

## NEW COMMUNICATION TECHNOLOGIES, THEIR HISTORY AND SOCIAL INFLUENCE: AN ANNOTATED BIBLIOGRAPHY

This annotated bibliography covers scholarship on the history and influence of new communication technologies. The term “new” is used in a historical sense, which is to say that all technologies were at one time new. For example, innovations in timekeeping, the reproduction of visual images, and Johann Gutenberg’s invention of printing with movable metal type were new in the context of the period between the thirteenth and mid-fifteenth centuries and they helped to make possible the modern world. This bibliography attempts to cover both very old and very recent developments in communications, and in so doing to place the rapid changes of our modern-day world into historical perspective.

Scholars have suggested that changes in communication can often have profound historical consequences, challenging established values as well as economic and power structures, altering the way we organize, indeed, perhaps even transforming the way we think. Some speculate that empires rise and fall as a result of these innovations. If we look at Gutenberg’s invention now more than five centuries removed from our own time, we can see that the printing press set in motion changes that were of enormous historical importance not only for Western Civilization but for the entire world. It greatly increased the volume of printed material, was a catalyst in the Protestant Reformation, in the rise of science, capitalism, nationalism, and democratic government. It freed scholars from rote memory and stimulated creative thought in many areas. It altered our relationship with history and how we experience the past.

What do we make, though, of the many achievements of more recent times? Forget for a moment the latest developments in digital computing and consider a few of the many achievements of the nineteenth century. The advent of steam power, photography, and the electric telegraph during the first half of the nineteenth century were but precursors of even more stunning advances in the later half of that century. The phonograph (which made it possible for the first time to capture sound), the telephone, the electric light and the spread of an electrical network, moving pictures, and the wireless had by 1900 laid the foundation for much of twentieth century living. These innovations in communication were part and parcel of the Industrial Revolution and they helped to facilitate the shift from rural to urban living, and the transition from traditional to modern thinking. Taken together, these developments amounted to one of the great divides in human experience.

Some measure of the magnitude of change in the United States can be seen in the statistics involving patents. During the first half of the nineteenth century, the federal government in the United States issued 50,000 patents for new inventions. Between 1865 and 1890, that number increased to 1,000,000, and in the three decades following 1890, yet another 1,000,000 patents were issued. Certainly not all, or even most of these patents related to communication, to be sure, but many did. Perhaps more important than the statistics, beyond any one innovation or set of inventions, though, was a new way of thinking. As Alfred North Whitehead once put it, “the greatest invention of the nineteenth century was the invention of the method of invention.” By 1914, the British political theorist and psychologist Graham Wallas wrote that people found “themselves working and thinking and feeling in relation to an environment ... without precedent in the history of the world.”

During the twentieth century, the creation of new technologies related to communication accelerated at an increasing pace. Radio, cinema, and television; radar, rocketry, and satellite communication; digitization, computers, and the Internet are only among the most obvious innovations. Numerous inventions transformed our ability to record and transmit sound and images. The power and speed of computers, which seem to increase exponentially as their size diminishes, provided unprecedented ability to deal with complex problems. Undoubtedly they will help to continue to accelerate the rate of innovation and pace of change as the twentieth-first century unfolds.

Many of the inventions of the past century and a half, either individually or when taken together, may be comparable to Gutenberg’s printing press in their impact on history. Consider some of the themes in the literature of this bibliography. Several writers argue that democracy depends on print culture and that the more visual, electronic media of recent years threatens this system of government. Some contend that our dependence on electronic media imperils our legacy to future generations because while modern media give us the ability to record more than ever before, they deteriorate rapidly and the technology on which information is stored quickly becomes obsolete making the data inaccessible. Some writers maintain new media that pass easily across national boundaries and into our homes — radio, satellite television, the Internet — threaten the existence of the nation state. Some link the collapse of the Soviet Union to a flood of new media — computers, facsimile machines,

electronic mail, video recorders – that came into that nation during the 1980s. Other scholars argue that modern technology has become so sophisticated and invasive that it threatens to destroy almost any possibility of privacy. Still others maintain that recent developments in artificial intelligence and biotechnology may alter the very definition of what it means to be human.

It is, therefore, an important time to study communication technology and also perhaps to rethink the history of this field. The study of the history of communication is a comparatively new area. It was not until 1955, for example, that the first Mass Communications History Center was created. Established at the University of Wisconsin when the radio commentator H. V. Kaltenborn donated his papers to the State Historical Society, the Center was dedicated in early 1958, at a time when television was considered to be at the “apex” of modern mass communication. A couple of years later, a group of leading historians, political scientists, and communication researchers from around the United States met in Madison and suggested several broad areas in which historical documents should be collected, to complement the Historical Society’s already strong collections in print media. These categories included radio, television, film and theater, advertising, and public relations, and they defined the subsequent collection policies of the Historical Society.

These broad categories remain important, of course, to any program devoted to the study of modern communication. But much has happened since the 1950s. The Mass Communications History Center was dedicated only a few weeks after the Soviet Union had launched Sputnik and literally on the eve of the first man-made satellite to be put in space by the United States. Satellites helped to transform many areas related to communication including photography, surveillance, television, weaponry, global positioning devices, and cell phones.

The launching of Sputnik in October, 1957, had long-term consequences for research and development that affected communication in the United States in other ways. The establishment of the Defense Advanced Research Projects Agency (DARPA), created in the aftermath of Sputnik, promoted cutting-edge research in many areas including computers. Some of this work eventually led to the creation of the Internet. By the late 1950s, Americans had heard about computers but no doubt for many of them the term computer brought to mind UNIVAC, a huge machine that sometimes appeared on television game shows. Surely the increasing sophistication of computers and their widespread use by millions of people since that time represents a change of enormous historical importance.

Since the creation of the Mass Communications History Center many other developments have transformed communication and they need to be integrated more effectively into the ways we study and think about modern media. In 1955, the transistor was just making its presence felt in radios and the integrated circuit had yet to appear. Magnetic recording, both audio and videotape, had just started to bring major changes in the way Americans experienced entertainment, sports, and news. Innovations in cameras, lighting, and film technology made it possible to capture spontaneous events and replay them quickly, increasingly in color. Videocassettes, and then compact discs, combined with cable and satellite television brought great changes in home entertainment. The shift from analog to digital media during the past quarter century has affected almost all aspects of our society and we now only dimly perceive what its long-term significance may be.

This annotated bibliography attempts to bring together scholarship on these and many other crucial issues of our time. In so doing, it tries to build on and go beyond earlier reference works. Indeed, one category in the volume is simply labeled “Bibliographies.” It is devoted to other bibliographies that deal with technology, many of which focus on such specialized areas as electricity, computers, motion pictures, photocopying, and more. One earlier and unannotated bibliography similar in theme to this edition was compiled by Benjamin Shearer and Marilyn Huxford and entitled *Communication and Society: A Bibliography on Communications Technologies and Their Social Impact* (Greenwood Press, 1983). That work gave heavy emphasis to print media (books, magazines, newspapers), and to such non-print media as film, radio, and television. The volume appeared shortly after cable and satellite television had started to change home entertainment and about the time that video cassettes were becoming popular. Its publication came before the spread of personal computers and the Internet. Home movies and home video each received one entry respectively, and there were no entries for such topics as magnetic tape recording, digital media, or military communication. Only one entry appeared for the transistor and none for integrated circuits or microprocessing.

## Bibliography

### 1. Division of Motion Picture Censorship Records, 1922-1966.

Virginia created the censorship division on March 15, 1922. It was one of seven state censorship boards that operated until the 1960s. It was abolished on July 1, 1966. The Collection has about 150,000 items, including letters pertaining to censorship and race in films (e.g., *A Son of Satan*, c1924; *The House Behind the Cedars*, c1925). These records are located in the Virginia State Library and Archives.

### 2. Maryland Censor Board Records.

These are the records of the motion picture censorship board for the state of Maryland. There are a total of 34 boxes (1 cubic foot per) and 13 ledgers. For example, Box 11 is "Minutes -1945-1970"; and Box 19 -- "Film Analysis Cards I-M, Pre-1963." Minutes for any given meeting typically run a page or two. The pages are numbered consecutively. Often they give an account of theaters examined during the past week, eliminations from specific films (same information appears to be in the PCA files for specific films). Expense accounts given, information on individual board members (e.g., so-and-so, a former serviceman, had applied for reinstatement as a film measurer, etc.). Financial statements are given periodically. Occasionally there will be a more extended discussion of films (e.g., *The Outlaw*, April 24, 1946, p. 109, and Jan. 23, 1947, p. 187; or *Parole from the Big House*, May 22, 1946, p. 117).

The Minutes indicate that the Board cooperated with the National Legion of Decency (e.g., p. 141) on controversial films (e.g., *Father Murphy*).

These Minutes are good if one is writing a general history of Maryland censorship -- most of the Minutes are cursory with some occasional substantive discussion of objections to individual films. It is usually impossible to determine the reactions of specific board members from these Minutes.

These Records are at the Maryland State Archives, Hall of Records, Annapolis, MD.

### 3. Legion of Decency Papers.

This collection pertains to the Roman Catholic Legion of Decency, created in 1934 to bring pressure on the motion picture industry. There is an index arranged alphabetically by film title. The file card indicates when the movie was reviewed and volume the Legion's rating appeared in. There were 21 file card drawers (3x5 cards). Then there were 40 file drawers (plus half dozen more file drawers in another room) with folders with correspondence arranged alphabetically by film title. The additional file drawers (6 or so) appear to be arranged around topic (e.g., "pornography," etc.). These latter files appear to be clipping files and offer a good array of published articles on different topics.

The Legion of Decency Papers has a good deal of material on the 1950s and 1960s, and less on the 1930s and 1940 (although there are three files on Howard Hughes' *The Outlaw*). There are also files on such films as *And God Created Woman*, and *The Moon Is Blue*.

These Papers are located at the New York Catholic Center, 1011 First Avenue, New York, NY.

### 4. Maryland Censor Board Records (1916-1981).

These records contain a total of 34 boxes (1 cubic foot per) and 13 ledgers. For example, Box 11 is "Minutes - 1945-1970"; and Box 19 -- "Film Analysis Cards I-M, Pre-1963." Minutes for any given meeting of the Maryland Censor Board typically run a page or two. The pages are numbered consecutively. Often they give an account of theaters examined during the past week, eliminations from specific films (same information appears to be in the PCA files for specific films). Expense accounts given, information on individual board members (e.g., so-and-so, a former serviceman, had applied for reinstatement as a film measurer, etc.). Financial statements are given

periodically. Occasionally there will be a more extended discussion of films (e.g., *The Outlaw*, April 24, 1946, p. 109, and Jan. 23, 1947, p. 187; or *Parole from the Big House*, May 22, 1946, p. 117).

The Minutes indicate that the Board cooperated with the National Legion of Decency (e.g., p. 141) on controversial films (e.g., *Father Murphy*).

These Minutes are good if one is writing a general history of Maryland censorship -- most of the Minutes are cursory with some occasional substantive discussion of objections to individual films. It is usually impossible to determine the reactions of specific board members from these Minutes.

These Records are at the Maryland State Archives, Hall of Records, Annapolis, MD.

#### **5. The Open Mind [taped guest interviews].**

Richard Heffner headed the motion picture industry's Classification and Rating Administration from 1974 to 1994. But starting in May, 1956, he hosted a television program in New York called "The Open Mind," which ran off and on into the twenty-first century. Most of this collection pertains to "The Open Mind" shows done during the 1980s and 1990s (e.g., Neil Postman and others). There are a few from the 1970s (stored apparently in New Jersey). There apparently is not much for the earliest program done in the 1950s and 1960s. These interviews can be seen at the Museum of Television and Radio, 25 West 52d Street, New York, NY.

#### **6. Otto Preminger Papers, 1948-1972.**

While this collection does have information pertaining to a few Otto Preminger films, for those looking for information about his movie *The Moon Is Blue* (1953), which played an important part in the demise of the motion picture industry's Production Code, will be disappointed. These Papers are at the Wisconsin Historical Society, Madison.

#### **7. Records of the National Board of Review of Motion Pictures.**

These records are good for the era before the creation of the Motion Picture Producers and Distributors Association and also for the period afterwards. But the records often have little on why the content of specific films was censored. This collection, though, is quite large as indicated by its finding aid: "The Records of the National Board of Review of Motion Pictures." A sampling of the material here includes: Box 7 (correspondence from 1929-39), Box 30 (Folder: "International Federation of Catholic Alumnae"), and Box 32 (has lists of books turned into films, as noted in *The Library Journal*, 1917, 1918, 1919, 1930, etc.). This material is located at the Manuscripts and Archives Section, New York Public Library, New York, NY.

#### **8. United Artists Collection Addition, 1950-1980.**

For those interested in movie censorship, Box 6 in this collection contains one folder on *The Moon Is Blue* (1953). It had quite a lot of press releases, correspondence (from lawyers and those at United Artists) as well as memos from Preminger, and newspaper clippings on the film and efforts to censor it. This material is at the Wisconsin Historical Society, Madison.

#### **9. Will H. Hays Papers.**

This large, important collection covers Hays' work with the Motion Picture Producers and Distributors Association between 1922 and 1945, as well as other aspects of Hays' life. The collection is arranged chronologically and is also on microfilm. The collection is the most detailed on the working of the movie industry's public relations and business dealings. There is nothing comparable for either the presidencies of Eric A. Johnston (1945-1963) or Jack Valenti (1966- ).

#### **10. Production Code Administration Files.**

For anyone interested in examining how censors attempted to change the content of motion pictures from 1930 to 1966, this collection is a gold mine. It contains files on about 20,000 movies. Many of the files, which deal with specific films, go into great detail on what was changed and why. The files are particularly informative for the period between 1934 and 1954 when Joseph I. Breen headed the Production Code Administration.

**11. *Churchman* (1929).**

Articles criticizing Will H. Hays appear in this publication.

**12. *Christian Century* (1929).**

Contains articles critical of Will H. Hays and the motion picture industry.

**13. *Harrison Reports* (1920).**

This publication has a good deal about the content of motion pictures. Payne Fund Studies author Edgar Dale used this publication for plot summaries of 500 feature films between 1920 and 1930 for his book *The Content of Motion Pictures* (1935).

**14. *Rochester (NY) Journal* June 27, 1929 1929.**

Statistician Roger Babson quotes on movies as a cause of crime.

**15. *Roanoke (VA) News* June 21, 1929 1929.**

Statistician Roger Babson quoted on movies as a cause of crime.

**16. *Queen's Work* (1920).**

Daniel Lord edited this Catholic magazine for many years. Lord was the primary architect of the motion picture Production Code, and this publication gives insight into his ideas.

**17. Wilfrid Parsons Papers.**

Wilfrid Parsons, who edited the Catholic publication *America*, corresponded with several people involved with movie censorship, among them Daniel A. Lord and Joseph I. Breen. One finds evidence of Breen's apparent anti-Semitism in this collection. These papers are in the Lauinger Library, Georgetown University, Washington, D. C.

**18. Madaj Collection.**

This collection has a good deal of information on Joseph Breen, who worked for the Archdiocese of Chicago as a public relations man during the 1920s. It has had information on the Archdiocese reaction to motion pictures and other new media of the time. This Collection is at the Archdiocese of Chicago Archives and Record Center, Chicago, IL.

**19. Warner Bros. Archive of Historical Papers.**

This huge collection provides scholars with a detailed look at how specific Warner Bros. films were produced. It has a wealth of information on movie production, the stars, studio executives, and more. These papers are located in the Doheny Library, School of Cinema - Television Collection, University of Southern California, Los Angeles, CA.

**20. Eric A. Johnston Papers.**

Johnston was president of the Motion Picture Association of America from 1945 until his death in 1963. This is a solid collection with considerable material on Johnston's personal life, but it has nowhere near as much information about Johnson and the MPAA as the Will H. Hays Collection in Indianapolis has on Hays's years as head

of the movie industry. Johnston's Papers are located in the Eastern Washington State Historical Society, Spokane, WA.

**21. Department of State Decimal File, 1945-49.**

These U.S. Department of State records pertain to Eric Johnston's efforts to expand markets for American movies abroad. Johnston was then president of the Motion Picture Association of America. These papers are located in National Archives I, Washington, D. C.

**22. *East Village Other (EVO) (New York) 1960s 1960.***

The *East Village Other* was an underground newspaper during the 1960s, one that, like other underground papers, used relatively inexpensive printing technology and made innovative use of color.

**23. *Avatar (Boston) 1960s 1960.***

The Boston *Avatar* was an underground newspaper during the 1960s, one that, like other underground papers, used relatively inexpensive printing technology and made innovative use of color.

**24. *Oracle (San Francisco) 1960s 1960.***

The San Francisco *Oracle* was an underground newspaper during the 1960s, one that, like other underground papers, used relatively inexpensive printing technology and made innovative use of color.

**25. *Berkeley Barb 1960s 1960.***

The *Berkeley Barb* was an underground newspaper during the 1960s, one that, like other underground papers, used relatively inexpensive printing technology.

**26. *Saturday Evening Post (1949).***

Color was used in magazine advertising throughout the twentieth century. During the late 1940s, the *Saturday Evening Post* has many examples of color advertising.

**27. *Ladies Home Journal (1940).***

This publication, aimed at women, is a good source for finding color advertisements. Color ads were used by magazines throughout the twentieth century. During the late 1940s and early 1950s, they were widely used.

**28. *Playboy (1950).***

*Playboy* was a magazine that exploited such technology as color photography in its nude photographs of women. Its circulation rose sharply during the 1960s and it was influential in the youth culture of that decade. It feature articles from leading writers and intellectuals. Some, such as Arthur C. Clarke and Alvin Toffler, discussed the impact of new media on society. During the mid-1980s, the magazine became a target for Meese Commission and anti-pornography crusades.

**29. *Esquire: 1940s-1960s.***

In a case that had implications for Hollywood publicity, the Supreme Court in 1946 narrowed the federal government's power to regulate sexual images in magazines when it unanimously overturned the postmaster general's decision in 1943 to deny mailing privileges to *Esquire* on the grounds that it included cartoons, pictures, and other sexual material that reflected a "smoking-room type of humor." Written by Justice William O. Douglas, the decision contributed to proliferation of so-called girlie publications. *Esquire* was also one of the early magazines after World War II that devoted space to showing pictures of partially nude women.

**30. *Cavalier* (1950).**

This publication was among the male-oriented magazines that featured nude and semi-nude pictures of women during the 1950s and 1960s. These magazines often took advantages of recent developments in camera technology such as color photography.

**31. *Rogue* (1950).**

This publication was among the male-oriented magazines that featured nude and semi-nude pictures of women during the 1950s and 1960s. These magazines often took advantages of recent developments in camera technology.

**32. *Stag* (1950).**

This publication was one of many male-oriented magazines that featured nude pictures of women. The magazine exploited improvements in photography that had taken place during the 1950s and 1960s.

**33. *U. S. Male* (1960).**

This publication was one of many male-oriented magazines that featured nude pictures of women. The magazine exploited improvements in photography that had taken place during the 1950s and 1960s.

**34. *Jaguar* (1960).**

This publication was one of many male-oriented magazines that featured nude pictures of women. The magazine exploited improvements in photography that had taken place during the 1950s and 1960s.

**35. *Cosmopolitan* (1960).**

This magazine is interesting for many reasons, among them its use of color, nudity, and appeal to women during the 1960s and 1970s.

**36. *Village Voice* 1960s 1960.**

As an underground newspaper during the 1960s, the *Village Voice* was like other underground papers in that it used relatively inexpensive printing technology and made innovative use of color.

**37. Records of the National Association of Theatre Owners (NATO).**

This collection pertains to theater owners in the United States. It contains a good deal of information on the public's reactions to motion pictures. This collection is in Special Collections and Manuscripts, Harold B. Lee Library, Brigham Young University, Provo, UT.

**38. . Princeton, N. J.: Opinion Research Corporation, 1957.**

This survey deals with the public's response to motion pictures. It was a period when television was beginning to make inroads on Hollywood's audiences, especially those people interested in family entertainment. A copy of this survey is in Folder 10, Box 9, Mss 1446, Records of the National Association of Theater Owners (NATO) , Special Collections and Manuscripts, Harold B. Lee Library, Brigham Young University, Provo, UT.

**39. Kinsey Institute Library Film and Video Collection.**

This collection, compiled by the Kinsey Institute, is a good source on the numbers of pornographic films made, especially prior to the late 1960s. It is located in the Kinsey Institute Archives, Indiana University, Bloomington, IN.

**40. Kinsey Institute Collection, Photography Collection.**

This collection, compiled by the Kinsey Institute, give evidence of the extent to which photography was used for pornography during the late nineteenth and twentieth centuries. It is located in the Kinsey Institute Archives, Indiana University, Bloomington, IN.

**41. WHORM: Subject Files.**

These files in the Reagan Library in Simi Valley, CA, cover many subject. For example, they include a report from the Television Information Office entitled "The New Television Pressure Groups: a perspective on the drive against diversity." Also there is some correspondence with Jack Valenti. These files are at the Ronald Reagan Presidential Library, Simi Valley, CA.

**42. Michael J. Curley Collection.**

This collection in the Archdiocese of Baltimore has material on Catholics and the motion picture industry. Box 4 contains correspondence from Joseph Breen writing as Eugene Weare in 1925-26. Box 23 has some correspondence from Daniel Lord in 1935 saying the "impression grows that big business and administration having recognized Moscow Commission is furthering Mexican tyranny, including communistic destruction of civil and religious liberties.

**43. National Catholic Welfare Conference, Episcopal Committee on Motion Pictures, 1933-1944, National Conference of Catholic Bishops.**

This collection deals with the Legion of Decency and more broadly, the Catholic Church's stance on motion pictures. It is located at 3211 4th Street, N.E., Washington, D. C. (Mullen Library?, Catholic University?, Washington, D. C.).

**44. U. S. Senate Committee on Commerce Papers.**

This collection contains materials pertaining to the 1968 Senate hearings on movie rating led by Maine Senator Margaret Chase Smith. Smith was especially worried about the rising levels of sex and violence in American movies and television programs. These papers are at National Archives 1, Washington, D. C.

**45. Harold A. Innis Papers.**

This collection contains correspondence to and from Harold Innis as well as copies of his published and unpublished writings. There are also several taped interviews given by people who knew Innis. It is an important collection for scholars wishing to study is important Canadian historian and political economist. Innis's Papers are located at the University of Toronto Archives, University of Toronto, Toronto, Ont., Canada.

**46. Motion Picture Association of America: Rating Sheets.**

While these records have little on the ratings for specific movies, they do have information pertaining to Jack Valenti and such issues as video piracy of American motion pictures abroad. This material is in the Motion Picture and Television Reading Room, Library of Congress, Washington, D. C.

**47. *Penthouse* (1970).**

*Penthouse*, together with *Playboy*, was a magazine that exploited such technology as color photography in its nude photographs of women. During the mid-1980s, the magazine became a target for Meese Commission and anti-pornography crusades.

**48. *Reader's Digest* (1960).**

This magazine, oriented toward a mass audience, is interesting for many reasons. With regard to movies and pornography, critics of the movie industry such as Maine Senator Margaret Chase Smith used its pages to attack

sex and violence in films. Later, critics of the 1970 Presidential *Commission on Obscenity and Pornography* attacked research that said erotica was not harmful and restrictions on it should be loosened.

**49. *Newlook* (1980).**

According to testimony at the Meese Commission hearings, this *Penthouse*-owned magazine carried advertisements that show/promoted violence against women.

**50. *Playgirl* (1985).**

This magazine, the female version of *Playboy*, exploited such technology as modern photography in its nude picture of men. During the mid-1980s, the Meese Commission targeted it as part of an offensive against pornography.

**51. *Christian Century* (1985).**

This publication was critical of Hollywood's relationship to substance abuse and pornography, and also of the movie industry's adoption of a new rating category, PG-13, in 1984.

**52. *Hollywood Reporter* 1988 1988.**

This important trade publication is informative about Hollywood personalities, studios, new media, and reactions to such movies in 1988 as *The Last Temptation of Christ*.

**53. *Movieguide* (1980).**

This publication give insight into Christian criticism of motion pictures during the 1980s and 1990s.

**54. *Daily Variety* 1930s- 1990s 1930.**

This trade publication contains articles not only on movie personalities and studios, but also new technologies as they appeared in Hollywood.

**55. *Proceedings of the Society of Photo-Optical Instrumentation Engineers* 80, 100, 135, 174, 221, 333, 334, 394, 470, 538, 633, 1086, 1185, 1262, 1466, 2726, 3051, 3334.**

These volumes contain technical papers prepared by scientists who worked in areas related to photolithography, and provide information for those interested in the scientific evolution of this technology.

**56. *Scientific American* 237.No. 3 (1977).**

This issue of *Scientific American* is devoted to assessing the significance of microelectronics. It includes the following articles: **Robert N. Noyce**, "Microelectronics"; **James D. Meindl**, "Microelectronic Circuit Elements"; William C. Holton, "The Large-Scale Integration of Microelectronic Circuits"; William G. Oldham, "The Fabrication of Microelectronic Circuits"; **David A. Hodges**, "Microelectronic Memories"; **Hoo-Min D. Toong**, "Microprocessors"; Lewis M. Terman, "The Role of Microelectronics in Data Processing"; Bernard M. Oliver, "The Role of Microelectronics in Instrumentation and Control"; **John S. Mayo**, "The Role of Microelectronics in Communication"; Carver A. Mead, "Microelectronics and Computer Science"; Alan C. Kay, "Microelectronics and the Personal Computer."

