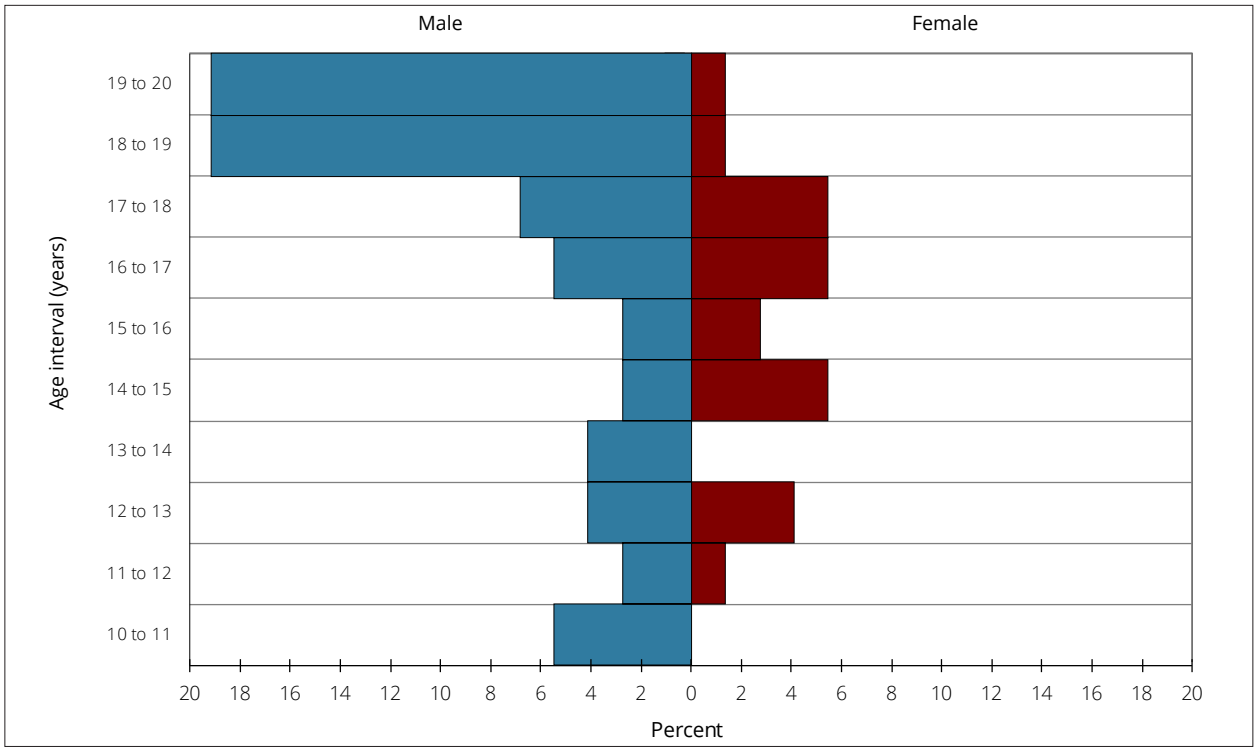

Figure 5.11 MCPFC ten- to twenty-year cohort age and sex distribution (n=73), 1882–1925.

Place of birth was another variable in which this group differed from the younger groups. In the one-to-ten cohort, only 7.5% were foreign-born (n=15), while in this category 37.0% were migrants (n=27), thirty-four were native-born (46.6%), and twelve did not have nationality listed (16.4%). The most common place of birth outside the United States was Germany (n=12), followed by Austria (n=8), Sweden (n=2), Greece (n=2), Norway (n=1), Italy (n=1), and South America (n=1).The latter was somewhat unusual, as almost all migrants buried at MCPFC were European, with a small population from the Middle East. This individual, FRANK TOMCIZ (d. 13 April 1911), was listed as living in Willard, Wisconsin, a small rural community approximately 220 miles northwest of Wauwatosa. He died at age ten at the Milwaukee Hospital following an undisclosed operation; cause of death was listed as tumor of the brain. No information was recorded regarding his parents, possibly an indication that they were not present

in the city when their son died. Like FRANK, forty-six others did not have parental information provided (Table 5.8). This steep increase in lack of parental nativity on death certificates may be a reflection of less familial involvement for the older individuals.

Table 5.8 MCPFC parental nativity for ten- to twenty-year cohort (n=73), 1882-1925.

By far the most common cause of death category was infectious disease, with tuberculosis, which killed 34.2% of the cohort (n=25), being the most deadly. Within the noninfectious medical category, equal numbers of gastrointestinal (n=4) and cardiovascular (n=4) cases occurred (Table 5.9). Regarding to the latter, all appeared to be chronic or congenital heart conditions. This included BERTHA DRAEYER (d. 19 January 1908), age fourteen years, one month, and sixteen days, who, according to her death certificate, was a ward of MCHDC and had been suffering from chronic endocarditis and cirrhosis of the liver for some time before her death at MCGH. However, no information was provided regarding the etiology of her condition that would explain why she suffered from these diseases at such a young age. According to a *Journal of the American Medical Association* article published in 1894, these two conditions were often associated and caused by a combination of three factors:

> Familiar examples of such agents are lead, alcohol and the syphilitic poison. Thus we find these three lethal substances playing an important role in the etiology of a large class of chronic inflammatory and degenerative processes, as for example *chronic endocarditis*, arterio-sclerosis, chronic parenchymatous nephritis, contracted kidney, *cirrhosis of the liver*, gout, multiple neuritis and chronic system degenerations, inflammation of the spinal cord such as chronic myelitis and locomotor ataxia...In many instances several of these etiologic factors unit to produce a given disease, and it is often difficult to assign to each its proportionate share [*emphasis added*] (American Medical Association: 297)

Despite being only fourteen years old, it appears BERTHA was a victim of diseases that befell many older individuals buried at MCPFC.

Table 5.9 Primary causes of death listed for individuals ten years to twenty years of age (n=73), 1882-1925.

Though not common in this age group, some traumatic causes of death more common among adults were recorded. These included drownings (n=2), suicide (n=1), and asphyxia caused by illuminating gas (n=1). One of four railway accidents within this cohort, an unidentified teenage boy approximately 18 years of age, designated UNKNOWN MAN 64 by the coroner's office (Figure 4.9, Chapter 4), was accidentally struck by a Chicago and Northwestern passenger train on the morning of 4 June 1912. When he was buried by the county eighteen days later, his name was still a mystery. However, tantalizing glimpses into his identity were preserved in the coroner's file (Figure 5.12).

Only two individuals within this age group were autopsied. The primary cause of death for one, an adolescent girl named HATTIE GRADWOHL (d. 22 January 1896), was listed as "cretinism—child was malformed being an idiot" with contributory factors "probably due to termination of disease—excessive quantity of blood found in ventricles of brain." The fact that HATTIE's remains were used as a medical specimen was well-documented in an article detailing the deplorable conditions in which she had been living, as well as her disease, treatment, and

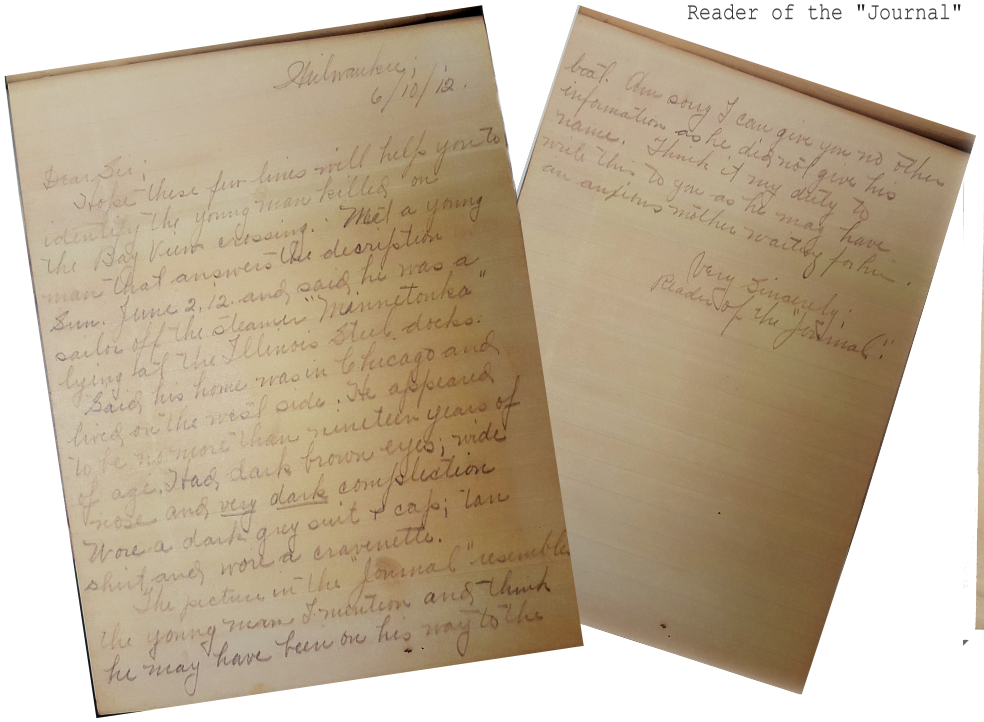

Milwaukee
6/10/12

Dear sir;

Hope these few lines will help you to identify the young man killed on the Bay View crossing. Met a young man that answers the description Sun June 2, 12 and said he was a sailor off the steamer "Minnetonka" lying at the Illinois Steel docks. Said his home was in Chicago and lived on the west side. He appeared to be no more than nineteen years of age. Had dark brown eyes, wide nose and very dark complection[sic]. Wore a dark grey[sic] suit and cap; tan shirt and wore a cravenette.

The picture in the "Journal" resembles the young man I mention and think he may have been on his way to the boat. Am sorry I can give you no other information as he did not give his name. Think it my duty to wife this to you as he may an anxious mother waiting for him.

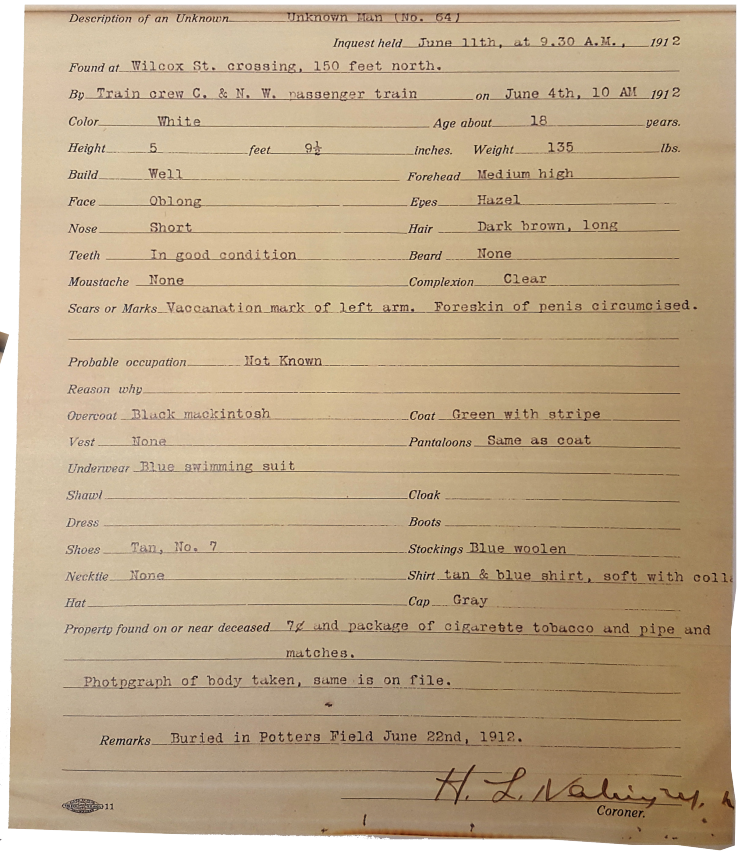

Very Sincerely;
Reader of the "Journal"

Milwaukee;
6/10/12.

Dear Sir;
Hope these few lines will help you to identify the young man killed on the Bay View crossing. Met a young man that answers the description Sun. June 2, 12 and said he was a sailor off the steamer "Minnetonka" lying at the Illinois Steel docks. Said his home was in Chicago and lived on the west side. He appeared to be no more than nineteen years of age. Had dark brown eyes, wide nose and very dark complexion. Wore a dark grey suit & cap; tan shirt and wore a cravenette. The picture in the "Journal" resembles the young man I mention and think he may have been on his way to the boat. Am sorry I can give you no other information as he did not give his name. Think it my duty to write this to you as he may an anxious mother waiting for him.

Very Sincerely;
Reader of the "Journal"

Description of an Unknown Unknown Man (No. 64)
Inquest held June 11th, at 9.30 A.M., 1912
Found at Wilcox St. crossing, 150 feet north.
By Train crew C. & N. W. passenger train on June 4th, 10 AM 1912
Color White Age about 18 years.
Height 5 feet 9½ inches. Weight 135 lbs.
Build Well Forehead Medium high
Face Oblong Eyes Hazel
Nose Short Hair Dark brown, long
Teeth In good condition Beard None
Moustache None Complexion Clear
Scars or Marks Vaccanation mark of left arm. Foreskin of penis circumcised.
Probable occupation Not Known
Reason why
Overcoat Black mackintosh Coat Green with stripe
Vest None Pantaloons Same as coat
Underwear Blue swimming suit
Shawl Cloak
Dress Boots
Shoes Tan, No. 7 Stockings Blue woolen
Necktie None Shirt tan & blue shirt, soft with coll
Hat Cap Gray
Property found on or near deceased 7¢ and package of cigarette tobacco and pipe and matches.
Photpgraph of body taken, same is on file.
Remarks Buried in Potters Field June 22nd, 1912.
H. L. Nalling
Coroner.

Figure 5.12 (a) Anonymous letter sent to the coroner describing interaction with UNKNOWN MAN 64 directly before his death; (b) Description of UNKNOWN MAN 64 (Courtesy of Milwaukee County Historical Society).

eventual death and dissection (Friend 1897; see also Richards 2015). Eight others were also used for anatomical purposes, and with the exception of HATTIE, all were over eighteen years of age.

Most of these individuals used as medical cadavers also had a common place of death. HATTIE died at the Children's Free Hospital in Milwaukee, but the others were all patients at MCGH. In total, forty died at the county hospital, though most resided in the city (Table 5.10). One teenage boy, CHARLES ROCZESKA (d. 1 March 1898), had his residence as well as place of death listed as MCGH. No information about his parents was provided, but his cause of death, poliomyelitis anterior (indefinite), explains his living at the hospital. This is also the first age category that included inmates at one of the two county psychiatric facilities; both were confined to the Milwaukee County Asylum for the Chronic Insane. TOBIN BLUE (d. 31 July 1916), an African-American male eighteen years of age, died from heat exhaustion and hydrocephalus. His death certificate indicated he had been a patient at the asylum for a year, but the document does

Table 5.10 Residence and place of death categories for ten- to twenty-year cohort (n=73), 1882–1925.

not disclose why he was placed there. The second individual, ELSIE BRUESKE (d. 2 September 1916), sixteen years old, was only at the asylum four months before she died of typhoid fever. Here the secondary cause of death, epilepsy, provides some clue to why she was admitted to the asylum. In addition to the constant medical attention needed to care for an epileptic (Hooper 1860), during ELSIE's life time there was an accepted correlation between her condition and hereditary insanity (Mott 1910).

*Chi-squared goodness of fit*. Only thirty-four individuals from this cohort were buried at MCPFC during the twenty-year comparative period, and with the exception of three years, there were statistically significant fewer burials than expected (Figure 5.13). The largest difference was 1918, when two burials occurred but eleven were expected ($\chi^2 r = -2.846$). The years no significance was found were those with small spikes in the number of adolescent burials (Figure 5.14); these included five burials in 1907 and 1914, and four in 1916.

JOSEPH STACHOWIAK (d. 14 April 1916) died and was buried during the latter year, one of only three individuals in the thirteen- to fourteen-year age interval. His German parents, ANTON STACHOWIAK and JOSEPHINE LOSKA, were listed on his death certificate, but his residence was identified as St. Aemilian [Armilieanus] Orphanage. This institution was run by the Sisters of St. Francis of Assisi and was originally founded for children orphaned by the cholera epidemic in 1849 (Archdiocese of Milwaukee 2017). However, he did not die at the orphanage:

> JOSEPH STACHOWIAK, about 13 years of age, inmate of the Armilieanus Asylum, parents living at 1096 7th Ave, was found on a tank in a cave at the plant of the William Franzen Glass Works by one OE Hanson, employed by the American Appraisal Co, 635 23rd Avenue, at about 9 o'clock this morning, who reported the case. Body identified by Father Schmitz of the Asylum, by the No 85 mark on clothing. Had been missing from the Asylum since March 27, 1916. Last seen by his aunt Jennie Kanczewski living at 772 Windlake Avenue on March 30, 1916." COD: accidental, asphyxiated by fuel gas (probable); contributory—body decomposed. [signed] Frank Luehring, coroner

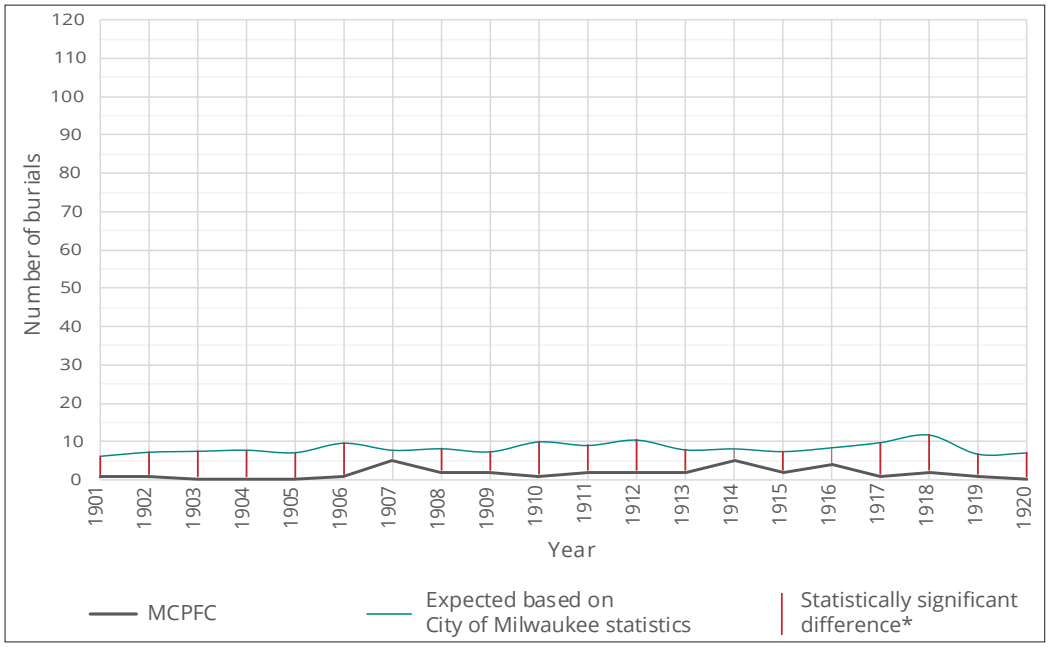

Figure 5.13 MCPFC ten-year to twenty-year cohort, 1901–1920.

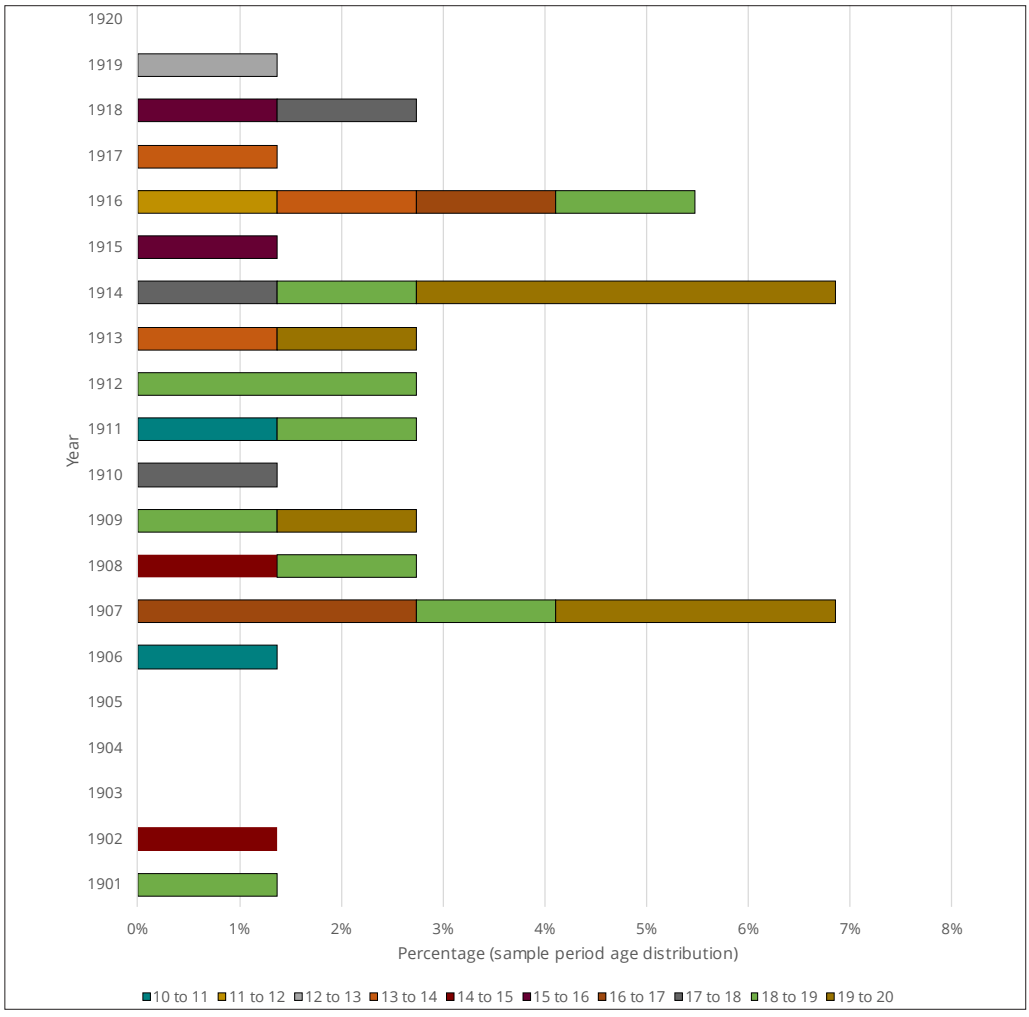

Figure 5.14 MCPFC ten- to twenty-year age distribution in one-year intervals, 1901–1920.

Newspaper articles covering the discovery of the remains and identification of the boy as JOSEPH indicated that he and two other boys had "escaped" the institution (Figure 5.15). One of the boys had been found, but when the Catholic orphanage refused to take him back, he was sent to the MCHDC; the whereabouts of the other boy were unknown. A *Milwaukee Sentinel* article from 15 April 1916 describes a visit to the STACHOWIAK family home where JOSEPH's seven-year-old brother was looking after a large group of even younger children while his mother was at the morgue identifying the remains of her elder son (Figure 5.16). Because JOSEPH had voluntarily left the Armilieanus Asylum, it is likely they refused to arrange for a proper burial and his parents were too poor to pay for one themselves, leaving JOSEPH one of the relatively few adolescents buried in the county potter's field (Figure 5.17).

*Twenty to thirty-five*. The character of the MCPFC burial population changed drastically in the adult age categories. While the older subadults make up a small proportion, young adults—those aged twenty to thirty-five years—represent 11.3% of the total population (n=813). Of these, 536 were listed in the RBMC, while the remaining 277, or thirty-four percent, of the cohort were not documented. As can be seen in Figure 5.18, the twenty- to thirty-five-year-olds were dominated by males (n=688), and especially males older than thirty. Females accounted for only fifteen percent of the group (n=125); only twelve of these women were under twenty-two years of age. This includes MARY MCCLOSKY (d. 6 February 1886), a twenty-year-old married house servant who died of puerperal peritonitis. In his treatment of pregnancy and midwifery, Leishman says of puerperal peritonitis, "An ordinary attack of peritonitis almost always comes on with in a week of the period of delivery...the sooner after labor the symptoms manifested, then more serious is our prognosis as to the issue of the case; and, in a large proportion of cases, if not checked by appropriate treatment, it is apt to run rapidly to fatal termination" (1873:658).

# BODY OF UNKNOWN BOY IS FOUND ON TOP OF A FURNACE

**Police Believe It May Be That of Joseph Stachowiak, Who Escaped From Asylum.**

## BOY FRIEND IS QUIZZED

**Lad, One of Three Who Fled From Institution, May Throw Light on Mystery.**

## BODY BADLY DECOMPOSED

**Found by Worker in Basement of William R. Franzen Glass Works.**

The body of a boy, about 14 years old, in a badly decomposed condition, was found on Friday on top of an unused furnace in the basement of the plant of the William R. Franzen Glass works.

The remains of the lad were in such condition that the coroner has been unable to determine what caused death. It is also impossible to recognize the features and the only means of identification are the clothes.

### Find Prayer Book.

In the finding of a prayer book containing the name of Leo Thompson, 90 Oneida street, the authorities thought they had learned the identity of the lad, but investigation at the Thompson home on Oneida street proved that he is still living. He is at the home for dependent children, but when questioned on Friday stated that he did not know how his prayer book came into the possession of the dead boy.

It was then learned that Thompson had been an inmate of the St. Aemilianus Orphan asylum, St. Francis, and that with two other lads of his own age, Anton Zdarniecki, 875 Eighth avenue, and Joseph Stachowiak, 1096 Seventh avenue, he had made his escape from the asylum. Thompson was later recaptured and because of the refusal of the officials of the orphan asylum to take him back was sent to the home for dependent children.

### May Be Missing Boy.

No trace of Zdarniecki or Stachowiak has ever been found since their escape from the asylum and it is believed that the body found on top of the furnace may be that of one of them.

According to Father Reidl, head of the asylum, the description furnished him by the coroner's office fits that of Stachowiak. The coroner has summoned the parents of the lad to come to the morgue to try and identify the clothing. Officials of the asylum also will come to the coroner's office to try and identify the remains.