**57. *Daedalus: Journal of the American Academy of Arts and Sciences* 96.no. 3 (1967).**

The entire issue is devoted to theme entitled, "Toward the Year 2000: work in progress." The volume groups contributors around five "problems areas" -- "the adequacy of the governmental structure, the changing nature of values and rights, the structure of the intellectual institutions, the life-cycle of the individual, and the international system." Contributors include: **Daniel Bell**, "The Year 2000 -- The Trajectory of an Idea"; **Ernst Mayr**, "Biological

Man in the Year 2000"; **Gardner C. Quarton**, "Deliberate Efforts to Control Human Behavior and Modify Personality"; **Harry Kalven, Jr.**, "The Problems of Privacy in the Year 2000"; **John R. Pierce**, "Communication"; **Samuel P. Huntington**, "Political Development and the Decline of the American System of World Order"; **Ithiel De Sola Pool**, "The International System in the Next Half Century"; and many others including **Daniel P. Moynihan**, David Riesman, Margaret Mead, Zbigniew Brzezinski, Daniel Ellsberg, Erik H. Erikson, and Karl W. Deutsch.

**58.** *Scientific American* 276.no. 3 (1997).

This issue has a number of short articles on "The Internet: Bringing Order from Chaos." The articles include: **Clifford Lynch**, "Searching the Internet"; **Michael Lesk**, "Going Digital," on the advantages and difficulties of electronic libraries; **Paul Resnick**, "Filtering Information on the Internet"; **Marti A. Hearst**, "Interfaces for Searching the Web"; and **Brewster Kahle**, "Preserving the Internet," on archiving material from the World Wide Web.

**59.** *Journal of Mass Media Ethics: exploring questions of media morality* 13.no. 2 (1998).

This issue is devoted to considering ethical questions involving new media technologies. Articles include: **Thomas W. Cooper**, "New Technology Effects Inventory: Forty Leading Ethical Issues"; **Adam Clayton Powell III**, "Satellite Imagery: The Ethics of a New Technology"; **Donald B. Kraybill**, "Plain Reservations: Amish and Mennonite Views of Media and Computers"; and **David J. Gunkel**, "Virtually Transcendent: Cyberculture and the Body."

**60.** *Variety* 1978 1978.

**61.** New York Times Oral History Program, the American Film Institute Seminars.

This collection contained seminars on the work of cinematographers Winton C. Hoch (Part I, No. 82) and Haskell Wexler (Part I, No. 188).

**62.** Production Code Administration Files (1930-1966).

This collection is a major source for any scholar interested in motion picture censorship and the Motion Picture Producers and Association of America (MPPDA) between 1930 and the late 1960s. The collection contains files on some 20,000 films. Often the files are detailed with letters and memoranda revealing how the Production Code Administration censored movie scripts, line-by-line, scene-by-scene, usually before production began.

**63.** *National Geographic* (1910).

Catherine Lutz and Jane Collines argue in their book *Reading National Geographic* that magazine has provided one of the most important ways in which Americans have learned about life outside their borders. But the photographs in this publication reflect a bias. "The photograph can be seen as a cultural artifact because its makers and readers look at the world with an eye that is not universal or natural but tutored. It can also be seen as a commodity, because it is sold by a magazine concerned with revenues. The features of the photographs, and the reading given them by others, can tell us about the cultural, social, and historical contexts that produced them."

The authors estimate that 37 million people worldwide see each issue of this publication. "Its subscription rate is the third largest for magazines in the United States--following *TV Guide* and *Reader's Digest*. The magazine is used by schools as a teaching tool; it is subscribed to by middle-class parents as a way of contributing to the education of their children; its high prestige value affords it a place on coffee tables; its high-quality printing and binding and its reputation as a valuable reference tool mean that it is rarely thrown away, more frequently finding its way into attics and secondhand bookstores.

"It has always been private, but has powerful ties to government; it is a 'scientific' institution, yet dependent on the sales and popularity of its magazine; its photographs are realistic, yet highly stylized. Through its long history, the national Geographic Society has strategically deployed realist codes and has fashioned claims to objectivity in order to secure its position as both 'scientific' and 'popular.'"

**64.** "2,000 New Citizens Learn Voter's Duty." *New York Times* Oct. 30, 1915 1915: 5.

This article indicates that speeches, songs, and moving pictures were shown new citizens to instill love of flag, government, and country. The article subtitle read: "Must Be 'Unhyphenated and Unhesitating Americans,' Says Mayor Mitchel; ...Patriotism and Its Meaning the Only Topic of Speech, Song, and Picture."

**65.** "3 Lightless Nights a Week Advocated." *New York Times* Dec. 11, 1917 1917: 9.

This article reports that during World War I, the U. S. Fuel Administration ordered that electric signs advertising movies be turned off certain nights of the week.

**66.** "5-Cent Theatre Burns; Panic on Bowery." *New York Times* Feb. 4, 1907 1907: 2.

This article reports that draperies giving theater Oriental atmosphere caught fire.

**67.** "7 Foreign Films Set for Release: Lopert, Around-the-World Get Imports -- Wilde Films Hit by Legion of Decency." *New York Times* July 2, 1960 1960: 10.

This article discusses seven foreign films scheduled to play in the United States, including *Never On Sunday*, a Greek picture by the blacklisted director Jules Dassin. Also noted are two films about homosexuality condemned by the Roman Catholic Legion of Decency, *Oscar Wilde* and *The Trials of Oscar Wilde*. Both were from Great Britain. The Legion's statement on the latter two films read: "The subject matter of these films, dealing with a social aberration (perversion), is treated in such a way as to glamorize and to arouse undue sympathy on the part of an audience for the tragic weakness rather than for the genius of the character (Oscar Wilde) who is the principal of the story depicted."

**68.** "7-Elevens Drawn Back to 'Playboy' by Vanna Issue." *Adweek* April 13, 1987 1987, sec. National Newswire.

Despite the boycott efforts anti-pornography groups following the Meese Commission *Final Report* 9(1986) to get drug and convenience stores to stop selling *Playboy* and *Penthouse*, by 1987, 7-Elevens had begun to sell *Playboy* with nude pictures of game show hostess Vanna White.

**69.** "8mm Sound Film: ... A Survey of Progress to Date." *American Cinematographer* 44.4 (1963): 223.

This issue has several articles on 8mm film. It notes that the commercial application of this format is expanding and that 8mm has moved from simply something for amateur hobbyists to increasing areas of commercial application.

**70.** "8mm Sound-on-Film Camera Records Mock Riot." *American Cinematographer* 49.3 (1968): 198.

This one-page piece notes that the cost-conscious Ingelwood, CA, police department used a "Fairchild 900 8mm single system sound movie camera" to make a training film.

**71.** "10 Members Join New Movie Board: Film Review Group Doubled in Size as Representation Covers Added Fields." *New York Times* Sept. 18, 1957 1957: 37.

After the revision of the motion picture industry's Production Code in 1956, criticism remained that the appeals process was dominated by executives from the nine member studios of the MPAA and its president Eric Johnston. This article reports that Johnston doubled the size of the Appeals Board by adding exhibitors and producers who were not MPAA members. New members included John Ford, William Goetz, F. Hugh Herbert, and George Sidney.

**72.** "\$50,000 Film Theft Leads to Arrests." *New York Times* Nov. 11, 1919 1919: 17.

The subtitle for this article reads: "Police Say \$500,000 Worth of Pictures Have Been Stolen in Last Six Months."

**73.** "300 Burn to Death in Mexican Theatre." *New York Times* Feb. 27, 1900 1900: 1.

A report on a disastrous fire in a Mexican movie theater.

**74.** "\$1250 and UP Round the World [advertisement]." *Life* 88.2294 (1926): 33.

This ad reads: "110 days of glorious adventure in 22 ports in 14 countries. Interesting lands, strange people, all the color and mysticism of the Orient. Palatial President Liners. Commodious outside rooms. A world-famous cuisine. Sailings every Saturday from San Francisco (every fortnight from Boston and New York)." (33)

**75.** *The 1969 Film Daily Year Book of Motion Pictures*. New York: Film and Television Daily, 1969.

This was the 51st Annual Edition of the *Film Daily Year Book of Motion Pictures*. The work has much statistical data on the motion picture industry including production and distribution figures, information on foreign theaters, and a list of the Hollywood Press Corps (the work lists 325 people in Hollywood, 125 working internationally, 94 in New York alone, and 583 motion picture newspaper editors). This volume gives a good idea of the scope of the movie industry's public relations and publicity potential. The work summarizes highlights from 1968 including the new ratings system. It defines "voluntarism" on which the rating system was based. The volume also discusses "community relations activities." Francis O. Beermann writes about television during the previous year.

**76.** "The Abuse of Cinematograph." *The Times [London]* April 4, 1913 1913: 7.

This article discusses the effects of movie scenes of horror and crime on children.

**77.** "Academy Award Winner for Cinematography." *American Cinematographer* 48.5 (1967): 356-58.

This article discusses the Academy Award winners for Cinematography in 1966. Included are the work of Haskell Wexler and Ted Moore. The article discusses how cameras are less obtrusive than earlier. In "Who's Afraid of Virginia Wolff" (1966), hand-held cameras and zoom lens were used. The article also considers Ted Moore's creative use of the camera in "Moll Flanders." He captured "the rich hues of Henry VIII's lusty court and contrasts them effectively with the almost monochromatic austerity of the religiously circumscribed morality that pertained at the time. He records the subtle lushness of rural England, composing each scene like an oil painting by an Old Master. Yet his camera is never static, never reticent to move in pace with action that ranges from spiritual to physical, weaving on film a multi-colored tapstry of light brought to life by the currents of a decisive moment in history."

**78.** "Academy Award Winners for Cinematography." *American Cinematographer* 48.5 (1967): 356-58.

This article discusses the Academy Award winners for Cinematography in 1966. Included are the work of Haskell Wexler and Ted Moore. The article discusses how cameras are less obtrusive than earlier. In "Who's Afraid of Virginia Wolff" (1966), hand-held cameras and zoom lens were used. The article also considers Ted Moore's creative use of the camera in "Moll Flanders." He captured "the rich hues of Henry VIII's lusty court and contrasts them effectively with the almost monochromatic austerity of the religiously circumscribed morality that pertained at the time. He records the subtle lushness of rural England, composing each scene like an oil painting by an Old Master. Yet his camera is never static, never reticent to move in pace with action that ranges from spiritual to physical, weaving on film a multi-colored tapstry of light brought to life by the currents of a decisive moment in history."

**79.** "'An Achievement in Journalism'." *New York Times* Nov. 21, 1906 1906: 8.

This article indicates that newspapers had begun to publish photographs taken at night. For example, in November, 1906, the *New York Times* used thirty pounds of flashlight powder to take a photograph of crowds outside the Times Building in New York on election night. Reprinted from the *Louisville Courier-Journal*.

**80.** "Actors as Speechmakers." *New York Times* March 23, 1902 1902: 15.

This article is about actors' personality and danger of ego and boasting. The article's subtitle reads: "Annie Russell and Kyrie Bellew Give Advice to Young Actors."

**81.** "Actress to Cross Atlantic for a Day." *New York Times* May 1, 1910 1910, sec. C: 2.

This article reports on actress, Pauline Chase, who will sell autographed photos abroad. "The first among these will be one of Theodore Roosevelt, which Miss Chase went to Paris to obtain from the ex-President." The article's subtitle reads: "Pauline Chase Will Make Notable Trip from London to Aid Actors' Fund Fair. Will Sell Photographs. Has Autographed Pictures from Roosevelt and Leaders of the Theatrical Profession Abroad."

**82.** "Advertisers report on value of color in all media." *Printers' Ink* (1956): 21-23.

This study, conducted by Richard Manville Research, found that leading advertisers believed that color ads were much more effective than black-and-white ads. The advertisers thought that color was 84 percent more effective for outdoor advertising, 52 percent more effective for magazines, 50 percent better for Sunday supplements, 47 percent for TV, and 38 percent for newspapers. The advantages included better product identification, more realistic appearance of what was being promoted, and stronger emphasis on the quality of the product. There were concerns, though, with color advertising on television -- poor quality of the color, the high cost involved, and the fact that few people owned color sets in 1956. The advertisers, though, clearly believed that color would be used more and more in the near future. About 90 percent of those who received the questionnaire in this study had seen a TV program in color and about two thirds of them thought that color TV ads were good to excellent.

**83.** "AFL Unit Hints Boycott of Movie: Council Protests Filming of 'John Paul Jones' in Spain." *New York Times* March 31, 1958 1958: 19.

This article deals with the movie *John Paul Jones* (1959), one of the many so-called American-interest or "runaway" films that were produced abroad with some American talent. Hollywood labor groups protested this film and especially the fact that the signing of the Declaration of Independence in the movies actually took place in Spain.

**84.** "Against Colored Photoplays." *New York Times* March 18, 1923 1923, sec. X: 3.

This piece reprints part of an article by Philip E. Rosen, a photographer and director, that appeared in *The American Cinematographer*.

**85.** "The Age of Color." *Popular Mechanics* 70 (1938): 489-96, 128A ff?

"The world is spending millions for color today and, as a result, is rapidly changing from a dull, drab sphere into a gay and cheerful place garbed in all the hues of the rainbow," (490) begins this article which is richly illustrated with several color pictures. In the United States alone, approximately \$50 million of worth of dyes are used annually.

The dyestuffs helped to sell \$6-7 billion of merchandise each year. It is the color, the article says, that sells many of these goods. Because "color exerts a psychological influence on all of use,"(490) decisions to buy or not to buy are often strongly related to color.

There are assumptions here, which seem common in much literature talking about color during the early 20th century, about the effect of various colors. Red is "the symbol of war, hate, danger and courage while orange

signifies warmth, harvest and autumn. Green is linked with victory, safety and sickness and we associate yellow with cowardice and deceit." (490) Blue has "a cooling effect." (490)

A machine known as the Colorcable uses "a simplified system of code letters" and "can transmit thousands of separate colors over regular telegraph or cable communications," according to this piece. "In this manner it is possible, for example, to send the most popular shades exhibited in a Paris style show to New York in a few hours, and even a few minutes." (492)

The expanding use of dyes has made color available to a much wider population whereas earlier it had only been the very rich or royalty that afford to own richly colored goods. (494-95) In 1938, however, virtually everything is decorated with color a "miracle ... wrought largely by coal and chemistry." (495)

The article discusses how new colors have been unlocked from coal tar by chemists. "Locked in this evil-smelling gooey tar were hundreds or even thousands of colors waiting to be released by the magic hand of the chemist." (495)

**86.** *Alberts v. California* 354 U. S. 476 (1957) 1957.

This case, together with the *Roth v. United States* case decided the same year, changed the Supreme Court's interpretation of obscenity, one that earlier had been defined by the *Hicklin* case. Henceforth, it became much harder for prosecutors to convict people for obscenity.

**87.** "Alcock Forces Suggestive Ads Off Movie Doors; Inquiry Reveals Sex Lure Undermining Business." *Chicago Daily Tribune* June 15, 1918 1918: 13.

This article says that although movie content dealing with sex is censored, the posters and ads are "unrestricted." The article gives lengthy list of sexually suggestive movie titles.

**88.** "All Majors Have Subsids." *Variety* (1968): 7.

One way that the major Hollywood studios got around the motion picture Production Code during the 1950s and 1960s was by creating subsidiary companies. Those companies, unlike the Hollywood majors, were not committed to the Code.

**89.** "Amazing Developments in the Moving Picture Field." *New York Times* Sept. 7, 1913 1913, sec. X.

This article estimates that 3.45 trillion photos, or 40,909 miles of films shown daily in the 18,000 movie theaters. "Say that the 18,000 operators throughout the United States run through the machines three 1,000-foot reels of film four times daily, there would at that rate be thrown upon the screen 216,000,000 feet of film. And when it is remembered that each thousand feet of film contains 16,000 single pictures, we arrive at a total of 3,456,000,000,000 complete pictures. [editor's note: Surely a miscalculation. 3.45 billion pictures seems more accurate.] Reduce the number of feet of film to miles, and we have a total of 40,909 miles." (quotation, X4)

It discusses the improvement in films and notes the rise of good quality educational films, many of which deal with religion. It talks about educational films dealing with army and navy (military) life. It also says the moving picture "drives away dull care from many who can afford no more expensive recreation. While it is accomplishing this it is also sowing seeds of knowledge into minds vulnerable to such an entry only.

This article says that previously theaters had been "showing crimes in their horrible nakedness," (X4) but now the censors had cleaned up content and now "seldom" does a movie show anything "harmful." (X4) The article goes on to say that movies are improving, and it gives examples of the number of educational films that deal with religion, sociology, local government, army and navy life, customs, folklore, medicine, science, technology, and history (says 272 films make up history films). Movies will not replace books in schools but will "revolutionize our educational system. (quotation, p. X4) Says the moving picture "drives away dull care from many who can afford

no more expensive recreation. While it is accomplishing this it is also sowing seeds of knowledge into minds vulnerable to such an entry only.

"The same lessons in printed form would probably reach a tenth of those brought under the spell of the 'movies.'" (X5)

Quoting from a letter from a scenario editor of a large film company: "What the outcome of moving pictures will be no man can predict. Their vast possibilities have not even been touched upon. In all lines of learning they have become an eminent factor and the surface of development has hardly been scratched." (X5)

With regard to movie theaters the article says that "the country is fairly studded with these little theaters. Figuratively speaking, they have sprung up over night, reminding you of so many mushrooms which bob up before your eyes as you walk through the field after a heavy rain." 1,200 movie theaters in NYC; 18,000 in US and 10.8 million attend daily. Movies are now in every village.

**90.** *American Art Posters of the 1890s*. New York: Metropolitan Museum of Art; Distributed by Harry N. Abrams, Inc., 1987.

This book is about art posters in the Metropolitan Museum of Art in New York. There are three relatively brief essays followed by pictures of the posters. The last section is an annotated catalogue of the posters in the museum. See under individual author: **Phillip Dennis Cate, Nancy Finlay, and David W. Kiehl**.

**91.** "American Films Now Circle the Globe." *New York Times* June 30, 1912 1912, sec. X: 8.

This article says that American films are preferred in other countries although "the life of the films manufactured in the United States is said to be much shorter than that of most other films." American films in almost every country and even are popular in China. Cowboy films popular but their popularity is now on the wane. Many want at least one scientific film about bird and animal life or industrial and commercial welfare. Types of films not liked love affairs; fooling or mocking police and government officials; pictures instilling "revolutionary ideas in the heart of the youth."

The subtitle of this article reads: "Subject Matter of Moving Pictures is Given as Reason for Popularity. Demand Is for Real Life. Japan Considers Our Actors Inferior Reports on Enterprise from China to Turkey."

**92.** "An American Pantheon Suggested: Current History to be Preserved for Posterity." *New York Observer and Chronicle* 89.36 (1911): 313-14.

This article discusses Alexander Konta's ideas for historical preservation and the creation of the Modern Historic Records Association. Konta pointed out how very little was really know of ancient Egypt, Greece, and the Middle Ages because records were either not kept or were destroyed. He then asked "'What is this advanced civilization of our doing for the enlightenment of the historians of the far distant future?'" (313, Konta quoted) The Egyptians, he said, "'at least wrote on stone to a far greater degree than we do, who trust the accounts of our current history to the most perishable of mediums of preservation -- paper.'" (313, Konta quoted) Konta when on to say that "'the written word will always be the chief source of information for historians.'" He suggested: "'why not make it imperishable by photographing the written word after it has been printed in books and newspapers and preserve the plate in a fireproof vault? Why not do the same thing with documents of State? It is the same with portraits of the great men of the past. Look at the contradictions, the uncertainties. How little we know of how they looked!'" (313, Konta quoted)

Konta urged documenting more than great men or important events, however. He said that "'history is not longer past politics, or past wars, or past leaders. It is a matter of all that the oldtime historians neglected, of the daily life of the common people, or their economic arrangements and social ways of the pioneer, the settler, the trader on the frontier. These are records that we purpose to preserve for posterity as well as the documentary

evidence of so-called "great" events. And mind you, these records will be most needed, and be most serviceable, if our present civilization continues to develop without breaks or interruptions. We cannot make too many records of the present to leave to posterity, and we cannot make them too durable." (313, Konta quoted)

Konta proposed to use the most modern communication technology of the time to preserve the past. "Why not enlist the services of the phonograph and the moving picture machine, of all the reproductive mechanical inventions of the present era?" he asked. (313, Konta quoted) He argued that filming important speeches and recording them on the phonograph would enhance their value for historians who might otherwise have only the printed version of the speech. "The time is coming when the phonographic reporter and perhaps the vitagraph reporter as well will take their places beside the stenographers in the parliaments of men." (313, Konta quoted)

Konta's goal was "to create for posterity a "living picture" of our era such as we should like to have of the life and the men and the events of the past. The word "history" in the name of our association is employed in the widest modern sense. It includes science and mechanics, art and music, our daily life in town and country in all its significant phases, as well as the politics that will be past to-morrow. And while waiting for posterity to come we shall make duplicates of our records and use them in our schools and lecture rooms." (313, Konta quoted)

**93.** Committee on Science and Technology, U. S. House of Representatives, Ninety-Ninth Congress, Second Session (Serial AA). *American Science and Science Policy Issues: Chairman's Report*, United States House of Representatives, Committee on Science and Technology.

This Report examines the American research university and its relation to the federal government. It discusses several specific topics: interdisciplinary research, national laboratories, international cooperation, Department of Defense research, energy, space, education, computers, materials, social sciences, ethics, technology, and biotechnology. For example, with regard to biotechnology, the Report notes that "the possibility exists for producing potentially hazardous altered life-forms. This fact must be acknowledged although it should be recognized at the outset that the prime concerns today are not with direct threats to man, but rather with blurring species lines, possible loss of genetic diversity and integrity, and unanticipated environmental harm. Nevertheless, we cannot ignore the fact that new life forms, ranging from viruses to men themselves, though innocently conceived, could turn out to be dangerous." (69) In a section entitled "The Forty Year Vista" (125-42), the Report looks back four decades and ahead into the future for a similar length of time. A list of recommendations follows, as well as a bibliography of other Background Report (Appendix B) and other Task Force on Science Policy Hearings (Appendix c).

**94.** "Amusement as a Factor in Man's Spiritual Uplift." *Current Literature* 47.2 (1909): 185-88.

This article discusses Professor Simon N. Patten's (University of Pennsylvania) observations on coming into a city have a vacation in the country. "The change was distinctly for the worse," it says. "They had left a mountain-camp in the morning, happy and care-free, and they had become, without knowing it, formal and irritable as they returned to civilization." (185) On a "brightly-lighted street" in the town's center, Patten "something strange...." "It seemed to have only one side: and the people's faces were turned one way. The side to which people flocked was light; the other side was, comparatively speaking, dark." (185) On the dark side of town were the "very Institutions of Civilization itself" (quoting Patten) (186) -- the library, high school, and church.

The work presents an excerpt from Patten's work (here titled "Product and Climax. By Simon Nelson Patten, New York: B. W. Huebsch") (186 n). Quoting Patten, it was on the "'wrong side', where all the right things were assembled"

Patten then describes the "right" side of the street where people were attracted: Quoting Patten: "It was festooned with lights and cheap decorations meant only for fair weather;... beside penny shows and the gay vestibules of nickel theaters. Opposite the barren school yard was the arcaded entrance to the Nickelodeon, finished in the white stucco, with the ticket seller throned in a chariot drawn by an elephant trimmed with red,

white and blue lights. A phonograph was going over and over its lingo, and a few picture machines were free to the absorbed crowd which circulated through the arcade as through the street. Here were the groups of working girls -- now happy "summer girls" -- because they had left the grime, ugliness and dejection of their factories behind them, and were freshened and revived by doing what they like to do...." (186)

The article paraphrases Patten when it says "How strange it was the stimulation of pleasure should be the only part of life for which there existed no distinctive institution!" (187)

This article laments the spread of industrial civilization, and says that "It is when fatigue, dejection, indifference, bitterness and disease are dominant that the dark side of the street brightens up and the moral agencies take heart again. Their constituency, Professor Patten affirms, is the devitalized. Their message is to those who battle against industrial civilization calls for the solace of religion and the alms of charity...." (187)

Patten likened the movies to the saloon. "The next higher form of climax lies in the melodrama and its allied cheap shows, such as the nickel theater or 'moving picture' show. These latter are rated by Professor Patten as 'the first amusement to occupy the economic plan that the saloon has so long exclusively controlled.' Their enormous popularity is proof that they appeal to the foundation qualities of man. They are, moreover, upbuilding, from Professor Patten's point of view, for the pictures they present of exciting adventures rouse the imaginative and concentration which have lapsed in humdrum toil. A conservative estimate puts the number of people in New York City who daily visit the nickelodeon at 200,000. Here is a tremendous factor in the imaginative life of the people, for good or for ill." (188) Patten also likens movies to sports. Quoting Patten: "'In the lower realm, where religion and morality do not act, amusements and sports are the only effective motives to elevate men. Sport is the beginning of inspiration, just as amusement is the lower round of regeneration.'" (188)

**95.** *An Analysis of the Motion Picture Industry, 1946-1953: Volume I.* Box 9, Mss 1446, Records of the National Association of Theater Owners (NATO), Special Collections and Manuscripts, Harold B. Lee Library, Brigham Young University, Provo, UT.

This analysis of the motion picture industry during the years immediately following World War II was done for the National Association of Theater Owners (NATO). During this period, the movie industry suffered a serious decline in attendance. This report indicates, for example, that in 1953, 5,347 theaters operated in the red on their total operations, and another 7,029 theaters were in the red on income from selling ticket but managed to stay in business on profits from concessions.

**96.** *Analysis of the Motion Picture Industry, 1946-1953: Volume II: An Appendix to Volume I.* Box 9, Mss 1446, Records of the National Association of Theater Owners (NATO), Special Collections and Manuscripts, Harold B. Lee Library, Brigham Young University, Provo, UT.

This analysis of the motion picture industry during the years immediately following World War II was done for the National Association of Theater Owners (NATO). During this period, the movie industry suffered a serious decline in attendance. This report indicates, for example, that in 1953, 5,347 theaters operated in the red on their total operations, and another 7,029 theaters were in the red on income from selling ticket but managed to stay in business on profits from concessions.

**97.** "Animated Journalism." *World's Work* 20 (1910): 13476-77.

This article reports on the increasing use of cameras to record daily events. It asks "To what lengths is the camera going as a factor in modern life?" (13476) It then says that "The psychology of the trained photographer, whose instinctive impulse, when a shot is fired or a magazine explodes, is to press the button of his camera, would be an interesting study, but the fact that the omnipresence of the machine is rapidly creating a complete pictorial mirror of life is more important." (13476)

The article notes that cinematograph manufacturer Pathé Frères has set up a daily news service using motion pictures. "The enterprise, which goes by the name of *The Animated Gazette*, is a complete news organization, with an editor, Mr. Steer, who has abandoned the old methods of Fleet Street for the new journalism and a staff of 5,000 'photo-correspondents' scattered pretty well over the world." (13477) The piece predicts that "There is little doubt that the new idea will soon be at work in America." (13477)

**98.** "Announcement: McClure's Magazine Is Published Monthly with Illustrations." *McClure's Magazine* 1.1 (1893): 94-96.

This three-page announcement says that the magazine will be published with illustration, the it will carry material on "the edge of the future," (94) and that it will focus on the "newest knowledge." (96)

**99.** "Any More at Home Like Brigitte?" *Life* 45 (1958): 101-02.

One of several articles in mainstream U. S. magazines publicizing Brigitte Bardot after her movie *And God Created Woman*. This piece is about Brigittes' younger sister.

**100.** "Archdiocese Demands Stronger Anti-Porn Laws and Prosecution." *Los Angeles Times* March 15, 1987 1987, sec. A: 32.

This article discusses the efforts of Cardinal Roger M. Mahoney of the Archdiocese of Los Angeles to promote stronger anti-pornography laws and prosecution. This came in the aftermath of the Meese Commission report and at a time when cable television and video cassettes were making pornography much more available to the public. The article also discusses Dennis Jarrard and the archdiocese's Commission on Obscenity and Pornography.

**101.** "Are the Lives of Actors Immoral?" *Current Literature* 43.1 (1907): 84-86.

This work begins by mentioning other works that discuss the lives of actors and then turns to devote most of its attention to a book recently published by an anonymous author entitled *The Seamy Side: A Story of the True Conditions of Things Theatrical* (1906). The author of this article says that "in the not too distant past, the stroller was looked upon as a vagrant and social outcast. A marked change has taken place in this view. Prima donnas are frequently represented as paragons of virtue, and theatrical stars are expected to shine in the social world." (84) *The Seamy Side*, however, challenges this positive view. "Lack of real culture, brutality, egotism and utter disregard for marital ties are laid at the door of the theater" ... where "even the leaders in the profession trade as much in their beauty as in their talent.... Drunkenness, drug habits and all-around rottenness reign ... supreme in the stage world," according to this book, facts that press agents attempt to hide.

The latter half of this article (85-86) then presents the protests against this book, including the refutation offered by J. Harry Benrimo in the *Times Saturday Review*. Benrimo's acting company had been criticized in *The Seam Side*. Alan Dale, writing about the book in the *Cosmopolitan*, is also noted. (86)

**102.** "Arrival of a New Stage in the Art of the Movies." *Current Opinion* 58.4 (1915): 251.

This article comments on Reverend Dr. Thomas B. Gregory, who said that D. W. Griffith's movie *Birth of a Nation* was a masterpiece and demonstrates for the first time the educational possibilities of cinema. According to this piece, Gregory believed that he had seen a literal recreation of history. "That the story as told by the picture is true the Reverend Doctor Gregory is ready to swear on the Bible, the Koran, and Zend and all the other 'Holy Scriptures' put together. He know it is true because he lived through the actual realities themselves. He saw the real carpet-baggers, the real 'New Voters,' the real reconstruction 'Statesmen,' the real Ku Klux Klanners. He is prepared to say that not one of the more than five thousand pictures that go to make up the wonderful drama is in any essential way an exaggeration. They are and all faithful to historic fact, he says, so that, looking upon them, you may feel that you are beholding that which actually happened."

**103.** "Art Growth in Posters." *Current Literature* 17.5 (1895): 422-23.

This article begins by saying that the French have taken the lead in improving artistic design and production of posters. Photography, however, has not yet played as big a role in posters as many assumed in 1895. "The great advances made in poster-work in the United States have been due to three things: to improved processes of lithography, to the great national spirit of competition, and to the growing number of young American artists who do not consider it beneath their artistic dignity to draw a circus pictures, provided they draw it well, who have turned the lithographers' rooms in New York, Cleveland, Boston, Cincinnati, and Chicago into veritable 'ateliers.'" (422) The quality of "show posters" for theater and circuses is of much higher quality than it was with woodcuts were used. The article discusses lithography. "Very nearly all the lithographic stone used for poster-work in this country is imported from Bavaria," it says. (422) The article focuses on black-and-white posters as "the color scheme has yet to be evolved." (423) It considers how color is added to black-and-white schemes. Better presses and the need for speed effect the nature of lithography and newspaper reporting. "Neither plan may produce a classic work, but both plans do produce work that is full of the color and life of the moment and the man." (423) As many as 12 to 20 artists may work on the same drawing and must blend their styles "into a harmonious whole." (423)

The author says that "the younger illustrators have gone boldly into the new swirl with a flat-tint brush in each hand, and in the impressively grotesque and the extravagantly attractive have out-Chereted Cheret." (422) The article concludes by saying that one "need only a glance at the New York bill-boards to show that the show posters of to-day are full of a chic, spirit, good drawing, and excellent detail not always found in many things that attain the dignity of gilt frames and gallery exhibitions." (423)

**104.** "The Art of Book and Newspaper Illustration. 1." *American Architect and Building News* 43.947 (1894): 78-80.

This article on page 80 discusses recent developments in newspaper illustration. It talks about the role of the photographer in newspaper illustration and how the artists who draws pictures is being used less and less. It also notes that wood-engraving is being replaced by photo-engraving. "At present we are casting off -- ungratefully it would seem -- the experience of the life time of the wood-engraver, and are setting in its place an art half-developed, half-studied, full of crudities and discords. The illustrations which succeed in books and newspapers succeed, for the most part, from sheer ability on the part of the artist; they are full of ability, but, as a rule, are bad examples for students to copy. 'Time is money' with these brilliant executants; they have no time to study the value of a line, nor the requirements of the processes, and so a number of drawings are handed to the photo-engravers -- which are often quite unfitted for mechanical reproduction -- to be produced literally, in a few hours. It is an age of vivacity, daring originality, and reckless achievement in illustration." (80)

The article also comments on the important of electric lighting. "It enables the photographic operator to be independent of dark and foggy days, and to put a search-light upon objects which otherwise could be utilized. So far, good. To the illustrator this aid is often a doubtful advantage." (80)

**105.** "Art, Exploitation Audiences Bait for TV: Only Sex Lure 'Em Back." *Variety* (1952): 18.

During the late 1950s and 1960s, movies from France, Italy, Sweden, Germany, Japan, and Argentina dealt explicitly with sex. Often these films were renamed and advertised for American audiences in ways that exaggerated their sexual content. Early on foreign film exhibitors realized that "the raw, unvarnished approach to sex" would attract not only the raincoat crowd but also "discriminating" customers who wanted "primitive honesty" in the treatment of sex.

**106.** "[article]." *St. Louis Post Dispatch* June 5, 1969 1969: 1A, 13A.

This article discusses the National Commission on Causes and Prevention of Violence.

**107.** "Artistry on a Glowing Screen: The New, Natural Look in Computer Graphics." *Time* (1985): 68-69.

This article discusses computer images shown at the Association for Computing Machinery's Special Interest Group on Computer Graphics (SIGGRAPH) in 1985. It notes that while the results resembled surrealist painting or photographs, "the methods used require more mathematics than artistry." (68) The article goes on to say that "The basic techniques by which this translation is accomplished were laid out in the late '60s and early '70s by two University of Utah professors, Ivan Sutherland and David Evans, in fulfillment of a contract for the U. S. Department of Defense. Their task: to build a flight simulator for pilot training that would show on a screen the same unfolding landscape the pilot would see from the air. To do this, the Utah scientists first had to program into the computer a precise mathematical model of every tree, house and mountain in the flight path." (68)

**108.** "Asks Jews to Uplift Stage." *Chicago Daily Tribune* Aug. 8, 1909 1909: 1.

This article reports that "Jewish citizens of the United States and especially those residing in New York are called upon by Rabbi Alexander Lyons to assist in the uplifting of the modern drama.

"Dr. Lyons makes his appeal in an article on 'The Purification of the American Stage,' which appears in the August number of the Federation Review."

**109.** "Assails 'Puritans' Sunday'." *New York Times* July 17, 1916 1916: 9.

The subtitle of this article reads: "Dr. Fitch Says Working People Have Right to Recreation."

**110.** "The Assertive Billboard." *American Architect and Building News* 94.1700 (1908): 31.

This article laments the spread of colored billboards that are offensive to good taste and which defile the beauty of nature. "The dweller in large cities finds his aesthetic sensibilities constantly affronted by the insistent demands on his attention by advertisements that flaunt their announcements at every turn. Whether he saunters upon the surface, betakes himself to the elevated cars, or drops into the subway, these vari-colored posters, whose color schemes offend good taste, claim his notice.... If we walk abroad these offensive billboards stare at us with all their ugliness; if we take train for some distant city we find the entire route lined with signs, and, while we may object to this defacement of the landscape, the discordant note in a beautiful view -- and it always happens that the most assertive signs are set up in the most picturesque places -- we cannot cease to admire the skill of the advertiser who so persistently repeats his story between New York and Washington,, that it is indelibly fixed on one's memory." The story concludes by lamenting that the city committee in New Bedford has permitted advertisers to cover the fence about the municipal building.

**111.** "Astonishing Success of Drawing Room Cinema." *The Times [London]* Jan. 4, 1913 1913: 4.

This is a newspaper advertisement for a home movie camera.

**112.** "At the Playhouses." *Los Angeles Times* July 10, 1896 1896: 36.

This article talks about what was shown at the premiere of Vitascope in Niagara Fall -- e.g., a kissing scene, and a "graceful woman who danced in skirts."

**113.** *Atlantic Telegraph: Its History, from the Commencement of the Undertaking in 1854, to the Sailing of the 'Great Eastern' in 1866.* London: Bacon and Company, 1866.

This work is interesting for the fact that it is a history of the transatlantic cable published in 1866. It also has a map of proposed submarine and land telegraphs in 1866. In addition, it has diagrams of the cable used.

**114.** "Baldwin at London." *Los Angeles Times* Sept. 21, 1902 1902: 2.

This article talks about the first moving pictures of the Arctic

**115.** "Baldwin Tells of Trip." *Chicago Daily Tribune* Sept. 21, 1902 1902: 14.

This article discusses the first moving pictures taken of the Arctic. The article's subtitle reads: "Arctic Explorer Gives Further Details of Voyage."

**116.** "Ban Immodest Postals." *Los Angeles Times* March 11, 1909 1909, sec. II: 10.

This article reports that "The immodesty of many picture post cards and the immorality of moving-picture shows occupied the attention of the South Coast Civic League...."

**117.** "'Be Decent or Close,' Alcock Warns Theaters." *Chicago Daily Tribune* June 18, 1918 1918: 18.

The article quotes Acting Chief of Police Alcock in Chicago on movie posters: "The posters some of the movies have displayed are vile. I have ordered all these removed. It is bad enough to have a picture based on sex matters without having posters outside promising something "racy" inside." The article's subtitle reads: "Runways Must Go Unless the Women Put on More Clothes."

**118.** "Beauty and Brains." *Chicago Daily Tribune* Oct. 1, 1916 1916, sec. I: 4.

This ad is about a "Beauty and Brains" contest and *Photoplay* magazine. The writer Kitty Kelly is also mentioned.

**119.** "Beauty Pervades New Show Shop." *Los Angeles Times* April 1, 1917 1917, sec. III: 23.

This article notes that the "Rialto Picture Theater's To Open Soon."

**120.** "Before the Camera. Photographing Statesmen and Generals. The Vanity of Posing Public Men Exposes Itself." *Los Angeles Times* March 11, 1894 1894: 13.

The sub-title of this article reads: "President Cleveland and Wife in the Photograph Gallery. Talks with Photographers Arthur and Garfield -- ... The Cabinet and the Camera."

**121.** "Being Photographed." *New York Times* Jan. 11, 1914 1914, sec. X: 7.

According to this article, actors say that being photographed in England is more of an event than in the U. S.

**122.** "Being Photographed." *Life* 54.1398 (1909): 224.

This article begins by saying that "no one ever admits that he goes to be photographed of his own volition.... But behind this screen hides vanity, perhaps; or the desire to see himself as others see him. He wishes to get out of the island of self and have an exterior glimpse at his personality. In the uncertainty of life some record should be left for posterity, even if the man portrayed be ... commonplace...." The article says that photographic portraits "each represents a distinct personality" but that those pictured "all are as it were in a trance...." The subject, "seated in a chair ... feels at once the spell of the studio. The camera, always mysterious, points at him." The photographer is more likely to get a natural image when he takes a picture of someone when they are not aware that they are being photographed.

**123.** "Bennett Urges Entertainment Industry to Join War on Drugs." *St. Petersburg Times* Oct. 24, 1989 1989: 3A.

William Bennet, then head of the nation's war on drugs, here urges the motion picture industry to be more active in antidrug campaign.

**124.** "Berlin Safeguards Picture Theaters." *New York Times* June 30, 1915 1915: 15.

The subtitle to the article reads: "Strict Rules to Prevent Fires Rigidly Enforced, Write Consul Thackara. No Inflammable Film. None Yet in Use by the German, He Says Paris Also Take Precautions Against Fire."

**125.** "Bernard Shaw's Utopian Vision of the Films of the Future." *Current Opinion* 58.6 (1915): 411.

This article draws on George Bernard Shaw's article in *Metropolitan Magazine* entitled "What the Films May Do to the Drama," and quotes Shaw predicting that moving pictures "will compete so successfully with the spoken drama that it will drive it to its highest ground and close all paths to it except those in which its true glory lies -- that is, the path of high human utterance of great thoughts and great wit, of poesy and of prophecy, or, as some of our more hopelessly prosaic critics call it, the Path to Talk." Shaw believed that even better things will be achieved once the phonograph and cinema are synchronized successfully.

These developments will lead to the increasing fame of actors and actresses. No longer will the great performer "be condemned to the inhuman task of playing his great parts for hundreds of consecutive nights, 'nor to relinquish his art under the strain of excessive and useless repetitions of his parts as an actor.' We shall hear no more of the 'fugitive fame' of the actor's art. The Hamlet of Forbes Robertson, for instance, filmed and recorded, may delight posterity, generation after generation:" [quotation from article's author]

[quoting Shaw] **"If this come to pass, the actor's fame will spread both in time and space. This is occurring already. I have never seen Max Linder in the flesh; nor have I even been within miles of the American Vitagraph company of players. Yet I am as familiar with their persons and their acting as I was in my youth with Buckstone's Haymarket Company or later on with Augustin Daly's Company."** (my emphasis) Shaw laments there were not films to capture their work and they say: "What a life it will be when all the theaters will be picture theaters, and all the players immortal."

Shaw looked "forward ... to that delightful time when all the great orations and political speeches are filmed and recorded for the benefit of Democracy .... He concludes" [quotation from article's author]

[Shaw quotation] -- **"I shall not be at all surprised if the cinematograph and phonograph turn out to be the most revolutionary inventions since writing and printing, and, indeed, far more revolutionary than either; for the number of people who can read is small, the number of those who can read to any purpose much smaller, and the number of those who are too tired after a day's work to read without fall asleep enormous. But all except the blind and deaf can see and hear; and when they begin to see farther than their own noses and their own nurseries, people will begin to have some notion of the sort of world they are living in; and then we, too, shall see -- what we shall see."** (my emphasis)

126. "Beware Elvis Presley." *America* 95 (1956): 294-95.

"Beware Elvis Presley," the Catholic publication *America* counseled in 1956. The harmful effects of his music on the young were bad enough when limited to records. "Unfortunately," the magazine said, "Presley makes personal appearances." And those appearances were denounced in many local newspapers as "downright obscene" and little more than a "strip-tease with clothes on." It was one thing to hear Presley's music, another to read about his performances, but when he began appearing on television in 1956, he was seen and heard by millions. For Presley's critics, it was an assault on people's homes. If only television and other media "would stop handling such nauseating stuff," the editors of *America* lamented, "all the Presleys of our land would soon be swallowed up in the oblivion they deserve."

127. Committee on Science and Technology, U. S. House of Representatives, Ninety-Ninth Congress, Second Session (Serial V)

Task Force on Science Policy. *Bibliography of Reports by the National Academy of Sciences, 1945-1985: Report Prepared for the Task Force on Science Policy*, United States House of Representatives, Committee on Science and Technology.

This document is *Science Policy Study Background Report No. 2 -- Part B*. The bibliography, which is unannotated, is organized by year and moves forward chronologically giving reports for each year from 1945 through 1985.

**128.** *Big As Life: An American History of 8mm Films*. Feb. 1998 - Dec. 1999. San Francisco, CA: San Francisco Cinematheque.

This work is a special edition of *Cinematograph: A Journal of Film and Media Art* (Feb., 1998 - Dec. 1999), and deals with the history of 8mm films.

**129.** "The Biograph in the Vatican." *Scientific American* 80.2 (1899): 24.

This article notes that by early 1899, 17,000 photographs of Pope Leo XIII had been taken with his approval. "Upon the announcement of the recent illness of Pope Leo XIII, it was found that with one exception no authentic photograph of the Pope had been taken during the past six years. Within a few months however no less than 17,000 photographs of the Pope have been taken in the loggia and gardens of the Vatican with the aid of the 'Biograph' camera.

"Mr. William Kennedy Laurie Dickson, representing the Mutoscope and Biograph Syndicate, Limited, of London, England, the English connection of the American Mutoscope Company, went to Rome for the purpose of obtaining moving photographs of the Pope. He had credential from Cardinal Gibbons, Monsignor Martinelli, Archbishop Ireland, and other noted prelates in the United States, and by special permission of the Pope he secured nine series for the 'Biograph' and 'Mutoscope,' and these scenes were exhibited on December 14, at Carnegie Music Hall, New York city, in the presences of Archbishop Corrigan and other distinguished clergymen of the Roman Catholic faith. They had previously been shown to Monsignor Martinelli in Washington and given his approval." (24)

**130.** "Biographical Sketch: Dan Glickman, Secretary of Agriculture". 2000. (Oct., 2000). July 5, 2004. <<http://www.usda.gov/agencies/gallery/glickman.htm>>.

This website for the United States Department of Agriculture (USDA) provides a biographical sketch of Dan Glickman (through 2000), who replaced Jack Valenti as Head of the Motion Picture Association of American (MPAA) in 2004. It notes that before becoming Secretary of Agriculture under President Clinton, Glickman had been a congressman from Kansas and served on the House Agriculture Committee. There he helped to author four pieces of farm legislation. Glickman was also considered one of Congress's leading experts on aviation policy and wrote legislation establishing product liability protection for the manufacturers of small aircraft.

**131.** "The Birth of a New Art." *The Independent* 78.3409 (1914): 8-9.

This article argues that motion pictures are a new art form and that they do "for the drama what printing did for literature." (8) Moving deserved to be considered a new art form, even more than the printing press, which was essentially "a mechanical extension of an old art, ... the art of calligraphy." (8) The movies make "possible for the first time the unlimited reproduction of actual events. This world of ours," it argues, "is in constant motion, and no static art can adequately represent it. There is no such thing as still life, or still anything else in the whole universe. Everywhere and always there is motion and only motion and any representation of reality at rest is a barefaced humbug." (8) "We have now for the first time the possibility of representing, however crudely, the essence of reality, that is motion," the article says, and it goes on to cite Henri Bergson. "'Bergson has shown us what a paralyzing influence static conceptions of reality have had upon history of philosophy and how futile have been all attempts to represent movement by rest.'" (source not given) In short, "the moving picture may mark a new epoch in the history of culture." (8)

The magazine says that henceforth it will review on a regular basis motion pictures just as it would good plays and books. The article notes that there are no standards in the press on what constitutes movie criticism. This article may have been written by the magazine's literary editor, Edwin E. Slosson.

**132.** "Black and White Pictures. Do the Public Prefer Them?" *Moving Picture World* 7.6 (1910): 245.

This article notes that the public prefers black and white picture (like Biograph's) but that as matters progress, B&W will be relegated to obscurity as the public comes to want color pictures. "In reference to the article which we printed last week on the subject of orthochromatic moving pictures, several of our friends who are actually engaged in the making and development of the pictures have, in some sort, joined issue with us. They say that the public is at present not educated up either to the perception or the appreciation of moving pictures in which the tone values correctly rendered. In other words, from the purely pictorial standpoint, the public does not know a good picture when it sees it.

"...We concede that the public is not quite ripe for appreciating moving pictures with correct tone values. But that time will surely come.

"And it will come, oddly enough, because of the public's present preference, that has been pointed out to us by our friends in the manufacturing end of matters a preference for the black and white picture the black and white picture, let us say, of the Biograph kind. This type of picture is deservedly popular, because it gives a fine, rich deposit in the shadows and clear, delicate lights. It has, one might call it, the engraving-like quality which we all appreciate. All the same, however, the human eye is not accustomed to monochrome. Nature, itself, as we have pointed out before, is polychromatic and not monochromatic, that is to say, it is composed of many colors or luminosities or depths or shades. Any convenient term can be chosen for expressing our meaning. And sure enough as the education of the public in moving pictures progresses it will demand that its pictures on the screen shall not be monochromatic, but shall correspond to nature. The result would be that the black and white picture will be relegated to comparative obscurity. Already the change is apparent and is in progress. You have, as we pointed out last week, pictures of the Gaumont and Urban-Eclipse type which are orthochromatic in quality. Then you have the Pathe colored picture, also the tinted picture...."

One might compare this article to Richard Abel's comments about audience preference for black and white film in westerns -- perhaps a reaction to the use of color by Pathé.

**133.** "Black-and-White." *American Architect and Building News* 92.1651 (1907): 55-56.

This article is an extract from the *Edinburgh Review* (July, 1907). It notes that photogravure has influenced black-and-white art in two directions. "It has encouraged direct pen-drawing as counter-distinguished from the etching of the earlier day, and almost transformed its character. Pen-drawing has of course always existed; we find numerous examples of it among the Italian masters, though (for the reasons which were explained above) with these it is rarely naturalistic. Rembrandt practised it; but for his own behalf, not as a 'public' art. Until the invention of photogravure (this, too, was in the sixties) there were no adequate means for reproducing such work. The other form of black-and-white art which has been directly influenced, almost created, by the new 'processes,' is drawing by washes in ink or Indian ink. There were no means of reproducing these, and so using them in illustration, until photogravure was invented." (55) The article then considers Joseph Pennell, a master draughtsman, talking about the atmosphere created in pen-and-ink drawing.

The author argues that two things distinguish modern art -- "its sensitiveness and its unintellectuality. The former is in some fashion the counterpart of the latter. Most modern artists would triumphantly accept the charge of being non-intellectual; only they would translate it into another phrase -- non-literacy. It is the boast, in many regards the legitimate boast, of modern art that it is not literary, that it does not confound two different arts, that it does not tell stories in its pictures, nor appeal to the vulgar emotion of simple curiosity. And it would claim to be much more sensible or sensitive than was the art which immediately preceded it to those emotions which rightly belong to art, to fine tones of color, to harmonies, to all the elements that distinguish real impression got from outward objects, from what we 'know' concerning them. We have seen how modern black-and-white has upon its side freed itself from many bonds which came from literature, has freed itself to a large extent from the tyranny of the line whose title rests much more on its aptness in the giving of information than in the gratification of an artistic sense. One cannot say but that this is a good, if this were all: what is not so good

remains behind. For often this artistic sensitiveness degenerates into a sort of hysteria, a sort of delight in all that is intellectually stupid, because it is there not outside the regions of art; and the, passing over as hysteria does to the opposite of its first state, it turns into a pleasure in insensibility, a coarse blotchings, in fantastical ugliness and all other kinds of tomfoolery, such as we find in Beardsley and his school. (56)

"For the 'unintelligence' of modern art, however, that is not so much its special characteristic: it but sadly reflects the unintelligence and unintellectuality of modern life generally -- of modern society, which is marked by a decadence in almost every branch of literature. In that field, in place of the greater histories of an earlier time, works which were literally monuments, it gives us 'treatises' or handbooks; or else those gossipy, half-informed volumes of which the libraries are full. ... This unintellectuality is reflected likewise in art; and, with all other branches of it, the art of drawing in black-and-white." (56)

**134.** "Boeing Digital Cinema Surpasses 10,000 Screenings, Demonstrates Live Streaming Capability". 2002. (Oct. 31, 2002). Nov. 7, 2005. <[http://www.boeing.com/news/releases/2002/q4/nr\\_021031t.html](http://www.boeing.com/news/releases/2002/q4/nr_021031t.html)>.