The body of the lad was discovered by O. E. Hansen, an appraiser of the American Appraisal company. He had been sent to the basement of the plant to appraise the pipes which connect the furnaces in the basement with other furnaces in the plant. The furnace on top of which the body was found has not been in use for several months, although gases were said to fill the basement of the building.

### Overcome by Gas?

It is believed, if the body proves to be that of Stachowiak, that after escaping fro mthe asylum on March 27, he crawled into the basement of the plant to remain in a warm place over night and was overcome by the gases which filled the basement. As no one from the plant ever had occasion to enter the unused basement, the body was not found until after the appraised had been sent into the place.

The description of the body found, as given out by the coroner, is that of a boy about 16 years old, 4 feet 11 inches in height, weight about 90 pounds, medium build, light brown hair and dressed in black and white striped knee pants, black belt, blue shirt, black stockings, gray sweater and brown cap.

# BROTHER JOE DEAD; 'OLLIE' LIFTS BURDEN

**Cares for Little Flock of Sisters and Brothers While Mother Is at the Morgue.**

## "JOE" IS FOUND DEAD

**Youth Who Ran Away From Orphanage, Dies in Glass Works Basement.**

"My brudder, he killt!"

A pair of brown eyes set in a round baby face beneath a thatch of yellow hair gazed seriously up at the caller, who had stood rapping at the shabby door for fifteen minutes before a grating key in the rusty lock announced its opening.

"What's your name, sonny?"

"Stachowiak."

"Well, what's your first name?"

"Ollie."

"Is your mamma at home, Ollie?"

The grave little chap eyed the caller appraisingly for a few seconds before answering. "My brudder Joe, he's killt," he repeated impressively. "My ma's gone away." He hesitated, then stood aside, and the caller entered the little parlor, which by this time was filled with wriggling children, who had gathered from all directions to the little Seventh avenue home. As she seated herself upon the bright green couch, drawn up beside the wall with its red covering, she heard the key grate in the lock again.

"How old are you, Ollie?"

"Seven."

"And are you here all alone?"

"Me and de kids. I'm lookin' after 'em."

"Are these all your brothers and sisters?"

### Clara His Twin.

"No'm. Just two of 'em are my bruders. My sister's outside—she's 7, too. We're twins. Her name's Clara. This is Eddie." He pushed forward a miniature of himself, who sucked his thumb and gazed contemplatively at the visitor.

"An' dis is John. Hey, give me back dem keys, you——" and he administered a vigorous slap to another brown eyed cherub. "Eddie's 5 and John's 6," he explained.

"Have you any other brothers or sisters, Ollie?"

"Rosie—she's grown up. She works. An' Stanley. He's 10."

"Have you any pictures of Joe?" asked the caller.

"Nope! He never had no pictures took. But we got a picture of my pa and ma," and he pointed proudly to a framed photograph of a handsome young couple in the wedding finery of twenty years ago.

"Well, Ollie, guess I'll have to be going now. Good-by!"

"Good-by, lady. My mudder'll be back after while."

"You stay dere——" and he rolled the good natured Eddie into a heap on the red and green ingrain carpet as he followed the visitor to the door. As she hurried down the broken steps and out the narrow little gate, she head the key grate in the lock once more.

Figure 5.15 *Milwaukee Sentinel* article (14 April 1916) detailing the discovery of JOSEPH STACHOWIAK's remains.

### Find Boy's Body.

The body of a boy, 13 years old, in a badly decomposed condition, was found on Friday on top of an unused furnace in the basement of the plant of the William R. Franzen Glass works.

A clew contained in a prayer book found beside the body led to the discovery that the body is that of Joseph Stachowiack, 13 years old, 1096 Seventh avenue, who, with two other boys, escaped recently from the St. Aemilianus Orphan asylum. The body was in such badly decomposed condition that the coroner has been unable to determine the cause of death.

### Prayer Book Near Body.

The prayer book found beside the body contained the name of Leo Thompson, 90 Oneida street. Investigation at the Thompson home disclosed that the Thompson boy had been an inmate of the asylum. He and the Stachowiak boy and Anton Zdarniecki, 875 Eighth avenue, it is said, escaped from the institution. Young Thompson was recaptured, but no trace had ever been found of the other two boys. The Thompson boy, who now is in the Home for Dependent Children, was unable to throw further light on the death of the boy and could not say how he had obtained possession of the prayer book.

Father Riedl, head of the asylum, declared the description furnished by the coroner's office coincides with the description of the Stachowiak boy, and the parents also came to the morgue and completed the identification, and that was why "Ollie" was home taking care of the children.

The body of the lad was discovered by O. E. Hansen, an appraiser of the American Appraisal company. He had been sent to the basement of the plant to appraise the pipes which connect the furnaces in the basement with other furnaces in the plant. The furnace on top of which the body was found has not been in use for several months, although gases were said to fill the basement of the building.

### Overcome by Gas?

It is believed that after escaping from the asylum on March 27, he crawled into the basement of the plant to remain in a warm place over night and was overcome by the gases which filled the basement. As no one from the plant ever had occasion to enter the unused basement, the body was not found until after the appraiser had been sent into the place.

Figure 5.16 *Milwaukee Sentinel* article (15 April 1916) describing interview with seven-year-old OLLIE STACHOWIAK.

# COUNTY WILL BURY BOY. VICTIM OF GAS FUMES

The potter's field will be the final resting place of Joseph Stachowiak, 13 years old, whose remains were found on top of a furnace at the William R. Franzen glass works. The interment will take place Monday morning, according to an announcement by the coroner Saturday night. The parents are too poor to provide other burial for the boy.

The lad evidently had crept into the basement of the Franzen building to seek relief from the cold following his escape from the St. Aemilianus' Orphan asylum, on March 27, and was overcome by gas fumes which filled the place.

Friday night the mother of the dead boy went to the morgue, where she verified the identification made by officials of the orphan asylum.

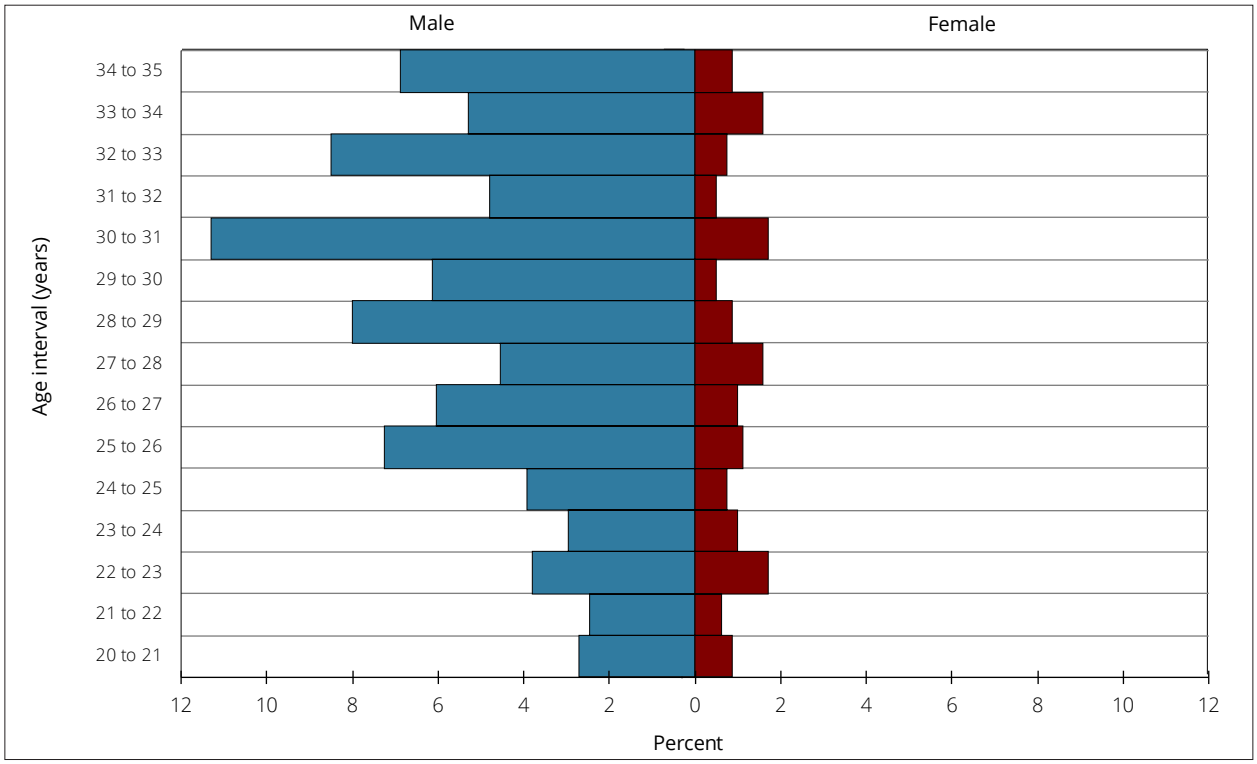

Figure 5.18 MCPFC twenty- to thirty-five-year cohort age and sex distribution, 1882–1925.

The fact that MARY was married introduced a new variable for consideration: marital status. There were clear differences in martial status within both the age and sex distributions (Figure 5.19). Both males (n=222) and females (n=29) had a relatively high number of individuals without marital status indicated on their death certificates; however, the percentage of males without statuses listed was higher than females, thirty-two percent versus twenty-three percent, likely illustrating the greater importance placed on a woman's marital status. Singles made up the majority of males (53.6%), while single and married statuses were relatively evenly distributed among females, 31.2% and 37.6% respectively. Additionally, there was a much higher percentage of divorced women (n=6, 4.8%) than men (n=2, 0.3%). Of note, all the women were listed as divorced while the two men were identified as "separated."

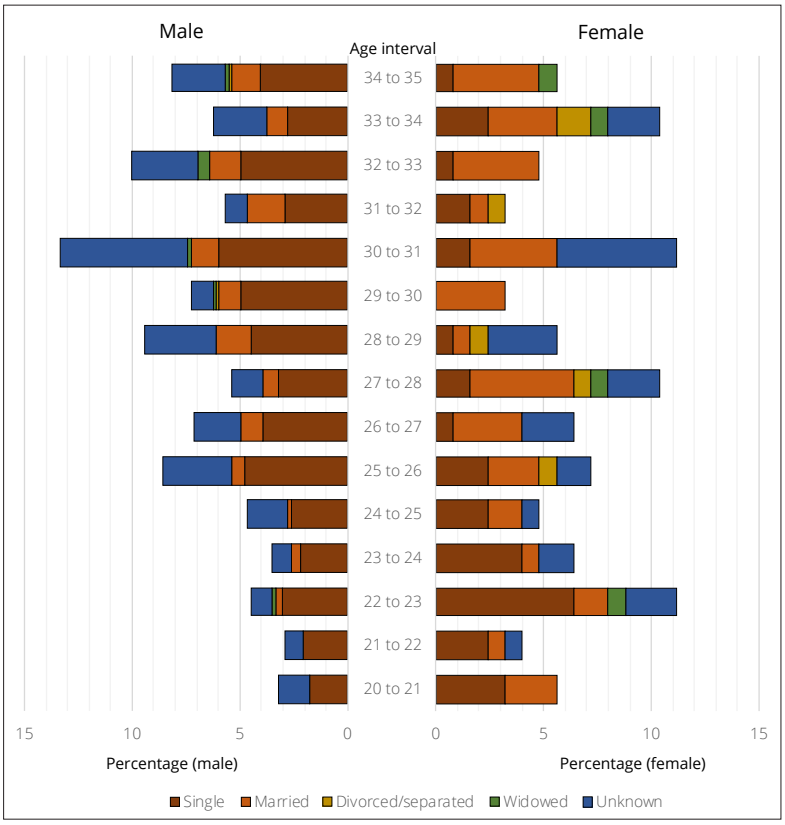

Figure 5.19 MCPFC twenty- to thirty-five-year cohort, age and sex distribution with marital status, 1882–1925.

One of these men was LEROY E. MOODY (d. 3 June 1921). A patient at Muirdale for a year, he succumbed to pulmonary tuberculosis when he was twenty-nine years, ten months, and six days old. Despite being married but separated, he apparently had no family capable or willing to claim his body; after his death, his remains were turned over to Charles Judson for anatomical purposes. No information about his wife was listed on his death certificate, but a record of his marriage to EMMA PALINKE, age 18, on 4 December 1911 is listed in the Cook County, Illinois, Marriages Index (2011), and the birth of their child, FLORENCE ANN MOODY, was recorded 28 April 1912 (Cook County, Illinois, Birth Certificates Index 2011). Their daughter died three months later and was laid to rest in St. Mary's Cemetery in Chicago (Cook County, Illinois, Deaths Index 2011). No other information could be found about EMMA, but LEROY

was listed on the 1920 United States Federal Census (2010) as lodging at the Salvation Army Industrial Home, a boarding house for homeless and unemployed men (Bliss et al. 1913).

LEROY, born in Chicago, was one of only twenty-seven percent (n=218) of this age group born in the states. The majority of these native-born individuals (57.3%) did not have parental nativity listed on their death certificates. Of those who did, most were children of German parents (n=31) or natural-born U.S. citizens (Table 5.11). One hundred and sixty-three others did not have place of birth listed; the remaining 432 were Europeans. Migrants from central Europe account for the largest segment of this age group (Figure 5.20; Table 5.12). These individuals came from Switzerland, Bohemia, Austria, and Germany, but by far the most numerous were the Germans (n=157). Only twenty-five of these German migrants were women, most under thirty. FRIEDA PETERSON (née ENDNER) (d.3 August 1900) was a twenty-two-year-old widower who died at MCGH from cerebral gumma caused by syphilis. Anders states, "Cerebral syphilis is usually a late (tertiary) manifestation, appearing on average three or four years after infection....The symptoms of the acquired form are with few exceptions referable to three affections: (a) epilepsy, (b) brain-tumor, and (c) paralysis" (1905:336). While FRIEDA was widowed and had no family to arrange a proper funeral, MATHILDA SCRIBNER (d. 23 August 1888) was married, though it is clear from the documentary record that her marriage was problematic. According to witness testimony in the coroner's inquest, she had been seen

multiple times the day of her death crying uncontrollably because her husband had been gone for sometime, supposedly to find work, but she was distraught, thinking he had abandoned her and she had no way to support herself. She eventually committed suicide by throwing herself in front of a train. A *Weekly Wisconsin* (1888) article mentioning her death reads:

> MARTILA[sic] SCRIBNER, a young married woman who imagined that she had been deserted by her husband, committed suicide by throwing herself before a train on the Chicago, Milwaukee & St. Paul Railway near North Avenue station on the nigh of the 24th. Her fear that she had been deserted was found after her death to have been groundless.

Apparently her husband had been located after her death, but nevertheless she was buried in the poor farm cemetery.

Given the much higher frequency of burials in this age group, it is not surprising that more varied causes of death are present. While more types of non-infectious medical deaths were recorded (n=185), infectious diseases were by far the most deadly (n=436); tuberculosis alone killed thirty-six percent (Table 5.13). The high number of smallpox deaths were attributed to outbreaks in 1894 and 1925, while the equally high number of typhoid fever cases were distributed throughout the cemetery's usage. Typhus, described by Hooper, was a disease often associated with unsanitary environments:

> The most general cause that gives rise to this disease, is contagion, applied either immediately from the body of a person labouring under it, or conveyed in clothes, or merchandise, &c.; but it may occasioned by the effluvia arising from either animal or vegetable substances in a decayed or putrid state: and hence it is, that in low and marshy countries it is apt to be prevalent when intense and sultry heat quickly succeeds any great inundation." (1860b:364)

Within this age group, the majority of individuals who fell victim to the disease were under thirty years of age, a trend consistent with predisposing causes addressed by Anders:

Table 5.13 Primary causes of death listed for individuals twenty to thirty-five years of age (n=813), 1882–1925.

> The young and middle aged furnish a preponderant proportion of cases, owing to the fact that they are more liable to exposure to the virus than during other periods of life....Epidemics, however, occur oftenest in winter, since the homes of the underfed pauper population are illy ventilated, and hence favor concentration of the specific poison. (1905:70)

This seasonal assessment, however, was not consistent with the MCPFC population, as many of the deaths occurred during summer and fall months. FRANK KUDA was a twenty-five-year-old Bohemian migrant laborer who died in September 1910 at MCGH after fighting the disease for only five days. The address listed on his death certificate places his residence in the Third Ward. Gurda (2015) noted that at this time the neighborhood was dingy, not particularly desirable, and had the highest residential population density in the city. He goes on to state, "In 1910, government investigators pronounced the neighborhood's housing the worst in Milwaukee" (Gurda 2015:24).

In contrast to the previous age group, there was a noticeable increase in the number of accidental deaths as well as suicides and homicides. The most common accidental deaths were caused by trains (n=39). Of these, eighteen were men that could not be identified by the coroner. The frequency of unidentified individuals grows drastically in the adult categories; lack

of identification made it impossible to find friends or family to claim the remains, and therefore almost all those who died in Milwaukee County and were unidentified were laid to rest at the MCPFC. This included UNKNOWN MAN 91 (d. 30 November 1914), who was killed while attempting to steal a ride on a Chicago, Milwaukee & St. Paul Railway Company freight train. Although he was never identified, witnesses to his death more information about him than is typically know about most who met similar fates. A witness named FRANK FISHER told the coroner he had met the deceased earlier that day and the man had told him his name was Joe. FISHER said the man was a native-born Moravian and spoke Bohemian like him. They had crossed paths while roaming Clinton Street looking for employment, but not finding anything, the two decided to try their luck in Chicago and went to the tracks to steal a ride. A number of other men were also waiting to jump the train and were successful, but the deceased lost his grip and was dragged under the wheels; the train never stopped. Several photographs were found on the body including one with the name JOE CURKAL written on the bottom (Figure 5.21). However, the condition of the body prevented the coroner from positively identifying the deceased as the man in the photos, and he consequently became one of the hundreds of unidentified individuals interred in the MCPFC.

Shooting deaths were another phenomenon limited to adult age cohorts. Nineteen suicides and five victims of gun violence were buried at the MCPFC. Limited information is available about the earliest gun homicide, an UNKNOWN MAN (d. 21 May 1888) approximately twenty-five years old, found dead in the Town of Oak Creek. More is known, however, about the other four from coroner's inquests and newspaper accounts, partly because of the sensational nature of the deaths. This is well illustrated by the case of LAZZLO SZALAY (d. 12 August 1921). SZALAY, a thirty-year-old Austrian native who had been incarcerated in the

Figure 5.21 Photographs found with UNKNOWN MAN 91, likely of the deceased (Courtesy of Milwaukee County Historical Society).

Milwaukee County House of Corrections for burglary on 3 January 1918, escaped sometime after and  was eventually recaptured. He was released on 30 July 1921, but thirteen days later was killed in a gun battle with a homeowner after he and an unknown accomplice attempted a home invasion (Figure 5.22). During the coroner's investigation, the man who shot SZALAY, STEVE SCHLESAK, was informed of his constitutional rights prior to testifying; he did not understand English, and the interview was conducted in German. He informed the panel that in Germany he had been a Hussar, a German cavalryman, for three years and was classified as a sharp shooter with multiple medals. His wife (not named) also participated in the gun battle, firing her own weapon and reloading her husband's gun when he ran out of ammunition. SCHLESAK insisted he was only trying to protect his wife and young daughters and the authorities agreed, classifying the homicide as justified and not bringing any charges. Older documents from his previous incarceration had noted that SZALAY's parents lived in "Jugo-slavia," but that he had an aunt in Pennsylvania. It is unclear whether or not she was located, but he was buried in the MCPFC 18 August 1921 in grave E–127.

Those who died due to accidents, suicides, and homicides lived within the community and died within the city. Most others, those who perished from medical causes, died on the county grounds (Table 5.14); in total, 504 individuals died at either the MCGH, Muirdale, MCHMD, MCACI, or the MCAH. An additional eighteen died at the county correctional facility while incarcerated. Eight of these were suicides, including ROBERT MARCH (d. 21 June 1886), whose cause of death was listed as "voluntary starvation," and CHARLES KURRLE (d. 17 July 1895), who slit his own throat with a butcher's knife while on kitchen duty. Records for the jail are unfortunately unavailable, so little additional information could be found explaining why these men were arrested, though a newspaper article describing KURRLE's death noted that he had been sentenced to fifteen days for being drunk and disorderly (Figure 5.23). It appears alcohol-related transgressions were common, as three others died in the correctional facility due to alcoholism or delirium tremens.

Charles Kurrle, a prisoner at the house of correction, committed suicide at that institution Wednesday by cutting his throat with a bread knife. Kurrle was sentenced in the police court on July 5 to fifteen days for being drunk and disorderly. His time would have expired on the 20th. At the house of correction he was employed in the kitchen and early Wednesday morning went to work as usual. A short time later he was found with his throat cut and life extinct. Deceased was 29 years of age and supposed to have a brother living on a farm in either North or South Dakota.

Figure 5.23 *Weekly Wisconsin*, 20 July 1895, describing the suicide of CHARLES KURRLE at the Milwaukee County House of Corrections.

Only one of the eighteen who died at the house of corrections was autopsied by the coroner: JOSEPH SCHMIDT (d. 7 March 1910). SCHMIDT's official cause of death was acute nephritis, and though a postmortem was held, little additional information was included in the inquest. Out of the 813 individuals in this age group, only thirty-five had recorded autopsies and only eight of these were women. MYRTLE WOODS (née MILLS) (d. 14 May 1894) was among those autopsied by the coroner's office. One of only 151 African-Americans buried in the cemetery, WOODS was twenty-seven when she ingested a large quantity of ergot, attempting to induce an abortion. Luff notes, "[Ergot] is certainly capable of causing contractions of the uterus during the later states of pregnancy, but in the earlier states it is considered somewhat doubtful whether it can initiate contractions of the uterus or produce them with sufficient force to cause the expulsion of the uterine contents" (1895:352). The doctor who visited WOODS shortly after she took the toxin noted that she was in considerable pain, consistent with the symptoms of ergot poisoning:

> (i) Epigastric pain, thirst, nausea, and vomiting. (ii) Giddiness, cardiac oppression, numbness, and tingling of the extremities. (iii) Shivering, coldness, cramps, delirium, coma and convulsions (Luff 1895: 353)

The male acquaintance with whom she had been living told the coroner that she was from Chicago and her husband there had been sent to jail. After he was sent away, she came to Milwaukee and began working at a "sporting house." Though she did not know how far along her pregnancy was, the coroner concluded after the autopsy that she had been five to six months pregnant.

While a small proportion of twenty- to thirty-five-year-olds were autopsied, a much larger segment became medical cadavers; one hundred and sixty-nine, or approximately twenty-one percent, were used for anatomical purposes. Both males and females were cadavers, though

males accounted for eighty-nine percent. The most common cause of death among those selected for dissection was tuberculosis (n=96). It is unclear whether this is an artifact of the high number of people succumbing to the disease or an explicit selection process targeting this disease, though it should be noted that this represents thirty-three percent of tubercular deaths, while only eighteen percent of suicides resulted in medical dissection. This included NELLIE B. BAUMAN (née MCMANN), a thirty-three-year-old divorcée. Other than the standardized form requesting her remains signed by Charles Judson, the only document in her coroner's inquest contained the following:

> On examination of the body of NELLIE B. BAUMAN and investigation held, I find that the said NELLIE B. BAUMAN came to her death on the 7th day of March, 1906 from the effects of a dose of carbolic acid poison, taken with suicidal intent.

*Chi-squared goodness of fit*. Four hundred and sixty-five individuals from this group were buried at the MCPFC during the comparative period. Unlike the previous age cohorts that resulted in multiple years with significant differences between the actual and expected number burials, there was only one year with a significant difference for the twenty- to thirty-five-year group (Figure 5.24).

In 1902, only seven burials were documented, though based on the chi-squared goodness of fit test approximately eighteen were expected ($\chi^2 r = -2.543$). Also, unlike the younger cohorts, there was no obvious pattern or trend within the age distribution that might account for the statistical significance in this single year. The seven buried in 1902 range in age from twenty-three to thirty-three and include six males and one female; causes of death include medical (n=2), infectious disease (n=2), accidental (n=2), and suicide (n=1). At first glance, the fact that none of those buried in 1902 were cadavers could account for the significance, but this was also true for

1901, when the actual and expected number of burials were virtually equal (n=15, $\chi^2$e=13.27). Currently, it is unclear why so few young adults were buried at MCPFC in this year while all the others meet expectations.

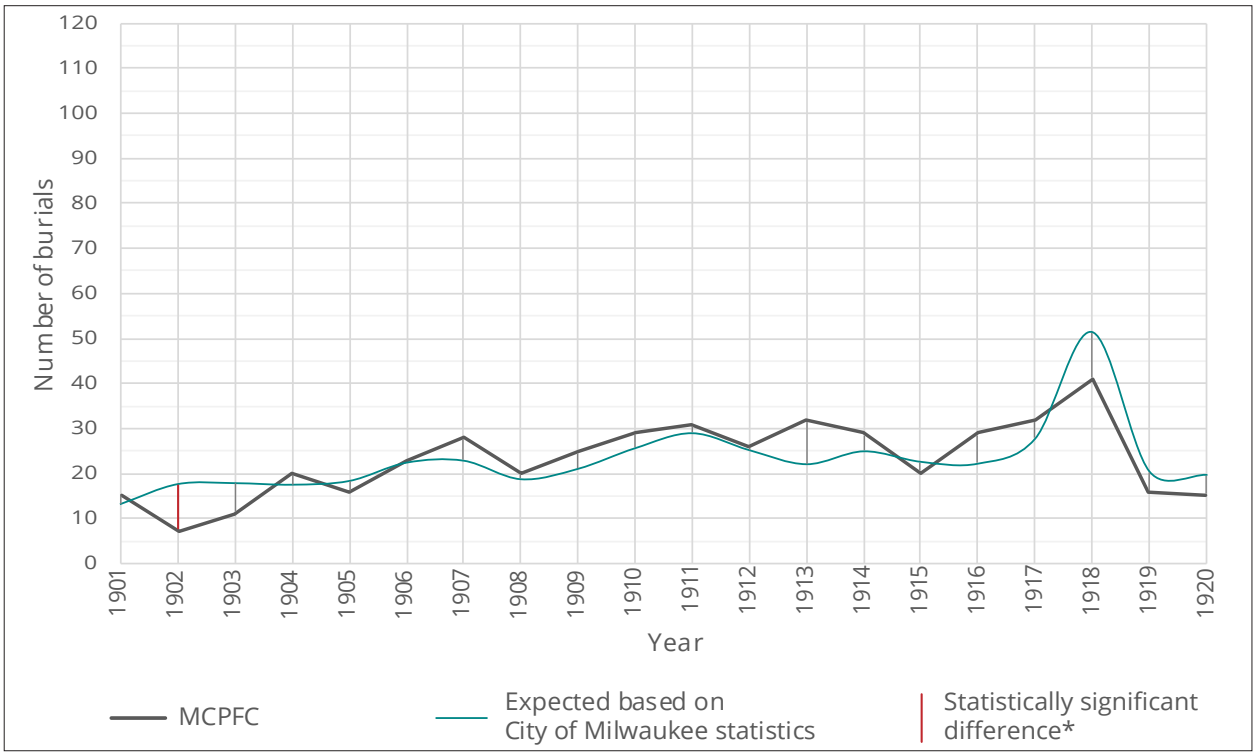

Figure 5.24 MCPFC twenty- to thirty-five-year cohort (n=465), 1901–1920.