This news release says that in less than five months, Boeing Digital Cinema, part of the Boeing Company's Boeing Integrated Defense System, has given 10,000 screenings of digital cinema and continues to give 100 per day. Among the movies transmitted by Boeing Digital Cinema were *Star Wars Episode II: Attack of the Clones* (Fox/Lucasfilm); *Spy Kids II* (Miramax); *Signs* (Buena Vista Pictures Distribution); and *Banger Sisters* (Fox). The article notes that digital delivery could save Hollywood perhaps \$1.5 billion per year.

**135.** "Boeing Integrated Defense Systems". 2003. (Jan. 4, 2003). Nov. 7, 2005. <<http://www.boeing.com/ids/ids-back/index.html>>.

This website give information about Boeing Integrated Defense Systems (IDS), based in St. Louis, including company officers. Among other activities, IDS is involved in digital cinema

**136.** "Boeing's Digital Cinema Ready for Viewing". 2001. (March 6, 2001). Nov. 7, 2005. <<http://spaceflightnow.com/news/n0103/06cinema>>.

This Boeing news release, in *Spaceflight Now*, says that Boeing Digital Cinema is able to give same day delivery of digital media by way of satellite. This service was to be demonstrated at Bally's and Paris hotels in Las Vegas, March 5-8, 2001, at the ShoWest 2001 Convention. Boeing Digital Cinema is a service of Boeing Satellite Systems, Inc. of the Boeing Company.

**137.** "Book - Talk." *Nassau Literary Magazine* 53.5 (1897): 280-86.

This piece offers reviews of several books including Alexander Black's *A Capital Courtship* (New York: Charles Schribner's Sons, 1897). (285-86) It notes (286) that the work has photographs of Grover Cleveland and William McKinley at their desks in the White House.

**138.** "Books and Authors." *New York Times* May 25, 1901 1901, sec. BR: 6.

This review of Frank M. Chapman's *Bird-Life, A Study of Our Common Birds* says: "Wild Life in Color Most people will acknowledge that the so-called color photography has not yet been developed to an excellence which is superior in toning and tint to the best specimens of old-time lithography. And yet color photography has made it possible to present nature books with colored illustrations well within the reach of the reading public; this would have been impossible had lithography been employed...."

**139.** "Boons for Posterity." *New York Times* Nov. 11, 1911 1911: 12.

Alexander Konta says "light and sound waves never lie" (Konta quoted). Notes that Lincoln's voice and Napoleon's actions forever lost. "But posterity in its remembrances of things past may summon back the voices and the prominent figures of this and succeeding generations." Article goes on to say that "Print, the

photographic plate, the phonographic roll, and the kinoscope have superseded the goose-quilled manuscripts of the fallible copyists of old. But our modern paper is perishable; the new society will do well to return to parchment."

**140.** "The Boston Location Filming of 'The Thomas Crown Affair'." *American Cinematographer* 49.10 (1968): 740-43, 770-71, 786-87, 793-94.

In this interview, cinematographer Haskell Wexler discusses how the movie "The Thomas Crown Affair" was filmed on location. He explains the use of zoom lens, hand-held cameras, hidden cameras, cameras operated by remote control, and the use of lighting. Director Norman Jewison wanted the characters to "play chess with sex" and used only two large soft lights to create a "dreamy, sexy mood." (p. 743) For a scene shot inside a sauna devoid of steam, Wexler filmed using a red light which suggested heat. (p. 770) Wexler says that he used a 50mm lens made by Angenieux with a speed of F/.95, the "fastest lens I've ever seen." (p. 786)

**141.** "Boy Admiring Movie Posters Hit by Truck." *Chicago Daily Tribune* Feb. 26, 1917 1917: 13.

Children attracted to movie posters -- and one of the dangers.

**142.** "[Breen, Joseph Obituary]." *New York Times* Dec. 8, 1965 1965: 47.

This obituary deals with the man who was perhaps the most powerful film censor in the United States from 1934 to 1954.

**143.** "[Breen, Joseph]." *Variety* Dec. 15, 1965 1965: 13.

See also the story related to Breen's obituary in *Variety*, Dec. 8, 1965, p. 3.

**144.** "Brigitte Conquers America." *Look* 22 (1958): 62-64ff.

One of several articles in mainstream U. S. magazines publicizing Brigitte Bardot after her movie *And God Created Woman*.

**145.** "British Board of Film Classification". Nov. 7, 2005. <<http://www.bbfc.co.uk>>.

The British Board of Film Classification is the agency responsible for rating (and previously censoring) motion pictures in Great Britain.

**146.** "British Movie on Homosexuality Denied Seal of Approval Here." *New York Times* Nov. 16, 1961 1961: 45.

This British-made movie dealt with homosexuality and was denied a Production Code Administration seal of approval in the US. "Independently produced overseas by Allied Filmmakers and starring Dirk Bogarde, the movie is a dramatized condemnation, based on the Wolfenden Report, of Britain's laws on homosexuality," this article reports. The film gained acclaim abroad and Pathe-America Distributing Company picked it up to exhibit in the United States. Budd Rogers who was head of the company said the movie would play in the U. S. with or without the PCA seal, and indeed, it opened in New York on Feb.. 5, 1962.

**147.** "Broadway to Have a New 'Theater of Color'." *Current Opinion* 71.5 (1921): 612-13.

This article discusses the plans of Achille Ricciardi who plan to begin a "theater of color." (612) "He proposes a transformation of the static scenic settings by the plastic use of illumination in providing a vivid and living background to emphasize the content of plays already written and suited to such interpretation. In realizing his effects, Ricciardi has developed several interesting devices. He projects his light on the stage from the sides, from above and also from concealed sources in the floor, whereby a figure walking above is suddenly and unexpectedly cast into strong illumination. Most of his side-lights, explains Oliver M. Saylor, in the Boston *Transcript*, are passed

through water contained in glass boxes and chemically colored. The effect of ... rippling light is also obtained through this device." (612)

The article provides a lengthy excerpt from Ricciardi talking about the Theater of Color: "The appearance and developments of colors constitute the essence of my theater. Among our predecessors color belonged to the technic of the stage rather than that of the 612/613 drama.... We aim to make of the stage not a cornice, but a part of the drama, its visible element, not merely its exterior. We should remember that the stage has a dual structure; architectural, which limits the space of the action, and spiritual, which fuses the psychological motives with the surroundings. Moving color modifies forms without disfiguring them. In an atmosphere of successive colors the emotional intensity of the drama reaches its proper pitch without alteration of the phonetic value or the style of the dialog, as in opera.... In considering color as psychological background, we must remember that music gives the sensation of tempo and painting the impression of space, and that the only element which can arouse the sensations of tempo and space at the same time is the magic element of color freed from form. In answer to the objection that the same color will not suggest the same emotional reactions to different people, I reply that we are all children as regards our color sensibilities, which are simple and primitive and therefore more likely to be similar than different. Red is cheerful and white is pure; these conceptions are found in all languages and prove the universal intellectual nature of the sense of color. I believe that a deep blue with a sickle of green will give the impression of a landscape more successfully than painted cardboard and bad white lead." (613)

The author of this article discusses specific colors. "A taste for red is almost always associated with passion and the sensual pleasures of life," it says. (613)

**148.** "Bull Fight Is Held at the Stock-Yards for Moving Pictures." *Chicago Daily Tribune* Nov. 22, 1898 1898: 1.

The subtitle of this article reads: "Matador Is of Straw, but the Steer Is Alive, and Having Been Goaded to Frenzy Nearly Kills a Cowboy Who Falls Into the Arena."

**149.** "Burton Holmes' Third Talk. Gives His Illustrated Lecture on 'The Cities of the Barbary Coast' Football Pictures." *Chicago Daily Tribune* Nov. 27, 1897 1897: 8.

This article notes that "Among the moving pictures the football scrimmages on the University of Chicago campus in the Thanksgiving game aroused the greatest interest, with the polo and golf scenes a close second."

**150.** "Bush Lashes Hollywood's Lax Attitude Toward Drugs." *Toronto Star* March 23, 1989 1989.

This article deals with President George H. W. Bush's attack on Hollywood's depiction of substance abuse.

**151.** "Busse Sees Levee; Changes Ordered; Mayor Visits 'Red Light' District, and Many Blows to Vice Follow; Takes Slash at Stage." *Chicago Daily Tribune* June 2, 1907 1907: 2.

This article reports that Chicago Mayor Busse appalled by billboard for "James Boys in Missouri," to be shown at the Alhambra theater. "A smoking revolver was held in the hand of a villain who was standing over his victim."

"'I wonder how that is for the morals of the general public,' said Mayor Busse. 'I believe this would bear some investigation.'"

He also did not like a handbill for "The Moonshiner's Daughter." "It was filled with pictures of blood curdling adventures.... The hero was seen in a big jug of 'moonshine' whisky, while another bottle protruded from the 'here's vest pocket. There were more pictures of the kind that make school boys thirst for toy pistols and worse. 'Don't fail to see the great fight in the whisky still,' was a 'tip' found on the bottom of the poster."

"Electrical signs also were found to be objectionable, although many have been removed by order of Capt. McCann. No more permits will be issued for electric signs of any sort in the district.

Subtitles to the article reads: "Believes Lurid Melodrama at Theaters Will Bear Investigation."

**152.** "By the Way." *Outlook* 104.12 (1913): 641-42.

This article comments on several topics including the use of Civil War photographs by newspapers. "The reprinting in the newspapers of pictures of the battle of Gettysburg published fifty years ago in the illustrated weeklies of that time brings home the fact that photography has to a certain extent changed the character of war illustration. Greater fidelity to fact is seen in present-day illustration of military matters. The chaos of fighting men, fancifully pictured by the military artists of the past, is not acceptable to readers nowadays, educated as they are by the camera." (641)

**153.** "California Color Films." *Los Angeles Times* Feb. 16, 1912 1912, sec. II: 8.

This article's subtitle says: "Kinemacolor Company's New Process Here First. Takes Pictures at the Rate of Seventy to Second. Propose to Display Local Scenery All Over the World."

**154.** "Camera Drama vs. Spoken: The Latest War in the American Theater." *Current Opinion* 59.6 (1915): 405.

This article begins by quoting William A. Brady who said that "if pictures go on as they have been going on in the last ten years, it will mean the death of the spoken drama." It then discusses an editorial response to Brady's ideas in the *New York Evening Post*. "The American drama has always been a drama of action, as opposed to words," the *Current Opinion* article says. The decline of serious drama has been caused by commercial writing. "Dream of huge profits, efforts to please every diverse type of audience from coast to coast, writing for the millions, our playwrights, as this authority points out, have been compelled to go very thin on character, ideas, dialog, to concentrate on action, and action reduced to its elementary terms. These influences are the true ones leading to the death of the spoken drama, the drama of ideas as well as action. This is the effect of Big Business in the American theater." The article quotes from the *Post* editorial to the effect that the movie and serious drama do not have to be in conflict. "By satisfying the elementary appetite for "action," it [the movie] may yet drive pistol-waving from the theater and leave the stage clear for a real spoken drama. People will go to the movies for one thing and to the theater for another. And the dramatist who is relieved from the demand for something doing every minute may give us plays that are spoken in a more real sense than the "spoken" drama of crooks and detectives."

**155.** "Camera Men Dare Death in Arena with Lions." *Los Angeles Times* Aug. 31, 1913 1913, sec. III: 1.

The subtitle reads: "Big Scene in 'Quo Vadis' in Which Christians Are Devoured, Required Nerve and Quickness in the Making Actors Trained but Had to Take Big Chances."

**156.** "Camera's Inroads in Field of Illustrating." *New York Times* Nov. 3, 1901 1901, sec. SM: 12.

This interesting article notes that the camera has replaced the illustrator in weekly papers and also in the illustrated daily newspapers and in cheap magazines. The cost of producing an illustrated paper has dropped significantly during the past five or six years. The cost of using photographs is about one-fifth as much as using traditional illustrations supplied by artists. The article compares the news coverage of William McKinley's assassination in 1901 with that given to Abraham Lincoln's assassination in 1865, and how differently pictures were obtained during in 1865 and in 1901. In Lincoln's time, artists were sent to sketch the scene and wood engraving were used. It took one to two days to engrave a drawing on wood, and perhaps four days before the image was ready to publish. At the time of McKinley's assassination, newspapers had many photographs (many stock photos, to be sure) to choose from. Newspapers had photographs even of obscure places on file and they were readily available. It cost *Collier's* about one-tenth as much to put out an extra edition after McKinley's death as it did *Harper's* to produce an extra issue after Lincoln's assassination. The article notes that even five or six years before McKinley's death, an extra required sending out several artists. By 1901, photos could be gotten from

Buffalo to NYC in about 14 hours. This article also discusses the use of photographs in cheap magazines and that illustrations are still used in fiction.

**157.** "The Campaign to Curb the Moving Picture Evil in New York." *New York Times* July 2, 1911 1911, sec. SM: 15.

The article reports on New York City mayor's committee on safeguarding the public at motion picture entertainment; it wanted movies to be "clean, safe, and healthful, and moral." The subtitle to the article reads: "Organized Efforts to Censor Exhibitions Which Under Existing Conditions Are Harmful."

**158.** "Can the Camera Immortalize the Melancholy Mask of Eleonora Duse?" *Current Opinion*.1 (1917): 27.

This article is about Italian actress Eleonora Duse, who critics in Europe felt surpassed Sarah Bernhardt in subtlety. She retired at the peak of her success which make her a "semi-mythical figure," according to this article. She is now considering returning in the movies because, according to an excerpt quoted here from the *Boston Transcript*, she believed "that from this mute stage, which has in its favor the rare and enviable element of the approbation of the most numerous and humble portion of the world's population, in the dark and crowded halls, new expression of esthetic beauty and moral beauty may manifest themselves...." Later, this article quotes Matilde Serao, who wrote of Duse: "'Her unforgettable eyes have ever that internal depth of poignant melancholy which she made as penetrating as a subtle sound.'"

**159.** "Can the Making of Motion Pictures Ever Be a Fine Art?" *Current Opinion* 63.4 (1917): 251.

This article begins by saying that "It appears that the public has been deceived, or at least misled, by such savants as Hugo Münsterberg and Vachel Lindsay into believing that there are fundamental elements of art in the photodrama and that it is destined to take rank eventually as an eighth art in the cultural world. As a matter of fact, we read with a degree of surprise, the movies have no concern with art at all. Their sole concern is with life, and the trouble is that the public has been taught to expect more of them than they have been or ever will be able to deliver. Such, at least, is the interesting assertion made by one motion-picture magnate who has no illusions about the industry and who has been making a confidant of William Marion Reedy." This person was recently quoted in the *St. Louis Mirror* and an excerpt from his interview is reprinted in this article. This person emphasized movies' education value in teaching geography and other subjects in the schools.

**160.** "Canadian Rating and Classification Systems: Film Classification in Canada". Nov. 7, 2005.

<[http://www.media-awareness.ca/english/resources/ratings\\_classification\\_systems/film\\_classification/canada\\_film\\_classification.cfm](http://www.media-awareness.ca/english/resources/ratings_classification_systems/film_classification/canada_film_classification.cfm)>

The Canadian Rating and Classification System is the primary agency rating motion pictures, television programs, video games, and other entertainment in Canada.

**161.** "Capitalism's Pin-Up Boy: Eric Allen Johnston." *New York Times* Feb. 26, 1958 1958: 8.

This article, written about the time Eric Johnston organized a bi-partisan conference for President Eisenhower to support U.S. foreign aid, gives biographical details of the MPAA president's life. It begins by calling Johnston "the personality boy of United States capitalism." It then quotes Johnston saying: "We are too mealy-mouthed. We fear the word capitalism is unpopular. So we talk about the 'free enterprise system' and run to cover in the folds of the flag and talk about the American way of life." The article says that Johnston preferred not to use his middle name or initial (Allen).

**162.** "CBS Introduces Its Electronic Video Recording System." *American Cinematographer* 50.4 (1969): 398-99, 421.

This article comments on a "new method of playing back any existing movie or videotape material through a standard TV receiver." The process, demonstrated a month earlier, was CBS's Electronic Video Recording system

(EVR), and it promised "many important applications" and it promised "to create almost as great a film boom in certain areas as the Super-8 format." (398) The article says CBS was "preparing to convert titles in their film libraries to EVR cartridge format" (421) and that one company CBS owned, Baily Films and Film Associates, had 450 separate movie titles. This development was expected to have "a powerful impact on education, business, entertainment, the arts, and information processing industries. Its applications are almost numberless." (421)

EVR did not record images from television sets, "but only plays back pictures previously produced on standard film or videotape and then transferred to an EVR cartridge." (398)

**163.** "Celebrities Made While You Wait." *Chicago Daily Tribune* Nov. 22, 1903 1903: 34.

**This article notes that the key to achieving celebrity status is having your photograph taken. "It costs no more to become a 'well known society woman,' a 'rising young lawyer,' a 'prominent author,' or a 'successful physician' than it does to have three dozen photographs taken. Indeed, the taking of the photographs and the making of the celebrity are parts of the one and same transaction....** (my emphasis)

"Pick up any of those magazines which make a feature of a photographic department. In these pages you will find pictures of celebrities you have not met till now. You will wonder how they have escaped you. But there is their picture, with the line which certifies the original of the picture to be a 'prominent,' or a 'rising,' or a 'well known,' or a 'successful' this, that, or the other.

"Take those periodicals that are devoted to specialties - to the law, to sports, to medicine, to engineering. There again you will find the same pictures of the same persons....

"In many cases you happen to know that the originals of these pictures really have done some notable thing. They have done something for which they should be honored. You do not wonder that their pictures appear in the public prints. But as for the others -- those celebrities who, as it were, have sprung up like the mushroom between the setting of the sun and rising of the same -- of those celebrities you are skeptical.

"You need be uncertain no longer. For herein is revealed the secret spring from which many of our heroes and heroines come.

"The first step to be taken by one who would shine in the fierce white light of publicity is to have pictures taken. If the applicant for the sittings is a well known actor or actress or a politician of great prominence these pictures will not cost a cent.

"Most photographers are glad of the advertisement they get from the connection of their name with that of their distinguished subject. But these people who can get photographs for nothing are not the people who need the advertising."

The subhead then reads: **"Seeks Fame's Advance Agent."**

"He who would like to see his picture in public print together with a written notice in which his merits are alluded to hies [sic] himself either in Chicago or in New York to the professional celebrity maker....

"Three dozen photographs are at once taken. There was a time when the camera told the truth, but that was many, many years ago. Now the most commonplace face in the world can when it is looked upon by the magic lens, transform itself into a thing of beauty, which will be a joy as long as the photograph lasts. The pictures are taken...."

**164.** "Celebrities Write on Parchment for Future Ages." *New York Times* June 2, 1912 1912, sec. SM: 9.

This article reports that Bernard Shaw, Admiral Dewey, "and Others Contribute to the Modern Historical Records Associations Ambitious Project," by writing on parchment to preserve a record of their work.

**165.** "The Celluloid Danger." *The Times [London]* April 1, 1913 1913: 7.

This article reports on the fire hazard posed by celluloid.

**166.** "Censor Bars 'The Miracle'." *Chicago Daily Tribune* April 11, 1913 1913: 10.

This article details the reason why Chicago authorities censored the film *The Miracle* (1913?). The article's subtitle reads: "'Depicts Immorality and Is Insulting to Religion.'"

**167.** "Censors Conduct Model Picture Show." *New York Times* May 16, 1909 1909: 7.

This article reports that Board of Censorship of Moving Pictures and the People's Institute gave a demonstration mainly to school teachers and it was a "model show." The subtitle of the articles reads: "Had the Theatre So Lighted That the Audience Could See to Read; Exhibit Biblical Pictures; Also Statues and Paintings A Comic Side, Too Speaker Thinks Clergy Fear Human Nature."

**168.** "Censors Inspect Nickel Theaters." *Chicago Daily Tribune* May 1, 1907 1907: 6.

Lieut. Alexander McDonald, head of Chicago's new "nickel theater bureau" quoted: "'In my estimation the penny arcades are more in need of reform than the nickel theaters, and the theaters need it badly enough.... I will venture that there weren't 20 per cent of the penny moving pictures that could be called decent.'"

The subtitle of this articles reads: "Find Many Bad Shows in Them and Worse in the Penny Arcades; Have Much to Condemn; Expect to Cover City in Three Days and Make a Complete Report. Penny Arcades the Worst. Thaw and Other Murder Scenes."

**169.** "Center for Moving Picture Supplies." *Chicago Daily Tribune* Feb. 7, 1909 1909, sec. Q: 9.

This article talks about Chicago's place in supplying the growing moving picture business.

**170.** "Charged Charms of Brigitte: Bardot Boom Balloons in the U. S." *Life* 44 (1958): 50-52.

This one of several articles (several appeared in *Life* alone) in mainstream magazines publicizing Brigitte Bardot and her movie *And God Created Woman*. The magazine devoted three pages of non-nude color photographs to the actress designed to accentuate her "charged charms."

**171.** "Charity's Report Backs Allegations that Priest Engaged in Misconduct." *Los Angeles Times* Aug. 5, 1990 1990, sec. B (Metro): 3B.

This article details charges that Bruce Ritter, a Catholic priest who had been a member of the antipornography Meese Commission in 1985-86, had himself been involved in sexual misconduct.

**172.** "Chasing an Emotional Rainbow." *New York Times* Nov. 21, 1937 1937: 178.

This article discusses color's ability to arouse emotions and the interest that has been shown in this topic by movie makers who have used Technicolor. "Makers of Technicolor movies, naturally are deeply interested in the capacity of color to induce emotion. The affinity is a heaven-made one -- emotions being so to say, the primary colors of the movie palette. Because there is no adequate research on the subject, problems involving color emotion (?) are almost without precedent. But serious attempts have been made by the staff of Selznick-International to break down color effects and establish a sort of emotion spectrum." The article mentions Dr. Robert T Ross of Stanford University and also William A. Wellman.

**173.** "Child Pornography Law Enacted." *New York Times* May 22, 1984 1984, sec. A: 20A.

This article deals legislation passed to fight child exploitation and child pornography.

**174.** "Child Takes Poison after Picture Show." *New York Times* June 7, 1911 1911: 3.

The subtitle to this article reads: "12-Year-Old Girl Moved to It by a Lurid Romance She Saw Depicted. Yearned to Die a Heroine. Swallowed the Deadly Tablet at Her Mother's Side Heroic Measures Save Her."

**175.** "Children and the 'Movies'." *Youth's Companion* 95.9 (1921): 134.

This article notes that perhaps two-thirds to three-fourths of movie audiences were youth "of all ages, from high-school pupils down to youngsters of not more than five years; but most ... of the grade-school age, say from seven to twelve years of age." These *blasé* little 'movie fans' were watching material comparable to the dime novel and "cheap love stories." Only "there is no reading that present or can present things so vividly as the moving-picture screen presents them...." It is the parents' responsibility to supervise what their children watch.

**176.** "Children Cheered War Heroes; Two Thousand Little Ones the Happy Guests of the City History Club." *New York Times* Feb. 23, 1899 1899: 12.

This article reports that children cheered moving pictures and telephotographs. "The popular generals and well-known warships were instantly recognized and their appearance on the screen was greeted with a deafening hubbub of whistling and yelling that the patient lecturer had difficulty quelling.

"Roosevelt in his Rough Ride uniform and Wheeler, both ever present where any fighting was going on, were the most popular of the warriors, and the Brooklyn and Oregon warships, aroused the greatest enthusiasm."

**177.** "The Children in Danger." *Chicago Daily Tribune* Oct. 9, 1906 1906: 8.

This article says that movies are more dangerous to children than the live theater. It says that "If the rapid increase noticed this year in the number of penny arcades and nickel electric theaters meant only that speculators were reaping a rich harvest of small coins at little expense to themselves there would be no objection to it." But "there would be no call for police interference if the children were not taught immorality as well as encouraged in thriftlessness."

While some stage plays are "depraved," the movies are "more dangerous to children because they are brought near to the children's schools and homes, and the price is so low that children who never have been to the theater in their lives are habitual patrons of the penny or nickel shows." Article says that movies have "as many ... criminal or disreputable scenes as the imagination of the kinesiograph artist can suggest are presented with lifelike distinctness for young children to gloat over." The machines show things that "no father would wish his young son or daughter to look upon."