*Thirty-five to fifty*. The second largest cohort in the MCPFC burial population (n=1510), thirty-five- to fifty-year-olds accounted for nearly twenty-one percent of the total burial population. Four hundred and forty-one of these individuals were not list in the RBM; of these, 307 were medical cadavers. The proportion of medical cadavers in this group, roughly twenty percent, was consistent with the twenty to thirty-five cohort. Also continuing trends established in the ten to twenty cohort, males (n=1360) greatly outnumber females (n=150)—90.1% and 9.9% respectively (Figure 5.25). This was the most skewed sex distribution within the entire population.

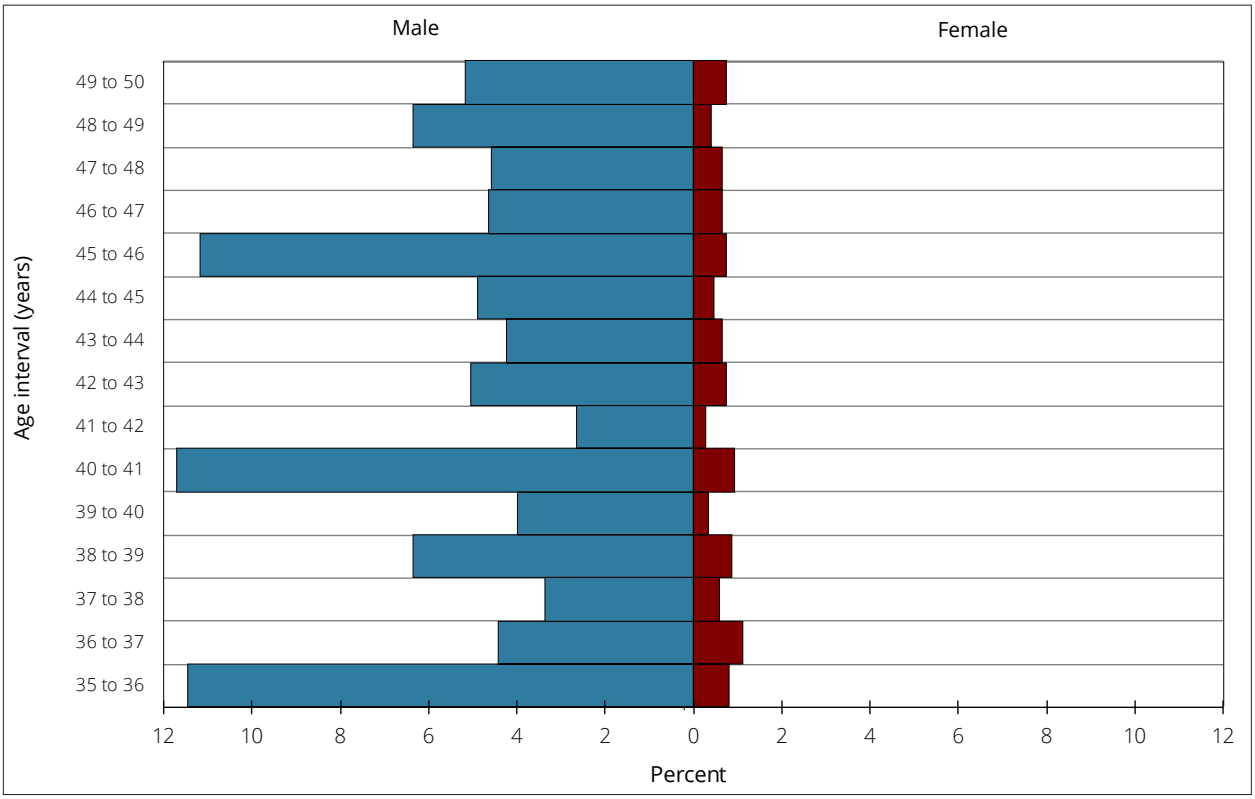

Figure 5.25 MCPFC thirty-five- to fifty-year cohort age and sex distribution (n=1510), 1882–1925.

While most males were single (n=581, 42.7%), married was the most common marital status among females at forty-one percent (Figure 5.26). One of these was ALTA CARROLL, a forty-two-year-old woman who died on 30 December 1924 from chronic alcoholism. Though she was listed as married and a JACK CARROLL was recorded as her spouse, a letter from her sister found in her inquest file indicated that ALTA and her husband had been estranged for some time. She expressed regret about not being able to afford to send for her sister's body and seemed displeased that ALTA's remains had been released to the medical college for anatomical purposes after only fifteen days; she was aware that there was supposedly a thirty-day waiting period before a body was officially classified as unclaimed. In response to her letter, the coroner sent the following reply:

> Replying to your letter of the 21st, Alta Carroll's body was called for by the anatomical agent on January 14th and was taken to a medical college. It will be necessary for you to write to the anatomical agent—Mr. Charles E. Judson, Wauwatosa, Wisconsin—as to the length of time they hold bodies before dissecting them. Her belongings consisting of a trunk of wearing apparel is held at this office subject to the orders of Mr. Carroll and we cannot send the same to you at this time.

He also noted in an another letter that MR. CARROLL could not be located and that an intake order for MCGH for alcoholism treatment had been recovered, but ALTA was never admitted.

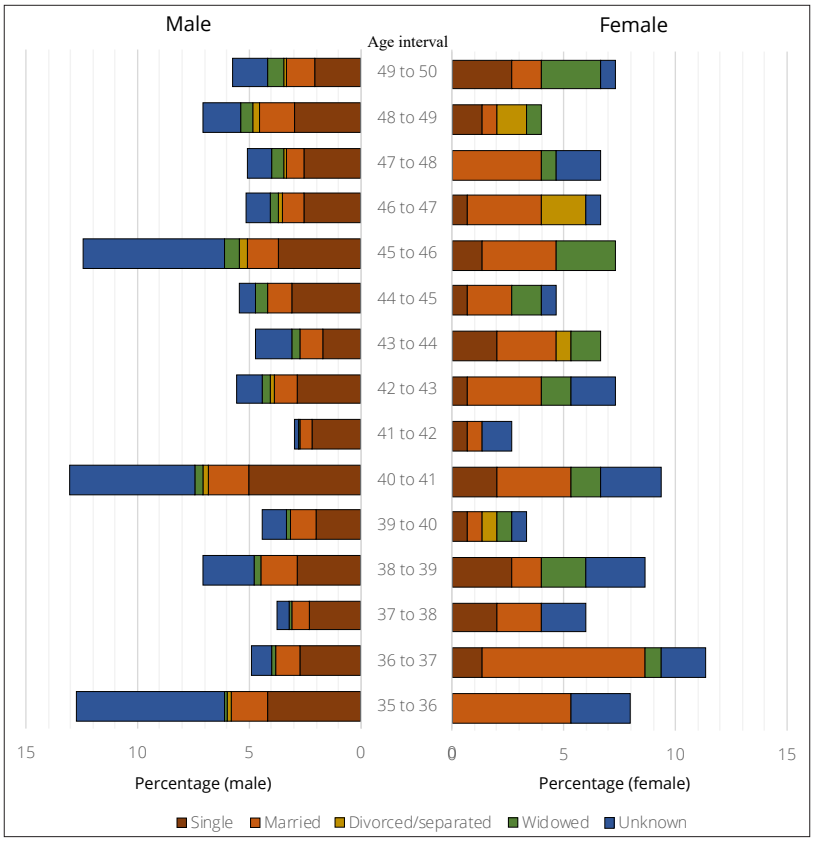

Figure 5.26 MCPFC thirty-five- to fifty-year cohort, age and sex distribution with marital status (n=1510), 1882–1925.

Not surprisingly, though a small percentage of each sex, widows make up a larger proportion than in the previous adult age group. Among the twenty to thirty-five cohort, three percent of females (n=4) and one percent of males (n=8) were widows. However, in this older group fifteen percent of females (n=23) and five percent (n=73) of males had outlived their

spouses. When attempting to identify which factors might explain the higher proportion of female widows, marital status was cross-tabulated with nativity, the hypothesis being that foreign-born widows would have had less of a support system that could provide a proper burial. However, the percentages of native- and foreign-born individuals among widowed males and females was remarkably similar: 64.4% foreign-born male widows versus 60.9% foreign-born female widows. The biggest difference was found within the married individuals, where only 14.5% of married males were native-born, but 35.5% of married females were from the states, suggesting that though these women may have had family locally to arrange for a proper burial, they were incapable or unwilling to do so. There may have been more married women estranged from their husbands, like ALTA CARROLL, or perhaps differential burial practices between married men and women.

More individuals in this group were foreign-born (n=746) than native-born (n=317), though no place of birth was listed for 447 individuals. The frequency of native-born individuals with parents from North America—particularly the states—and Western Europe were very similar; Ireland was the most common parental place of birth among the latter region. The number of parents from Central Europe, mostly Germany, was only slightly less than Western Europe (Table 5.15). The parents of one individual, WALTER STAFFORD (d. 28 December 1917), whose place of birth was simply "USA," were listed as being born in Africa. WALTER, who died from epilepsy at the Milwaukee County Hospital for Mental Diseases, had "Etheopian" [sic] listed for "color" on his death certificate; it is unclear whether his parents' place of birth was assumed by the attending physician based on WALTER's ethnicity or if it was self-reported by WALTER when admitted to the hospital. His remains were turned over to Judson for anatomical purposes the day he died.

While native-born individuals with Irish parentage outnumber German descendants, migrants buried in MCPFC were predominately from Central Europe (n=470) (Table 5.16, Figure 5.27). At almost twenty-two percent of the entire cohort, Germans constituted the largest portion from this region (n=329). The second largest foreign population came from Eastern Europe (n=123), with most coming from Poland (n=45), Russia (n=31), and Hungary (n=25). While the Eastern European population was somewhat evenly distributed among these three countries, the Western (n=70) and Northern European (n=52) groups were much more homogeneous, with the bulk of Western Europeans coming from Ireland (n=42) and those from the north hailing from Norway (n=32).

Very few within this population were born outside of Europe or the United States. Twenty-six individuals were Canadian and four were born in Mexico. Only one person, THEOBALD LASSO (d. 16 July 1924), was born in South America. His death certificate indicated that he was from Peru and, unlike WALTER STAFFORD, documentation was recovered supporting this place of birth. A manifest from the ship *Prince August Wilhelm* includes a TEOBALDO LASSO from Lima, Peru, arriving in New York on 31 May 1911. A number of significant facts about THEOBALD were recorded on this document, including that he was thirty years old and single at the time of his arrival. He could read and write, and

his final destination was Scranton, Pennsylvania, where he was to attend the International Correspondence School. He paid for his own ticket to the states and had $200 in cash on his person. He had been to New York twice previously (once in 1897 and again in 1899), had never been an inmate at a poorhouse or asylum, and was not a polygamist or an anarchist. He was in good mental and physical health and was 6'1" with a fair complexion and had black eyes and hair (New York Passenger Lists, 1820–1857). At some point, THEOBALD relocated to Texas; he signed a World War I draft registration card on 12 September 1918 (Figure 5.28) (Unites States World War I Registration Cards, 1917–1918). His Houston address was listed, as well as his occupation as a watchman for a detective agency. Listed as nearest relativities are two individuals in Shownee, Oklahoma. There are no documents, unfortunately, that might allude to why THEOBALD was in Milwaukee, where he eventually died in MCGH from pulmonary tuberculosis.

Though his background was unique, THEOBALD succumbed to the most common cause of death in the MCPFC. Four hundred and seven individuals died from TB, while another 199

died from other infectious diseases like pneumonia (n=117), syphilis (n=40), and typhoid fever (n=11). Non-infectious medical deaths accounted for 513 deaths, with cardiovascular diseases (n=135) being the most common. In regard to the other death categories, this age group had only one less homicide than the earlier cohort (n=13), but proportionally fewer thirty-five- to fifty-year-olds were the victims of interpersonal violence (0.9% versus 1.7% among twenty- to thirty-five -year-olds) (Table 5.17).

One individual who met a violent end was UNKNOWN MAN 87, aka FRANK KLUG. Described as 5’7½”, 165 pounds, very muscular, and missing his first right mandibular molar, this man was found shot multiple times in Oak Creek on the tracks of the Chicago, Milwaukee & St. Paul Railway Company. A gentleman named NIC GEORGEIC was found by police nearby with a (literally) smoking .32 caliber revolver. During the inquiry, GEORGEIC denied having shot the victim; however, after the coroner’s jury recommended him for prosecution, he was convicted of first-degree murder. The remains of the man shot were identified by friends and cousins as one FRANK KLUG, though initially his own wife and her mother were adamant the

deceased was not her husband; their FRANK KLUG had left some time ago because he was afraid his probation officer was going to send him back to jail (Figure 5.29 and Figure 5.30). His mother-in-law was interviewed and insisted the deceased was not her son-in-law because he was too short—their FRANK KLUG was 5'10" and weighed about 180 pounds—but the men pressing her in interviews kept asking leading questions until she conceded he was in fact her son-in-law. After a time, she and her daughter came to accept the identification and the deceased was buried as FRANK KLUG in the MCPFC. Imagine MRS. KLUG's surprise when her husband walked through her front door a year later, alive and well (Figure 5.31). Despite his miraculous return, page 82 of the RBMC still lists "Frank Klug (alias Unknown Man 87)" as being buried on 9 September 1914.

Suicide rates among thirty-five- to fifty-year-olds was nearly identical to the younger adult cohort (8.1% versus 8.7%). There were slight differences between the most common methods of suicide, though the top three for both were shooting, gas or poison, and hanging. However, the percentage of accidental deaths was highest in this age group. Only about eleven percent of young adults and six percent of old adults (see below) died as the result of accidents, but accidental deaths accounted for thirteen percent of middle adult deaths. Drownings (n=69) and railroad-related (n=59) incidents were the most common accidents, and only two women perished from accidental deaths. The earliest was ANNA PULZHINSKI, a forty-five-year-old married German immigrant who died from accidental drowning. Her husband, JOHN, testified that she had not come home from her job at a rag shop on 2 January 1899. Though her body was not discovered until early March, the coroner concluded that she likely died the night she went missing. JOHN PULZHINSKI also remarked that he and their children often "scolded" her for her excessive drinking—she got intoxicated on whiskey a few times a week for at least

MAN MURDERED SATURDAY

IDENTIFIED AS FRANK KLUG

Body Recognized by Cousin, Friend and an Acquaintance.

WIFE STILL IS DOUBTFUL

Thinks Husband May Be Alive and Wants Likeness Printed.

Although the body of the man murdered Saturday afternoon on the Milwaukee road, near Lake station, was identified positively today as that of Frank Klug of 617 Lapham street, Mrs. Julia Klug, his wife, is still doubtful and asked The Evening Wisconsin to print his photograph, so that her husband could see it if he is alive.

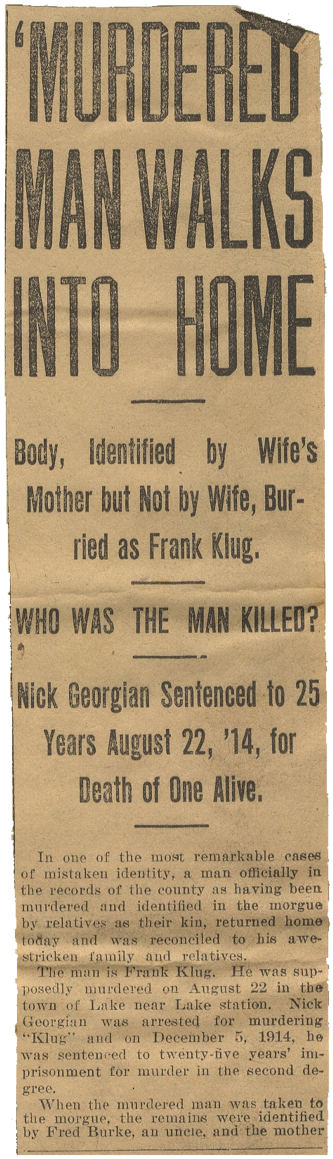

FRANK KLUG.

Figure 5.30 Postmortem photo of UNKNOWN MAN 87, aka FRANK KLUG (MCHS Coroner's Inquest 28 August 1914).

'MURDERED MAN WALKS INTO HOME

Body, Identified by Wife's Mother but Not by Wife, Buried as Frank Klug.

WHO WAS THE MAN KILLED?

Nick Georgian Sentenced to 25 Years August 22, '14, for Death of One Alive.

In one of the most remarkable cases of mistaken identity, a man officially in the records of the county as having been murdered and identified in the morgue by relatives as their kin, returned home today and was reconciled to his awe-stricken family and relatives.

The man is Frank Klug. He was supposedly murdered on August 22 in the town of Lake near Lake station. Nick Georgian was arrested for murdering "Klug" and on December 5, 1914, he was sentenced to twenty-five years' imprisonment for murder in the second degree.

When the murdered man was taken to the morgue, the remains were identified by Fred Burke, an uncle, and the mother of Mrs. Klug as that of Frank Klug. Mrs. Klug was positive that the corpse was not that of her husband and in this she was joined by Mrs. Anna Christian, mother of Klug. As time went on Mrs. Klug became reconciled to her fate and gradually came to the conclusion that the murdered man was her husband.

Learns of His "Death."

During all this time Klug was working for several farmers in the state. Having become disgusted and fearing arrest, Klug decided to remain away from his wife and three children. A yearning to learn what became of his family induced him to write to a friend and the friend informed him of the supposed murder. It was the first inkling that Klug received of his "death" and subsequent "burial."

The real identity of the murdered man now remains unsolved. The body was buried in a cemetery by relatives of Klug, while his wife took up her new abode at 613 Seventh avenue and received $12 a month from the county in mother's pension. The grave was marked as that of Klug and relatives visited it frequently.

Mrs. Klug stood in astonishment in her home Sunday morning when Klug walked into the house.

Meets Wife in New Home.

"Hello, Annie," he said. "I am Frank. I was not murdered. I have been working all this time.

At first Mrs. Klug believed her eyes deceived her. Presently the realization came that she was not a widow and that the father of her three children was living. Rushing to her husband, she buried her head in his arms and gave way to her emotion.

Burke, the uncle, was notified of Klug's return. The uncle was positive that the murdered man was Klug and was skeptical about the return of his nephew. In fact, Burke could not be convinced and when Klug went to his home Klug had much trouble in convincing his uncle as to his identity.

The three children of Klug had almost forgotten their "papa." The oldest boy was the first to remember him. Mrs. Klug was happy at the return of her husband and forgave him for his disappearance, exactly a year ago. With the three children Klug came to the city hall today and visited with Probation Officer Dan Horlivy, who went to the morgue at the time of the murder and said that his ward was not the dead man.

How He Spent Time.

Klug gave the following account of his absence from Milwaukee:

"I was afraid to come back for fear I would be arrested for abandonment, having been placed on probation a short time before. I went to Walworth county and worked for a farmer for a time. Then I went to Waukesha county and later to Jefferson county. I was working lately in a pea canning factory in Whitewater, when I wrote to my friend. He answered that I had been murdered. That made me inquisitive and I decided to return to my family immediately."

"I surely was happy to see Frank back," said Mrs. Klug. "If it were not for that fact that he figured so prominently in the murder case and I began to mourn him as dead, I do not think that I would forgive him. But I am sure that he will support us now."

"Drink was the cause of your trouble," Mr. Horlivy told Klug. "You would go down with the dock workers and spend your money instead of giving it to your family. Am I not right?"

Tears welled in Klug's eyes as he drew a mental picture of these visits and he nodded his head in assent.

Georgian Now in Jail.

During the trial in municipal court, the state proved corpus delecti by placing the uncle and the mother of Mrs. Klug on the stand. Both testified that the body of the dead man was that of Klug and it was entered in the records. No motive was shown for the murder other than that Georgian was slightly demented and that he had been drinking. Georgian was arrested by former Undersheriff Walsh and the case was prosecuted by former District Attorney Fred Yockey. Attorney Fred Knoell defended Georgian.

Judge Backus talked with Klug during the noon recess and Klug promised to support his wife and three children if given another trial. The judge virtually agreed to continue the probation for the sake of the wife, who was compelled to board her children and do all her housework after returning from her work during the day.

*Figure 5.31 Evening Wisconsin*, 19 July 1915.

thirteen years—but she often responded that they had better leave her alone or she would "go away." However, he stated that she had not been drinking the night she disappeared. There was no indication in the coroner's file as to why her husband did not arrange for a burial outside the potter's field. The second woman who perished as a result of an accident was SUSIE, aka MARTHA FELTON (d. 21 April 1914). The summation in her coroner's inquest (the only document included, dated 23 April 1914) stated:

> In the matter of death of Susie R Felton, aged 45 years, widowed, living at 195 5th St. This party fell on an icy sidewalk on February 2nd, 1914, in from of 195 5th St. and fractured her right hip. She was removed to Emergency on Feb 3rd where on Feb 4th she was transfered to the county hospital and she died there on April 21st, at 9:10 am.

Though she had been living at MCGH for months prior to her death, FELTON's Milwaukee home on 5th Street was listed as her residence on her death certificate. She was one of 319 individuals from the city who died at the county hospital (Table 5.18).

Table 5.18 Residence and place of death categories for thirty-five- to fifty-year cohort (n=1510), 1882–1925.

An additional 331 also died at the hospital but did not have a residence recorded. Three individuals were inmates at a county institution but died out while out in the community. One gentleman, JAMES DWYER (d. 19 May 1918), an inmate at the county infirmary, was accidentally killed while trying to cross railroad tracks near the institution. Two others, however, left the county grounds to commit suicide: HENRY MARKWARDT (d. 14 November 1918) and JOHN E. MACCABEE (d. 11 May 1919). Little information was recorded for MACCABEE, other than that he was a thirty-six-year-old single laborer born in Ohio and an inmate at the county almshouse. His cause of death was listed as "suicide—drowning while insane," though there is no clarification in his coroner's inquest as to what kind of mental illness he suffered from or why he was not confined to one of the psychiatric facilities. This was not the case for MARKWARDT, a single thirty-five-year-old German sailor who also committed suicide by jumping into the Milwaukee River. A Writ of Temporary Detention appeared in his coroner's file with the following description of his condition:

> The disease is increasing. There are not rational intervals. Henry Markwardt is insane. He has many delusions. He imagines that the government is after him, and that he is to be stood up against a wall and be shot. He is in constant fear of mob violence directed against him. He is very disturbed. Rests very poorly. Does not destroy clothing or other property. Has no filthy habits. Physical condition good. Parents were not blood relations to each other. Has no infection disease. Has been offered a hearing in court but does not desire such a hearing.

Given his apparent mental state, it was unclear how the deceased was allowed to escape the Hospital for Acute Mental Diseases and make his way to the Grand Avenue bridge.

While many of those who committed suicide and those who were county patients became medical cadavers after their deaths, these three men did not. Though there was a high proportion of accidents within this age group, the most common causes of death resulting in anatomical

dissection were tuberculosis (n=174), pneumonia (n=37), cardiovascular diseases (n=34), and syphilis (n=25). In total, 434 individuals were turned over to a medical institution as cadavers; only six percent of these were women (n=42). All of these women died from medical conditions with the exception of MARGARET KENNEDY (d. 6 March 1897), who committed suicide by burning herself to death. The married forty-nine-year-old New York native was discovered by neighbors after they saw smoke coming from her home (Figure 5.32). They testified that she had just returned from a sixty-day incarceration at the House of Corrections and that her husband, JOHN, with whom she often quarreled, had been laid off and recently admitted to the hospital. A known alcoholic, KENNEDY was found aflame in her bed with a bottle of whiskey, a can of kerosene, and three pictures of an unidentified actress nearby. Her husband's illness could have made it impossible for him to claim her body, and a letter requesting her remains was curated in her coroner's file.

BURNED HERSELF TO DEATH.

Maggie Kennedy Ends Her Life by Setting Fire to Her Clothing.

Mrs. Maggie Kennedy committed suicide yesterday morning at her home, 358 Reed street. She has several times been arrested for drunkenness. On Dec. 16 she was sent to the workhouse on that charge. When she was released two weeks ago she returned home, where she has frequently been found in a drunken condition. Yesterday morning it was noticed that smoke was issuing from the windows of her house. Charles Rahn and Charles Langraff, residing at 356 Reed street, broke into the house and found her lying in bed which was on fire. She had taken a can of kerosene, saturated her clothing and the bedding and had set fire to them. Beside her lay a half empty bottle of whisky. The fire was put out, but the woman was dead.

Little of her history is known except that she told her acquaintances that she formerly was a circus bareback rider. She was 34 years of age. Her husband, a sailor, is ill at the Marine hospital.

*Figure 5.32* *Milwaukee Sentinel* article (7 March 1897) reporting the suicide of MARGARET KENNEDY.