**178.** "A Chromotherapeutic Key to Dramatic Art." *Current Literature* 48.5 (1910): 515.

This article talks about the effect of colored lights in the theater. Color "light exerts not only a therapeutic and sanative influence, but an emotional one as well." The article considers a recent lecture by Charles R. Clifford, reprinted in *The Illuminating Engineer*, on how "the whole history of dramatic expression on stage will have to be written anew by an authority competent to realize and apply chromotherapeutic principles." Clifford argued that "the effect of color upon the nerve force of the nervous is more distinctly shown than the effect of music." (Clifford quoted) The article then discusses the various emotional effects of different colors (e.g., yellow provokes laughter, green contentment, red stimulation, etc.) and the likelihood that moonlight is a factor in causing many people to fall in love. Audiences in the theater are rarely aroused by music the way they are by color. "It is the engineer who controls the lights who makes and unmakes the art of the playwright -- and why? Because, replies our expert, the play is always seen by artificial light."

**179.** "The Cinematograph Craze." *The Dial* 56.664 (1914): 129-31.

This article notes the rapidly growing popularity of movie -- three-quarters of million people attend them every day in Chicago, it says. "It is a mushroom growth that has developed almost over night, and we have not yet had time to view it in all its bearings." (129) The article discusses the social and educational implications of the movie theater **"It is, in a sense, the culmination of the process of substituting pictures for words, -- of actual images for the images which the stimulated mind creates, -- which was inaugurated when the photographic illustration began to invade our magazines and to disfigure our newspapers. It shows in a very striking way the demoralizing modern tendency to seek lines of least resistance in every form of activity, to convert education into amusement, and work into play, without giving the least thought to the way in which the process softens the mental fibre and saps the character. Generally speaking, the picture performs its proper function when it supplements the word, printed or spoken, and perverts its function when it would become a substitute. For the picture never can really be a substitute for the word, which is equivalent to calling it a substitute for thought, and the intuitional elements which it supplies to the mental process are a poor exchange for the analytical elements of logical interpretation which reading and listening demand."** (130) (my emphasis)

The article cast doubt on the educational value of films or their ability to recapture history. "A great deal of nonsense has been written about the moving picture as an educational agency. If kept strictly in its place as an adjunct to the methods that demand application and concentration, it may serve a useful subordinate purpose. The historical scene as realized from a close study of the sources may be vivified by this form of dramatic presentation, although the setting and the action are necessarily 'faked.' What the imaginative picture in the school text does for the child may be done for him more realistically by the projection of the film on the screen. But all that he will get from it at best is a series of fleeting impressions, and no opportunity is offered him to study the details of scenery and costume and architecture. The fleeting impression, however, can never make a serious contribution to the work of education." (130) Scientific films with microscopic views of subject matter might be more valuable if they have the proper explanation accompanying them.

The author of this piece sees slightly more value in the travel film. "By its means, one may become a traveled observer with a minimum of effort, and its success is attested by the large use which the travel-lecturers make of it. The real traveller, of course, finds his delight in leisurely contemplation of the foreign scene, dwelling at length upon its details, and giving the impression time to fix itself upon the memory. The arm-chair traveller in the picture play-house can do nothing like this, and can retain but a jumbled recollection of what has been shown him. But even such travel is better than none at all..." (130)

Great literature offers possibilities for moving pictures. "Literature offers a boundless field for this new kind of illustration, and its exploitation, guided by artistic conscience, may add much to our enjoyment of the great works of fiction and poetry." (130)

Movies offer great temptations to appeal to "vulgar and depraved tastes," and so "some sort of censorship is demanded by the interests of public morality." (131) Noting that some sort of legal regulation movies operates now in most major cities, the author says that "Censorship as an official institution is never an unmixed good, and is capable of developing into a greater evil than any it seeks to avert, as we have seen in the cases of English licensing of plays and the Russian treatment of the press. The present danger in this country seems to lie in the sort of official stupidity which lays down general rules, and then applies them undeviatingly in all cases -- a procedure which would have the ludicrous result of placing Shakespeare's 'Julius Caesar' under the ban because scenes of violence and murder are in general prohibited." Modern censors "catch not only the vicious and vulgar in their net but also the merely tragic which, distressing as it may be to view, remains an essential part of life, and must not be left out of the scheme if we are to pretend to picture either the history of civilization or the conceptions of the great creative writers. It is not legitimate to throw upon the screen anything which may be described in a printed book that is published without legal interference?" (131)

**180.** "The Cinematograph's Value In Biology: Recording the Flight of Insects." *The Times [London]* May 13, 1911 1911: 6.

This article talks about the use of moving picture to study the rapid flight of insects. Cameras must be able to take many pictures in much less than one second's time.

**181.** "Cinematographs: Truth and Fiction." *The Times [London]* April 9, 1913 1913: 11.

Commenting on moving pictures and their ability to portray things out of their natural context, this article says that "...The horses and the woman and the trees appear on the street as if they had nothing to do with the future or with the past.... Let alone the strange way in which isolating something from its context heightens the meaning, there is also the sheer excitement and curiosity of the sights themselves."

**182.** "Cinematography for the Amateur: A New Invention." *The Times [London]* Feb. 25, 1914 1914: 10.

This article discusses the invention of a seven-pound movie camera.

**183.** "Cinematography, a New Art for Amateurs." *Arts and Decoration* 11 (1919): 230.

The writer of this piece takes the view that "as an educator," film had "no equal." He discusses changes in cinematography that are making it more accessible to a broader public and makes it possible to produce home movies. Already by this time, many schools were purchasing motion picture equipment as the technology became smaller and safer (e.g., inflammable film) and they had begun collecting educational movies for their libraries. The results, so claimed one publication for those working in art and design, were astounding. Now, thanks to films, even a child of only eight knew "far more of physiology, geology, geography, or bird and animal life the world over than most of his elders." Even more amazingly, all this information had "been absorbed with no tax to the youthful mind or memory."

Not only can film teach history but it can capture the past. "There is another and intimate phase of this new art that makes an even broader appeal; we can have animated pictures of our loved ones; we can preserve for next year the beauty of this year's garden, and for the years to come the charms of childhood. Here is the great human appeal of the home movie. Here is the opportunity to visualize, at least, 'the touch of a vanished hand.'"

**184.** "Cities Prohibit Fight Pictures." *Chicago Daily Tribune* July 6, 1910 1910: 1.

This article deals with the moving pictures of the Jack Johnson-Jeffries 1910 heavyweight boxing match. The subtitle reads: "Official of Half Dozen Large Places Act Because of Race Hatred While Followed Contest; Plan Nation Wide War; Christian Endeavor Societies Will Urge Every Governor to Prevent All of Film Expositions."

**185.** "Citizens Roused by Crime Shows." *Chicago Daily Tribune* Oct. 6, 1906 1906: 7.

In Chicago, this article says, "Along Milwaukee avenue are nearly a dozen of these cheap amusement places, between West Ohio and West North Avenue. The 'shows' offered principally are 'moving pictures,' showing train robberies, lynchings, safeblowing, 'black hand' conspiracies, and all manner of crime and bloodshed." The subtitle to this article's headline reads: "Moving Pictures of Scenes of Violence Declared to Demoralize Children. Will Protest to Mayor. Ald. Beilfuss Says Cheap Theaters Must Be Supplanted or Made Harmless." The subhead that follows in the article reads: "Crime Taught to Children."

**186.** *City of Renton v. Playtime Theatres, Inc.* 475 U. S. 41 (1986) 1986.

Realizing that the *Miller*, *Paris Adult Theatre*, and *Jenkins* cases by themselves were inadequate to eliminate adult movie houses, communities tried a different approach that involved controlling land use and concentrating such theaters into "combat zones." The goal was to prevent concentration in areas where residential neighborhoods and businesses might be destroyed. The United States Supreme Court upheld this method of control in two cases, *Young v. American Mini Theatres* (1976) and *City of Renton v. Playtime Theatres, Inc.* (1986). Neither case involved criminal penalties or suppressing films completely.

**187.** "Clerics Say President Vows a Major Drive to Curb Smut." *New York Times* Nov. 15, 1986 1986, sec. 1: 9.

This article covers religious leaders, President Ronald Reagan, and anti-pornography efforts. "Representatives of 200 American religious leaders said today that they had won President Reagan's commitment to make a national anti-pornography campaign a major priority of his Administration," this article begins.

**188.** "Close of the Celebration: A Veritable Hot Time in the Old Town Last Night." *Los Angeles Times* Aug. 27, 1899 1899, sec. A: 1.

This article reports that "Tonight witnessed the culmination of San Francisco's three days' greeting to the First California Volunteer Infantry and the California Heavy Artillery, the return from the Philippines of these organizations marking an epoch in local annals...."

"The events of the past three days are now matters of more than local history. The arrival of the transport Sherman, the splendid demonstrations of the bay and the Aladdin-like transformation of the city's chief streets into the semblance of an enchanted realm by the artistic and lavish arrangement of electric lights in many colors -- all these were enough to turn the heads of ordinarily self-possessed people...." The article goes on to describe the celebration honoring the returning troops.

**189.** "Club Women Want Cleaner Photo Plays." *New York Times* May 28, 1916 1916, sec. X: 12.

This piece reports on efforts by women to influence the tone and content of motion pictures. The article's subtitle reads: "Mrs. Jane S. Johnson Urges General Federation to Use Its Influence Upon Producers."

**190.** "Code Appeal Lost by Narcotics Films: Movie Association Directors, After Showing, Refuse Seal to 'Man with Golden Arm'." *New York Times* Dec. 7, 1955 1955: 48.

In November, 1955, the *New York Times* reported that United Artist would release the movie, *The Man with the Golden Arm*, with or without the PCA's seal. It was the first time that a major studio had announced its intention to exhibit a controversial film before submitting it to the PCA. The studio did submit the film to the PCA but the PCA refused to approve it. Johnston and the MPAA's Appeals Board upheld this decision on December 6, 1955, but the studio heads were divided. Only five voted to uphold the appeal while four other abstained. The following day, Arthur Krim announced that United Artist would withdraw from the MPAA in protest. This episode contributed to Johnston's decision to revise the Production Code in 1956. The revised Code permitted treatments of narcotics use in movies.

**191.** "Code Is Reversed on Seal for Film: Review Board Takes Action on 'Happy Anniversary' -- Dialogue to Be Added." *New York Times* Nov. 6, 1959 1959: 23.

This article discusses the first appeals case under the motion picture Production Code to be decided since Eric Johnston, MPAA president, doubled the size of the Code's Appeals Board by bringing in independent producers and directors. This appeal involved overturning the PCA rejection of a movie entitled *Happy Anniversary* (1959) that involved pre-marital sex. Dialogue was added to add compensating moral values and the film received the PCA's seal.

**192.** *College Theater v. United Artists, et al.*

This case involved a suit filed by a theater owner who challenged the Motion Picture Association of America's rating from the 1980 movie *Cruising*. Some at the time saw the case as potentially a challenge to the rating system itself.

**193.** "Collins Cleanses the Dance Hall." *Chicago Daily Tribune* Feb. 13, 1906 1906: 1.

The subtitle of this film reads: "Orders Boys and Girls Under 18 Years Old Be Kept from Public Unless Attended by Parents. To Stop Immoral Plays. Ordinance to Go Into Effect on Thursday Will Prevent Depiction of Vice in the Local Theaters." Collins was Chief of Police in Chicago.

**194.** "Color and the Picture." *Moving Picture World* 7.4 (1910): 182.

This article says that "Our advertisement pages, for some time past, have announced the imminent introduction of kinemacolor to the American public, and this week we are in receipt of a batch of literature bearing on the subject...."

"...We never expect to see the time when color will wholly replace monochrome in the picture, any more than oil paintings or water color paintings will displace black and white work in graphic art. There are numerous subjects made by the moving picture which are best translated in monochrome...."

**195.** "Color in Beauty." *Current Literature* 5.6 (1890): 419-21.

This article is reprinted from the *New York Mercury* where its full title was "Color in Beauty -- A Society Woman."

**196.** "Color in Nature." *Scientific American* 130 (1924): 390.

"We live in a world of color," begins this article. "Not only is color a natural characteristic of all forms of nature, but Man endeavors to surround himself with even more color by dyeing his textiles, painting his houses and structures and in fact coloring almost everything that he fabricates not excepting his own person."

Color in nature has both utilitarian and decorative purposes. The "brilliant colors of the feathers of birds are for decorative effect only and play a part in sexual attraction."

This piece discusses color as it appears in other aspects of nature and concludes that mankind is still a long way away from being able to replicate nature's hues. "It is strange that these coloring matters which give such lasting colors in flowers produce only fugitive results when used on textile fabrics. They are all complex substances and one of the real marvels of nature is the ease with which the plant builds up these coloring matters. The chemist succeeds in synthesizing them with great difficulty only, and by methods so complex that it is obvious that we are not even on the road toward learning how the plants do it." (390)

**197.** "Color In The Motion Picture." *American Cinematographer* 50.1 (1969): 80-83, 120-21, 168-71, 164-66, 178.

This 1969 piece examines the use of color in movies. After World War II, better film and lighting made it easier to shoot movies on location. In 1949, Eastman Color introduced a multilayer negative and printing film stock that made it possible to use virtually any 35mm camera to shoot color features, even low-budget color movies. The breakthrough convinced Technicolor to do away with its unwieldy cameras. "The appearance of the market in 1949 of the Eastman Color single-strip negative and printing film stock was an event that literally revolutionized color filming and heralded the approach of the day (now at hand) when black and white theatrical features would all but disappear from the screens of the world."

**198.** "Color Movies Coming in Vogue." *Science News-Letter* 8.250 (1926): 5-6.

This article says that several companies are interested in making color movies and that they may supersede black and white films. It notes that the cost of color movies is greater but may not be a huge factor in the total cost of such films. It notes that these films can be duplicated indefinitely, unlike the hand-color films. It notes that there are shortcomings to these films in that such colors as "Pure lemon yellow, cobalt blue and the pure purple shades are not available ... -- at least not until some three-color process is perfect" (6), but that many patrons don't seem to care. "These shortcomings, nevertheless, are not noticed by the cinema patron, who spends most of his time appraising the flesh tints anyway!" (6)

The article continues: "The color of film costs several times the figure for black and white. However, when even the cheapest comedies cost five dollars per second of theater exhibition time, or in other words five dollars per foot of film, the added expense does not rate high when compared to other costs. Unlike the hand-tinted films of previous years, the new films may be duplicated in positive indefinitely without continued repetition of the great initial cost." (6)

**199.** "Color Photography. Advances Made Possible by the Instantaneous Plate." *Chicago Daily Tribune* June 28, 1886 1886: 6.

The subtitle for the article reads: "Prediction of the Coming Success of Photography in Colors."

**200.** "The Color Red." *Living Age* 259.3353 (1908): 124-26.

This article begins by saying that "it has been asserted, and the theory has many disciples, that color exercises a great influence over character.... Of all colors, red is the one round which innumerable superstitions have gathered and it has exercised a vast influence, for good and evil, among all sorts and conditions of people from the dawn of civilization down to the present day." The author comments on color and the uncivilized. "History tells us of the partiality of uncivilized man for bright colors. They appear to excite in savages the pleasure they do in children, for primitive peoples received education mostly through the senses." (124) Continuing, the article asserts that "Brilliant colors have always pleased warlike people and it is therefore natural that red should be the favorite. In its most vivid tints it has a great effect upon the senses: the color of blood excites to action and encourages to combat. At the present day red pigment is used by all uncivilized races...." (125) The article notes superstitions that have grown up around the color red -- e.g., "antipathy to red hair ... in England and Wales among the peasantry...." (125) In ancient times, color was assumed to cure disease. (126)

**201.** "Color Studies." *Pictorial Review* 3.1 (1901): 26-27.

This article discusses the meaning of different colors and points out that some people believe that "colors themselves have an inherent meaning of their own." (26) Thus "Blue means not only beauty, but also truth, faith and all the greater virtues.... Scarlet in all its deeper shades is the wickedest of colors, the very rogue of the rainbow." Gray, rose, violet, green yellow, brown, white, black also represent different values "but all this is only the primer of color meanings. Experts can read a sunset much as your true music lover can expound an opera by Wagner. The color cult is as interesting as the study of palmistry, for every shading, like each delicate tracing on the palm, is a different indication." (27)

The article notes that actors and the theater use color. "Not only are color harmonies and blendings studied, but the peculiar occult significance that attaches to each." (27) Sarah Bernhardt and Mme. Duse are among the actresses who "have made an art of this color idea." (27)

**202.** "Color versus Drawing in Art: A Symposium." *Art World* 3 (1917): 170-76.

This piece is a lengthy editorial about the proper relation of color to drawing in art, and it introduces a symposium on the subject that included essays by the painter Carroll Beckwith and Elliott Daingerfield, who was a well-known landscape painter. The magazine, *The Art World*, was opposed to "the growing vice of untruthful drawing" (170) in modern art and the tendency to elevate color over form in painting. It considered the drawing engaged in by modernists to be "aesthetically" and "socially vicious" (171) and the magazine saw itself as "making a most vigorous war" against this type of art. (171) It opposed "rebellious artists" who did what they pleased, and considered the debate over color and its relationship to form as part of "the age-long fight between reason and riot, between self-restraint and self-indulgence." (172)

This editorial begins by pointing out that there are six elements of art -- "conception, composition, expression, drawing, color, and technique." (170) Color was considered to be fifth in importance of those elements. The author quotes a platitude which said that "Drawing is the mother of living form while color is its glorification."

(170) Color glorified form and Nature is the foundation on which the use of color should be built. "When nature creates any living thing she first make the form, and always of an agreeable linear design -- then she colors the form. Color alone is not her aim. It is form plus color, color being the glorification of the form." (170) Later, the editorial says that "in any Standard of Art, color becomes fifth in importance -- the surface technique being the least important." (175) In the symposium, which Beckwith and Daingerfield took differing views of color, editorial sides with Daingerfield's position on the relation of color and form.

The editorial argues against the use of color in modernism and the lack of precision in drawing by artists. The author (or authors) consider themselves "engaged in a fierce battle against the growing vice of untruthful drawing in the world of art." (170) "To draw perfectly in order to give life to a figure has been the ideal of every great artist from Pheidias down," says the editorial. (171) The editorial quotes Daingerfield who said that "weak men never learn how to draw because nothing in art is so difficult as to draw correctly and expressively...." (Daingerfield quoted, 170) Among the artists reflecting this trend was Delacroix, who is described as "a rebel," or "anarchistic rebel against common-sense." (172) Delacroix reflected a growing trend in art. The advocacy of ideas about art that he embodied marked "the birth in art about 1850 of 'modernism,' a word coined by Baudelaire and defined and hurraed by him into a movement. The result was the appearance of the successive phases of 'modernism': impressionism, neo-impressionism, post-impressionism, cube-ism, tube-ism, future-ism, etc., in which color was gradually more and more so worshipped and drawing step by step so despised that there is to-day not one painter in ten who really is able truthfully to draw a human figure, not to speak of drawing as Rembrandt, Holbein, Velasquez or even Raphael, Titian or Veronese drew." (173) This was a type of "degenerate art." (174)

In addition to Delacroix, other modern artists including Monet come in for criticism. Of Monet's "Rouen Cathedral," the editorial calls it "a badly drawn 'color orgie,'...." (175) Monet would not be forgotten, the editorial predicted, but his reputation would rest on his early work "before he became a 'color experimenter.'" (176)

A caption beneath the painting "The Fisherman" (by ?) reads: "An example of insane drawing by a cynical 'modernistic' charlatan. A specimen of the degenerate and vicious 'deformation of the form' the combating of which is one of the main purposes of *The Art World*."

Commenting on the relation of color and Nature: "Nature's supreme spiritual purpose is to stir up emotions. For that purpose she uses form and color. But the form and its linear composition is more important as a means of stirring our emotions than color...." (171) Quoting Augustus Thomas who said: "A word or phrase, act or symbol thrills us in proportion to its capacity -- as an explosive agent -- to touch and fire a center of associated emotional memories." (Thomas quote, 171) It has become a "commonplace," the editorial says, that a colored picture would be even more "emotion-stirring" than a black and white one. (171)

The editorial concludes by saying that great American art will only emerged "by agreeing with nature that, before we think of color in art we must first insure the life and beauty of the form, which can only be obtained by the utmost possible truth of drawing, even though we ultimately must follow nature's plan and glorify the form by means of the color." (176) A "work of art is great in ratio of its power of stirring the highest emotions of the largest number of cultured people *for the longest period of time*." (174, emphasis in original text)

**203.** "Color View of Photos." *New York Times* Feb. 21, 1909 1909, sec. C: 2.

This article says that "When the audience viewed the composite picture through the complementary colored glasses a startling stereoscopical effect was produced." The subtitle to the article reads: "Royal Society Tries Method That May Be Applied to Moving Pictures."

**204.** "Colored Movies Hurt Eyes Less Than Black and White Ones." *The Science News-Letter* 9.283 (1926): 8.

This brief article reports that Professor Leonard T. Troland of Harvard University maintains that color films strain the eyes less than black and white ones. As early as 1914, Troland had written a paper on the problem of flicker

and the movie picture jumping which caused eye strain. Troland is quoted as saying that "The more natural a picture is, it seems, the easier it is for the oculo-motor system to make the images 'appear as they should.' In black and white pictures violent contrasts often have to be used in order to get the effect of depth and reality, and such contrasts tire the eyes. Colors on the other hand express contrasts in a harmless way and also improve the truthfulness of the pictures." (8)

Troland acknowledges that there had been problems with earlier color films. The article reports that "When motion picture in color were first introduced about fifteen years ago annoying fringes of red and green on the edges of moving objects disturbed the enjoyment of the pictures and critics said that they were much worse for the eyes than the black and white performances. The trouble was that the red and green components were not photographed simultaneously and the effect was a doubling of the image on the screen which the eye muscles struggle to make into one again. This upset the normal balance of what Prof. Troland calls the ocular reflexes." (8) Troland says that in recent years the double images and fringing in color motion pictures has been improved, if not eliminated. (8)

**205.** "Coloring and Decorating the Pan-American Exposition." *American Architect and Building News* 74.1351 (1901): 52-54.

This article discusses the use of electricity and color at the Pan American Exposition held in Buffalo, NY, in 1901. The Board of Architects and the Exposition Company discussed the use of color in considerable detail. The treatment of sculptural groups around the Government Building were designed "to suggest man in his primitive state...." (53) "The Electric Tower, the crowning achievement of man, is dedicated to the great waterways and the power of Niagara, which is utilized to generate current which will run the Exposition. The "beautiful emerald-green hue of the water as it curls over the crest of Niagara Falls" was used "on some portion of every building." (53) Color was used to represent different states of man's civilization. "Taking it for granted ... that as we enter the grounds from the Park through the forecourt, the causeway bids welcome to the visitors and the countries taking part in the Exposition, and we would come upon the elementary conditions, that is, the earliest state of man suggested on one side and primitive nature on the other," and here the "strongest primary colors" were used. As visitors advanced "up the grounds, the colors should be more refined and less contrasting, and the tower, which is to suggest the triumph of man achievement, should be the lightest and most delicate color...." (53) Continuing, the article says that "the Electric Tower is very light ivory, and is enriched in the capitals, brackets, finials, stars, pinnacles, with gold, and is crowned with a gilded figure of the 'Goddess of Light.' The panels have the brightest fresh blue-green..., suggesting the water as it curves over the crest of Niagara...." (53)

Color was used purposefully on other buildings too. "In the Electricity Building light shades of green and violet bunting are used.... In the Agriculture Building the colors used are intended to suggest autumn and spring...." (54)

**206.** *Colour 73: Survey Lectures and Abstracts of the Papers Presented at the Second Congress of the International Colour Association, University of York, 2-6 July 1973.* New York: John Wiley & Sons (a Halsted Press Book), 1973.

This work contains papers and abstracts on a wide range of topics relating to color -- color vision, color differences, color rendering and reproduction, design and architecture, and more. The work contains tributed to Deane B. Judd.

**207.** "Colour Cinematography: Recent Advances." *The Times [London]* April 3, 1912 1912: 23.

An update on developing in making color moving pictures.

**208.** *Commercial Pictures Corp. v. Board of Regents of New York.* 305 N.Y. 336, 113 N.E. 2d 502 (1953), rev'd per curiam, 346 U. S. 587 (1954) 1953.

**209.** *Hearings before the Committee on Commerce, United States Senate. The Committee on Film Classification, June 11, 1968.* Smith, Margaret Chase. 1968.

In June, 1968, Maine Senator Margaret Chase Smith spearheaded a brief Senate hearing on motion picture classification. Smith believed that movies, television program, and their advertising had become too violent and sexual for children. She did not favor censorship but did want some kind of rating system to give parents warning. This material is in the Margaret Chase Smith Papers, Margaret Chase Smith Library, The Northwood Institute, Skowhegan, ME.

**210.** "Comstock Takes Hand in Physical Culture Show. Has Promoters Arrested for Putting Up Posters." *New York Times* Oct. 6, 1905 1905: 9.

The subtitle of this article reads: "Showman Says He'll Fight. How Can One Show How Physical Culture Has Improved the Body if the Body is Clothed?"

**211.** *Cook County Police Censorship Records? (1907-1983).*

The Cook County police set up the first municipal motion picture censorship board in 1907. Files exist -- usually a sheet detail how much film was cut and for what reasons -- on many early silent movies. Many of these films no longer exist and these files may be one of the few documents indicating what they film were about. The Police Department's Film Review Section, and Chicago's Motion Picture Appeal Board operated through 1983. Their funding was eliminated from the city's budget in early 1984.