Few postmortem interventions were performed on females, but approximately seven percent of both males (n=96) and females (n=11) were autopsied by either the coroner or a MCGH physician. Most autopsies were conducted on those who died from medical or infectious conditions (n=79), though this represents only seven percent of those categories. With regard to homicides, all but three of the thirteen who died violently received postmortem examinations. This included UNKNOWN MAN 125 (d. 9 June 1917), a middle aged man described as 5'10" and 148 pounds with a medium build. While he had

been a regular at the saloon in which he was accosted, no one there knew much about him. He apparently offended a man named OSCAR POWERS, who punched him in the jaw, dislocating the first cervical vertebrae and ultimately killing him. According to a police officer on the scene after the altercation, POWERS claimed, "He called me a cock sucker and I am Irish and no Irishman will stand for that." He further noted that he had to hit the deceased with his left hand because his right hand was still injured from hitting a different man who had insulted the saloon cook several weeks prior. Because no identity could be determined for the victim, he was buried in the MCPFC on 26 June 1917 in grave Y45.

*Chi-squared goodness of fit*. Nine hundred and fifty-nine thirty-five- to fifty-year-old individuals were buried in the cemetery between 1901 and 1920. While there were observed differences in the number of actual and expected burials in the one- to ten-year and ten- to twenty-year cohorts, this is the only group where statistically significant differences were observed for every year of the comparative period (Figure 5.33). Unlike the subadults, however, there were consistently *more* middle adults interred in the MCPFC than expected based on the ACHRs. The average difference between the actual and expected values was 24.06, with five years having greater than thirty burials more than expected: 1906 (n=58, $\chi^2r$=6.784, $\chi^2e$=24.452), 1912 (n=61, $\chi^2r$=6.442, $\chi^2e$=27.325), 1918 (n=73, $\chi^2r$=6.206, $\chi^2e$=35.845), 1919 (n=74, $\chi^2r$=6.712, $\chi^2e$=34.532), and 1920 (n=53, $\chi^2r$=6.872, $\chi^2e$=21.291). No obvious age trend was observed to account for this higher than expected number of interments, suggesting other factors influenced burial practices for this cohort.

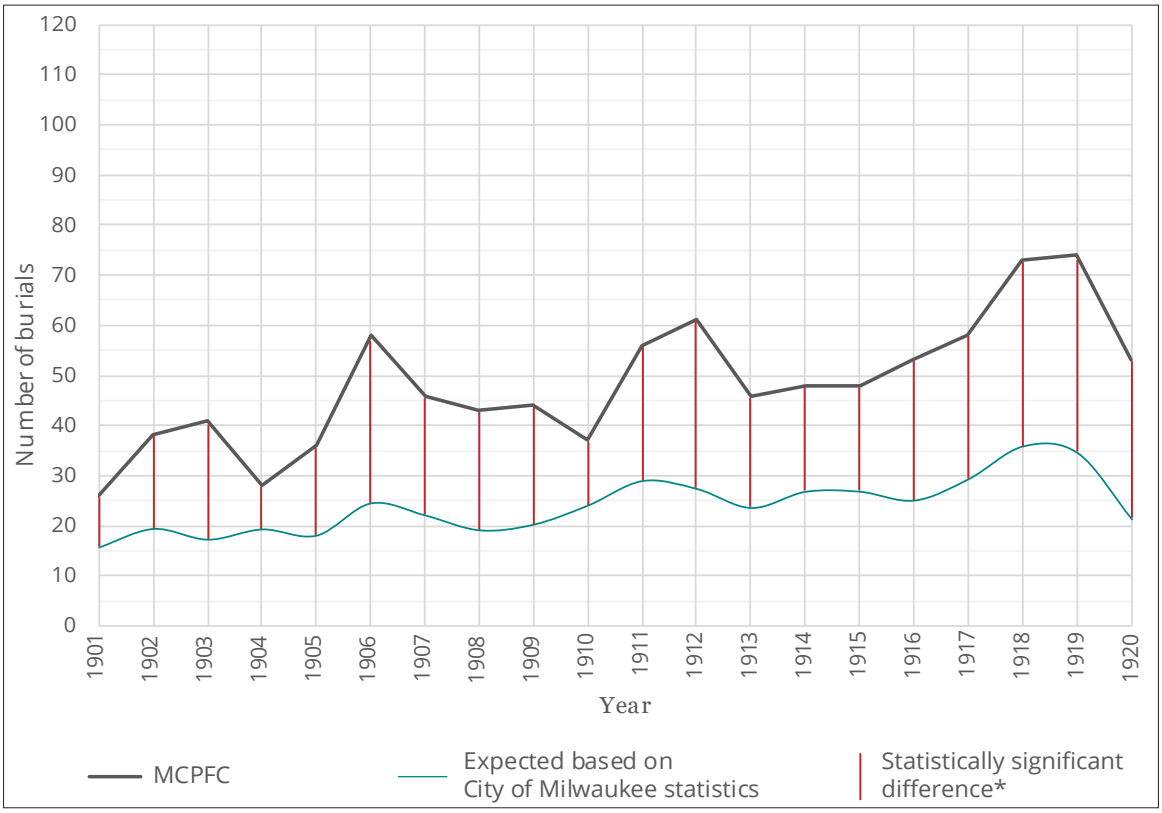

Figure 5.33 MCPFC thirty-five- to fifty-year cohort, 1901–1920.

*Over fifty.* At thirty-two percent (n=2,307), this age group made up the largest cross-section of the MCPFC burial population. Of these, 1,464 were listed in the RBMC, while the remaining 842 were not documented. This high number of unlisted individuals can be attributed to the higher frequency of cadavers among the oldest cohort; of the 734 old adult cadavers, 551 were not included in the burial ledger.

Similar to the adolescent and other adult cohorts, the this group was dominated by males (n=1,966) who made up eighty-five percent of the cohort (Figure 5.34). Single was the most common marital status among males (n=668, 34.0%) and widowed among females (n=167, 49.0%) (Figure 5.35). Typical of the widows buried in the MCPFC, JUSTINA PRIZIEGENTKA (d. 7 January 1915), aged seventy-five years, died at the Milwaukee County Almshouse; fifty-four percent of the widowed females (n=90) died while confined to either the poor house or a

county psychiatric facility. Though her address on 4th Avenue was listed on her death certificate, PRIZIEGENTKA had resided at the almshouse for nine years, seven months, and twenty-one days before she died of pneumonia.

A Russian migrant, PRIZIEGENTKA was also representative of the majority of her cohort, of which 66.3% were foreign-born. Three hundred and sixty-four others did not have place of birth recorded, and the remaining 413 were born in the states. The majority of native individuals were the children of those also born in the U.S., though a large number were born to early Irish or German migrants (Table 5.19). Only one person from this group was descended from a parent born outside North America or Europe: EMMA HALL (d. 25 July 1924), a married fifty-two-year-old woman, had an Irish mother and a father born in East India. Though a patient at the Milwaukee Hospital for the Mentally Diseased, she died at MCGH from gall stones, cholecysistis, and cerebro-spinal syphilis; no information was provided indicating how long she had been an inmate or the identity of her husband.

The majority of those in the over-fifty age group were migrants from Central Europe (n=1102, 47.7%) (Table 5.20 and Figure 5.36); though a number originated from Austria (n=69), Bohemia (n=34) or Switzerland (n=32), most came from Germany (n=967). With seven countries represented, Western European immigrants

were more diverse than those from Central Europe, though the Irish (n=123) did significantly outnumber others like the English (n=41), Scottish (n=18), and Dutch (n=17). A smaller number came from Eastern Europe, with most from this region being Polish born (n=75). One such individual was JOHN HADHOWSKI (d. 27 December 1914). A married laborer, he died at the Milwaukee County Infirmary from myocardial insufficiency and arteriosclerosis ten days short of his eightieth birthday; his death certificate indicated he had been a resident of that institution for ten years, five months, and fourteen days.

In contrast to the younger groups, accidental deaths constituted a significantly smaller proportion among old adults; only 0.5% of those over fifty perished in an accident (versus 10.5% for young adults and 13.1% for middle adults), likely indicating a less dangerous lifestyle. Given the advanced age of those in the fifty and over group, it is unsurprising that medical deaths (n=1394) not only made up a greater percentage of deaths than the younger cohorts, but were more varied as well (Table 5.21). There were a number of medical death categories that were not present among the twenty to thirty-five or thirty-five to fifty groups; of particular note was the diagnostically-vague senility/old age category. In his treatise on the topic, Crichton-Browne (1905) says of senility:

> But here again dubiety reigns, for very different opinions are held as to the essential nature of senility. As commonly understood, it is a highly complex condition, made up of a number of infirmities which are really epiphenomena, and not essential to it. Stripped of these, regarded apart from the many maladies and morbid states which occur in some old persons and not in others, the dregs of bygone follies or misfortunes, it becomes a simple and general, but by no means uniform atrophy, a state of involution in which cell—growth is more than counterbalanced by cell—decay, and which although there is no question of disease, ends in death as soon as the wasting in vital organs reaches a point incompatible with functional activity. (45)

The ambiguous nature of senility as a cause of death was evident in the MCPFC documentary record. Sixty-five individuals had senility or old age listed as their primary cause of death, but an additional 266 had senile debility listed as a secondary or tertiary cause of death; little information explaining senile diagnoses was provided. A case in point is the coroner's inquest for CARL FERNOW (d. 31 December 1911), a single German shoemaker who died at seventy-six years, nine months, and twenty-four days. The sole document in his coroner's file reads:

> Investigated the death of CHARLES[sic] FERNOW, age apparently 76 years, single, an inmate at the County Alms House for the past 20 years. While taking his dinner on the 31st of December he suddenly fell over and died, the cause of death ascribed as being senility and myocarditis. The body was sent to the [Physicians and Surgeons College], Chas E Judson having charge of same.

The proportion of over-fifty individuals like FERNOW living and dying in county institutions was much higher than younger groups (Table 5.22). Six hundred and twelve either lived and died at the county poor house or resided at the almshouse and died at the county hospital. This accounted for 26.5% of the cohort in contrast to 1.5% of young adults and 2.5% of middle adults. At 8.7%, the number of elderly from county psychiatric facilities was also higher than for those between twenty and thirty-five (3.4%) and thirty-five and fifty (6.8%). There was also a significant difference between the two separate psychiatric hospitals; of those institutionalized, more young and middle adults were confined to the supposedly short-term Hospital for Mental Diseases (64.0% and 53.9% respectively) than the long-term Asylum for the Chronic Insane, while 67.4% of over-fifty individuals committed were inmates of the asylum.

The long term care provided by the asylum for elderly patients is typified by THEODORE STIEFOATER (d. 11 November 1914). An eighty-nine-year-old laborer from Germany, STIEFOATER died from exhaustion and senile dementia after living at the chronic asylum for ten years.

STIEFOATER escaped the fate of dissection, but many older adults who lived and died on the county grounds did not. In total, 734 or 32% of over-fifty individuals were anatomized. The highest proportion were those who died at the county hospital (n=341), with seventy-nine of those having lived at the almshouse or a psychiatric facility becoming medical cadavers; additionally, 144 died at the poor house and 108 at the mental hospital or asylum. While infectious diseases like tuberculosis were common causes of death leading to dissection in the younger adult groups, cardiovascular deaths accounted for most cadavers in this group. Those who were single (n=316) or widowed (n=220) were more likely to be turned over to Charles Judson than those with spouses.

In regard to other postmortem procedures, ninety-nine individuals were unquestionably autopsied. Almost all such autopsies (n=90) were conducted on those who died from medical conditions, while the remaining nine were performed on one suicide, five accidents, and three homicides. One homicide victim, UNKNOWN MAN 142 (d. 29 March 1918), died at the Emergency Hospital after being beaten with bricks by FRED SCHULTZ, an acquaintance who did not know the deceased's real name.  After a day of drinking, both men became belligerent and SCHULTZ lost his temper after the UNKNOWN MAN had repeatedly teased him. The physicians who conducted the autopsy noted numerous traumatic injuries:

> ...cut triangular in shape left parietal region each angle about 2 in length extending to bone, the distal ends of cut having been made surgically...cut over left parietal bone extending 1 inch to periosteum. Abrasions extending over frontal region, compound fracture lower jaw, 3/4 right of median line, both eyes black and blue, compound fracture extending from frontal bone to base of skull...

UNKNOWN MAN 142 was described as having a heavy build, a height of 5'8", a weight of 185 lbs., a full face, brown eyes, and a Roman nose. His hair was black, but he had a grayish brown mustache with two weeks of beard growth. His clothing was also described in great detail, down to his gray cotton undershirt. Two separate people came to the morgue and identified the man as a friend or relative only to find that the person they feared dead was actually alive shortly before receiving the remains. Because no true identity could be assigned and no one claimed the body, UNKNOWN MAN 142 was buried in grave Z88 at the MCPFC.

*Chi-squared goodness of fit*. One thousand four hundred and twelve individuals over fifty were buried in Cemetery II during the comparative period. Despite this high frequency of burials, only two years had significantly more interments than expected based on the ACHR data (Figure 5.37); 1903 saw sixty-nine older adults buried when only fifty-three were expected ($\chi^2r=2.215$) and 1904 had seventy-two burials, twelve more than the expected fifty ($\chi^2r=3.078$).

Life expectancy values (e°x) found in the life tables in Appendix A help explain these two unusual years. In all years without a significant difference between the actual and expected number of burials, the MCPFC life expectancy values for intervals after fifty years were similar to or lower than those for the city. For instance, in 1910 ($\chi^2r=0.1096$), the year with the smallest difference between actual (n=71) and expected burials ($\chi^2e=70.082$), the average life expectancy after fifty was 8.823 years for the city and 8.907 years for the MCPFC burial population. However, in 1903 the city average was 8.616 years and the county population was

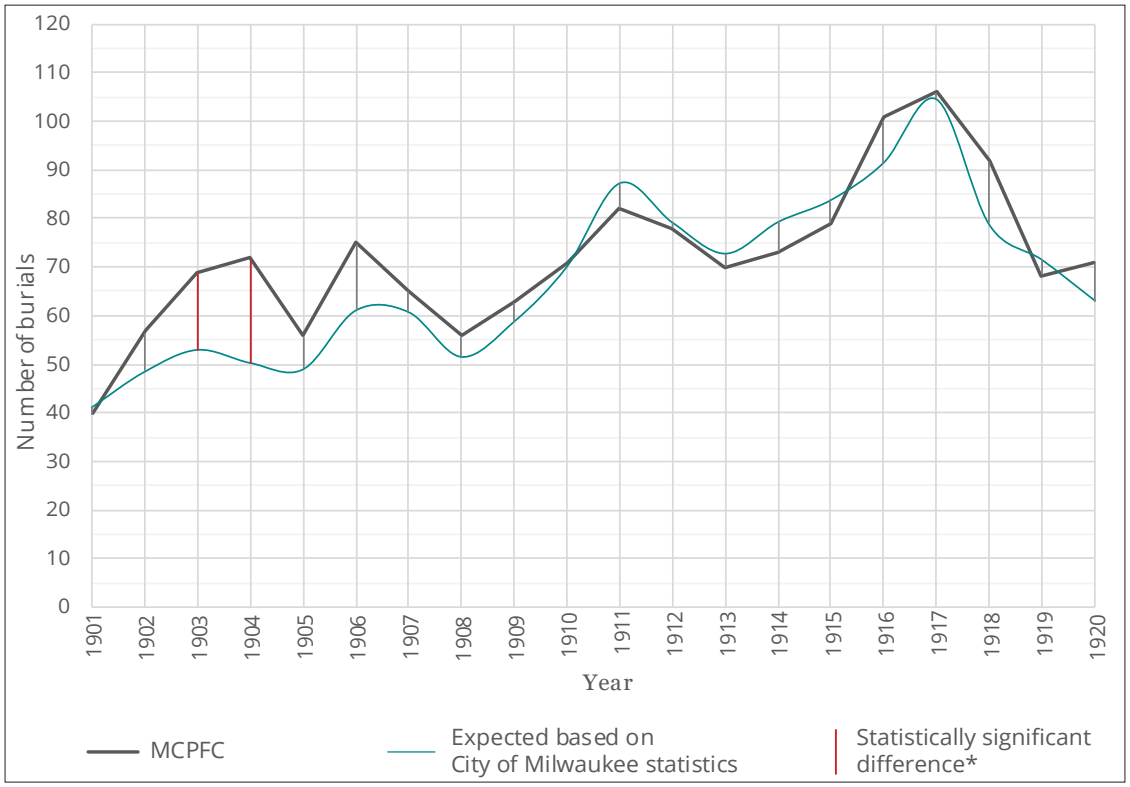

Figure 5.37 MCPFC over-fifty-year cohort, 1901–1920.

10.232. Similar differences can be observed for 1904, when 8.396 years was the city average, but the county average was 10.661 years. This indicates that in these two years there were more older individuals living longer in the MCPFC burial population than the greater Milwaukee community population. This is supported by the fact that although the average age at death for those over fifty in 1903 (μ=68.07), 1904 (μ=66.24), and 1910 (μ=66.489) were similar, the two significant years had higher standard deviations (11.850, 11.900, and 10.733 respectively).

*Summary of MCPFC Population Age Structure*

The significant differences between the City of Milwaukee community and the county cemetery age structures are the strongest evidence that institutional cemeteries are biased samples of their parent populations. Table 5.23 summarizes these differences. Most striking are the differences in subadult categories. The higher than expected stillbirths and young infants, as

Table 5.23 Summary of MCPFC population age structure compared to City of Milwaukee vital death statistics, 1901-1920[§].

§Data presented in two periods, 1901-1909 and 1910-1920 because stillbirths were not included the ACHRs until 1910.

well as the lower than expected older infants, toddlers, children, and adolescents, clearly indicate that diverse and powerful social and institutional constraints influenced the agents responsible for these burials. These influences are discussed in more detail in the Discussion.

*Sex*

It is clear from the data provided in the previous section that the burial population in most age categories was heavily skewed towards males. However, to determine if this distribution was a reflection of the City of Milwaukee's population or an artifact of differential burial practices at the MCPFC, statistical testing based on sex was conducted. Unfortunately, the ACHR's authors did not cross-tabulate sex with age; therefore, in order to conduct the examination, all age groups within the burial population were consolidated for comparative purposes. Similar to the previous chi-squared goodness of fit tests, a twenty-year sample period between 1901 and 1920 was used. The null hypothesis was that the sex distribution within the burial population was the same as the city's. A rejection of the null hypothesis indicates that the sex of the deceased influenced whether or not they were ultimately buried in the county's potter field.

Between 1901 and 1920, 97,013 deaths were recorded for the City of Milwaukee; males made up 54.1% (n=52,513) and females 45.9% (n=44,500). Within the MCPFC burial population during the same years, 4,199 burials were documented; males made up 78.61% (n=3,301) and females only 21.39% (n=898) (Figure 5.38). Clearly, a noticeable difference exists between the respective proportions; the degree to which these differences are significant is reflected in the chi-squared goodness of fit test:

$$\chi^2 = 1013.8, df=1, p=<2.2e^{-16}$$

The residual value for males is $\chi^2r=21.564$, with an expected value of $\chi^2e=2,272.91$; there were over a thousand *more* male burials in the MCPFC than one would expect based on the City of

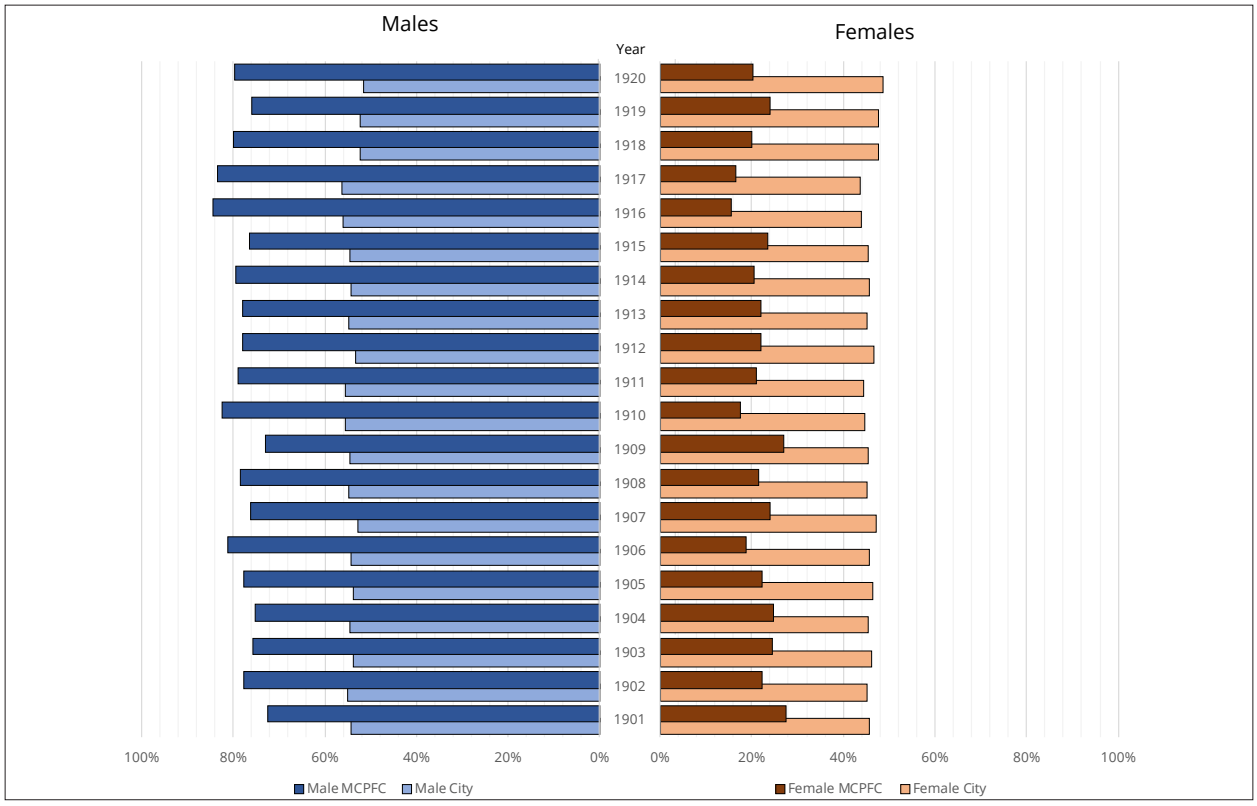

Figure 5.38 Proportions of males and females for MCPFC burial population and City of Milwaukee, 1901–1920.

Milwaukee death statistics. For females, the residual result is $\chi^2r$=–23.426, with an expected value of $\chi^2e$=1,926.09, indicating more than a thousand *fewer* female burials than expected.

There was no consistent pattern of changing significance over the comparative period, though a general trend towards more significant differences within sex distribution in the later years was observed (Table 5.24). The years with the largest chi-squared values and residuals were the years with the highest number of burials: 1916 (n=252), 1917 (n=277), and 1918 (n=274). In all three of these years, the chi-squared residuals for both males and females were greater than |6.00|. The most significant value for females was 1917 (n=46, $\chi^2r$=–6.840, $\chi^2e$=121.35). During this year, no females in the childhood or adolescent categories were interred in the MCPFC. In fact, only three young adult women were buried that year: MARY JANUEZ (d. 5 January 1917), aged twenty-two years; OLIVE WEST (d. 27 January 1917), aged twenty-

| 1920 | 53.243 | 1 | $2.95e^{-13}$ |

five years; and THERESA BARTLETT (d. 26 September 1917), aged twenty-eight years.

The most significant year for male burials was 1918, when 219 males were buried, but only 143 were expected ($\chi^2r$=6.350). This difference may be attributed to higher than average cases of four different cause of death categories for men. In 1918, twenty-two men were killed in accidents, though the average for the comparative period was only μ=9.45. Similarly, eighty-three men died from non-infectious medical conditions, but the average was μ=54.43. Four homicides were recorded, though μ=1.93 was the average. The largest discrepancy between the number of male deaths this year and the average was with infectious diseases: 105 men buried versus an μ=40.68 average. In regard to stillbirths (n=1) and suicides (n=4), both were fewer than the period average (μ=3.64 and μ=6.11, respectively).

Similar to the age structures, the significant differences in sex distribution further reinforce the assertion that this cemetery does not accurately reflect the greater Milwaukee community. During the comparative period, the number of females listed in the City of Milwaukee death statistics was lower than the number of females in this cemetery, but the difference was relatively small—women made up 45.9%. The fact that females constituted only 21.4% of the county burial population indicates that the social networks in which they operated were either very different than those of most men, or that their roles within these social networks greatly affected the choices made by friends and family regarding their burial locations.

*Martial Status*

In addition to sex, marital status was analyzed to determine if an individual's status affected burial at the MCPFC. Also like sex, the ACHRs did not differentiate between age groups when reporting marital status data. In the death certificate database, subadult marital status was entered as "N/A," but, based on figures published in the health reports, it is clear that subadults were included in the single category. For the purposes of statistical testing, MCPFC subadults were included in the single calculations.

Chi-squared goodness of fit tests were run on marital status, with the null hypothesis being no difference in the proportion of single, married, widowed, or divorced individuals between the MCPFC population and the City of Milwaukee. A rejection of the null hypothesis would support the argument that individuals with certain marital statuses were more or less likely to be buried on county grounds due to the presence or absence of a spouse to claim the remains and arrange a proper burial.

The frequency and proportion of marital statuses for both the City of Milwaukee and the MCPFC burial population is provided in Table 5.25. Similar to the sex variable, a cursory examination of the figures suggests that there is a significant difference between the two populations. This observation was confirmed by the chi-squared goodness of fit test results:

$$\chi^2 = 806.26, df=3, p=<2.2e^{-16}$$

With the rejection of the null hypothesis, an examination of each marital status was necessary to determine which condition was different than the city proportions.