**212.** "Coolidge Has Learned the Art of Publicity." *New York Times* Aug. 7, 1927 1927, sec. XX: 11.

This article maintains that "Calvin Coolidge is the best known President in the history of the United States. [Theodore] Roosevelt does not compare with him, and no other President ever compared with Roosevelt. Even Coolidge's voice is known to millions who never saw him. His opinions and intentions have wider publicity than had those of any President from Washington to Harding. His face, mannerisms and gestures are familiar to every one of the multitudes who go to the movies or look at the newspapers." Talks about the use of press conferences, photography, newsreels, radio. The article also discusses Andrew Jackson ("the inventor of Presidential publicity"), Lincoln, McKinley, and Wilson. The subtitle reads: "Radio, Movies, Newspapers and His Own Personality Make Him the Widest Known of Our Presidents The Whims of Other Chief Executives."

**213.** "'Coon' Songs in Politics." *Chicago Daily Tribune* Sept. 13, 1898 1898: 1.

The subtitle for this article reads: "Congressman Lorimer Prepares a Spectacular Program for Opening His Campaign. Pictures with Oratory. Scenes of the War and Portraits of Heroes Will Intersperse Arguments for Re-election."

This article says that a Republican congressman to use moving pictures of Spanish American War engagements at Santiago, war vessels parading in New York harbor, and its heroes in reelection campaign. "'Coon' songs and moving pictures of the war, the captivating attractions of the summer gardens and theaters of Chicago, will be used by Congressman William Lorimer in his campaign for reelection as Representative from the Second Illinois District. The first trial of this new idea in politics will be made tomorrow night at Bartlett, in Hanover Township. Following that will be one night stands at all the country towns in the Lorimer territory....

"Besides the picture already mentioned, 'The Bombardment of Matanzas,' 'The Battle of Balquiri,'(?) and some scenes of life in the camps will be shown, as well as pictures of McKinley, Dewey, Schley, Miles, Shafter, Merritt, and other heroes. It is the first time anything of this kind has ever been attempted in a political campaign."

**214.** Committee on the Judiciary, United States Senate. *Copyright Infringements (Audio and Video Recorders), Hearings before the Committee on the Judiciary, United States Senate, Ninety-Seventh Congress, First and Second Sessions on S. 1758, Nov. 30, 1981 and April 21, 1982.* United States Senate. 1981.

These hearings with supporting documents run 1,384 pages and includes testimony from several people in the entertainment and recording industries including Jack Valenti, Alan Greenspan, Sony president Joseph Lagore, MCA president Sidney Sheinberg, Screen Actors Guild president Charlton Heston, singer Beverly Sills, Charles D. Ferris (counsel to the Home Recording Rights Coalition), and others.

By the mid- and late-1970s, pirated copies sold abroad of Hollywood movies had become a major concern for film leaders such as Motion Picture Association of America president Jack Valenti. By the early 1980s, the use of video recorders was bring a revolution in home entertainment in the United States. Movie industry leaders such as Valenti, for example, maintained that VCR users were making private libraries of films and using the VCR to fast forward through commercials, thereby threatening to undermine commercial films and television. These hearings have survey information on VCR (and audio cassette) use in the United States during the early 1980s.

**215.** Committee on the Judiciary, United States Senate. *Copyright Infringements (Audio and Video Recorders), Hearings before the Committee on the Judiciary, United States Senate, Ninety-Seventh Congress, First and Second Sessions on S. 1758, Nov. 30, 1981 and April 21, 1982.* 1981.

**216.** "Correspondence: Charles Urban Gives All His Time to Kinemacolor." *Moving Picture World* (1910): 262.

Charles Urban discusses Kinemacolor in a Jan. 25, 1910 letter to *Moving Picture World*.

**217.** "Court Upholds Porn Film Law." *Pittsburgh Post-Gazette* Sept. 21, 1994 1994, sec. A: A6.

This work concerns the Child Protection and Obscenity Enforcement Act of 1988. It notes that a three-judge panel of the U.S. Circuit Court of Appeals for the District of Columbia reinstated a provision in this law required those who made explicit sex films, magazines, and other materials to keep records of all the actors, including their ages, names, and nicknames.

**218.** "Cry of Fire in Theatre." *New York Times* Dec. 5, 1904 1904: 1.

The subtitle to this article reports that "Women Faint and Several Are Trampled in Rush for the Doors."

**219.** "The Cultivation of Obliviousness." *The Independent* 85.3510 (1916): 369-70.

**220.** "Culture Watch; Cardinal Rules." *Los Angeles Times* Oct. 2, 1992 1992, sec. B (Metro): 6B.

This article covers Cardinal Mahony's proposed new production code for motion pictures, the Cardinal's turn away from that plan, and his critics. The article says that "on Wednesday the cardinal, in a pastoral letter to the

entertainment industry, disavowed any intention of saddling the film industry with Torquemada-like edicts and instead offered 'suggestions' on the need for more 'human values' in entertainment."

**221.** "Czolgosz Present." *Los Angeles Times* Sept. 25, 1901 1901: 5.

President William McKinley and his assassin were filmed the day before the president's murder, according to this article. "Only for a fraction of a second does he [Czolgosz] stand still; then he again begins to move forward. The kinoscope pictures his movements exactly. He makes his way to the foot of the stand on which the President is speaking. Again he turns his face toward the kinoscope. This time he looks wild and excited. His derby at is pulled down over his eyes, but as he raises his head they can be seen readily."

**222.** "Dan Glickman To Succeed Jack Valenti as Head of MPAA; Valenti Resigns after 38-Year Tenure." *Motion Picture Association of America Press Release* July 1, 2004 2004.

This MPAA press releases announced Dan Glickman's appointment as president of the Motion Picture Association of America, replacing Jack Valenti. It give biographical background on Glickman. It notes that "Valenti will continue to supervise (with the President of the National Association of Theatre Owners) the voluntary film rating system which he devised in 1968."

**223.** "Dan Glickman, Former U. S. Secretary of Agriculture". ([2004?]). July 5, 2004.  
<<http://www.greatertalent.com/bios/glickman.shtml>>.

This website for Great Talent Network, Inc., Celebrity Speakers Bureau, give biographical background on Dan Glickman, who replaced Jack Valenti as head of the President of the Motion Picture Association of America on September 1, 2004. It notes that Glickman's suggested speaking topics include: "Humor in American Politics"; "World Hunger and America's Foreign Policy"; and "Public Health Challenges of Bioterrorism." The biography gives details about Glickman's education and early career.

**224.** "Daniel Frohman Gets Big Stars to Act for 'Movies'." *New York Times* Dec. 22, 1912 1912, sec. SM: 7.

This article uses the word "star" to discuss effort to bring famous actors into the 'Movies.' "Denying that 'the movies' incite to riot, instigate crime, corrupt manners and injure the theater business, Daniel Frohman jumps into the arena as a 'moving -picture manager,' with a list of stars which include Sarah Bernhardt, ....

"Into this 'temple of the new art' will come as many of the famous players of our generation as can be got to pose, bringing with them the play in which each has made his greatest success. This does not by any chance mean that Mrs. Fiske or Miss Marlowe is 'going into the movies.' It means simply that each of these actresses will go to Mr. Frohman's studio for two, or , perhaps three weeks, between engagements, and present, in moving picture form, the one play in which the American people will most want to remember her; as she might, for example, have a plaster cast made of her hand."

The subtitle of this article reads: "Famous Manager Expects to Work a Revolution in the Moving Picture Field with Film Plays by Bernhardt, Sothern and Marlowe, Viola Allen, James K. Hackett, Mrs. Fiske, Beerbohm Tree, and Others Noted Plays and Characterizations Will Be Preserved for All Time."

**225.** "The Daring of the Wicked." *Herald of Gospel Liberty* 106.30 (1914): 932.

The article comments on the National Convention of Moving Picture Men and its opposition to movie censorship. The article argues that such "censorship is a real necessity, if the morals of the public are to be protected at all." It contends that moving pictures are much more dangerous to morality than the more traditional live theater. "You see a vulgar word, a corrupt sentiment, or moral impurity, given to the people from the old-fashioned theater, was bad enough to do untold harm, but when it comes to putting vulgarity before the people in pictures, and moving pictures at that, which makes the evil seem to be a living reality, the danger is increased by

many fold." The National Convention's opposition to film censorship "is as bold as the wicked one could ask," this article says, "and we dare say it is even a bolder stand than the devil himself would favor, not that he objects to it, *per se*, but because it so plainly shows the purpose of these men, that they are determined to make money out of the business, if in doing so they have to poison the whole moral element of all human society." The article continues by saying that "It is money at any price, no matter what the best interests of the community, the Church, and the home may have to say as to the matter."

The article ends by drawing a parallel from the Bible. "It was immorality that destroyed Sodom. Just as well as it was immorality that destroyed Achan and Simon and many others. The danger faces us to-day. What shall we do? Stand still, or shall we meet the enemy and stop him?"

**226.** "David Fights Goliath: His Last Days Film Offers C.I.A. View of Christ's Life in Contrast to Scorsese's Last Temptation." *Southwest Newswire, Inc.* Sept. 2, 1988 1988.

This article is about a one-hour film made by Kenneth Berg in Israel entitled *His Last Days*, designed to counter the interpretation of Jesus in Martin Scorsese's *Last Temptation of Christ* (1988).

**227.** "Dazzles Ben's Eyes. Grand Illumination in the Electricity Building." *Chicago Daily Tribune* June 2, 1893 1893: 1.

This article describes the effect of electrical lighting at the 1893 Columbian Exposition in Chicago. "At the southeast corner, running up another column and away in various directions along the floor of the balcony, ran waves of electric light, showing alternately in red, white, and blue. Hanging from the floor of the balcony, were globes of fire that revolved swiftly and changed color with every revolution. From the north half a dozen big crystal globes, lifted high above the floor, cast a dazzling light across the building. They are part of the French exhibit and are designed for use in lighthouses. Half way down the east balcony a large electric 'finger' wrote the name of the exhibiter in fiery script upon a frame of incandescent globes. The whole building was filled with light...."

**228.** "Death of Mr. John Bunny: A Comedian of the Films." *The Times [London]* April 29, 1915 1915: 5.

On the death of comedian John Bunny, *The Times* of London wrote: "Though he is dead moving pictures will keep him before the public for many years."

**229.** "The Decay of American Journalism." *The Dial* 22.260 (1897): 2-4.

This article condemns the so-called "new journalism" and says that "if the average American journalist ever had such a thing as a conscience, it was killed long ago, and its place taken by a simulacrum of hypocritical accent and leering mien. This effective modern substitute for a conscience in journalism has discovered the secret of preaching virtue in such a manner that it nowise interferes with the practice of vice. It will, for example, devote one editorial column to deploring the brutal tendencies of the age, and fill twenty columns of the same issue with the highly-colored account, from all possible points of view, of the latest event in the annals of the prize-ring. It will take the high moral ground upon the evils of partisanship, and at the same time gloss over the corruption of the party in whose interests its own are wrapped up...." (2)

The article notes criticism made recently by the Baltimore Yearly Meeting of Friends" condemning newspaper for publishing "'pictures and advertisements, both personal and medical, which so insidiously lead the innocent and unsuspecting from the path of virtue,'" and calling on publisher to raise the "'moral tone'" of Sunday newspaper to make them "'a power for good among the people.'" (3) This article also note efforts in Illinois and New York legislatures to pass laws to regulate newspapers by "making it an offence to publish portraits without the consent of the persons portrayed." (3) It urges people to stop buying newspapers that are dishonest, have a "vulgarity of tone," and reflect "pernicious sensationalism." (3) Such a newspaper, the article says "pollutes the home." (3)

This article asserts that it is an "undeniable fact that most newspapers published in our large cities are so devoid of principle that they constitute a perpetual menace to every genuine interest of our civilization.... There is no more important work to be done for our civilization to-day than that of shaming such newspapers either out of existence or into amended lives, and the responsibility for that work is shared by all alike." (4)

**230.** "Defeated by Pornography [editorial]." *New York Times* June 2, 1986 1986: 2A.

An editorial critical of the Meese Commission and inaccurate in its account of the Commission's work. The Commission "ended up appealing more to sensibility than evidence," it says.

**231.** Committee on Armed Services, U. S. House of Representatives, Ninety-Ninth Congress, First Session. *Defense Department Authorization and Oversight Hearings on H. R. 1872: Department of Defense Authorization of Appropriations for Fiscal Year 1986: Part 4 of 7 Parts, Research, Development, Test, and Evaluation -- Title II, March 6, 7, 8, 19, 20, 21, 26, 27, 28, 29, 1985; April 2, 3, 4, 16, 1985.* United States House of Representatives, Committee on Armed Services. 1985.

These hearings considered defense appropriations for the 1986 fiscal year. Much testimony involves the Strategic Defense Initiative but there is also discussion of electronic combat (222), support for a National Communication System (303), "genetic engineering which can be used to develop chemical and biological detection system, vaccine antidotes" and robotic/artificial intelligence systems to optimize the results that human operators can obtain from machines and also permit remote controlled hazardous operations." (451) There is also a section (640-49) that deals with DARPA's Strategic Computing Program. Charts show the increasing in computing power from the early 1960s to the mid-1980s, and predictions that new supercomputers will be "many orders of magnitude beyond the capability of the most competent machines available today." (640) At the time, there were "nine completely new and different types of computers," including the Butterfly processor that were either on contract or new to being under contract. Part of this program involved expanding cooperation with universities "to develop a whole new generation of computer scientists who are in the parlance of this technology and are competent artificial intelligence experts." (648) It notes that in the past MIT, Carnegie-Mellon University, University of Southern California, Stanford, and Berkeley have been centers for this kind of research and that plans call for expanding research to support to other universities.

**232.** "The Degenerate Stage." *Century Illustrated Magazine* 50.4 (1895): 635-36.

This article begins by saying that "Nobody with any knowledge of the facts will deny that the American theater, considered merely as a rational means of entertainment, without reference to its relations to literature and art, is in a most forlorn and debased condition. Tragedy, high comedy, the historical and romantic drama, have been virtually banished from the stage, or find few worthy interpreters, and have been replaced to a large extent by worthless melodramas, the extravagant buffooneries of so-called farce-comedies, or the feverish and unwholesome society play, in which the most vicious topics are discussed openly under the pretense of solving social problems." (635)

The author sees various causes of this decline. Death has taken away many talented writers and actors. Theater managers assumed that "the people do not want an elevated stage; that they wish to be amused, not instructed; and that all that he and his fellows can do is to follow the general economic law of supply and demand, and cater to the public taste. This, on the face of it, looks plausible, but there never was a more fallacious bit of special pleading. The simple fact is that managerial ignorance, vulgarity, and greed are more largely responsible for current theatrical evils than all other causes put together." (636) Theater managers "with scarcely an exception, do not possess even the rudiments of a liberal education. They know nothing of art, literature, or acting, and care nothing about them." (636)

The creation of theater circuits is having a devastating effect on the stage, according to the author. "The establishment of this unenlightened theatrical monopoly has worked and is working serious mischief. The

organization of theatrical circuits extending all over the country is not only fatal to the competition which is essential to progress, but, by a system of rotation, enables plays of small value to be kept upon the stage for two or three years. This practice not only acts as a bar to new productions, but confines thousands of actors to one part for season after season, depriving them of all opportunities of improvement, confirming them in all sorts of mannerism and slovenliness, and encouraging them to cultivate a special line, instead of seeking to acquire that power of versatility which is the one supreme test of excellence in their profession." (636)

The article condemns the lack of sound criticism of the stage and laments "the absurd prominence given to the sayings and doing of minor theatrical folk -- a class which includes a large number of the vainest and emptiest of created mortals. It is strange that the modern actor, without managers, instructors, or critics, and discussed with so much reverence, should degenerate?" (636)

Writers are to blame, too, because they have settled for "writing for a market instead of for fame." (636)

**233.** "Dehumanizing the Stage." *Current Opinion* 54.4 (1913): 297-98.

This article provides an interesting commentary on the state of talking motion pictures in 1913 as well as differences between movies and live theater. The article begins by speculating that a combination of the phonograph and moving pictures might eliminate real actors "from the domain of the sonant arts." (297) Thomas Edison, it is noted, has been predicting the future lies with the combination of these two technologies and talking films will open great entertainment (e.g., opera) to the poor. But there are still serious problems with talking films. 1) The volume is often not loud enough to be heard by everyone. 2) **"The spectator feels that the words spoken were uttered by the figure on the screen, but it is difficult to forget that they are being transmitted through a phonograph. An illusion of vocal reality has not yet been reached."** (297) (emphasis added) 3) Complex scenes are difficult to stage. Placing the phonograph in an area where it can best record sound is very hard to do.

The article ends by citing an article in *The Metropolitan* by Will Irwin on the "subtle and important differentiations between screen play and stage play. In real drama, we are told, the field of vision gradually recedes in scope. The spectator is looking into a capital V from above. The view of the moving-picture lens, on the other hand, widens in scope. The spectator is looking into the capital V from below. The best modern drama, if recorded unchanged by the moving-picture camera, would seem disproportionate and ineffective." (298) (here Irwin is being paraphrased)

**234.** "A Democratic Art." *The Nation* 97 (1913): 193.

If the photoplay was an art, said *The Nation* in 1913, it was "not a very high art" and one "created for the masses and largely by them." Granted the medium had a "universal appeal," the magazine said, but it was one that went directly to "elementary emotions." The movies simply replaced "the old-fashioned melodrama" and it was doubtful that they imparted much in the way of serious knowledge. "To watch one of these exhibitions is like seeing an animated popular magazine, without the labor or turning the pages. And like the picture magazine it requires no thought and little attention."

The author says that movies are something more than just "popular" -- the are "intimate," and "To an extraordinary extent" they are "entering into the daily thought of the masses." They appeal to "all nations, all ages, all classes, both sexes" and the "crowds not only throng to the shows; they talk about them, on street corners, in the cars, and over the hoods of baby carriages."

**235.** "Deus ex Machina." *Los Angeles Times* May 25, 1912, sec. II: 4.

From a humorous poem: "The greatest study of mankind is man, / At least it used to be -- for now 'tis seen / That we have found a more effective plan, / To study mankind out of a machine, / But that the show was speechless, made us sad; / No tale of life in silence should be told; / So science brought the phonograph, to add / A

tongue to these dumb phantom forms. / 'To hold / The mirror up to nature' now we go / Into a moving- talking, ten-cent picture shows....

"Oh, mighty triumph of dramatic art! / Oh, inspiration, far beyond our reach! / You to these cold flat figures could impart / This modern miracle of seeming speech; / That human interest has been thus cut out / From modern drama used not make us grieve; / It suits an age whose joys beyond a doubt / Are part mechanical, part make-believe; / Now life itself with nature once aglow / Is but a moving talking, ten-cent picture show."

**236.** Committee of Armed Services , United States Senate, Ninety-Eighth Congress, Second Session (S. Hrg. 98-1205)

Subcommittee on Tactical Warfare. *Development and Use of Training Simulators, Hearings before the Subcommittee on Tactical Warfare, Sept. 26, 27, 1984.* United States Senate, Committee on Armed Services. 1984.

On the first day of these hearings, military officers involved with defense-related research testified. On the second day, representatives from Singer Company and General Electric, and a general involved with the Strategic Defense Initiative testified.

**237.** "The 'Dime Novel' Picture. More 'Newspaper Neurasthenics'." *Moving Picture World* 7.9 (1910): 452-53.

*Moving Picture World* quotes critic of movies comparing them to dime novels: "What, indeed, is the moving picture show but dime-novel literature flashed on a screen by means of magic lanterns and purveyed to youthful minds pictorially for half the old price? It is in the dime novel that its enormous popular vogue had its source and it is by dime-novel standards that its moral influence must be measured." (452) (emphasis in original text) The article goes on to refute this view.

**238.** "Directors Approve Voluntary Classification at Scottsdale Meeting." *National Association of Theatre Owners, Inc., Newsletter* 3 (1968): 1-2.

This issue has information about the origins of the motion picture rating system, formally adopted later in 1968. Theater owners -- NATO was their major national organization -- were principal participants in the formulation and acceptance of this new rating plan.

**239.** "Distinguished Witnesses Indict and Defend the Screen Drama." *Current Opinion* LXV.2 (1918): 98-99.

This article presents four views about writing for motion pictures. Frank Crane argues that movie producer "exploit actors at the expense of authors."(98) George Middleton, a playwright, says that at the present time, "no self-respecting dramatist can ... afford to bother with the movies. Thomas H. Ince says scenario writing provides great opportunities for college undergraduates. Rob Wagner argues that "not one-half of one percent of scenarios submitted to motion-picture producers are available for any purpose."

**240.** "Do Motion Pictures Merely Feed Our Prehistoric Appetites?" *Current Opinion* 62.4 (1917): 256-57.

This article comments on statements about movies made by the influential museum director and librarian John Cotton Dana, and by Edwin H. Blashfield who had written an article in the *New York Times Magazine* (March 4, 1917), p. SM8. Excerpts from Dana are also included in this article.

The article begins by saying that "To attend a motion-picture play is to be primitive; to listen to an orator is to be a cave man; to read is to be civilized. It is the printed page on which we must put our hopes for progress rather than on the spoken word. As for the sense of sight on which the whole structure of the photodrama, of course, depends it is the most primitive and automatic of the faculties, and therefore, says John Cotton Dana, in the *New York Sun*, is responsible for the 'frightful' popularity of the photoplay, 'appealing as it does, to the appetites and fancies of prehistoric man.' ..." (256)

The article reprints an excerpt from Dana's remarks:

"The movie eye is primeval, while the ear of the happy auditor is merely Pliocene. But by so much as Pliocene antedates the birth a few thousand years ago of the art of writing, by so much does hearing surpass in case the practice of the art of reading. The movie was born almost in the mud of the world's first seas; the orator, the master of the ear, has had his way with men a million years or two, and long practice has made submission to him easy; but reading was painfully conquered only yesterday, and must be reconquered by each new generation.... The movie's-seeing habit provokes no cerebation." (256)

This article paraphrases Dana saying that "In other words, producers of films and managers of photoplays have unconsciously tapped the prehistoric man and have found the vein as wide as all humankind and marvelously rich." (256) It then quotes Dana saying: "My indictment does not lie against the obvious stupidity, dullness, inanity and frightful banality of the movie play itself, not against the pardonable tho lamentable activities of the movie promoter.... My argument against it lies elsewhere, to wit, in the constitution of man himself...." (256)

Further quoting Dana: "We see by nature, we talk by nurture. Every normal man can see and understand the movies, no matter how unintelligent he may be. A few chosen spirits learn to talk, and a few more learn to understand the talkers. Obviously, then nearly all of our fellows prefer the movie to the spoken word.... It grows by he very ignorance and the lack of reading power on which it feeds. It makes daily more difficult the one supremely important task, that of making all men readers, and therefore more intelligent and therefore more self-restrained." (257)

A brief paragraph is devoted to Blashfield's article in which he says that the motion picture is a bridge between civilized man and prehistoric man.

**241.** "Dockstander's Films Gone. Washington Police Destroy Them to Save President's Feelings." *New York Times* May 22, 1904 1904: 3.

This article reports that a fictitious film showing Theodore Roosevelt helping negro into a carriage is destroyed by authorities. "Major Sylvester, the Superintendent of Policy, to-day announced that he has had destroyed all of the films of the moving pictures taken a day or two ago for Lew Dockstander on the east front of the Capitol building, when President Roosevelt was impersonated in the act of helping a fictitious negro into his carriage.

"The police authorities say that this closes the incident."

**242.** "Does Photos in Colors." *Chicago Daily* June 26, 1896 1896: 9.

The subtitle of this article reports: "Process of a Chicago Man is Exciting the East. Work of James W. McDonough. It Is Said, Will Soon Bring About the Formation of a Corporation to Turn His Discoveries to Commercial Account Two Processes at Present Used Attainments of a Scientific Investigator."

**243.** "The Doom of the Old Black and White Moving Pictures." *Current Opinion* 55.3 (1913): 183-84.

This article summarizes and excerpts material from an earlier article, apparently in *Engineering*, about the state of making color motion pictures in 1913. The article begins by discussing how moving pictures work -- a succession of photographs, 16 separate pictures taken during one second, or about 16,000 photographs shown in the course of about 16 minutes. It then talks about the earlier days when films were colored by hand. It offers an excerpt from the *Engineering* article (quoting from that piece): "With the introduction of three-color photography it becomes possible to obtain results vastly superior to those above described, and a notable step in advance was achieved by the introduction of the "Kinemacolor" process, which, however, is based, not on the ideal three-color system, but on one with two colors only. Many attempts have been made to apply triple projection methods to cinematography, but so fare with indifferent success." (184)

This article notes that in 1913 there were "only two ways of reproducing natural colors in picture or lantern slides: -- The 'additive,' which relies on the fact that red, green, and blue-violet light combine together to form white.... The alternative process is styled the 'subtractive,' being employed to produce three-color prints from blocks or other lantern slides...." (184) The *Engineering* article also discusses the Zoetrope process which shows promise in the making of future color motion pictures.