Table 5.25 Marital status recorded for City of Milwaukee and MCPFC burial population, 1901–1920.

| | City of Milwaukee | | MCPFC* | |
|---|---|---|---|---|
| | n | % | n | % |
| Single | 47,7722 | 49.42 | 2,558 | 69.36 |
| Married | 32,968 | 34.14 | 513 | 13.91 |
| Widowed | 15,280 | 15.82 | 555 | 15.05 |
| Divorced | 603 | 0.62 | 62 | 1.68 |

* Five hundred and twenty-two adults did not have marital status listed

Three of the four statuses returned significant residuals at the |1.96| threshold. The largest residual, and therefore the largest difference, between actual and expected values was for married individuals ($\chi^2$r=-21.025). In total there were 746 *fewer* burials of married individuals than expected ($\chi^2$e=1259.01). There was little difference in the proportion of married individuals within the sexes: 10.58% of females were married compared to 12.70% of males. A larger discrepancy was observed within the single category, where 69.82% of females were single but only 58.32% of males did not have a spouse. Statistically, far more singles were buried in MCPFC than expected based on the city population. The residual for singles was $\chi^2$r=17.230 and the expected value was $\chi^2$e=1822.40; this is 736 *more* unmarried individuals. Additionally, there were more divorcées (n=62) buried in the county cemetery than expected ($\chi^2$r=8.12, $\chi^2$e=23.032); the proportion of divorced individuals within the two sexes was roughly equal (1.34% females, 1.5% males).

While there was a noticeable difference between males and females in regard to widowhood (12.4% and 16.2%, respectively), this was the one marital status that was not significantly different than the proportions found within the larger City of Milwaukee population. A chi-squared residual of $\chi^2$r=1.181 does not reach the significance threshold and the difference between the actual (n=555) and expected widow burials was relatively small: twenty-nine less than expected ($\chi^2$e=583.521). Interestingly, the youngest widower buried in the MCPFC was WILLIAM SMITH (d.12 July 1919), a twenty-two year old African-American laborer who died from pulmonary tuberculosis at MCGH. The MCGH Male Register did not record an occupation for SMITH, but did note that he was Baptist and that, in the case of death, a THOMAS SMITH of Highpoint, North Carolina, should be notified (Milwaukee County Historical Society Male Register, 1918–1920: 37). Unfortunately, there is no record of whether or not this relative was

reached, and if so, why they did not arrange for a proper burial.

The importance of social ties and networks in avoiding a pauper's burial is highlighted by these significant differences in marital status. Cannon, in his discussion of agency and gender in mortuary practices, references Parker Pearson's (1993) assertion that the dead do not bury themselves and states that decisions concerning mode of burial are "more likely to be found in the choices of survivors, which would generally be family members of the deceased" (2005:48). He continues by suggesting that the selection of a monument for a man or a woman is, in most cases, the responsibility of the surviving spouse. Although living children, other family members, or even the deceased could have chosen monument styles in a large number of cases, the death of a married man or woman increases the likelihood that the choice would be made by a surviving spouse (Cannon 2005). Clearly, within the context of the MCPFC, grave marker selection is not a concern, but similar to Cannon's case, the decisions related to burial location—pauper or proper cemetery—for a married individual would have fallen on his or her spouse. The fact that significantly fewer married people than expected were buried in the county cemetery underscores the importance of this social network component.

*Nationality*

Nationality and place of birth are other variables hypothesized to have influenced burial at MCPFC. Similar to the previous analyses, chi-squared goodness of fit tests were performed to determine if significant differences between the proportion of native-born and foreign-born individuals between the City of Milwaukee and the county cemetery population were present. Rejection of the null hypothesis that the two populations displayed the same proportions would prompt further tests on countries of origin to ascertain which were over- or underrepresented in MCPFC.

Analysis of native- versus foreign-born was straightforward. Each ACHRs published during the twenty-year comparative period included simple nativity categories: (1) born in Milwaukee, (2) born in U.S., but not Milwaukee, and (3) foreign-born. Data from the death certificate database was aggregated into similar groups to facilitate testing; unfortunately, however, 774 individuals during this period did not have place of birth listed and therefore were excluded (Table 5.26). Despite this, the results of the chi-squared goodness of fit tests indicated a significant difference:

$$\chi^2 = 453.25, df=2, p=<2.2e^{-16}$$

The chi-squared residual for those born in Milwaukee (n=858) was $\chi^2r=-15.874$ with 608 *fewer* burials than expected ($\chi^2e=1465.714$). The other two categories also returned significant results, though both indicated *more* burials than expected. Two hundred and sixty-four more individuals born in the U.S. but not Milwaukee (n=902) were interred at MCPFC ($\chi^2r=10.449$, $\chi^2e=638.228$), while the difference between the actual and expected numbers of foreign-born individuals was 344 ($\chi^2r=9.606$, $\chi^2e=1282.059$).

Table 5.26 Nativity recorded for City of Milwaukee and MCPFC burial population, 1901–1920.

| | City of Milwaukee | | MCPFC* | |
|---|---|---|---|---|
| | n | % | n | % |
| Milwaukee | 41,588 | 43.29 | 858 | 25.34 |
| U.S., not Milwaukee | 18.109 | 18.85 | 902 | 26.64 |
| Foreign | 36,377 | 37.86 | 1626 | 48.02 |
| * Seven hundred and seventy-four s did not have place of birth listed | | | | |

With regard to the foreign-born, investigating which countries may have accounted for significantly different burial numbers was complicated. While basic nativity status was consistent throughout the ACHRs, the specific countries of origin listed in each year changed numerous

times. Between 1901 and 1910, the list of foreign places of birth was exhaustive with every country reported during that year listed. However, in 1911 only certain common countries of origin were explicitly listed, with a miscellaneous "other countries" line added to the end of the table. The same twelve countries were included until 1914, when for some unknown reason England and Ireland appear to have been consolidated into one figure, but listed only under England. Another change occurred in 1917 when they reverted to the comprehensive list, only to go back to the abridged version in 1918. The entire report for 1919 was truncated and no table for place of birth was included, forcing this year to be removed from temporal-level testing. Finally, the last year, 1920, included the shortened list typical of the middle portion of the comparative period.

To gauge potential significance for different countries, chi-squared goodness of fit testing was run on the ten counties included in each report; all others were integrated into the "other countries" category. Figure 5.39 illustrates the differences between the actual and expected number of burials during the entire comparative period. Four countries—Norway ($n=29$, $\chi^2r=0.676$), Ireland/England ($n=140$, $\chi^2r=1.321$), Italy ($n=17$, $\chi^2r=–0.106$), and Canada ($n=32$, $\chi^2r=0.699$)—did not have significant residuals; therefore, the proportions of individuals from these countries buried in the MCPFC were similar to those from the greater Milwaukee community. However, residual values for four countries and the "other countries" group indicated that there were significantly more immigrants from these places in the burial population: Sweden ($n=26$, $\chi^2r=6.748$), Austria ($n=205$, $\chi^2r=15.277$), Greece ($n=13$, $\chi^2r=2.309$), Russia ($n=66$, $\chi^2r=3.767$), and other countries ($n=171$, $\chi^2r=6.717$). Fewer individuals than expected came from Germany ($n=757$, $\chi^2r=–7.158$) and Poland ($n=87$, $\chi^2r=–3.953$). These latter results are interesting given the large German and Polish immigrant population in Milwaukee

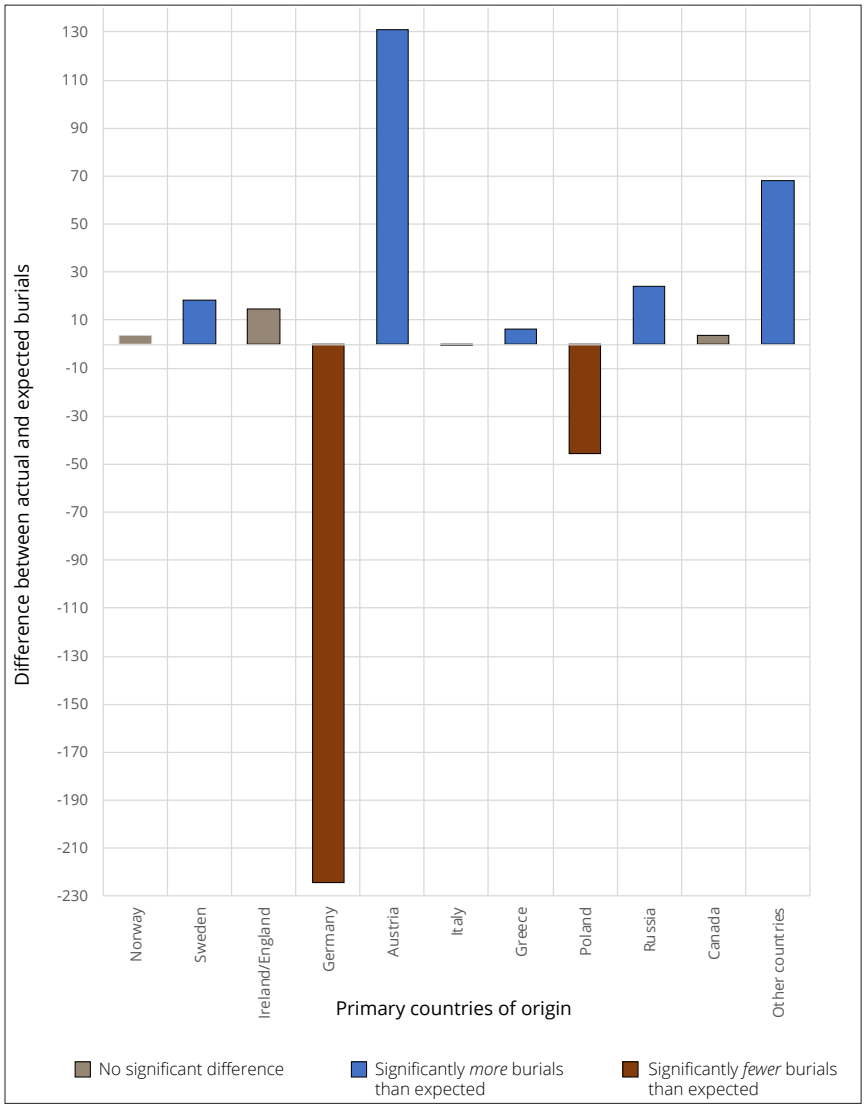

Figure 5.39 Difference between the number of actual and expected burials for each of the major foreign countries of origin, 1901–1920.

during the years in which the cemetery was active. While it is recognized that the large number of individuals without place of birth recorded could be affecting these values, the patterns and trends are still worth exploring (see Discussion).

To elucidate any temporal trends, tests were run on the two populations for each year between 1901 and 1920; all years returned significant p-values with the exception of 1901 and 1909 (Table 5.27). In regard to the countries with the most extreme differences between

actual and expected values, there does appear to be shifting patterns over time. Germany, for example—the county with the highest frequency of foreign burials in the cemetery population but with the second highest absolute value residual score—did not have significantly fewer burials than expected until 1914. Prior to this year, the number of Germans buried on county grounds was consistent with the overall Milwaukee population. However, from 1914 on, there was an average of μ=20.83 fewer burials than expected. Temporal analysis of Polish immigrants was very different from the Germans, as only three years during the earliest part of the comparative period resulted in significant differences: 1902 (n=1, $\chi^2$r=–2.003, $\chi^2$e=5.841), 1903 (n=0, $\chi^2$r=-2.757, $\chi^2$e=7.600), and 1906 (n=0, $\chi^2$r=–3.225, $\chi^2$e=10.399). The sole Pole buried during these three years was LOUIS SMITH (d. 21 March 1902), a thirty-eight year old married laborer. He died at MCGH from pneumonia and exhaustion, and his remains were turned over to Charles Judson for dissection. The MCGH male patient register noted that SMITH was Catholic and had lived in Milwaukee approximately five years. When admitted, he had reported that in the case of death the staff should notify GUSTAVE GREUT, who lived at the same boarding house on Clinton St; this was likely because his wife still lived in the Old World (Milwaukee County General Hospital Male Register, 1900–1904:42).

Table 5.27 Results of chi-squared goodness of fit tests for foreign countries between the City of Milwaukee and MCPFC, 1901–1920.

| Year | $\chi^2$ | *df* | p |
|---|---|---|---|
| 1901 | 14.786 | 18 | 0.6766 |
| 1902 | 38.253 | 19 | 0.0051 |
| 1903 | 51.29 | 21 | 0.0002 |
| 1904 | 109.22 | 22 | $1.52e^{-13}$ |
| 1905 | 46.028 | 22 | 0.0020 |
| 1906 | 49.113 | 20 | 0.0003 |
| 1907 | 38.011 | 21 | 0.0129 |
| 1908 | 132.59 | 23 | $<2.2e^{-16}$ |
| 1909 | 23.959 | 22 | 0.3494 |
| 1910 | 45.221 | 26 | 0.0111 |
| 1911 | 59.382 | 9 | $1.76e^{-09}$ |
| 1912 | 50.071 | 12 | $1.36e^{-06}$ |
| 1913 | 78.868 | 14 | $4.59e^{-11}$ |
| 1914 | 104.89 | 11 | $<2.2e^{-16}$ |
| 1915 | 86.441 | 11 | $8.28e^{-14}$ |
| 1916 | 32.245 | 11 | 0.0002 |
| 1917 | 189.42 | 25 | $<2.2e^{-16}$ |
| 1918 | 43.319 | 11 | $9.56e^{-06}$ |
| 1919 | — | — | — |
| 1920 | 34.008 | 14 | 0.0021 |

Austria had the largest absolute value residual returned for the comparative period. With the exception of four years (1901, 1904, 1909, and 1910), there were more Austrian immigrants

interred in MCPFC than expected. As previously noted, the migrant populations in 1901 and 1909 were not significantly different than expected. In 1904, the chi-squared residual for Austria ($n=4$, $\chi^2r=1.775$, $\chi^2e=1.692$) was near the $|1.96|$ threshold, though the smallest difference between actual and expected burials was in 1910 ($n=6$, $\chi^2r=0.9303$, $\chi^2e=4.113$). For the years in which there was significance, the average difference between actual and expected was $\mu=8.714$, with the maximum difference of nineteen found in 1914.

The significant differences in nationality relate directly to Milwaukee's transatlantic migration history (Chapter 3). The timing, motivations, and demographic makeup of these migrant groups affected the social networks in which they participated while in Milwaukee. The birds of passage whose stays in the United States were meant to be temporary likely had strong social ties with individuals in the Old World, but their surviving friends and family—even if they could be found and notified—were in no position to ensure a proper burial an ocean away, even if they had the volition to do so.

*Discussion*

The previous sections demonstrate the complex nature of the MCPFC population and identify groups that were overrepresented—stillbirth; the middle aged and, in some years, the elderly; men; and migrants from Sweden, Austria, and Greece—and those that were underrepresented—infants over three months old, as well as all other subadults; women; married persons; native-born individuals; and migrants from Germany and Poland. What follows is a brief discussion of the historical and cultural factors that likely influenced these findings.

*Stillbirths and other subadults*. While the 1914–1916 significant differences in stillbirth burials is intriguing, what is more striking is the overall contrast between this category and all other subadult cohorts. Where stillbirths met or exceeded expected numbers, the much lower

than expected frequency of older infants, toddlers, juveniles, and adolescents clearly reflects a strong aversion to burying children in the pauper's cemetery, even if the means to bury them elsewhere were hard to come by for poverty-stricken families. If this was the case for children, however, why were stillborns treated differently?

Many of Milwaukee's migrants, and by extension their natural-born children, were Catholic (Conzen 1976; Gurda 2008; Still 1948), and therefore much of the rationale for this disparate treatment may relate to the prohibition by the Catholic Church against the burial of unbaptized individuals in consecrated ground. Garattini,writing about burial practices in Ireland, states,

> Infants and children who dies without baptism were buried in separated areas alongside other categories of "excluded," such as, for example, suicides, heretics, women who died in childbirth, and so on... As a consequence of the exclusion of the unbaptized from churchyards, several solutions were in place: sometimes they were buried in the fields (as was done with animals) or at crossroads; on other occasions they were buried outside of the cemetery walls and under the utters in toddler to receive come drops of water (metonymy for the salvific water of baptism) on their graves. The north side of the church, known to be the worst side to be buried in, due to its lack of light and its association with pagan afterlives, was also used to bury them. In Ireland, as in other parts of Europe, unbaptized children were also buried i separated burial grounds. (2007:194)

Catholic cemeteries in Milwaukee most certainly had similar designated areas for unbaptized infants, but they also most certainly charged a fee that many obviously choose not to pay.

A likely explanation for this lack of investment in stillbirth burial can be found in Warner's (1959) *The Living and the Dead: A Study of the Symbolic Life of Americans*. Though concerned with status and symbolism in a traditional contemporary graveyard, his examination of the relationship between social personality and mortuary treatment is relevant. He defines social personality as "the product of the individual's interaction with other members of the

society and the sum of the social positions he has occupied while living in the social structure" (Warner1959:304). Social personalities, therefore, are dependent on the number and strength of relationships between different individuals. Because young infants (and according to Warner, women) do not have strong or clearly-defined social personalities, less effort and expenditure is provided for their burial treatment. This lack of established social personalities in infants is echoed by a number of historians concerned with changing attitudes towards children and childhood (Cunningham 2005) and parent-child emotional bonds (Dye and Smith 1986; Pollock 1983). Dye and Smith, investigating the ego documents of mothers between 1750 and 1920, note that while many women recorded the minute details of their social lives, descriptions of their young children were limited to developmental milestones, not individualistic personalities:

> One wonders whether this silence testifies to something more significant... to an unspoken acknowledgment that until infants had grown into children (and perhaps hearty ones at that) they remained something less than compete persons. (1986:335)

If this lack of personhood and undeveloped social personalities was true for young infants who at least had the benefit of interacting with their parents, however briefly, then it was surely true for those who perished in utero.

On the surface it would appear that these explanations, particularly Warner's social personality theory, fall apart when we attempt to explain the smaller-than-expected number of infants, children, and adolescents. If these youngsters had yet to develop strong social personalities or, in the case of the infants, had not yet become complete persons in their parents' eyes, why were so many spared a pauper's burial?

Here, it becomes important to distinguish between, on one hand, Warner's concern with status display through plot location and grave marker selection in a traditional cemetery,

and on the other hand, a parent's decision whether to allow his or her child to be buried in an unconsecrated potter's field. It is unlikely the breadless who lost children expended significant amounts on funerals or burials—in fact, their final resting place in a community cemetery may be as sparse and unmarked as many MCPFC burials—but their placement in a proper, Christian cemetery would have been, to them, worth the cost.

Cunningham (2005) and Snyder (1992) both stress the growing recognition in the nineteenth century of children and childhood as something special and distinct from the evils of adulthood. Cunningham notes that this was manifested in a variety of ways, including "a concern for the salvation of the child's soul" and "a sense that children were the messengers of God" (2005:41). Snyder (1992) asserts that this evolution began during industrialization and the shift to a marketplace economy:

> The thriving city marketplace was frequently depicted in sentimental Victorian literature as greedy, immoral, impersonal, and opportunistic.... By the late 1830s the concept of childhood was beginning to be highly valued. Perceived as untamed blossoms, children were seen as pure, unblemished, and lacking in artifice. They were associated with the home, which stood in marked contrast to the outside world... children assumed a special place in the Victorian social order which death only seemed to solidify. Dying as they did before they had to enter the grownup marketplace insured their perpetual purity and spot in this order. (1992:11;14)

This innocence and purity would surely have been sullied by burial in a cemetery filled with voluminous examples of the depravity offered by the adult industrial world. This was, of course, compounded by the belief that burial in unconsecrated earth threatened the deceased's eternal soul and the prospect of reunion with loved ones in the afterlife (Mooney 1888).

The strength of this desire to keep young ones pure and unsullied even after death is underscored by the statistical testing provided above. That so few were buried at the MCPFC than expected also brings special attention to those burials that deviated from this trend—

especially the 201 between one and ten years and the seventy-three between ten and twenty years. As we will see during the narratives presented in the next chapter, consideration for individual circumstances and agency (or lack thereof) begins to elucidate factors that could outweigh these powerful ideological and religious influences.

*Adults: Male or female, single, married or widowed, native or migrant*. The heading for this section is long and cumbersome, but reflects the inability to consider any of these variables in isolation. Due to the nature of the available data, it was necessary to compartmentalize them during the demographic profiles and $\chi^2$ tests, but it is impossible to discuss why, for instance, so many more men were buried in Cemetery II without also taking into account their ages, marital statuses, and national origins. When we consider these intersectional identities, we get a clearer picture of the social structures affecting the MCPFC burial patterns.

By far, the largest segment of the population consisted of single, young and middle-aged migrant males working as laborers. While their occupations belie their low socioeconomic status, they also help explain the other factors as well. As discussed in Chapter 3, the pull of Milwaukee was its status as a growing industrial center in need of unskilled labor. Thousands of men of all ages from many countries answered the call, but most were, according to Commons (1907), of "working age"—fifteen to thirty-five years. Many were single, but many were also married, leaving their wives and children in the Old World. For some groups, like the Germans, this initial settlement was the first link in chain migration, but for others like the Austrians, Italians, and Greeks, the move was never meant to be permanent. Both Commons (1907) and Nugent (1992) noted that many individuals from these countries made the round trip multiple times.

These differences in migratory patterns explain the discrepancy between overrepresented Swedes, Austrians, and Greeks and the underrepresented Germans and Poles. The latter groups

were far more likely to come over in family groups and were also far more likely to make their residence permanent. This allowed for the creation and maintenance of social ties that could be relied upon in the case of a death in the family. Particularly true of Germans, a large portion of this group arrived much earlier in the city's history and were able to assist their later-arriving countrymen. Gurda quotes Rabbi Eppstein, who in 1837 stated:

> We are Germans by tongue; Germans by will of reasoning our way onwards;...Germans by the desire to seek knowledge and wisdom, and foster them; Germans by uniting in social life; a*nd Germans by assisting each other in times of need*.... We are Americans, but German Americans. [*emphasis added*] (2005:137)

Their tendency to officially organize themselves into social groups, regardless of social class, also prevented many from ending in a pauper's grave; most of these official groups, as long as a member's dues were up-to-date, provided funeral services and/or death benefits to families (Gurda 2008).

The Polish may not have "suffered from an embarrassment of organizational riches" (Gurda 2008:62) like the Germans (though they did have many important ethnic institutions), but in may ways they were more homogeneous, more insular, more endogamous, and more devoted to their Catholic parishes (Gurda 2008). All of these factors created a close-knit community that individuals or families could depend on after the death of a loved one. The extraordinary prominence of the Catholic Church and its associated cemeteries was especially vital in reducing the number of Polish MCPFC burials.

Be this as it may, burial in a Catholic cemetery, even within their own potter's field, required a loved one or family member to claim the body and arrange for the burial. Without these social ties and community safety nets, many died without someone able—or willing—to arrange a non-county interment. This fact accounts for the remarkably high number of males; so

many were birds of passage or unidentified transient wage-earners passing through the city who died unexpectedly before reaching their final destination, a place where someone may have been able to care for their eternal needs.

While national origins and age may have been the cofounding influences involved in male overrepresentation in the cemetery population, gender roles and marital status were the main determining factors affecting female proportions. Warner (1959) asserts that women had less-developed social personalities that limited the level of commemoration they received in traditional cemeteries, though both he and Cannon (2005) note that the levels of emotional attachment and sentiment revealed in their lesser monuments were more profound than those found on male markers. This sentimentality was the remnant of the Victorian "cult of womanhood," the attributes of which are described by Welter:

> The attributes of True Womanhood, by which a woman judged herself and was judged by her husband, her neighbors and society could be divided into four cardinal virtues-piety, purity, submissiveness and domesticity. Put them all together and they spelled mother, daughter, sister, wife-woman. (1966:152)

These virtues, though perhaps not enough to warrant elevated levels of display by the upper classes in their cemeteries, were enough to ensure that most women were not laid to rest in a pauper's cemetery. Like the aversion toward burying children unsullied by the world outside the home in unconsecrated ground, the piety, purity, and domesticity of women similarly made their interment in the potter's field anathema. Additionally, this cult of womanhood worked to ensure that society defined women by their relationships to their family. A byproduct of this was a sense of reciprocal duty toward mothers, wives, and daughters that played out in mortuary practices.

Obviously, this duty was not always met. It would be reasonable to assume that single adult women were more frequently buried in Cemetery II, since their identities would be limited

to daughter and possibly sister; the addition of a husband and children would expand the pool of individuals whose duty it was to ensure a proper burial. The demographic profiles for this cemetery, however, do not bear this out. Single women of all ages accounted for only eighty burials, while those who were married or widowed numbered 108 and 117, respectively. The high number of widows, most of whom were elderly (n=97), is not at odds with the cult of womanhood theory because this marital status reflects the loss of one's status as a wife and, given their advanced ages, likely as a daughter as well; the fact that sixty-four of these elderly widows were also inmates at one of the various county institutions hints at the dissolution of their statuses as mothers since no children were willing or able to provide for their care.

The fact that almost as many married women as widows were buried in the pauper's cemetery reveals the limitations of applying the cult of womanhood concept to this population. This theoretical limitation can be traced to this specific ideology being rooted in middle and upper class societies. Clearly the socioeconomic status of the husbands traditionally responsible for arranging a proper burial was an important factor, but the coroner's inquests discussed above are littered with examples of men abandoning this duty for various reasons, making individual agency an important consideration as well.

The centrality of agency in these analyses and the Chapter 6 narratives necessitates the recognition of two key points articulated by Tarlow (1999) and Cunningham (2005). The former, a British social archaeologist, rightly advocates for the incorporation of both agency and emotion in mortuary studies. Quoting Hodder et al. (1995:232), she writes, "Agency is 'a variety of social power relating to intentional and meaningful action' and requires knowledge, power and volition" (Tarlow 1999:26). While knowledge and power are vital concerns, volition, defined as "the desire to act or to obtain a particular outcome" (Tarlow 1999:26), is a factor rarely

considered by archaeologists:

> archaeologists influenced by Giddensian structuration theory have privileged the "knowledge" and "power" aspects of agency, while underplaying the significance of volition. Thus an attempt to write humane archaeologies has ironically resulted, in some cases, in rather mechanistic, dehumanized pictures of human action, where people in the past do not appear to be formulating plans, visions, stories or ideas, but responding to structural constraints and motivated (implicitly) only to exercise or subvert "power." (Tarlow 1999:27)

While this may seem to be a criticism of Giddensian structuration, she does not deny that volition, as well as knowledge and power, are socially constructed and constrained.

The potential intensity of these constraining influences is what makes Cunningham's (2005) statement significant. Though not specifically writing about agency and archaeology, but rather the shortcomings of certain approaches in social histories of childhood, the following passage from his book, *Children and Childhood in Western Society Since 1500*, is particularly relevant to our discussions of Milwaukee's breadless:

> It is at this point in time, the onset of industrialisation, that the limitations of a "family strategy" approach become most apparent. The phrase "family strategy" conveys a sense of a family rationally, if perhaps hard-heartedly, considering a range of options open to it: of a family in control of its own destiny and making a choice. Of course it is recognised that did this within certain parameters, institutional, economic, geographic, and moral, but nevertheless choice is of the essence of family strategy; it makes the people the agents more than the subjects of history. Few families undergoing the process of industrialisation would have greeted this with anything other than a hollow laugh. In truth there comes a point where the "parameters", "constraints" and "delimiting factors" affecting "choice" are so paramount that the notion of "choice" becomes meaningless. (Cunningham 2005:88)

In the narratives contained in the next chapter, we will explore in three cases how these issues of volition and the meaningless nature of choice in the face of extraordinary circumstances and extreme poverty played out in the Milwaukee County Poor Farm Cemetery.

# Chapter 6

## From Population to People: Individual Narratives from the Milwaukee County Poor Farm Cemetery

*Individual Narratives and Personal Engagement*

The three narratives presented here are diverse in many ways, but share some common elements. All center on individuals who were unusual in the cemetery population, based on the demographic study presented in the previous chapter, and the unique nature of their particular profiles facilitated the putative identification of their remains within the excavated portions of Cemetery II. Additionally, inspired by *The Archaeology of Mothering: An African-American Midwife's Tale* (Wilkie 2003) and *Dubuque's Forgotten Cemetery: Excavating a Nineteenth-Century Burial Ground in a Twenty-first Century City* (Lille and Mack's 2015), in each vignette I forego straightforward life history and situate myself within the narrative. By moving beyond simple biography, I am able to relate the sequence of events that led to these burials being identified, discuss what their excavated remains can tell us about their embodied past, detail the steps I took to uncover as much information as possible about their historically unremarkable lives, and make statements about how their families, in times of great stress and grief, acted in response to the "parameters", "constraints," and "delimiting factors" of poverty, religion, disease, and institutional mandates. With this approach, I hope to not only tell the stories of these disenfranchised few but illustrate how consideration of the individual can help to both explain deviations in archaeological patterns and enrich our understandings of those we study.

By adopting this approach, I am recounting not only the lives and deaths of Emilie Bannovski, Gertrude West, and the Rosche family, but also my personal engagement with their stories. Tarlow, in her call for the consideration of emotion in the past, explicitly states that her own emotional responses to her research "constituted a significant aspect of [her] fieldwork"

(1999:21). For example, she admits that for her own emotional well-being, after days of reading deathbed texts written for deceased children and teenagers, she would have to "spend a few days recuperating in the relative blandness of census reports" (Tarlow 1999:21). I would be remiss not to admit similar responses to the stories presented here, as well as countless others I came across during my own research. For example, I recall leaving the Milwaukee County Historical Society once after less than half a day's work due to an especially bleak run of infanticide inquests that made me worry I would be seen crying in public. Such reactions, rooted in my own self-identity as a mother and a wife as well as an intellectually-curious scholar, are acknowledged and interwoven in the narratives below.

### "Poisoned Beyond Hope of Recovery": Emilie Bannovski

*Loneliness and the feeling of being unwanted is the most terrible poverty.*
— Mother Teresa

To truly understand the way in which Burial 8108 was identified as EMILIE BANNOVSKI, it is important to note that neither the MCPFC osteological analyses nor my own research have been conducted in a linear, strictly chronological manner. While the analysis of the 2013 excavated material was conducted by trained professionals immediately after excavation, the same systematic examination of the 1990s burials by UWM was not initiated until 2016 and is ongoing at the time of this writing. The collection of death certificate and coroner's inquest data was done intermittently, and often concurrently, over a six year period.

I first became aware of the presence of an autopsied female adolescent three years after I began this project. Dougherty (2011) had just completed his dissertation on traumatic injuries observed in the cemetery population excavated in the 1990s. Though he completed this degree

at Indiana University, he only had access to this data because he had previously been a student at Marquette University when they had possession of the collection. The UWM–ARL had been granted final disposition of the remains the summer before I came to Milwaukee in 2008, and by 2011 they were in the process of completing a mammoth curational endeavor of reinventorying, stabilizing, and professionally and ethically reboxing the human remains and grave goods. While Marquette had been required by the Wisconsin State Historical Society to transfer possession of the excavated material and associated archaeological records, they were under no obligation to share any data collected during the seventeen years during which they studied the population; they chose not to do so. Therefore, Dougherty's 2011 dissertation was the first osteological data to which I had access.

Unfortunately, because he focused only on traumatic injuries, the data published in his manuscript were limited to only those burial lots in which such cases were observed. Hoping for comprehensive age and sex data, I encountered an appendix in his work where most descriptions related to adult males (the individuals most likely to have suffered traumatic accidents, homicides, or suicides). Discouraged but not deterred, I pored over the data hoping to find a burial description that would allow me to identify one or two keystone individuals in the southern section of the cemetery (the northern section having been identified by Richards in 1997). At first, a couple of burials with cranial projectile wounds appeared promising, but these were all noted on middle adult men; both this demographic and cases of gunshot wounds to the head were, unfortunately, too common to narrow down candidates to a useful number. Burial 8108, however, immediately stood out (Figure 6.1). Though this individual did not exhibit perimortem trauma, Dougherty noted the presence of a craniotomy. This alone was not unusual, but the fact that this procedure had been conducted on a female aged between sixteen

Figure 6.1 MCPFC Burial 8108 (Photo on file at UWM–ARL; reprinted with permission).

and nineteen years would have been extraordinarily rare. I was still in the process of collecting coroner's inquests, but I knew when I found this girl's records that I could discover who was buried in 8108.

In reality, I came across the death certificates and coroner's inquests for two teenage girls who had been autopsied. One was HATTIE GRADWOHL (d. 22 January 1896), mentioned in Chapter 5. Her official cause of death, "cretinism – child was malformed being an idiot," would have been easily recognizable osteologically; Richards (2015) located a medical journal article that included images of Hattie both during life and after death, and it was clear that her remains had been kept by her attending physician as an anatomical specimen. The only other adolescent female that had undergone an autopsy prior to burial was Emilie Bannovski (d. 6 August 1889), an almost sixteen-year-old girl whose cause of death was listed as "suicide by poison."

Having emphatically ruled out one of the only two possible candidates, I was confident Burial 8108 was Emilie. For a time, this confidence dissipated as preliminary UWM–ARL osteological analyses in 2016 indicated Burial 8108 was a young adult between twenty and twenty-seven years of age, far too old to be Emilie. Not only was this burial likely not Emilie,

but a check of my database revealed the number of likely candidates had gone from one to more than twenty. However, recent aging protocol reassessments conducted by juvenile osteology specialist and UWM doctoral candidate Brennon Charles resulted in Burial 8108's age being modified to the fifteen- to eighteen-year range. The classification of this burial as a young adult versus an adolescent was complicated by poor preservation and the fact that, though the original osteological inventory conducted in the 1990s indicated all of this individual's teeth were present, they were missing when UWM conducted their analysis (Brennon Charles, personal communication). Nonetheless, once again, Emilie was the only likely candidate.

Long before this intellectual roller coaster, I had begun researching Emilie's history, deeply invested in explaining why this girl was one of only fifteen female adolescents and one of only nine autopsied teens buried in the MCPFC. More generally, because I am the mother of a similarly-aged daughter, I wanted to understand why a child so young would take her own life and why her parents could not—or would not—arrange for a proper burial. Her narrative became integral to my archaeology of the individual approach.

Emilie migrated to the United States in November 1887 with her father Heinrich, mother Lena and younger siblings Albert (11 years), Rudolph (9 years), and Emile (11 months). They traveled on the vessel *Hermann*, in steerage, departing from the port in Bremen after leaving Danzig, Germany. The family disembarked in Baltimore, declaring their intent to stay in the states (United States Germans to America Index). It is unclear what specifically drew them to Milwaukee, though Heinrich was listed as a laborer, making it likely he brought his family to the city for factory work and the large German community.

One the evening of 6 August 1889, Emilie was found at the corner of Broadway and Mason Streets, unconscious, convulsing, and vomiting. A short notice was posted days later in

the *Weekly Wisconsin* (1889):

> EMILIE BANOWSKI, a girl 15 years of age, died at the Emergency Hospital from the effects of poison on the morning of the 6th. She was taken ill on the street, but denied having poisoned herself and said that a girl named Lena Reinke had given her some medicine. The police could not find the Reinke girl and are inclined to think that Emilie committed suicide. Her parents live at 314 Fifth Street.

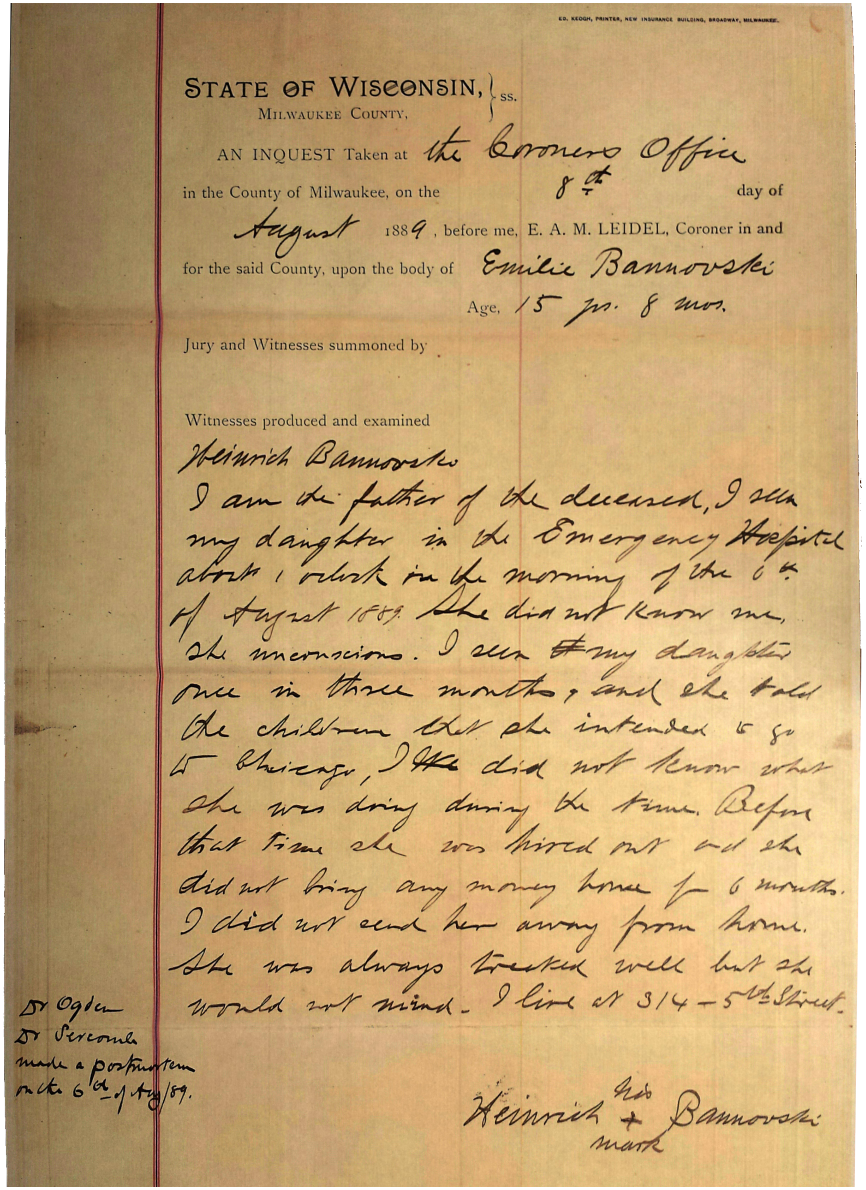

She regained consciousness long enough at the hospital to provide her name, age, and apparently the identity of the girl who gave her the substance she ingested.

In the late 1880s, coroner's inquests typically consisted of witness testimony and the autopsy report (if one had been conducted). The latter was missing from Emilie's file, though a notation made by coroner Leidel indicated Doctors Ogden and Sercanda[?] performed a postmortem exam shortly after death. The witness testimony was provided by her father, likely German and translated by the coroner:

> Heinrich Bannovski: I am the father of the deceased. I seen my daughter in the Emergency Hospital about 1 o'clock in the morning of the 6th of August 1889. She did not know me. She unconscious. I seen my daughter once in three months and she told the children that she intended to go to Chicago, I did not know what she was doing during the time. Before that time she was hired out and she did not bring any money home for 6 months. I did not send her away from home. She was always treated well but she would not mind. I live at 314 5th Street.

The addition of "his mark" at the end suggests Heinrich could not read or write (Figure 6.2)

Based on the statements made by the police, the coroner ruled her death a suicide and that was the cause listed on official documents. A *Milwaukee Sentinel* (1889) article published on the same day as the *Weekly Wisconsin* piece, however, provides more detail concerning Emilie's actions and calls into question whether she truly took the unknown toxin with suicidal intent (Figure 6.3).

at a moment's notice.

THE WORK OF POISON.

A Young Girl Picked Up on the Street Dies at the Hospital.

People who passed Broadway and Mason streets at 9 o'clock last night were surprised to see a young girl in an apparently helpless condition, gasping for breath and vomiting violently. She was taken to Emergency hospital, where two doctors examined her and pronounced her poisoned beyond hope of recovery. She was revived, however, sufficiently to state that her name was Emilia Banouski, aged 15 years, daughter of Henry Banouski, residing at 314 Fifth street. She said a girl named Lina Reinecke had procured her some medicine at a drug store for sickness she had. She said ever since a sick spell some time ago her mother had bothered her about the doctor's bill. The girl died before midnight, and her parents being sent for paid a short visit to the deathbed. A post mortem will be held on the body to ascertain the direct cause of death.

Dies at the Hospital

People who passed Broadway and Mason streets at 9 o'clock last night were surprised to see a young girl in an apparently helpless condition, gasping for breath and vomiting violently. She was taken to Emergency Hospital, where two doctors examined her and pronounced her poisoned beyond hope of recovery. She was revived, however, sufficiently to state that her name was Emila Banouski, age 15 years, daughter of Henry Banouski, residing at 314 Fifth Street. She said a girl named Lina Reinecke had procured her some medicine at a drug store for sickness she had. She said ever since a sick spell some time ago her mother had bothered her about the doctor's bill. The girl died before midnight, and her parents being sent for paid a short visit to the deathbed. A post mortem will be held on the body to ascertain the direct cause of death.

Figure 6.3 *Milwaukee Sentinel,* 9 August 1889.

Whether or not Emilie meant to kill herself or if she was simply trying to self-medicate, the official classification of her death as a suicide may explain her burial in the MCPFC. Like the stillbirth burials discussed in Chapter 5, individuals who took their own lives were prohibited from burial in Catholic cemeteries (Garattini 2007). The presence of a crucifix and a Sacred Heart of Jesus medallion[1] (Figure 6.4) are clear indications that Emilie and her family were Catholic, and consequently her parents could not petition for a pauper's burial in consecrated ground. Numerous clues to their impoverished status can be found in these documents: they were recently arrived migrants with three surviving young children; Heinrich was employed as an unskilled laborer; they had "hired out" their teenage daughter and lamented her lack of contributions to the household income; and finally, Emilie sought the help of a peer to procure medicine to avoid her mother's displeasure over another doctor's bill.

One has to wonder, however, if their obviously strained relationship influenced their lack of an attempt to bury Emilie elsewhere (she was laid to rest only two days after her death). Through my investigation into the Bannoskis, I discovered that Emilie's father, Heinrich, died only five years after his daughter, but was laid to rest in Milwaukee's Union Cemetery (Madison 2015). It is possible that the family's circumstances improved enough in the intervening years that they were able to afford a proper burial for Heinrich, or it could simply be that his status as the head of household demanded the expenditure no matter their financial situation. Either way, whether they could not, or would not, bury her somewhere other than the potter's field, it is clear they were at least partially active in her burial treatment, since few who came to the cemetery from the coroner's office were buried with personal tokens like those that accompanied Emilie.

### "Freak to Outsiders, But Jolly Friend to Us": Mrs. Gertrude West

*We're freaks, that's all.... We're the tattooed lady, and we're never going to have a minute's peace, the rest of our lives, until everybody else is tattooed, too.*

— J.D. Salinger, *Franny and Zooey*

The case of Gertrude West is one of the most extraordinary examples of how effective integrative approaches in historic period bioarchaeology can be. I was still in the process of transcribing the thousands of MCPFC coroner's inquests when I came across Dougherty's (2011) reference to the adolescent female with evidence of a craniotomy. As we now know, this burial was eventually identified as Emilie Bannovski, but that discovery had yet to be made. The prospect of identifying this burial provoked so much eagerness on my part that for a day I decided to abandon my chronological research strategy at the MCHS and have the archivist pull every inquest conducted on female MCPFC burials (excluding those known to be infants and children based on their register entries, which numbered around 140). My systematic approach already abandoned, I did not take the time to transcribe these records, deciding to do that when

they were pulled again in order, so I preceded to simply scan the death certificates for ages. I justified this shortcut to myself because I was not researching alone that particular day; my doctoral advisor and the director of the Milwaukee County Poor Farm Cemetery Project had joined me. We had learned just days prior that the original burial register, thought missing since before the 1990s excavation, was actually being curated at the historical society (and had been for some time). After viewing the ledger, we came across the inquest for GERTRUDE WEST. I immediately noticed the age listed on her death certificate, 42 years, 8 months, and 11 days, precluded her from my search for the autopsied adolescent, but the occupation listed directly under the age, "Exhibition Lady," caught my attention and prompted me to look more closely at the coroner's summation—she was employed with the Zeidman & Pollie Carnival Company, she died in Milwaukee from septicemia caused by a mosquito bite, and her weight at time of death was 658 pounds.

It seemed likely that, due to her unusual size, Gertrude would not have been buried in a regular coffin and therefore would have left a unique and easily recognizable archaeological signature. As chance would have it, the one person who would know if that signature existed was sitting at the table with me. Dr. Richards did, in fact, remember one particular burial from the 1991 field season that seemed peculiar, so upon our return to the UWM–ARL, we consulted the original excavation map and quickly discovered that burial lot 5048 was a likely candidate for our circus fat lady (Figure 6.5).

The excavation record described the coffin as a 32" by 84" rectangular box reinforced with 5" wide metal bands and containing five coffin handles of a type that had not been seen in any other excavated burial; in addition to these handles, two unusually ornate thumbscrews were also found (Figure 6.6). The astute field excavator noted:

> While this is purely speculation, it seem[s] that based on the size of the box and the outward flare of arms and legs (away from center of body), that this individual was more obese than the average individual at the [MCPFC]. It also seems possible that the "coffin" itself was actually a packing crate that was substituted for a coffin.

The only other grave goods recovered were fragments of a burial shroud and a 14-karat gold ring around the left ring finger (Figure 6.6).

A review of UWM's preliminary osteological analysis suggested the remains from Burial 5048 were that of a middle aged female; however, aging the skeleton was more complex than usual. Upon reexamining the remains, I found the auricular surface of the pelvis and the extensive osteoarthritic condition of the vertebral column (Figure 6.7) were consistent with a middle aged individual, but the completely unfused state of the cranial sutures (Figure 6.8), as well as the partially visible epiphyseal lines on the long bones were characteristic of a much younger person. These inconsistencies made sense after a review of several paleopathological texts. Both Roberts and Manchester (2005) and Ortner (2003) listed the symptoms of hypothyroidism as delayed skeletal maturation, particularly cranial sutures closure, and excessive weight gain. Other osteological indicators of hypothyroidism observed included osteoporosis, complex cranial sutures, and the presence of wormian bones (Figure 6.8 inset).

At this point, I felt this was as robust an identification as could be made, but in 2015, the first and third right mandibular molars of Burial Lot 5048 were sampled as part of a pilot study testing the utility of strontium isotope analysis for historic cemetery contexts (Freire and Jordan 2015). Through such analysis, Freire and Jordan found that the 87Sr/86Sr signatures of the individual buried in this grave were consistent with published geological and hydrological 87Sr/86Sr ranges for locations within Indiana, the birthplace listed on Gertrude's death certificate (Figure 6.9) (Freire and Jordan 2015).

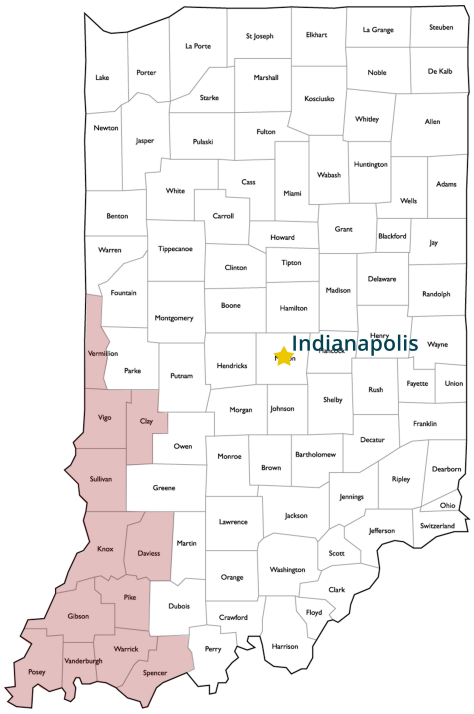

Figure 6.9 Indiana counties identified as possible birth locations for Gertrude West based on strontium isotope analysis (Jordan et al. 2015) (Adapted from worldatlas.com).

Unlike so many buried at the MCPFC, Gertrude's death did not go unnoticed. The death of a carnival fat lady garnered much public attention, as evidenced by newspaper headlines like "Woman Weighing 658 Pounds Dies…Problem for Coroner" (Figure 6.10) and "Freak to Outsiders, But Jolly Friend to Us" (Figure 6.11). Through these articles and the coroner's report, I was able to learn more about her life and reconstruct the circumstances that led to her interment in the county's poor farm cemetery.

PROBLEM FOR CORONER

Six Men Required to Remove Body From Hospital to Morgue.

One of the heaviest bodies ever re-

Figure 6.10 *Milwaukee Sentinel* headline, 31 July 1918, reporting the death of Gertrude West

WEDNESDAY, JULY 31, 1918

"FREAK TO OUTSIDERS, BUT JOLLY FRIEND TO US"

CARNIVAL FAT LADY IS DEEPLY MOURNED BY COMPANIONS

A post mortem examination was made Wednesday of what is, according to attendants, the heaviest body ever received at the Milwaukee county morgue. Mrs. Gertrude West, 42, the "fat lady" traveling with a carnival been in the show business all her life, and was with Barnum & Bailey's circus for a time.

"Of course, her size was a terrible handicap in getting around, but she never seemed to mind it much. She often told of the embarrassment that resulted if she fell, for it took four or five men to lift her into an ambulance, and such falls had occured twice in her life."

Big Job to Move Body.

Assistant Coroners Benjamin Litza and Thomas Kline were sent to the hospital to bring the body to the

Figure 6.11 *Milwaukee Journal* headline, 31 July 1918, reporting the death of Gertrude West

Her friends called her Gertie. She was married to Harry West, the barker for the carnival and her manager. She did not have children, though she was very fond of them. She was good-natured, had a sense of humor, and had worked in show business most of her life. Her size limited her mobility, but apparently this did not bother her except on the few occasions when she would fall and need medical assistance. (She once became embarrassed when it took five men to lift her into an ambulance.) Her amiable disposition is evident in the three pictures of her I was able to uncover.

I came across the first while conducting Internet searches for “Gertrude West fat lady.” Initially, the only promising return was a reference to a historical photograph being auctioned off on an oddities website; the listing read “Gertrude West, age 22, weight 711 lbs.,” but no image of the photograph was included because the item had already sold. Repeated requests to the website administrators for further information went unanswered. Undaunted, I continued to scour the web for other photographs when I stumbled across a now-defunct Tumblr blog with the singularly unfortunate title “Old Time Fatties, Fuck Yeah!” It contained a random assortment of historic period photos depicting circus fat ladies, some of which were captioned but most of which were not. One did, however, read “Gertrude *Barker*, age 22, weight 711 lbs” (Figure 6.12). I was ecstatic about the possibility of putting a face to one of the thousands of burials left unmarked and unremembered in our cemetery, but despite the almost identical title, I was uncertain of this image’s attribution.

Figure 6.12 Gertrude Barker [West], age 22, weight 711 lbs (Photo retrieved from defunct Tumblr blog "Old Time Fatties, Fuck Yeah!").

My fears were unfounded. Some time later, while again compulsively searching for any tidbit of information about Gertrude, I came across a newspaper article from the St. Louis *Post-Dispatch* detailing the curious marriage of Mrs. Gertrude *Baker* to the “tall and slender” Harry West (Figure 6.13). Though not the same photo as the first, the one included in this article clearly shows the same woman and was taken at the same time.

ST. LOUIS POST-DISPATCH

# 615-POUND BRIDE OF THIN MAN IS SOMEWHAT OFF WEIGHT

**Her Freak Friends Prepare Homecoming Welcome.**

In a three-story brick rooming house, 20 South Fifteenth street, in charge of Miss E. R. Coyle, who has four feet and 20 fingers, and occupied by circus sideshow stars, musicians and tent workers, a warm welcome is awaiting the return of a former lodger, Mrs. Gertrude Baker, weight 615 pounds, who shyly slipped from the house yesterday afternoon and was married by Judge Calvin N. Miller to Harry West, tall and slender, of Rock Island, Ill.

"I guess they were afraid to come back home last night," said Mrs. Jean Walker, "Jolly Jean," weight 400 pounds, to a Post-Dispatch reporter today. "We surely would have given them some party. Why, Gertie just ran away while her property man was fixing a stove in her room and planning for the summer trip. I didn't think she could do it, but she fooled almost all of us."

Miss Coyle is only four feet in height, but she moved briskly about the house as she hunted for a photograph of "Gertie." After looking through dressers and trunks she exclaimed: "Why, that little girl has hidden all her pictures. She must have known we would be looking for them." At this moment the property man joined in the hunt and produced a photograph that had been concealed in a guitar case.

MRS. GERTRUDE BAKER-WEST.