*Current Opinion* concludes: "There can be no question as to the importance in the future of the economical production of color pictures. Of all the systems to which reference has been made the only ones that have hitherto achieved commercial success are the Bicolor and the Kinemacolor processes. The large measure of perfection attained by both these systems and the excellence of the pictures produced in the case of such scenes of Oriental pageantry and the Delhi Durbar will induce the public to look forward with interest to the time when the three-color process can be adapted to cinematograph purposes." (184)

**244.** "Dr. L. T. Troland Dies in Fall Over Cliff." *New York Times* May 28, 1932 1932: 16.

This article reports the circumstances of Leonard Troland's accident death from a fall while climbing on Mount Wilson in California, and also recounts his versatile career in psychology and optics, as well as his work with Technicolor. It says that at the time of his death he had been dividing his time between doing research in Hollywood with the Technicolor Motion Picture Company and Cambridge, Massachusetts, where he taught at Harvard University.

**245.** "Dr. Troland Dies When He Falls Over Precipice." *Chicago Daily Tribune* May 28, 1932 1932.

This article reports the death of Leonard Troland, a co-inventor of Technicolor, from a fall on Mount Wilson in California. It notes that he had worked on developing devices to listen for submarines during World War I and was involved in creating a process to make movies in natural color.

**246.** "The Drama." *Current Literature* 38.1 (1905): 69-71.

Although this article is concerned mostly with discussing people who are exceptional actors and actresses, such as Mme. Gabrielle Rejane, it begins by discussing "Personality vs. Art," and lamenting the fact that personalities have become much better known than characters they represent or the dramas in which they perform. "Probably the most pronounced feature of the stage to-day, and the success of certain men and women upon it, is the large part that personality plays in comparison to art and essential verity.... Take half the actresses upon our stage, and you will find that it is rather a vogue than a reputation that they possess. You do not think of them as Juliets and Lady Teazles and Desdemonas, or whatever the character may be, but as Miss So-and-So. It is the same with actors. As a matter of fact, we have precious few real actors and actresses, but very many attractive personalities exhibited in a series of plays chosen to emphasize those very traits. Plays are 'built' upon these characteristics. This fact has been mentioned several times in this column...." (69) Such actresses as Mme. Rejane, however, are the exception and who, although "possessing a very marked personality, rises above that personality." (69)

**247.** "The Drama of the People." *The Independent* 69.3226 (1910): 713-15.

This article discusses the differences between moving pictures and the live stage. It begins by saying that "the cinematograph is doing for the drama what the printing press did for literature, bringing another form of art into the daily life of the people. Plays are now within reach, literally, of the 713/714 poorest, as are good books and good pictures. The secret of cheapness in art as in other things is mechanical multiplication. So long as a play required for each presentation the active co-operation of a considerable number of more or less talented persons it could never be cheap, and in its better forms it was necessarily accessible to a comparatively small part of the population. But once on a celluloid film a spectacle can be reproduced indefinitely, the good as cheaply as the poor, and superiority is no longer handicapped. The same effect is shown in the field of literature. Among the

dollar and a half books published every year there is a large proportion of trash or worse, but the volumes sold for fifty cents or less comprise the world's best literature." (713-14)

The article lists other advantages of movies over vaudeville and melodrama on the live stage. These include: 1) spaciousness and distance -- matters are not confined to a narrow stage; movies have a "third dimension" as "characters have a gradual approach and recession" (714); 2) there is more realistic scenery; 3) moving pictures can show what is happening in two places simultaneously; 4) actors no longer have to speak what is being written - e.g., reading aloud a letter that is being written; 5) moving pictures make close ups of action or faces possible (714); 6) "Ghosts, visions and transformation scenes are accomplished in a manner truly magical" (715); 7) silent moving picture presentation is international -- no translations needed from other languages; 8) "first nights" or openings are no longer confined to a privileged few; 9) replication of actors' performances is no problem and does not diminish the artistic value of the product the way a replica of a valuable painting might. Finally, 10) moving pictures give performances "the permanence of a painting or a statue. Dramatic art may have a true history and make real progress now that direct comparisons can be made with the past. The great actor will still have fame but his head will not be turned by constant personal adulation. It is not the least of the advantages of the cinematograph that dead men cannot rise to receive the applause that follows their death-scene." (715)

The article also discusses the disadvantages of moving pictures when compared to the stage: 1) "flickering and jerky action" (715); 2) pantomime, although work is advanced on making good talking films; 3) lack of good color -- "The problem of photography in natural colors may be regarded as solved altho it cannot in its present stage stand the quick exposure and great enlargement necessary for moving pictures." (715)

The article concludes by predicting that good "stereoscopic colored speaking moving picture drama" will be available in the future and that "It will be a new form of fine art not unworthy to rank with the elder arts." (715)

**248.** "The DVD Comes of Age." *New York Times* Aug. 17, 2003 2003, sec. 2 (Arts & Leisure): 1-26.

This section is devoted to considering the impact of DVDs. "In the six years that DVD's have been available in this country, they have reshaped the way we experience culture. Film was the first medium to feel the effects, but it's not the last. In the era of the DVD, it's not enough to sit back and watch. We're invited to meet the directors, interview the performers, read the scripts, study the storyboards, argue with the commentaries and play along with the scores." The articles in this section consider how material on DVDs is conceptualized and created.

**249.** "Dynamic Forces." *Los Angeles Times* Aug. 29, 1898 1898: 5.

This article talks about the fact that celluloid film bought in Europe, and that the acids in the celluloid destroy its sensitiveness of the emulsion before and after development. It is hard to carry on a long bicycle trip with the film deteriorating. The subtitle of the article reads: "In the Domain of Science, Industry and Electricity. From Our Own Correspondent. Celluloid Films."

**250.** "East, West Take Cue on Digital Cinema Standards". 2001. (Jan. 22, 2001). Nov. 7, 2005. <[http://www.gcn.com/vol20\\_no2/news/3567-1.html](http://www.gcn.com/vol20_no2/news/3567-1.html)>.

This article appears in *GCN: Government Computer News*, vol. 20, no. 2. It notes that "Hollywood needs Washington to help set standards to make digital cinema as interoperable as 35-mm film. And Washington needs Hollywood to develop motion imagery for military and other applications." The article notes that "digital technology holds promise for the rapid collection, distribution and management of moving images for military and intelligence applications."

**251.** "Echo: Exploring & Collecting History Online -- Science, Technology, and Industry". Nov. 7, 2005. <<http://echo.gmu.edu/index.php>>.

Echo's Research Center "Catalogues, annotates, and reviews more than 5,000 sites on the history of science, technology, and industry. Search or browse by key word, topic, time period, or content." Its Collecting Center contains a "directory of websites that emphasize the online collection of historical materials. Browse by topic, visit the projects, or read our Practical Guide to collecting history online." Its Tools Centers offers free tools to find, create, and manage digital materials, or search and contribute to a collaborative directory of any and all tools applicable to the practice of digital history." Its Resource Center provides "information about ... free workshops and consultancies for historians of science, technology, and industry, plus links to Digital History, our full guide to producing online history."

**252.** "Edison Controls Pictures." *New York Times* March 9, 1910 1910: 8.

This article discusses Thomas Edison's effort to control patents relating to moving pictures. It reports that in 1908, 10,000 moving picture theaters in the United States; in 1910, there were 13,000 theaters with a daily attendance of 4 million people, each paying 7 cents.

**253.** "Edison Now Making Concrete Furniture;... Home Moving Pictures, Too; ...." *New York Times* Dec. 9, 1911 1911: 6.

Edison gives demonstration of "a new home moving-picture outfit." The cost would be \$50 to \$75 retail. One goal is to focus on "religious and education subject." Edison's "hobby," it is reported, is "to get the moving picture into the realm of education."

**254.** "Edison Shows the Home Kinetoscope." *New York Times* March 28, 1912 1912: 11.

This article reports that Thomas Edison has demonstrated his Home Kinetoscope. "This invention, which is the product of a great deal of labor and a great deal of money, is simply a miniature moving picture machine, a biograph that a child can handle, and that an ordinary living room can hold. Its chief difference from the ordinary commercial kinetoscope lies in the fact that it is very simple, very compact, and that its films are non-inflammable."

It has a roll of film 80 feet long "which carries in infinitesimal proportions the material for moving pictures that take sixteen minutes to operate."

Children in "Public School 155 are saving up to buy one of the new machines for their own edification. A textbook publisher is already on the road looking into the possibilities, and he is arranging to have scenarios made from school books." This fits into "Edison's great dream" which was "one of education by moving pictures."

This article's subtitle reads: "Tiny Machine Has Non-Inflammable Film and Throws a Picture 2 by 1 ½ Feet. Would Use It in Schools. Geography Would Become Impressive, He Says, and Innumerable Stories Could Be Told."

**255.** "Edison's Latest Marvel The Electric Country House." *New York Times* Sept. 15, 1912 1912, sec. SM: 9.

This article discusses Thomas Edison's electric country house with a gasoline generator and storage batteries to create electricity. This house also has a "home kinetoscope, ... a moving picture machine on a small scale, and is fed with miniature films and throws its pictures on a four-by-five aluminum screen. These little negatives are so small that as many of them can be spaced on 75 feet of film as would require, if they were of average size, something more than 2,000 feet."

The subtitle of the article reads: "Any One May Now Have an Electric Plant in His Own Cellar at a Comparatively Small Cost Which Will Light and Heat It and Make House Work Easy."

**256.** "Edison's New Invention....Life-size Figures Made to Walk and Dance...." *Los Angeles Times* April 4, 1896 1896: 2.

This article talks about the early reaction from audiences to Thomas Edison's invention of moving pictures.

**257.** "Edison's Vitascope Cheered. 'Projecting Kinetoscope' Exhibited for First Time at Koster & Bail's." *New York Times* April 24, 1896 1896: 5.

This article talks about the early reaction from audiences to Thomas Edison's invention of moving pictures.

**258.** "Edison's New Light." *Los Angeles Times* May 23, 1896 1896: 6.

This article mentions a new, more powerful light, Vitascope, and also Nikola Tesla.

**259.** "Editorial Round Table ... Revolution in Lighting." *Los Angeles Times* Sept. 22, 1907 1907, sec. VI: 10.

This article reports that "Electric light is produced at the present time by heating a body white hot when we use its incandescence. This is an expensive and crude way, and the future light will be produced directly from the vibrations of the ether which constitute light. This is accomplished in part at present, for instance, in the mercury vapor tube invented by Peter Cooper Hewitt and also in what is known as the Moore's tube...."

**260.** "Edwards Cinemas Chain Won't Run 'Last Temptation'." *Los Angeles Times* Aug. 7, 1988 1988, sec. 2 (Metro): 8.

The article deals with a large theater chain's (Edwards Cinemas) decision not to show the controversial movie *Last Temptation of Christ* (1988). It also notes that a campaign against the film led by fundamentalist minister Rev. R. L. Hymers, Jr., has been anti-Semitic.

**261.** "Effect of Light on Selenium during the Passage of an Electric Current." *Nature* (1873): 303.

**262.** "Effect on Juvenile Character: Subject and Treatment." *The Times [London]* Jan. 16, 1917 1917: 5.

A report on what impact moving pictures may have on juveniles.

**263.** "Efforts to Lure School Children." *Chicago Daily Tribune* April 26, 1907 1907: 4.

The subtitle to the article reports: "Free Tickets to Dance Halls and Nickel Theaters Are Offered to Pupils; Teachers Tell of Evil; Policed Department Will Be Called Upon to Put an End to the Practice."

**264.** "Elaborate Apparatus Makes Three-Dimension Movies." *Science News-Letter* 21.577 (1932): 273.

This article reports that "Motion pictures in which the actors 'stand out from the screen' and appear in relief have been produced with experimental apparatus devised by Dr. Herbert E. Ives of the Bell Telephone Laboratories in New York. Dr. Ives reported his experiments before the meeting of the National Academy of Sciences.

"The apparatus for producing such pictures is quite elaborate. Instead of a lens, the camera uses a four-foot concave mirror, like those used in reflecting telescopes. It reflects the image of what it 'sees' on a transparent screen consisting of 200 minute concave grooves. Here photographic records of successive exposures are made, not on motion picture film, but on small photographic plates.

"Prints from these negatives are then mounted on a large disk, which brings them in slow succession into position in the projecting machine, while another smaller disk, rapidly rotating, flashes light through the lens. The projection screen consists of 200 quarter-inch transparent rods, whose front and rear surfaces focus the light to form the apparently solid moving images in the projection space.

"Immediate commercial application is hardly expected, Dr. Ives stated, because of the difficulty of obtaining the extreme accuracy of all mechanical and optical adjustments necessary for successful operation."

**265.** "Electric Shock." *Youth's Companion* 79.6 (1905): 72.

This article warns readers, especially youth, of the dangers of electricity. "One of the new and not uncommon dangers of modern life is that of getting in the way of a powerful current of electricity and receiving the entire discharge through the body," it begins.

**266.** "Electric Sign Monstrosities." *Scientific American* 103.13 (1910): 230.

This article laments the impact of electric signs used for advertising in Times Square and elsewhere in New York City. The electric signs are better than the traditional billboards in that at night they don't blot out the countryside. "It was inevitable when once the electric incandescent and arc light lights had been perfected, that their peculiar fitness as instruments of advertising should ultimately be recognized. The electric sign, if it be arranged with any degree of taste, is not the form of Brobdingnagian billboards strewn out along the railroad routes of the country, the average electric sign is a thing of positive beauty. Moreover, being displayed at night, it does not tell its story at the expense of surrounding country or background, being in this respect superior to the railroad billboard, which more often than not is spread, like an ugly smear, right across the beauty of an otherwise attractive landscape.

"But even a good thing may be carried too far, and this is what is happening just now in the matter of electric sign advertising. We have in mind the creation of an enormous and most unsightly steel-and-terra cotta tower in Times Square, in this city, which rises sheer from the roof of an otherwise attractive building and extends some hundreds of feet above the sidewalk. This tower, whose surface is entirely unbroken by window, cornice, pilaster, or column, is to be covered, unless the hopes of its projectors are doomed to disappointment, throughout the whole vast width and height of it, with mammoth electric signs. By night, the affair will have a certain spectacular attractiveness and an undoubted commercial value -- but by day! It would be difficult to conceive of an object more vulgarly obtrusive and more exasperatingly ugly than this bald shaft of steel and masonry, grid ironed from top to bottom by the framework and wiring that go to make up electric sign paraphernalia.

"Unfortunately, the permit for this structure, obtained during the previous city administration, is of such a character that Superintendent Miller of the Building Department confesses himself to be powerless to prevent or even modify the construction. We are hardly in sympathy with Mr. Brunner, vice-president of the Art Commission, in his conviction that the time has come when a systematic effort should be made to prevent the erection of unsightly electric signs, not only in Broadway, but throughout the whole city." (230)

**267.** "Electric Telephotography." *Scientific American* 98.16 (1908): 276.

This article says that a "Swiss inventor, Eugen Frikart, has taken out a patent on a method of electric telephotography, which should attract considerable attention." It is an improvement on the apparatus devised by the German inventor Arthur Korn because Frikart's invention "can transmit .... pictures and writing over still greater distances without any metallic connection between the sending and the receiving station, the transmission taking place on the same principle as wireless telegraphy. It is possible, for instance, to transmit from Bern to Berlin, in five minutes, a facsimile of a piece of manuscript, without using any conductor. The transmission can take place at any time of the day, no optical apparatus being necessary. Further, only the instrument for which the picture is intended can receive it." The article says this invention should be of assistance to ships at sea and to law enforcement authorities. The article concludes by saying that "There are still many difficulties which the new invention has to combat, but it is hoped that it will soon reach the same state of perfection as the wireless telegraph."

**268.** "Electrical Firmament, 1874-1894: Will There Be as Many New Stars in the Next 20 Years?" *Electrical World* XXIII.9 (1894): 265-71?

This article discussing the status of electricity in 1894: "...with the exception of the telegraph and if we add a few years more this branch will then also be largely included almost every application of electricity worth noting has had its birth or development in these two decades [1874-1894]; and it does not require the gift of prophecy to

predict that even thousands of years hence the last quarter of this century will stand out in the annals of progress as the age of Pericles does now in the records of antiquity." (265)

**269.** "Electrical Palace and Fountain at the Paris Exposition." *Scientific American* 83.15 (1900): 231.

This article discusses the use of electricity and colored lights at the Paris Exposition in 1900. "The Electrical Palace and Fountain occupy one end of the Champ de Mars and constitute the central feature of this part of the Exposition grounds. By day, the ensemble presents a highly decorative effect, but it is at night that it appears to best advantage, when the crest of the Electrical Palace is outlined by thousands of incandescent lamps of varying colors, and the various cascades and jets of the fountain are brilliantly illuminated." Later the article says that "For the illumination four colors are used -- red, yellow, blue, and white; the lamps of different colors are arranged alternately, and for each color there is a separate circuit which passes to a mechanism in the basement, which allows each color to be thrown on at will...."

**270.** "Electricity at the Fair." *Chicago Daily Tribune* June 2, 1893 1893: 4.

This article talks about electricity and color and 1893 Columbian Exposition: "The opening display in the Electricity Building last evening was a charming one. Overpowering in its magnificence, rivaling nature in the variety of her wealth of tint and color and in splendor almost challenging comparison with the mid-day sun, it may fitly [sic] be described as the crowning glory of the Fair. It is so in the most complete sense of the term, for the electric force as there exhibited in the greatest aggregation of power yet obtained by mortals and developed in a bewildering variety of expression is at once the perfection of the beautiful and the highest realization of the useful. The youngest of all the arts based upon scientific investigation, the application of electricity to the service of civilized man is the most brilliantly successful of them all.

...

"The display of the evening included lighting evolved by the hand of man, running up a column of changing hues, and thence merging into a steadier light; and automatic pencil that seemed to write letters in living fire and the most effects in coloring; while everywhere was a flood of light, here soft, there brilliant, in some places concentrated, in other diffused. The tout ensemble was one of fact as far surpassing in grandeur the palace which the imagination of an Oriental writer conjured up for Aladdin as that exceeded the fitfully illuminated tent of the humble wanderer in the Arabian desert. It was a masterly exhibit of the triumph which mind has in these later days achieved over matter, of the way in which man has harnessed the most occult forces of nature in his chariot and forced it into more prosaic service in his workshop to do his mighty will."

**271.** "Electricity in the Movies." *Literary Digest* 66 (1920): 107-13.

The movies did not result from "the discovery of a new principle" but rather were depended mainly on "the celluloid film and the electric light." (107) The article quotes extensively from another piece by H. F. O'Brien in *The Electric Journal* which is about studio lighting and the use of such equipment as the Cooper Hewitt Mercury Vapor tube. Some studios use portable motor generators that are mounted on trailers. O'Brien predicted even greater advances in set lighting during the coming years.

**272.** "Electricity in the Times Building." *New York Times* Jan. 1, 1905 1905, sec. BS: 27.

This lengthy article details how the *New York Times* building is now using electricity in early 1905. "Electricity actuates all its moving machinery from the ponderous 100-ton presses to the drop of the annunciator that summons an office boy," this story says. He details several aspects of the building from the electricity in the switchboard and telephones, to the telegraph and Western Union, to timekeeping. The article gives 17 reasons why the *Times* decided to use the Edison electrical connections. The subtitle for the article reads: "Greater Variety and Greater Number of Uses of Electricity Than in Any Other Place -- An Electrical Show Place -- Many Kinds

of Lights -- Why Outside Service Was Preferred to an Isolated Plant -- An Unusual Switchboard -- Novel Three-Throw Kiss Switch -- Load Diagram of the Building -- 74 Miles of Wire and 21 Miles of Conduits."

**273.** "Electricity's Uses in the Times Building." *New York Times* Jan. 10, 1904 1904: 17.

This article reports that "The Times Building, when finished, will be an electrical marvel." He sets out 17 reasons why the *Times* decided to use the Edison Central Station Service. It set out some of the uses electricity will be put to including 111 motors that will drive four Hoe octuple presses, and many other types of machinery. The article's subtitle reads: "To Operate Over One Hundred Different Appliances. Will Run the Presses, Light the Building, and Furnish Various Conveniences in the Interests of Tenants."

**274.** "The Electrograph -- A New Facsimile Telegraph." *Scientific American* 84.24 (1901): 373-74.

This article discusses the facsimile telegraph invented by Herbert R. Palmer, M. E. Thojas, and Dr. William P. DunLany, and made by the International Electrography Company in Cleveland, OH. It notes that it took about 80 minutes to prepare a picture to send to newspapers on a 1,500-mile circuit and that the transmission itself took about 10 minutes. (374) "In the reproduction of a very fine-meshed picture, the stylus of the transmitting machine and the pen of the receiving machine will rule 80 lines per inch. Coarser pictures are transmitted at the rate of 40 lines per inch, or in 4 minutes. The space occupied by a cut in a newspaper could be filled by an equivalent number of words telegraphed by an ordinary operator at a speed of 25 or 30 words per minute. Hence, the time required in transmitting a picture by means of the electrograph is exactly the same as that consumed in telegraphing a verbal message. About 40 minutes are required to prepare the zinc plate for transmission and about 30 minutes to prepare the picture reproduced by the receiving machine for newspaper printing. On a 1,500-mile circuit 80 minutes suffice to prepare a zinc enlargement, transmit the picture, and reduce the picture reproduced for the press. Of this time not more than 10 minutes are consumed in transmission. Machines with cylinders thirty inches in length, having two carriages, are now in the course of construction and are to be used in duplex transmission, one picture being sent simultaneously each way over a single wire. A machine thus receives and sends a picture at the same instant. With two instruments at each end of the line, a quadruplex transmission is possible, four pictures being sent over the wire simultaneously. Thus the average time of transmitting a picture is reduced to two minutes' wire service. That these speeds can be practically attained has been proven time and time again by severe tests made over the Western Union, American Telephone and Telegraph Company, and the Associated Press wires." (374)

**275.** "Eleonora Duse: A Study from Photographs." *The Phrenological Journal and Science of Health* 101.4 (1896): 25-26.

This article comments on the beauty of Italian actresses Eleonora Duse and especially what is conveyed through her face and eyes as seen in her photographs. "In many respects the face of this celebrated actress is typical of the wonderful nation to which she belongs. Italy and art are almost synonymous terms." (25) As for her eyes, "We would not say there is a cast in these eyes, but if anyone else said so we would not contradict the statement. At all events there is not the straight, staid, settled expression that we expect in people who are governed by reason and a sense of moral obligation. But what depths of passion! what a wealth of love! Such a nature chafes in *allegro molto* time over the whole gamut of joy and sorrow, and alas! the final note is almost sure to be one of pain." (26) Then follows a description of her face: "This mouth is aid. It tells of deep feeling, of intense desires, of hidden lava that may burst forth and burn its way to the consummation of a purpose. It says nothing of hope, nothing of mirth."(26) And -- "The chin is strong, resolute, and tenacious. It bespeaks the kind of will that seizes with a firm grip and retains its hold. The ear is artistic. The forehead shows a comprehensive and versatile intelligence...." (26) As for marriage, "To add to her misfortunes, or rather to crown the bitterness of her early life, she is said to have made the terrible mistake in marriage which so often happens among the devotees of art." (26) Still, she has "reached the summit of international fame" (26) and no doubt, considerable wealth, also.

**276.** "End To Movie Code Urged by A.C.L.U." *New York Times* Dec. 6, 1955 1955: 45.

During the mid-1950s, many groups denounced the motion picture industry's Production Code for being too restrictive. The ACLU was among those groups urging that the Code be eliminated entirely.

**277.** "England Hard Up for Troops. Moving Pictures of Army Life to Be Sent Through the Country to Attract Enlistments." *Chicago Daily Tribune* Sept. 16, 1900 1900: 10.

The British are now using moving pictures to encourage enlistments into the military.

**278.** "Entertainment Software Rating Board (ESRB)". Nov. 7, 2005. <<http://www.esrb.org/>>.

Reacting to pressure from Congress, the U.S. Interactive Digital Software Association, the major trade association in the field, created the Entertainment Software Rating Board (ESRB) in 1994. The ESRB provided ratings and content descriptions. The maker of each game a submitted tape and questionnaire to a rating board made up of "three independent, trained raters" of varied backgrounds who had "no ties to the interactive entertainment industry." According to the ESRB's website, "The ESRB rating system helps parents and other consumers choose the games that are right for their families. ESRB ratings have two parts: rating symbols that suggest what age group the game is best for, and content descriptors that indicate elements in a game that may have triggered a particular rating and/or may be of interest or concern."

**279.** "Eric Johnston Dies; Aided 3 Presidents [obituary]." *New York Times* Aug. 23, 1963 1963: 1, 25.

This obituary provides good information on Eric Johnston's life prior to 1945, before he became president of the Motion Picture Association of America. Johnston is described as an "ebullient extrovert." His rise to the presidency of the U. S. Chamber of Commerce is covered. He was hailed as "the first breath of fresh air to blow through the Chamber in 20 years." (25) His work traveling to the USSR for the Franklin Roosevelt administration in 1944 is discussed as is his service to the Truman and Eisenhower administrations. This article says that Johnston ran for the Senate in Washington state in 1940 as a Republican and lost.