**"Gertie" Was Off Weight.**

"That doesn't do her justice," he remarked. "She was off weight when that was taken. Why, sometimes I have seen her up to 700 pounds."

One of those who will aid in the reception to the bride will be her show partner, Lewis Foust, known as "Kewpie," who weighs 600 pounds. "Kewpie" was not at home this morning and his friends appeared worried as to how he would receive the report of the marriage.

"They have a great act," volunteered Miss Coyle, "and I guess West will go out in charge of the show this year."

"Jolly Jean" appeared to be the most melancholy member of the party today. She explained that this was not because of the marriage, as she was delighted to see "Gertie" happy.

"I'm just bothered about my weight," she confided. "I have fallen off a lot this last winter, and I do not know whether my husband will let me go out with a show this season. The warm weather may let me pick up 75 pounds or so, however. Now, here's Lucy, who is gaining all the time."

**Lucy, 300 Pounds, Just Training.**

"Lucy" declined to announce her full name. She said her weight was only about 300 pounds, and added:

"I'm not in the business yet; I'm just in training."

Mrs. West, the bride, is regarded by her friends as rich, inasmuch as she owns a complete tent outfit with scenery and costumes. She met West last fall while her company was appearing in a town in Iowa, and they have corresponded since that time.

Figure 6.13 St. Louis Post-Dispatch article describing Gertrude's surprise marriage to Harry West.

**615–POUND BRIDE OF THIN MAN IS SOMEWHAT OFF WEIGHT | Her Freak Friends Prepare Homecoming Welcome.**

**Lucy, 300 Pounds, Just Training.**

"Lucy" declined to announce her full name. She said her weight was only about 300 pounds, and added:

"I'm not in the business yet; I'm just in training."

Mrs. West, the bride is regarded by her friends as rich, inasmuch as she owns a complete tent outfit with scenery and costumes. She met West last fall while her company was appearing in a town in Iowa, and they have corresponded since that time.

Beyond confirming the identity of the earlier photo, the story presented in this article proved to be exceptionally enlightening regarding Gertrude's social relationships. She clearly had many friends, including her exhibition partner Lewis "Kewpie" Foust, who were not only profoundly found of her but traveled and lived with her as well. However, the fear that Lewis would react badly to her sudden marriage to a relative stranger and the statement that "I guess West will go out in charge of the show this year" hints at tensions that may have eventually strained these ties. Also relevant to our consideration of her burial in a poor farm, the last entry in this article states that "Mrs. West, the bride, is regarded by her friends as rich, inasmuch as she owns a complete tent outfit with scenery and costumes."

The provenance of the third photo is even murkier than the first. During my many Web searches, I came across dozens of unattributed images of nineteenth and early twentieth century circus fat ladies. Most were clearly not Gertrude, though several later identified as the "Jolly Jean" quoted in the above article gave me pause. One mystery photo, however, caught my attention not long after I came across the Gertrude Barker image. Listed on several stock photo websites with tags like "Morbidly Obese Woman" and "Happy Woman Fat Retro," no information was provided about the woman's identity or the date it was taken, but something about the woman's smiling face was so similar to the other photo I saved a copy. After coming across the second image in the 1916 article with Gertrude looking full-faced at the camera and comparing it to the stock photo, I felt reasonably certain the "retro" "happy" "fat" "woman" was the same individual (Figure 6.14). The quality of this picture far exceeds the graininess of the previous two and truly does capture her good-natured disposition.

Figure 6.14 Closeup of *Post-Dispatch* image of Gertrude West compared stock image of unidentified fat lady (Purchased from alamy.com).

In late July of 1918, Gertrude was bitten by a mosquito in Oconto, Wisconsin, and within days, the bite became infected. By the time she was admitted to Milwaukee's Emergency Hospital, she was mortally ill and died on the 30th of July. Two separate newspaper articles detail the difficulties the coroner's office had in removing her body from the hospital's third floor. A partial autopsy was completed, and her husband arranged to have her body moved to the funeral home of Fred J. Borgwardt & Son. Harry also commissioned the construction of a special coffin (*Milwaukee Journal* 1 August 1918). A series of telegraph correspondences in the coroner's file indicates that Gertrude was to be buried in Milwaukee's Holy Cross Cemetery. However, the final newspaper article reporting on her funeral, published days later and titled "Fat Lady Laid to Rest in Potter's Field" (*Milwaukee Journal* 4 August 1918) details how her husband's attempts at a proper, private burial were thwarted by disputes over funeral expenses and the disturbances caused by masses of people trying to see her body. She was returned to the county morgue

and though her husband apparently continued to try and raise money to bury her elsewhere, he ran out of time and she was buried in the potter's field wrapped in a plain shroud, in a large, makeshift coffin. There is no mention in any of these articles about her friends or circus compatriots assisting in the effort to provide her with a decent burial, nor does it mention any of the "riches" she supposedly possessed. What is clear is that her husband's choices regarding her mortuary treatment were inevitably out of his hands—the realities of expenditures, the public's morbid curiosity that would have mortified her in life, and the regulations regarding the length of time a body could remain at the coroner's office not only limited his choices, but, as Cunningham says, they made them "meaningless." However, it was most likely Harry who provided the decorated thumbscrews for the makeshift coffin, a small piece of the grand burial he had wanted for his wife.

### "No Parent Should Have To Bury A Child": The Rosche Family

> *No parent should have to bury a child.... No mother should have to bury a son. Mothers are not meant to bury sons. It is not in the natural order of things. I buried my son. In a potter's field. In a field of Blood. In empty, acrid silence....*
>
> — Stephen Adly Guirgis, *The Last Days of Judas Iscariot*

I clearly remember the afternoon in 2008, while transcribing burial register entries into the department's Paradox database, when I came across the name ROSCHE five times in nine consecutive rows (Figure 6.15). Having worked with the MCPFC document for only a short time, I had yet to develop a sense of the population, but even then I knew that families were exceptionally rare; these burials had to have been the product of some horrible tragedy. That section of the register, however, did not list causes of death or ages, and this was long before I embarked on my quest to gather the all the death certificates, so on that afternoon, I had no idea how heartbreaking the Rosches' story truly was.

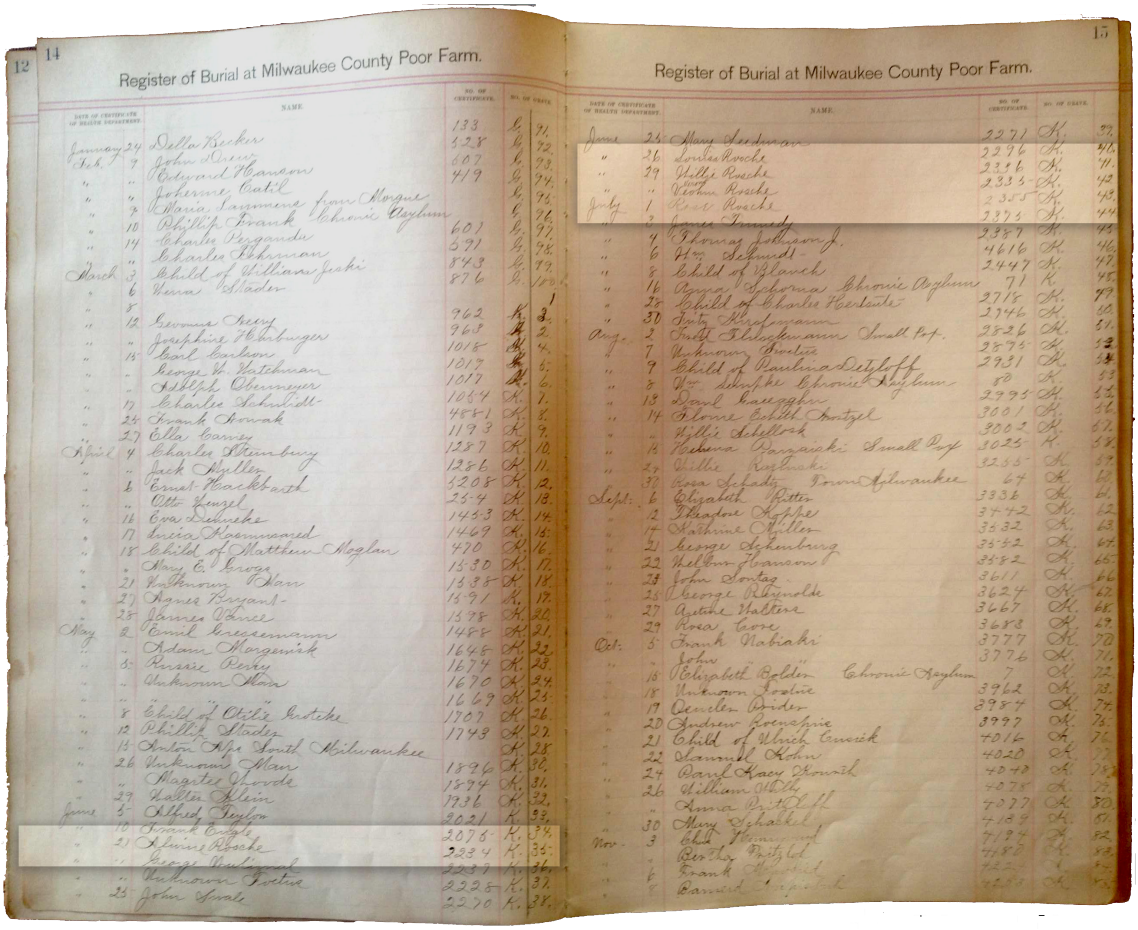

Figure 6.15 RBMC pages 14 and 15 showing listing five members of the Rosche family (Photo by author).

Later, while entering the pre-1907 death certificates at the Golda Meir Library, I began to understand this family's unfortunate history with Cemetery II. ALVINA (listed as ALWINE in the register), daughter of Franz and Mina Rosche, was fourteen years old when she died on 20 June 1894 from diphtheria. The membersof the Rosche family listed after her had died within days from the same infectious illness: four-and-a-half-year-old LOUISA on 26 June; two-and-a-half-year-old VROHNE and twelve-and-a-half-year-old WILLIE on 29 June; and ROSA, just two months shy of her tenth birthday, on 30 June. Like Alvina, Vrohne, Willie, and Rosa were listed as the children of Franz and Minne (or Mina) Rosche, but Louisa's certificate only had the name FRED included for father's name, while the mother's name was left blank. All five had

the same residence listed on First Street, but it was not unusual for extended families to share an address, so my initial assumption was that this child was probably a cousin of the other four. More in-depth investigation into their family revealed that all five were in fact the children of Frank Rosche and Wilhelmine Rosche (neé Scherbaarth).

Frank Rosche, an iron molder, was a native of Wisconsin born in 1854. Minne,however, was a Prussian migrant, arriving in the states during August 1869 when she was fifteen years old (Baltimore Passenger and Immigration Lists, 1820-1872). According to the same records, an Emilie Schaarbarth (age 46), Wilhelm Schaarbarth (age 17), and Auguste Schaarbarth (age 10) arrived on the same vessel out of Bremen. Wilhelm Scheirbarth (age 56), a joiner by trade and likely her father, came to the states a year earlier.

In 1874, Minnie and Frank were married in Marathon, Wisconsin, and after this union, census records and birth certificates indicate that children came often and with some regularity[2]:

Heinrich in 1877
Edward in 1879
Emma [Alvina] in 1879
Emil [William, Wilhelm, Willie] in 1882
Rosa in 1884
Alma in 1886
Lillie [Hulda] in 1889
Ida [Louisa] in 1890
Mable [Vrohne] in 1892
Elsa in 1893

Additionally, two more children were born after the deaths of Alvina, Willie, Rosa, Louisa and Vrohne in 1894:

Anna Martha [Hedwig Anna] in 1896
Frances [Margaretha Francie] and Gustave August (twins) in 1899.

In addition to the five children who succumbed to diphtheria in 1894 and were buried at the MCPFC, it appears they first lost Heinrich sometime prior to 1884; he is listed as a sibling on

the birth certificates of Alvina in 1879 and Willie in 1882, but not any of the following children, and he also disappears from the censuses. No Milwaukee County death certificate has been located for Heinrich, however, so I am unsure where he was buried. One of the twins, Gustave, also died in 1899 at five months old. He, too, was buried at the MCPFC. By the end of 1899, Minnie had borne Frank thirteen children, but only six still lived.

Alvina died six days before her sisters and brother, and she was laid to rest first. Whether or not financial concerns influenced her parents' decision to bury her in the potter's field is unknown, but Frank and Minnie clearly had several other deathly ill children to care for, and they may not have had the time or wherewithal to arrange a proper funeral. Certainly, after the other four passed in quick succession, the cost of undertakers, coffins, and burial plots at a traditional cemetery would have been prohibitively expensive, especially since this epidemic struck during an industrial depression, which caused many manufacturing plants to shut down and laborers to lose their jobs (Gurda 2008). Given his occupation as an iron molder, Frank may have been unemployed during this difficult time, further limiting their options.

In 2013, while investigating the MCPFC subadult population for evidence of endocranial lesions, visiting skeletal biologist Dr. Robin Lillie was able to assign ages to a sequential row of burials from the northern section of the cemetery excavated in the 1990s (Figure 6.16): 9.7–11 years for Burial 9321 (Figure 6.17), 2.3–2.4 years for Burial 9400 (Figure 6.18), 4.5–5 years for Burial 9403 (Figure 6.19), and 10–13 years for Burial 9322 (Figure 6.20). The demographic data presented in Chapter 5 clearly show that fetuses and young infants constituted the greater part of the subadult population; older children were rare, and therefore the pattern of individuals identified by Dr. Lille could only be the Rosche siblings.

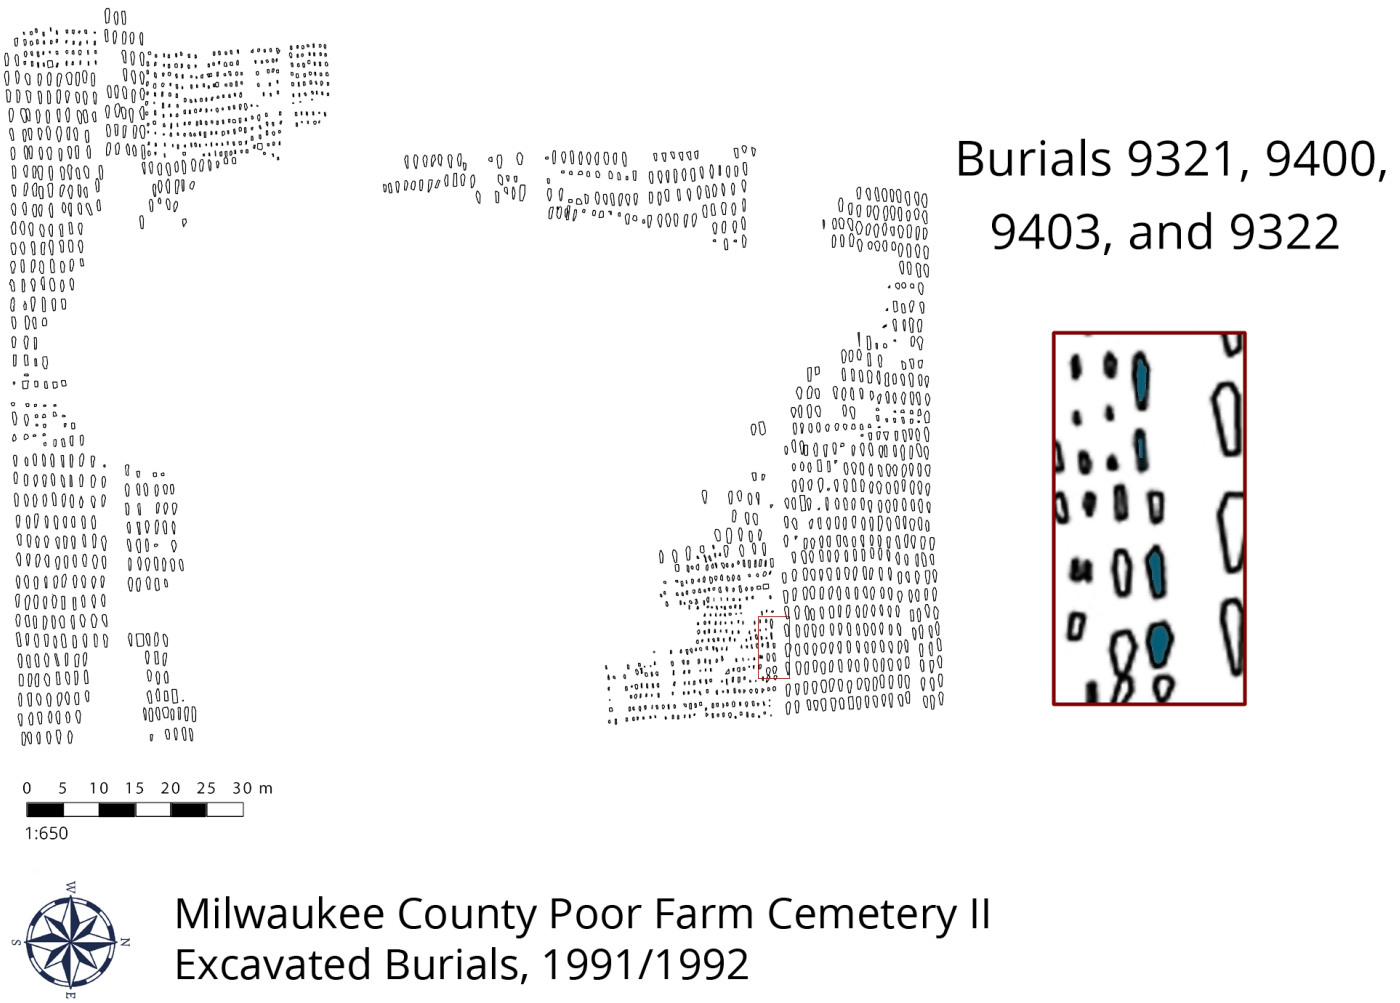

Figure 6.16 Excavation map showing location of Burials 9321, 9400, 9403, and 9322 (Map generated by author from GIS data compiled UWM-CRM; reprinted with permission).

Figure 6.17 Burial 9321, aged 9.7-11 years (Photo on file at UWM-ARL. Reprinted with permission).

Figure 6.18 Burial 9400, aged 2.3-2.4 years (Photo on file at UWM-ARL. Reprinted with permission).

Figure 6.19 Burial 9403, aged 4.5-5 years (Photo on file at UWM-ARL. Reprinted with permission).

Figure 6.20 Burial 9322, aged 10-13 years (Photo on file at UWM-ARL. Reprinted with permission).

The identification of Burial 9322 as Willie Rosche helps to explain an anomaly observed in the field; the excavator noted, "Juvenile was put into a[sic] infant coffin, The lower legs were folded back and both feet rested underneath the right pelvis." Without any context, it would appear this treatment of the body was an act of haste or carelessness on the part of the county undertaker, but I believe it is an expression of what little control Frank and Minnie had over their children's burials. The orderly manner in which graves were laid out in the children's sections of Cemetery II would have prohibited the burial of a coffin larger than the standard infant size, Alvina, buried days earlier, was a teenager and would have been placed in an adult coffin and buried in the adult section, but I believe Frank and Minne did what they could to ensure that their little ones stayed together, even if that meant putting Willie in a coffin too small for his twelve-year-old body. When Gustave died five years later, the Rosches still had six children to care for, and perhaps the knowledge that this baby had been buried in the same ground, unconsecrated though it may have been, as his older brother and sisters offered them comfort. He may be one of the hundreds of yet-to-be identified infant burials, but it is likely that Alvina numbers among the thousands destroyed to make way for the nurse's residence in 1932.

For better or worse, neither Frank nor Minnie lived to see the destruction of the poor farm cemetery. On 23 November 1908, Minne ingested carbolic acid with suicidal intent. Notably, she was not buried at MCPFC, but rather Union Cemetery in Milwaukee. Frank was buried in the same cemetery after he died while in Chicago in 1920. I have to wonder if, given the choice, they would have preferred being laid to rest closer to their children.

*Endnotes*

1 St. Margaret Mary was a seventeenth-century nun who was canonized after reporting numerous visions sent to her by Jesus Christ (Kelly 2014). The phrase “Behold the Heart” references one of these visions, a longer passaged shortened by most Catholics to “Behold the heart that has loved humanity so much and has been so little loved in return” (Richo 2014).

2 Typical of early documents, the names for each child differed depending on whether referenced in their birth certificate, census records, death certificates or burial register. The identity of each child on the different documents was cross-checked by age and/or date of birth. They are listed here by their names as they appeared on their birth certificates, with different monikers included in brackets.

# Chapter 7

## The Archaeology of the Individual and the Milwaukee County Poor Farm Cemetery

Prior to hospital construction in late 1991 and early 1992, and again in 2013, archaeologists were called upon to excavate 1,649 and 831 burials, respectively, from the unmarked Milwaukee County Poor Farm Cemetery. The individuals disinterred during these field seasons represent what remains of a much larger indigent population buried by Milwaukee County between 1882 and 1925 in what has been designated Cemetery II (one of four burial grounds utilized by the county in the late 19th and early 20th centuries). Long before the expanding facilities at Wauwatosa's Milwaukee Regional Medical Center threatened these graves, however, the very nature of pauper burial grounds caused the identities of these disenfranchised individuals to be systematically obliterated.

The research presented here is one component of the collaborative Milwaukee Poor Farm Cemetery Project, the mission statement of which is "to reverse the anonymity and neglect that has characterized the history of this cemetery, fulfilling the dual missions of ethical science and social justice for those once interred" (MCPFCP). The opening quotes in the introductory chapter from Hume's *Martin's Hundred* and Kathy Reich's *Break No Bones* were selected because they reflect this mission. My contribution to this important work was a project with the following complimentary goals: first, production of a comprehensive demography for the original burial population based on primary archival sources; second, the utilization of this demographic data and statistical testing to identify under- and overrepresented groups and provide contextual explanations for the relative frequency of these cohorts; third, contribution of aggregate data and procedures to the Milwaukee County Poor Farm Project's burial identification efforts; and finally, construction of life history narratives for a small sample from the underrepresented groups to

both demonstrate the utility of the archaeology of the individual approach and take steps towards reversing the anonymity of this disenfranchised population.

For many of Milwaukee's late nineteenth- and early twentieth-century residents, the pauper's burial was an all-too-real possibility and a dreaded fate. A potter's field funeral, if it could be called that, incorporated none of the elements central to a proper Christian burial—no religious rites, no beautifully adorned coffin, no elaborate tombstone—only a wooden marker without a name, merely a number. Compounding this fear of identity obliteration was the possibility of medical dissection, an anathema concept in a Judeo-Christian society that believed an individual's earthly remains must stay intact even after death. If burial in a potter's field was so loathsome, why were 7,226 individuals interred in the Milwaukee County Poor Farm Cemetery II? Poverty alone cannot be the answer, or this number would be even greater. Milwaukee's lower class was substantial, but clearly most found the means to bury their dead elsewhere.

A central theme in modern mortuary studies is that "the dead do not bury themselves but are treated and disposed of by the living" (Parker Pearson 1999:3), so if we are to understand why an individual was buried in the poor farm cemetery, we must first have a sense of the social network in which he or she lived. What networks, then, could the deceased have relied upon to ensure a proper burial, and why did these fail?

To elucidate these questions and satisfy the goals stated above, I executed a multi-scalar research program. I first developed a full accounting of the MFPFC burial population utilizing various documentary resources including the *Register of Burials at the Milwaukee County Poor Farm Cemetery* and Milwaukee County coroner's inquests. Second, I ran numerous goodness of fit chi-squared tests, comparing a temporally-controlled sample of City of Milwaukee death

figures against the cemetery demography to determine which categories of individuals were under- or overrepresented in the burial population. Contextualizing these results within the city's population history revealed the various social networks in which the dead participated during their lives and began to explain why these failed at keeping individuals from a pauper's grave. The next step, matching the names from the documents to excavated burials, required a reduced scale of analysis and a synthesis of archaeological, osteological, and archival data. Finally, I constructed three life history narratives that highlight the archeology of the individual approach's efficacy in illuminating failing social structures. Each case is unique and demonstrates that real value can be found in "seeing the trees through the forest."

*Milwaukee's Breadless and the Archaeology of the Individual*

Many social historians concerned with the everyday lives of those in the past have moved beyond traditional bureaucratic and institutional records to ego documents: the journals and diaries written by the individuals being studied. A limitation to this approach, and one that is readily recognized by these scholars, is that these documents tend to represent only the attitudes, values, and agency of the middle and upper classes; the frequently-illiterate masses that constituted the lower classes did not generally produce these types of manuscripts. As Cunningham laments:

> Historians of the mass of the population, as distinct from the elites, of Europe and North America adopt concepts and a language derived from the disciplines of demography, economics, and anthropology. The more literary resources, such as conduct books or diaries, which form the bulk of our evidence about elites, are either not present or thought to be irrelevant: peasants did not read conduct books. Demography tells us about the behavior of this mass of the population, the age at which they got married, the number of children they had, and so on; economics enables us to deduce their family strategies; and anthropology seeks to explain the meanings which people attached to their behaviour. In none of these do we have the illusion of intimacy which can be gained from reading a diary. Individual children and their families rarely come alive for us. (2005:82)

The project presented in this dissertation contradicts some of these assertions. While it is true that the breadless of Milwaukee did not generally leave diaries detailing their daily lives, their relationships, or their feelings about burying a loved one in a pauper's grave, an archaeology of the individual approach to the MCPFC population that includes multi-scalar demographic analyses and historically as well as culturally contingent explanations brings us a step closer to a more enlightened, if not a more intimate, understanding of these disenfranchised people.

There is an expectation that historic cemeteries are unfiltered reflections of the societies that utilized them; it is true that, at least demographically speaking, many cemeteries mirror their parent population. Support for this can be found in the similar mortality, age, and sex profiles generated from documentary data, as well as church and public cemetery excavations However, institutional cemeteries like MCPFC typically have significantly different compositions. So, how are past social networks reflected in these unusual contexts? Population-level analyses of historic cemeteries of all kinds allow for the recognition of patterns that represent broad social structures of the past. I argue, however, that the application of a multi-scalar archaeology of the individual approach, particularly to institutional cemetery populations, provides a new perspective that uncovers not only these social structures but also a fluidity and complexity that is often overlooked.

This framework is deeply embedded in the post-processual archaeology of the 1980s and 1990s that shifted the focus from systems theory, evolutionary determinism, and functionalism to a more "bottom up" archaeology. This shift resulted in the recognition of the varied experiences of individuals with different social identities. Additional advancements in this vein have recently been driven by feminists of color (Crenshaw 1989), who also stress the importance of

intersectionality.

The fluid nature of social identities within disparate social settings is part and parcel of discussions on the recursive relationship between agency and social structure. Considerations of structure and agency in North American archaeology generally rest up on the foundations laid by Giddens (1979, 1984) and Bourdieu (1977), and the interwoven nature of agency and structure is highlighted by several scholars.

Rooted in this framework of agency/structure is the acknowledgment that, to truly understand how individual actors exercise agency within the confines of social structure, the individual must be situated within his or her own historical context, and the emphasis on the contextual interpretation of individual actors has led several authors to assert that archaeology is an historical as well as anthropological discipline.

If one accepts the connection between archaeology and history, then the archaeology of the individual approach can be closely associated with the recent microhistorical trend in social history. Microhistory is the "intensive historical investigation of a relatively well defined smaller object, most often a single event, or a village community, a group of families, even an individual person" (Ginzberg and Poni 1991:3); the extensive focus on a small scale subject, especially an individual, allows for great precision and nuance in not only historical descriptions but interpretations of the social context of everyday lives.

Another similarity between microhistory and the theoretical framework applied here is an emphasis on narratives. Narrative writing in archaeology is not a new phenomenon; however, in recent years there has been considerable discussion concerning its place in archaeology, and particularly in historical archaeology. A foundational argument supporting its use—one that comes directly from post-processual thought—is that all archaeological writing, and by extension

historical writing, is subjective and a construction of past actuality. When an archaeologist writes about the past, he or she chooses what to include and what to omit. This process can never be wholly objective because the scholar's political ideology and past experiences, as well as research agenda, will always influence his or her choices.

Given this, the benefits of a narrative archaeology of the individual are as follows: (1) it facilitates holistic synthesis of different types of resources as well as integration of data within interpretation; (2) it produces contextual constructions of lived experience, especially for those who may have been ignored in the past; (3) it allows for complete transparency in both research and interpretation, allowing for the forfeiture of a positivist authoritative voice; and (4) it tends to lead to the production of a thoroughly accessible manuscript. The narratives constructed during this project strive to reflect all these elements.

*MCPFC Population and Individual Narratives*

The demographic profiles generated from these archival investigations were presented as in-depth analyses subdivided into age cohorts; other important variables like sex, marital status, nativity, cause of death, and postmortem intervention were incorporated into these descriptions. In keeping with the archaeology of the individual approach, I provided descriptions of specific individuals to highlight key points. Statistical tests comparing these age profiles to those from the City of Milwaukee demonstrated that this burial population differed significantly from the community in a number of key ways; stillbirths, the middle aged and, in some years, the elderly, men, and migrants from Sweden, Austria, and Greece were overrepresented while infants over three months old, as well as all other subadults, women, married persons, native-born individuals, and migrants from Germany and Poland were underrepresented. Following the presentation of this data I provided a discussion of the historical and cultural factors that likely

influenced these findings.

For example, explanations for the differences between the overrepresentation of stillbirths and the underrepresentation of other subadults drew upon a Catholic ideology that prevented unbaptized infants from burial in consecrated ground, Warner's (1959) social personality theory as it pertains to mortuary treatment, and changing societal attitudes towards childhood that would have greatly influenced parents' willingness to invest in a proper funeral for their children.

When discussing various differences among adults, it was important to remember the intersectional nature of individual identity; variables like gender, marital status, and nativity could not be considered in isolation. For instance, while occupation and place of origin were contributing factors in the burial of many young and middle-aged males (both single and married), advanced age, established attitudes towards gender roles, and marital status were the most significant influences in the underrepresentation of women.

The narratives that followed explored how issues of volition and the sometimes meaningless nature of choice in the face of extraordinary circumstances and extreme poverty played out in the Milwaukee County Poor Farm Cemetery. The three vignettes centered on individuals who were unusual in the cemetery population; based on the demographic study and the unique nature of their particular profiles putative identifications of their remains were possible. In each I went beyond straightforward life history and situated myself within the narrative. This allowed me to relate the sequence of events that led to their identification, discuss what their excavated remains can tell us about their embodied past, detail the steps I took to uncover as much information as possible about their historically unremarkable lives, and make statements about how their families, in times of great stress and grief, acted in response to the constrains of poverty, religion, disease, and institutional mandates. With this approach, I

hoped to not only tell the stories of these disenfranchised few but illustrate how consideration of the individual can help to both explain deviations in archaeological patterns and enrich our understandings of those we are studying.

*Significance of the Milwaukee County Poor Farm Cemetery Project*

The identification of and explanations for over- and underrepresented groups, as well as the life histories that grew out these considerations, were only two of the four stated goals of this project. The other two—the production of a comprehensive demographic profile for the original burial population and the contribution of aggregate data and burial identification procedures to the collaborative Milwaukee County Poor Farm Cemetery Project—were necessary foundations of the former, but also significant in their own right. In particular, the complete accounting of the burial population is integral to the MCPFC mission. Without the database generated via this research endeavor and the demographic study of that data, the individuals buried at the MCPFC would be lost in anonymity forever.

This research and the MCPFCP as a whole are unique among institutional cemetery investigations—no other archaeological excavation matches it in size, depth of analysis, or concern for the individual. For instance, the Secaucus, New Jersey, potter's field excavation resulted in far more excavated burials than Milwaukee County—in total 4,571 burials were disinterred—and documentary data in the form of burial registers were used to generate a demographic profile for the original burial population that included 9,791 individuals (Louis Berger Group 2005). Based on the authors' descriptions, these registers contained the same type of limited and inconsistent data found in the RBMC. Unlike the work presented here, however, the New Jersey registers were the only archival source utilized for their demographic analysis, which was therefore incomplete. Despite this documentary shortcoming, these investigators had

the unbelievable fortune of plot maps that they were able to associate with excavated burials. As a result, 825 individual burials were identified by name. Given the limited funding for analysis, however, only 409 or 8.9% of the excavated population underwent extensive osteological analysis and only six case studies were generated from this substantial identified group (Louis Berger Group 2005).

A number of other poor farm cemeteries have been excavated and analyzed in conjunction with significant archival research, but all are much smaller in scale than the MCPFC and most have only culminated in population-level analyses. One hundred and twenty burials were exhumed from the Dunning Poorhouse Cemetery in Chicago. Grauer and McNamara provide the demographic profile constructed from the osteological investigation of these individuals buried between 1851 and 1869, as well as the comparisons made to the 1860 and 1870 US Federal Censuses and the 1870 Chicago, Illinois Census Index (1995:93). The archival resources utilized for the demographic analyses for the Monroe County Almshouse Cemetery (aka the Highland Park Cemetery) were slightly more varied and specific to that particular institution (Lanphear 1988). However, despite having a complete archival accounting of the original burial population, as well as data gathered from 296 excavated burials, no study focused on individuals has been conducted (see also Higgins and Sirianni 1995; Sirianni and Higgins 1995; and Sutter 1995).

Though not specifically identified as such, the analysis conducted by Elia and Wesolowsky (1991) is similar to the archaeology of the individual approach taken here, but their burial population consisted of only thirty-two individuals from thirty-one graves. Thorough archival research was conducted and attempts were made to identity the excavated burials, but Elia (1991) notes this was a frustrating endeavor, largely due to incongruencies between

the osteological analyses and an uncertain burial record. Three tentative identifications—two infant siblings and one young adult female—were made. The only robust identification was an elderly African American woman who was the only person buried in the almshouse cemetery commemorated with an inscribed tombstone. A life history of this woman, Nancy Adams, was constructed, but the remainder of the burials remain anonymous.

Reversing the neglect and anonymity that has characterized these cemeteries is clearly a monumental task that can only be accomplished through the collaborative efforts of numerous scholars; this is another way in which the MCPFCP is unique. As of this writing, these efforts include aging fetal and infant remains using skeletal and dental methods and correlating these methods with the presence of safety pins used on diapers (Brennan Charles, personal communication); an assessment of traditional osteological indicators of tuberculosis in conjunction with DNA extracted from both bone tissue and the dental calculus (Helen Werner, personal communication); comorbidity of pneumonia and influenza during the 1918 outbreak and the causative power of medical specialization (i.e. physician v. coroner) on designated burial location (Ashley Brennaman, personal communication); the application of digital scanning techniques for reconstructions of embodiment and burial identifications (Jessica Skinner, personal communication); retrieving individuality from commingled and mixed burial contexts (Catherine Jones, personal communication); further elucidation of material culture categories (Eric Burant, personal communication); and the correlation of medical waste with evidence of postmortem medical intervention in an attempt to identify from which medical facility the anatomized remains came (Alex Anthony, personal communication). The work presented here serves as an integral part of the foundation these research projects can continue to build upon.

Ultimately, and each in their own ways, these ongoing activities add new perspectives

and approaches that will help facilitate further burial identifications. The specific identifications made during the course of my work—Burial 8108 as Emilie Bannovski; Burial 5048 as Gertrude West; and Burials 9321, 9400, 9403, and 9322 as the Rosche children—contribute to the growing number of putative and robust identifications made by Richards (1997) and Freire (2017). As more of these keystone burials are matched to names compiled during this project, it becomes increasingly likely that the MCPFC team will be able to further understand the complex burial patterns observed archaeologically, and subsequent identifications will occur more frequently and with more certainty. The cloud of anonymity surrounding these disenfranchised individuals will lift, allowing us to provide some of the dignity denied to them in death.

Dx=total number of individuals per age interval, dx=percentage of individuals dying in each age interval, lx=number of survivors of a theoretical cohort of 100 individuals entering each age interval, qx=probability of death in each age interval, Lx=total number of years lived during each age interval, Tx=total number of years lived after a lifetime of all individuals entering each age interval, e°x=life expectancy of all individuals entering each age (adapted from Ubelaker 1974)

# APPENDIX B

Comprehensive List of Individuals Buried in the Milwaukee County Poor Farm Cemetery

## MCPFC BURIAL LIST KEY

ID# Unique database identifier

Last name As listed on death certificate

First name As listed on death certificate

Color As listed on death certificate

| | |
|---|---|
| A | Arabian |
| B | black |
| C | coloreD |
| E | Ethiopian |
| I | Indian |
| M | Mexican |
| N | Negro |
| U | unknown |
| W | white |

Sex As listed on death certificate or deduced name listed (e.g unknown man)

| | |
|---|---|
| F | female |
| M | male |
| U | unknown |

Age Calculated from age listed (e.g. 41 years, 5 months, and 23 days)

| | |
|---|---|
| 999.00 | no age information available |

Age category Used in osteological analysis

| | |
|---|---|
| AD | Adolescent (13 - 19.9 years) |
| EC | Early Childhood (2.5 - 5.9 years) |
| IndA | Indeterminate Adult |
| IndS | Indeterminate Subadult |
| INF | Infant (Birth - 11.9 months) |
| LC | Late Childhood (6 - 12.9 years) |
| MA | Middle Adult (35 - 49.9 years) |
| OA | Old Adult (50 years and older) |
| P/F | Prenatal/Fetal |
| TOD | Toddler (1 - 2.49 years) |
| UNK | Unknown |
| YA | YA Young Adult (20 - 34.9 years) |

Marital Status As listed on death certificate

| | |
|---|---|
| — | not applicable |
| A | abandoned |
| D | divorced |
| M | married |
| S | single |
| U | unknown |
| W | widowed |

Birthplace As listed on death certificate

Occupation As listed on death certificate

| | |
|---|---|
| — | none listed |

Date of death As listed on death certificate

Primary cause of death As listed on death certificate

| | |
|---|---|
| — | left blank |

Autopsy As listed on death certificate or coroner's inquest

| | |
|---|---|
| N | no |
| Y | yes |
| ? | possible |

## MCPFC BURIAL LIST KEY (cont.)

Cadaver — As listed on death certificate, coroner's inquest, or indicated by medical agent as undertaker

| | |
|---|---|
| N | no |
| Y | yes |
| ? | possible |

Residence category — Classified according to residence listed on death certificate

| | |
|---|---|
| CIH | City Isolation Hospital |
| CF | Correctional Facility |
| CHl | County Hospital |
| CO | County Orphanage |
| CPR | County Poor Relief |
| CPF | County Psychiatric Facility |
| CEH | City Emergency Hospital |
| MRM | Milwaukee Rescue Mission |
| MT | Maternity Hospital |
| MUI | Muirdale |
| PCI | City/Private Institution |
| NCH | Non-County Hospital |
| UNK | Unknown |

Place of death category — Classified according to place of death listed on death certificate

SEE RESIDENCE CATEGORY ABOVE

Death certificate issuer — As indicated on death certificate

| | |
|---|---|
| C | coroner |
| COH | Commissioner of Health |
| MW | midwife |
| JP | Justice of the Peace |
| P | physician |

Grave number — As listed in burial register

| | |
|---|---|
| — | none listed |

Date of burial — As listed on death certificate; if indicated health department certificate date listed instead

Curriculum Vitae

## EDUCATION

| | |
|---|---|
| 2018 | **Ph.D.** Anthropology, University of Wisconsin—Milwaukee |
| 2008 | **M.A.I.S.** Historical Archaeology/Mortuary Archaeology/History of the Near Environment, Oregon State University |
| 2004 | **B.S.** Applied Anthropology, Oregon State University |

## PROFESSIONAL EXPERIENCE

| | |
|---|---|
| 2018 | **Field Technician** CARDNO \|Bethel Cemetery Relocation Project, Indianapolis |
| 2011–2014 | **Collections Manager** Department of Anthropology \| University of Wisconsin—Milwaukee |
| 2013 | **Staff Archaeologist** Milwaukee County Poor Farm Cemetery Excavation, Historic Resource Management Services \| University of Wisconsin—Milwaukee |
| 2004–2008 | **Supervisor/Analyst** Historical Archaeology Lab \| Oregon State University |
| 2006–2007 | **Board Member** St. Paul Mission Historical Society, St. Paul, Oregon |
| 2005–2007 | **Collections Manager** St. Paul Mission Historical Society, St. Paul, Oregon |
| 2007 | **Records Supervisor/Excavation Supervisor** Episkopi-Bamboula Archaeological Project, Cyprus \| University of Cincinnati |
| 2006 | **Field Director** Fort Yamhill Archaeological Field School \| Oregon State University |
| 2005 | **Field Foreman** Fort Yamhill Archaeological Field School \| Oregon State University |
| 2004 | **Field Lab Technician** Fort Yamhill Archaeological Field School \| Oregon State University |
| 2003 | **Lab Volunteer** Champoeg Archaeological Field School \| Oregon State University |
| 2003 | **Student Excavator** Champoeg Archaeological Field School \| Oregon State University- |

## PUBLICATIONS

### Book Chapters

2016 | Richards, P.B., Jones, C.R., Epstein, E.M., Richards, N.W., **Drew, B.L.**, & Zych, T.J. "You couldn't identify your grandmother if she were in that party":The bioarchaeology of postmortem investigation at the Milwaukee County Poor Farm Cemetery. In N.C. Nystrom (Ed.), *The bioarchaeology of dissection and autopsy in the United States*. New York: Springer International Publishing.

### Journal Articles

2015 | Picard, J.L., Balco, W.M., **Drew, B.L.**, Richards, J.D. Summary of phase III excavations at the McHugh site (47WP294), Waupauca County, Wisconsin. *The Wisconsin Archaeologist (96)*1: 118–123.

**Drew, B.L.** Ideology in historic cemeteries: A case study from St. Paul, OR. *Field Notes: A Collegiate Journal of Anthropology (2)*1: 1–14.

### Compliance Reports

2016 | Richards, P.B., Burant, E.E., **Drew, B.L.**, Epstein, E.M., Jones, C.R., Richards, N.W., & Zych, T.J. *Nine for mortal men doomed to die: The archaeology and osteology of the 2013 Milwaukee County Poor Farm Cemetery project (Froedtert Tract - 47MI0527)*. University of Wisconsin—Milwaukee Archaeological Research Laboratory Report of Investigations No. 381. Milwaukee, WI.

2014 | Zych, T.J., **Drew, B.L.**, Zweig, C., & Richards, J.D. *Phase II archaeological investigations of the Elder Brook School site (47OU309), Outagamie County, Wisconsin*. University of Wisconsin—Milwaukee Archaeological Research Laboratory Report of Investigations No. 213. Milwaukee, WI.

2012 | **Drew, B.L.** & Richards, J.D. *Phase II archaeological investigations of the McHugh site (47WP294), a nineteenth century Irish farmstead in Waupauca County*. University of Wisconsin—Milwaukee Archaeological Research Laboratory Report of Investigations No. 187. Milwaukee, WI.

### Dissertations/Theses

2018 | **Drew, B.L.** *Death in anonymity: Large scale individual burial identification from the unmarked Milwaukee County Institution Grounds Cemetery, 1882–1925*. (Unpublished dissertation, in progress). University of Wisconsin—Milwaukee, Milwaukee, WI.

2008 | **Boulware, B.L.** *The deathscape of St. Paul: Historic cemeteries as cultural landscapes*. (Unpublished master's thesis). Oregon State University, Corvallis, OR.

### Other Publications

2013 | **Drew, B.L.** *Milwaukee County Institution Grounds Cemetery Osteological Analysis Manual*. Manuscript on file, University of Wisconsin—Milwaukee Archaeological Research Laboratory..

2006 | **Boulware, B.L.** *OSU Students Unearth Early Oregon Fort*. St. Paul Mission Historical Society Quarterly Newsletter, September

**Boulware, B.L.** *Preserving St. Paul, one dish at a time*. St. Paul Mission Historical Society Quarterly Newsletter, January

## INVITED TALKS

2013 Drew, B.L. The McHugh site (47WP294): An early Wisconsin Irish Farmstead. Paper presented for the Robert Ritzenthaler Lecture Series, Wisconsin Archaeological Society, Oshkosh, WI.

Drew, B.L. Milwaukee County Institution Grounds burial identification: Integrating library resources with archaeological data. Paper presented for the Golda Meir Library and the Scholar Series, Milwaukee, WI.

2006 Boulware, B.L. SPMHS French Prairie archaeological ceramic collection and the Oregon State University historical materials analysis class. Paper presented at the annual meeting of the St. Paul Mission Historical Society, St. Paul, OR.

2005 Boulware, B.L. St. Paul Mission Historical Society: Preserving your history. Paper presented at the annual meeting of the St. Paul Mission Historical Society, St. Paul, OR.

## CONFERENCE PARTICIPATION

### Papers

2018 Freire, S.K., Richards, P.B., & **Drew, B.L.** *Six impossible things before breakfast: Understanding space and place at the Milwaukee County Poor Farm Cemetery*. Abstract accepted for the annual meeting of the Society for American Archaeology, Washington DC. (11–15 April)

**Drew, B.L.** *Artifacts in the archives: Material culture curated within the Milwaukee County Coroner's Inquests*. Abstract accepted for the annual meeting of the Society for Historical Archaeology, New Orleans, LA. (3–6 January)

2017 **Drew, B.L.** *What we knew then and what we know now: How new archival research has changed our understanding of the Milwaukee County Institution Grounds Cemetery Population*. Paper presented at the annual meeting of the Society for Historical Archaeology, Fort Worth, TX. (4–8 January)

2015 Jordan, A.M, Richards, P.B., Freire, S.K, & **Drew, B.L.** *The application of strontium isotopic analysis as an element of a multifaceted archaeological approach to historic cemeteries: Case studies from the Milwaukee County Institution Grounds Cemetery*. Paper presented at the annual meeting of the Midwest Archaeological Conference, Milwaukee, WI. (5–7 November)

Jordan, A.M, Richards, P.B., Freire, S.K, & **Drew, B.L.** *The Milwaukee County Institution Grounds Poor Farm Cemetery: A case study in the application of strontium isotope analysis as an element of a multifaceted archaeological approach to historic cemeteries for the creation of individual identifications*. Paper presented at the annual meeting of the European Association of Archaeologists, Glasgow, Scotland. (2–5 September)

**Drew, B.L.** *Who, what, where, when and how: A comprehensive archival investigation of the Milwaukee County Institution Grounds cemeteries, 1882–1925*. Paper presented at the annual meeting of the Society for American Archaeology, San Francisco, CA. (15–19 April)

Epstein, E., Charles, B., & **Drew, B.L.** *Neonatal line assessment among Milwaukee County Institution Grounds (MCIG) perinates to determine viability*. Paper presented at the annual meeting of the Society for American Archaeology, San Francisco, CA. (15–19 April)

**Papers (continued)**

2014 Picard, J.L., & **Drew, B.L.** *Flat glass and family treasures: A preliminary analysis of the artifact assemblage from the McHugh site (47WP294), a 19th century Irish farmstead in Waupaca County, Wisconsin*. Paper presented at the annual meeting of the Midwest Archaeological Conference, Champaign, IL. (2-4 October)

2013 **Drew, B.L.** *Bioarchaeological and archival investigations of the Milwaukee County Institution Grounds Cemetery collection: A progress report.* Paper presented at the annual meetings of the Society for Historical Archaeology, Leicester, United Kingdom. (9-12 January)

Richards, P.B., & **Drew, B.L.** *Burial and remembrance: The Milwaukee County Poor Farm Cemetery*. Paper presented at the annual meetings of the Society for Historical Archaeology, Leicester, United Kingdom. (9–12 January)

2012 **Drew, B.L.** *The integration of historical documents with archaeological data: The Milwaukee County Institution Grounds Cemetery Burial Identification Project*. Paper presented at the annual meeting of the Midwest Archaeological Conference, East Lansing, MI. (17–21 October)

**Drew, B. L.** *Individual skeletal identification: A comprehensive analysis of the Milwaukee County Institutional Grounds Cemetery, Wauwatosa, WI*. Paper presented at the annual meeting of the Society for American Archaeology, Memphis, TN. (18–22 April)

**Drew, B.L.** *The Milwaukee County Institution Grounds "forgotten" cemetery: An integrated approach to individual skeletal identification.* Paper presented at the annual meetings of the Society for Historical Archaeology, Baltimore, MD. (4–8 January)

2008 **Boulware, B.L.** *The 'deathscape' of St. Paul: Historic cemeteries as cultural landscapes*. Paper presented at the annual meetings of the Northwest Anthropological Conference, Victoria, British Columbia. (23–26 April)

2006 **Boulware, B.L.** *The 'deathscape' of St. Paul: What cemeteries can tell us about one of Oregon's earliest communities.* Paper presented at the annual meetings of the Northwest Anthropological Conference, Seattle, WA. (29 March–1 April)

**Posters**

2012 **Drew, B.L.** *Life on the western frontier: Functional analysis of artifacts recovered from the McHugh site (47WP294)*. Poster presented at the annual meeting of the Midwest Archaeological Conference, East Lansing, MI. (17–21 October)

Richards, J.D., & **Drew, B.L.** *The McHugh site (47WP294): Results from a phase II investigation of a nineteenth century Irish farmstead*. Poster presented at the annual meeting of the Midwest Archaeological Conference, East Lansing, MI. (17–21 October)

2010 **Drew, B.L.** *Register of Burials at Milwaukee County Poor Farm: Utilizing historical documentation in the analysis of an excavated historic cemetery.* Poster presented at the annual meeting of the Society for American Archaeology, St. Louis, MO. (14-18 April)

**Discussion Panels**

2011 **Drew, B.L.** *Archaeology of institutional life.* Panel discussion at the annual meeting for the Society for Historical Archaeology, Austin, TX. (5–9 January)

## TEACHING EXPERIENCE

**Indiana State University**

| | |
|---|---|
| 2017–present | World Cultures and Environments, Lecturer |
| | Prehistory and Climate Change, Lecturer |

**University of Wisconsin — Milwaukee**

| | |
|---|---|
| 2012 | Archaeological Curation and the Crisis in the Closet: A Practicum in Management and Care of Research Collections, Co-instructor |
| 2010–2011 | Introduction to Anthropological Statistics (traditional and online), Instructor |
| 2010 | Lifeways In Different Cultures: A Survey of World Societies (online), Teaching Assistant |
| 2009 | Introduction to Anthropological Statistics, Teaching Assistant |
| 2008–2009 | Introduction to Anthropology: Human Origins, Teaching Assistant and Discussion Instructor |

**Oregon State University**

| | |
|---|---|
| 2007 | Archaeological Databasing Systems, Instructor |
| 2006 | Evolution of People, Technology and Society, Teaching Assistant |
| 2005–2006 | Introduction of Cultural Anthropology, Teaching Assistant |
| 2004 | Comparative Cultures, Teaching Assistant |

## POTENTIAL COURSE DEVELOPMENT

Introduction to Anthropology
Introduction to Archaeology
Archaeology of the Midwest
Archaeology of the Northwest
First Americans, Last Frontiers
North America After the Ice Age
Human Origins
Anthropological Theory
Archaeological Field Methods
Historical Archaeology: Theory and Methods
Historic Materials Analysis
Anthropology/Archaeology of Death
Mortuary Archaeology
Human Osteology
Osteoarchaeology
Historic Cemeteries as Cultural Landscapes
Historical Demography
Statistics for Social Sciences

## AWARDS

2013 **Chancellor's Golda Meir Library Scholar Award**
University of Wisconsin—Milwaukee

2009 **Chancellor's Graduate Student Award**
Department of Anthropology | University of Wisconsin—Milwaukee

2008 **Chancellor's Graduate Student Award**
Department of Anthropology | University of Wisconsin—Milwaukee

2007 **Buck Davis Archaeological Scholarship**
Department of Anthropology | Oregon State University

2005 **Oregon Laurels Scholarship**
Department of Anthropology | Oregon State University

2004 **Oregon Laurels Scholarship**
Department of Anthropology | Oregon State University

## PROFESSIONAL AFFILIATIONS

Society for American Archaeology
Society for Historical Archaeology
Association for Gravestone Studies
Midwest Archaeological Conference
Wisconsin Archaeology Society
Milwaukee County Historical Society