**280.** "Eric Johnston on the Price-Wage Tightrope..." *U. S. News & World Report* 30 (1951): 28-29.

This article gives a brief biography of Johnston, then president of the MPAAA and Economic Stabilization Administrator. It says that as MPAA president "his chief objective has been opening up foreign markets for American films." (29)

**281.** "Eszterhas Urges Teenagers to Sneak into *Showgirls*." *Plain Dealer [Cleveland]* Sept. 15, 1995 1995, sec. E (Arts and Living Section): 8E.

Eszterhas, the screenwriters for the NC-17 rated movie *Showgirls*, urges teenagers to sneak into theaters to see the film, thus putting him at odds with MGM/UA and the Motion Picture Association of America.

**282.** "The Ethics and Etiquet of Photography." *The Independent* 63.3058 (1907): 107-09.

This article begins by saying that on July 1, 1907, in Germany, a "new law goes into effect ... prohibiting the photographing of any person or his property without his express permission." (108) The article continues: "But Germany leads the world in this matter of State control. The Government tends to prohibit everything that can be prohibited and many things that cannot. Photography belongs in the latter class.... There are undeniably abuses in our present free and unlimited practice of photography, but they are not such as can be remedied by law without improper interference with the rights of the camera. What these are cannot be exactly stated, for our mentors of morals and manners have neglected the subject.

"As regards photography in public it may be laid as a fundamental principle that one has a right to photograph anything that he has the right to look at.... Of course a person has no right to snapshot a stranger in a ridiculous or embarrassing position any more than he has a right to gaze into the window of a private house when the window

shade has been accidentally left up, but when one appears in public it is always with the expectation and often with the purpose of being seen, and nowadays he must also anticipate being photographed...." (108)

**283.** "The Ethics of Amusements." *The Friend: A Religious and Literary Journal* 77.12 (1903): 92.

This article prints excerpts from a recent sermon by Baptist minister A. C. Dixon (1854-1925) in which he denounced modern amusements. Apparently there was not much that Dixon liked in modern entertainment. The theater, he said was "a great black evil institution." He went on to say that "The theatre is a make-believe institution, though superior in intellectual cultivation to the gaming table or the dance. Here and there you find a good actor or a good actress, but the general tendency of the stage is towards immorality." Dixon maintained that "There is not a moral theatre on this globe. There are moral plays and moral actors, but there is not anywhere a moral theatre." He denounced modern plays and said that no more than five in 200 were such that "a self-respecting man could read to a daughter or wife." The American theater was "even worse than in China or Japan, because women do not appear on the stage in those countries. The American stage or the stage of the world is the only place where a black stain on a woman's character will make popular. Women on the stage make fortunes by associating their names with evil, and amusement managers will crowd their theatres with people who come just to see who is advertised as of that repute."

Part of Dixon's objections to theater appears to be rooted in the stage's appeal to the senses. "The theatre, through the eye and ear, does for the audience what the dance does through the sense of touch. The average modern play is full of suggestion and innuendo for both eye and ear. Undress that would not be tolerated in any respectable home, even among brothers and sisters, is common on the stage. Conversation which off the stage would mark a woman as unfit for decent company, and postures from which the face of modest virtue would turn in disgust in any other place, are not only tolerated, but are known by theatre managers to be the popular features of a play."

Dixon did not like dancing, card playing, or many other amusements either. The "modern social dance" was not an expression of joy in the biblical or even pagan sense. People did "not dance because they are happy, but they go to the ball for a good time."

Dixon ended on a dour note: "The pleasure seeking spirit does not, in the long run, bring pleasure. It fosters selfishness, makes ugly character and degenerates into a life of debauchery. It ends in hatred of all life and in a sense of failure, which is positive pain, and is certain, sooner or later, to banish all pleasures and fill life with disappointment and sorrow." Dixon concluded: "For me to live, is Christ."

**284.** "Everything Grist for Camera Mill." *Chicago Daily Tribune* Sept. 27, 1914 1914, sec. G: 3.

An account of how "Pretty Scrub Girls Invade the Loop" in Chicago.

**285.** "Evil Post Cards Flood the Mails." *Chicago Daily Tribune* Aug. 29, 1907 1907: 3.

This article talks about picture post cards made in France or Germany. Five police assigned to the cards and hunt for the manufacturers. The article explains about window displays, art pictures in book stores, "bathing scenes," "model posing," and "half nude women in bathing and art costumes." The article's subtitle reads: "Government Inspectors Try in Vain to Check Tide of Improper Pictures. Want Source Attacked. Urge Raids by City Police on Numerous Shops Selling Such Things."

**286.** "The Evolution of Motion Picture Lighting." *American Cinematographer* 50.1 (1969): 94-97, 108, 119, 177.

Light weight, high intensity lighting units made it possible to film in color, even in low levels of light. In 1955, the 16mm Super High-Intensity Color-Modified Studio Carbon doubled the usable light studios had for filming. Lighting improved during the early 1960s when studios adopted a modified version of the Sylvania Sun Gun, a

miniature, high-intensity light original developed for amateur film makers. By the late 1960s, studios had gained even better lighting with tungsten-halogen lamps.

This article appeared in an issue that was devoted to fifty years of innovation in cinema and this piece deals with motion picture lighting from its origins to the 1960s. Among the topics covered are incandescent lighting, the introduction in 1955 of the 16mm Super High-intensity Color-Modified Studio Carbon, and the Sylvania Sun Gun (1961).

**287.** *Excelsior Pictures Corp. v. Regents of the University of the State of New York*. 156 N. Y. S. 2d 800 (1956); affirmed 144 N. E. 2d 31 (1957) 1957.

The case involved a film, *The Garden of Eden* (1954), about a nudist camp. The movie played on the exploitation circuit.

**288.** "Exporting an Imaginary America to Make Money. Moving Picture Lovers in Foreign Cities Prefer Indian and Cowboy Films to All Others." *New York Times* July 30, 1911 1911, sec. SM: 4.

This article deals with the export of American films. "There is one American article of export out of which fortunes are being coined in every corner of the world, and which, under its rightful name, does not appear upon a single steamer's manifest. This is the picturesque -- what is bizarre, exciting, and unusual in American life, chiefly scenes of cowboys and Indians. This picturesque, a real, definite commodity of genuine commercial importance, goes with many another moving picture film across the seas, and Britain, South American, Australian, and South African [sic] clap their hands with joy, or otherwise show their approval when the exploits of their 'Yankee' brothers are flashed upon the screen."

"Exporting the picturesque has thus become a money maker. The average American film on other subjects is not apt to 'take' with the foreigner. He likes, beyond all, dash and action. The cowboy and Indian, especially when they have a strong, simple story behind them that he can readily catch, appeal to the most uninformed peasant and the most stolid mechanic. The story must be simple, for his delight is not at its keenest unless he fully understands what the strange figures are doing. Then they are very much to his taste.

"... This is the America that they have long imagined and heard about....

"... In England alone, according to the latest reliable statistics, there are more than two thousand theaters showing moving pictures....

"...Russia, curiously enough, is getting to be a stronghold of moving pictures and the most insignificant towns and villages, even in remote districts, are being well provided with these amusements. There are reported to be 1,200 electric theatres alone in the Russian Empire. On Sundays and holidays the crowds, as a Moscow visitor recently wrote home to this country, 'are so great that additional police officers are often required to keep the immense number of people moving and to prevent possible accidents.'"

**289.** "Faces That Aid Fortune." *Outlook* (1915): 498-99.

This article discusses the qualities that make for success before the motion picture camera. It cites Thomas Brady who said: "...As to looks, 498/499 a broad face, big eyes, and loads of hair - in the case of girls or women -- are good. A narrow face will not do. There is a girl now playing in New York who, up to a year ago, was considered a great stage beauty. The moving-picture makers all went crazy over her. A test was made of her, and it was found that her features -- she had a Roman nose and beautiful eyes - did not photograph well because they were too narrow..."

The article then notes that Mary Pickford was one who made the successful transition from stage to screen and that she had recently signed a contract to be paid \$2,000 a week for an entire year whether she worked or not, and that she was allowed to pick her own plays.

**290.** "Fame that Endures." *Friends' Intelligencer* 58.49 (1901): 776.

This article begins by saying that "there never was a time ... when personality was more regarded, or when individual character and achievement were so much celebrated." Certain people "are the objects of popular attention, if not of adulation, to an extent never exceeded." The press accounts for some of this fame. "The newspapers are continual evidence of it. They print daily the portraits of those to whom public attention is being directed. Men and women have their pictures carried broadcast, upon the presumption that everyone wants to see how they look. The old aphorism, 'Principles, not men,' is completely reversed. It is 'Men, not principles,' in our day. The general intoxication over the success of Admiral Dewey in sinking the Spanish ships could hardly be measured, at the time, yet it is liable at any moment to be outdone, if occasion should arise. Movements in mass seem to be responsive to and sympathetic with individuals, and probably we never placed so high an estimate on 'personal magnetism.'"

The article warns, though, that elevating personality in this manner is "often very ephemeral. A 'popular idol' can hardly remove his hat before the cheers are transferred to someone else -- the procession moves so fast. ... We see thus that the applause men get is often very fleeting. Many of those who have their pictures in the daily newspapers to-day will not accomplish the like triumph ever again..... The glory of this world, if it be based on works not enduring, will be transitory, indeed."

The author concludes by offering examples of people who have achieved enduring fame -- Martin Luther, George Washington, Benjamin Franklin, William Shakespeare, Homer. The fame of poets is long lasting. "Let us regard the personalities that are lasting, and imitate *them*."

**291.** "'Famous American Actors of To-day.'" *The Critic: A Weekly Review of Literature and the Arts* 26.774 (1896): 400.

This is a review of Frederic McKay and Charles E. L. Wingate, eds., *"Famous American Actors of To-day"* (T. Y. Crowell & Co., 1896?). The reviewer notes that there are many actors who have not "established any title to fame, although all of them have enjoyed a greater or less amount of local popularity." This book "demonstrates the melancholy truth that the race of famous American actors is all but extinct, without affording any reasonable ground for hope that it may be renewed in the near future."

**292.** "Fans Still Talk of Fight." *Chicago Daily Tribune* Aug. 7, 1910 1910, sec. C: 1.

Here is an account of the reaction to the moving picture of the Jefferies-Jack Johnson heavyweight boxing match. The article's subtitle reads: "Pictures Renew Interest in Reno Affair at New York. Big Crowds See the Films. Public Should Let Jeff Alone Now, Says James J. Corbett."

**293.** "Far Too Many Theatres Here, Says Dr. Vollmoeller." *New York Times* April 12, 1914 1914, sec. SM: 8.

German author Dr. Karl Vollmoeller says movies don't threaten the theater quoting him: "It is very interesting, but, after all, the moving-picture show has nothing to do with the theatre. There is no art about it."

The subtitle of this article reads: "Famous German Author of 'The Miracle' Now in This Country Believes That a Dozen of Them Could be Dispensed with and Has Hopes that Moving Pictures Will Clear the Atmosphere."

**294.** "Farley Begins War on Infamy of Stage." *New York Times* Dec. 19, 1912 1912: 9.

This article talks about Roman Catholic efforts to regulate the theater. The subtitle of this article reads: "Cardinal, Who Says He Never Went to Theatre In His Life, Backs Catholic Movement; McGean Blames the People...."

**295.** "Fashions in Kinemacolor." *The Times [London]*.

This article, part of *The Times* celebration of its 10,000th number, reports on a "world's fashion *revue*" given in kinemacolor.

**296.** *Federal Communications Commission v. Home Box Office*. 434 U. S. 988 (1977) 1977.

In this case involving Home Box Office (HBO), a United States Court of Appeals held that the FCC had exceeded its authority when it attempted to limit the ability of cable systems to show certain kinds of movies and sporting events. The decision eliminated the Commission's restrictions on pay TV's use of feature-length movies.

**297.** *Federal Communications Commission v. Midwest Video Corp.* 440 U. S. 689 (1979) 1979.

The United States Supreme Court eroded the Federal Communications Commission's power in *FCC v. Midwest Video Corp.* (1979). The Court said that the Commission had exceeded its power by requiring cable television systems with more than 3,500 subscribers to offer at least 20 channels by 1986 and to make available some of those channels for educational, government, and public uses.

**298.** "Festivities at the Paris Exposition." *Pictorial Review* 2.1 (1900): 22-23.

In describing the Paris Exposition, this article discusses the use of electric light and color. The use of color is linked to the Oriental. "Persian imagery alone could adequately describe the wonders of these palaces of Water and Light with their wealth of translucent color. It is not hard to imagine that as Parisians claim mortal eyes have not gazed yet on anything nearly approaching their equal. All that is powerful and grand, awe-inspiring and beautiful in electricity is here apotheosized." (23)

The article goes on to explain that "Another striking feature of the Champ de Mars is the Luminous Palace, the work of M. Pousin. It has been described as 'an opium dream,' and it certainly is as Oriental as a vision of Tom Moore's. M. Pousin is a painter who has devoted himself to the study of stained glass. He finds in glass his whole delight and ambition, as he says himself glass is more transparent than air, more opaque than metal, and one has every *nuance* of color, softness, subtlety, depth, solidity at command. It can be milky opaline, iridescent, black as night or metallic, and all forms are possible to it. M. Pousin is an enthusiast; he has raised the Palais Lumineux on some rocks in the middle of the lake near the Tour Eiffel...." (23)

**299.** "Few Arrests Under New Sunday Law." *New York Times* Dec. 23, 1907 1907: 3.

This piece concerns Sunday blue laws. The subtitle reads: "All Vaudeville Theatres Open, with Programmes Shaped to Meet Doull Ordinance."

**300.** "Field of Electricity." *Los Angeles Times* April 21, 1897 1897: 3.

This article discusses a proposal to use "electro-chemistry" to change the skin color of African Americans. It also discusses Marconi and the wireless. The subtitle to the article reads: "New Plans of Telegraphing without Wires. Black Skins Made White by Electricity -- New Methods of Using Morse Symbols -- The Hughes Microphone."

**301.** "Fifth Avenue Gay with Easter Host." *New York Times* April 13, 1914 1914: 5.

This article comments on the reaction of city crowds to the realization they are being photographed. It also notes the presents of many new automobiles. "A moving picture concern had possession of one of these busses, which was stationed on the Fiftieth Street corner of Fifth Avenue, opposite St. Patrick's Cathedral. The lens was aimed at the filing out. When this was over the operator aimed his machine at the sidewalk near the bus on the

west side of the street and began to take of the parade in progress. The first few feet of films were good, but as soon as people saw they were getting into moving pictures they quit marching and stood at attention under the bull's-eye of the camera. In a few minutes the whole block was jammed with persons struggling either to move on down the street or to supplant some one who was sticking to his position in the film with a pertinacity that bordered on selfishness. The congestion here lasted for more than half an hour and seriously blocked the parade.

"One woman with a camera who attracted a good deal of attention leaned from a window in the fifth floor of a private residence, studied the crowd patiently as if picking out the genuine Poirrets and Paquins and snapped her camera at intervals. A battalion of photographers lined up along the Vanderbilt and Sloane residence on Fifth Avenue, at Fifty-first and Fifty-second Streets, some of them even establishing their base on the stairs and in the entrance to the Vanderbilt residence. Probably there were more than a thousand photographers out altogether. Amateurs and professional and the paraders, as a rule, walked right into the cameras' mouths without flinching visibly."

The subtitle of the article reads: "Thousands of Visitors Out to See the Annual Spring Fashion Parade. Cameras Are Everywhere. Strong Desire of Many to Appear in Moving Pictures Blocks Traffic Near Cathedral."

**302.** "Fifty Years -- Or More -- of Evolving Cinema Technique." *American Cinematographer* 50.1 (1969): 52-56, 106-07, 131, 144-46, 160-66.

This 1969 piece was part of an issue devoted to the past fifty years of cinema technology. This article gives an overview of developments in cinematography and serves as an introduction to other articles in this issue.

**303.** "Fight Comic Supplements. New Orleans Club Women Want Artistic Illustrations." *New York Times* Jan. 30, 1912 1912: 1.

Women in New Orleans are upset by the comic pages in newspapers.

**304.** "Fight Films' Ban Is Broad." *Chicago Daily Tribune* July 25, 1910 1910: 1.

This article lists many crimes shown in movies that violate state laws. The article's subtitle reads: "Order by Chief Steward Also Embraces Art and Drama. Stirs Up a Buzz of 'ifs.' Agree However Ruling Affects Merely Reno Encounter Views."

**305.** "Fight Pictures Are Taken East; ... Crime Due to Moving Pictures." *Chicago Daily Tribune* July 11, 1910 1910: 2.

This article discusses the showing of the Jack Johnson-Jeffries heavyweight boxing match; it also reports that two 18-year-olds were arrested after trying to rob street car; they had just seen a movie -- a western -- about a train robbery.

**306.** "Fight Pictures Shown." *Chicago Daily Tribune* May 24, 1897 1897: 4.

This article discusses the showing of the film of the Fitzsimmon-Corbett boxing match. The article's subtitle reads: "Opening Exhibition in New York Fairly Satisfactory. Crowd Watches the Flickering Show with Much Interest But Disputed Points in Regard to the Fight Are Left Unsettled Illustrations of the Knockout Blow and of Corbett's Despair While Being Counted Out by Silver."

**307.** "Film Actors Thrive; Dyer Says Some Earn as Much as \$500 a Week." *New York Times* Nov. 13, 1913 1913: 7.

The salaries of movie actors are much higher than the pay given to stage performers.

**308.** "The Film Artistry of D. W. Griffith and Billy Bitzer." *American Cinematographer* 50.1 (1969): 86-91.

This 1969 article appeared in an issue devoted to the previous fifty years in the technology of cinema. This article notes, for example, that in 1898, William Randolph Hearst sent Gottlob Wilhelm "Billy" Bitzer to take

motion pictures of the Spanish-American War in Cuba, but Bitzer failed "because he could find no way to transport his heavy camera equipment from the beaches to the inland areas where military operations were in progress." This failure led to the invention of the light, more portable Mutoscope camera, patented in July, 1899.

**309.** "Film Batteries Wink and Things Do Move." *Los Angeles Times* March 12, 1911 1911: 1.

This article discusses the advantages of Los Angeles for making movies. It also talks about the impact of movies on actors.

**310.** "Film Censorship." *New Statesman and Nation* 43.1096 (1952): 262-63.

This article notes that Parliament has closed a loophole that exempted non-commercial 16mm film clubs from censorship relating to using inflammable film.

"Film censorship has never been popular. In fact, Parliament has never accepted it in principle, and it is still nominally a matter for local authorities who have added censorship clauses to the licenses they issue under an Act of 1909. But this Act was to make 'better provision for securing safety' and it has applied only to inflammable films. In this way, thousands of film societies, clubs and other non-commercial exhibitors, who use the 'non-flam' 16mm. film, have been exempt from control and censorship. Now that loophole is to be closed, unless the Government can be persuaded to amend the new Cinematograph Bill which had its second Reading in the House of Lords last week. The Bill has followed a private report to the Home Office from the Magistrates' Association, which pointed out that the need to-day was not to ensure physical safety -- 'Non-flam' is used in commercial cinemas now -- but 'to safeguard morals.'

"There are two aspects of the Bill which 16mm. users find particularly distasteful. It extends the 1909 Act in a way which would enable local authorities to refuse permission for a film society showing unless certain safety provisions are met -- and this seems scarcely necessary in view of the excellent safety record of 16mm. And the exemptions which were written into the Bill are quite inadequate to guarantee the independence of 16mm. users. An exhibition is to be exempt if it is private or free -- an ambiguous definition which does not deal with the problem of 'guest' tickets -- or if it is given by an organisation which has a 'non-profit' certificate of exemption from Entertainments Tax. But this clause would make the liability to censorship 262/263 dependent, not on the Cinematograph Act, but on the Finance Act of 1946. At present, such exemptions are given to organisations which have a charitable purpose or are 'partly educational.' It would be open to future Chancellors arbitrarily to change that definition. It may be possible to secure amendments to these clauses when the Bill comes before the House of Commons, and we are glad to see that the National Council of Civil Liberties has convened a conference on March 8, at the Memorial Hall, at which users of 16mm. film can work out a common policy to defend themselves and their audiences from this renewed attempt -- the last was in 1934 -- to impose a censorship that could be crippling."

**311.** "Film Cleanup Drive Begun By New Dictator Of Morals [Joseph Breen]." *Cincinnati Enquirer* July 11, 1934 1934.

This article discusses Joseph Breen, who then began as head of the motion picture industry's Production Code Administration. A clipping of it is located in Folder: "Breen, Joseph, 1933-43," National Catholic Welfare Conference, Episcopal Committee on Motion Pictures, 1933-1944, Washington, D.C.

**312.** "Film Code Board to be Augmented: Ten Representatives Will Be Added to Motion Picture Production Appeal Unit." *New York Times* June 14, 1957 1957: 20.

After the revision of the motion picture industry's Production Code in 1956, criticism remained that the appeals process was dominated by executives from the nine member studios of the MPAA and its president Eric Johnston. This article reports that Johnston doubled the size of the Appeals Board by adding exhibitors and producers who were not MPAA members.

**313.** "Film Code Study Set by Industry: Johnston to Head Inquiry of Self-Regulation System -- Wide Changes Foreseen." *New York Times* Jan. 25, 1956 1956: 26.

This article explains that MPAA president Eric Johnston has appointed a committee to study revision the movie industry's Production Code. Among those appointed to this committee were Barney Balaban (Paramount), Abe Schneider (Columbia), Daniel O'Shea (RKO). The actual work of the committee (not mentioned in this article) was farmed out to a subcommittee chaired by Kenneth Clark and overseen by PCA director Geoffrey Shurlock. This article does not that the Loew's theaters and other large theater circuits had shown *The Man with the Golden Arm* (1956), a movie about drug addiction, even though the PCA had banned it.

**314.** "Film Company Gets Criterion Theatre ... Special Performance Shortly of Dramatization of Rockefeller White Slavery Report." *New York Times* Nov. 3, 1913 1913: 9.

An account of the Rockefeller Report on White Slavery. It mentions such films as *Traffic in Souls* (1913).

**315.** *Film Daily Yearbook*. New York: MPAA, 1959.

Michael Conant, in *Antitrust in the Motion Picture Industry*, cited a study in the *Film Daily Yearbook* showing that four-wall theaters declined between 1946 and 1956, but that when drive-ins were included the total number of theaters during this period remained constant.

**316.** *Film Daily Yearbook of Motion Pictures*. New York: The Film Daily, 1968.

Used in Jack's Lyle's entry in Robert K. Baker and Sandra J. Ball's *Mass Media and Violence: Vol. IX: A Report to the National Commission on the Causes and Prevention of Violence* (1969), noting that by 1967 only 39 percent of the 462 feature films released in the U. S. were produced in America.

**317.** "The Film Finds Its Voice." *American Cinematographer* 50.1 (1969): 84-85.

This 1969 piece was part of an issue devoted to the previous fifty years in the technology of cinema. This article gives a brief history of sound in motion pictures. "Through the years, the art of sound recording improved, but only incremental changes were made in the equipment until the advent of magnet recording during 1947 and 1948."

**318.** "Film Heads Pledge Reform in Exports." *New York Times* Dec. 21, 1946 1946: 13.

This article discusses hearings before the subcommittee on foreign trade and shipping of the Special Committee on Post-War Economic Policy and Planning in the U. S. House of Representatives. Eric Johnston offered testimony for the Motion Picture Association of America, and he and others pledge to screen more carefully films sent abroad so that they did not reflect badly on the United States. Officials cited in this story comment on the fact that the Soviet Union was sending out blatant propaganda films, but that at that time, U. S. officials did not want to impose restrictions on Soviet films, even though the USSR had imposed restriction on American commercial movies.

**319.** "The Film in Politics." *The Independent* 87.3537 (1916): 402.

This article notes that cinema has become an "international language" and that several countries -- Great Britain, Australia, Canada -- "have protested against the corruption of their national ideals thru the influence of American-made films." The British are concerned that U. S. films are undermining their authority in India. "The British administration in India has been for some years concerned over the number of young Hindus who prefer to go to America for study instead of England, but these are few compared with the millions who may be infected with Americanism thru the film."

The author of this piece writes: "Let me make the films of a nation and I care not who makes its laws; this is the twentieth century form of the old aphorism.... Apparently the time will come when it may be said that the hand that turns the cinema rules the world."

**320.** "Film Makers' New Industry." *Chicago Daily Tribune* Nov. 3, 1907 1907, sec. B: 3.

Chicago is at the center of movie making in 1907.

**321.** "Film Shows Busy; Panic Stops One." *Chicago Daily Tribune* April 15, 1907 1907: 1.

This article reports that "An incipient fire riot emptied one nickel theater yesterday." The article's subtitle reads: "Nickel Theaters Replete in Crime Pictures, Lacking Fire Aid, Are Filled with Children. Bad Influences Shown. Investigation of Five Cent Playhouses Proves Corrupt Tendency of Performances on Young."

**322.** "Film Stars Tango and Gossip with 10,000 Happy Fans." *Chicago Daily Tribune* May 15, 1914 1914: 1.

The subtitle of this article reads: "Favorites of Motion Picture World Lionized at Coliseum Ball. Crush Smashes Camera. Adulation of Crowd for Movie Actors and Actresses Reaches High Mark. Major Funkhauser Eyes Dancers."

**323.** "Film Train Wreck Almost a Tragedy." *Los Angeles Times* Sept. 28, 1914 1914: 13.

This article reports that 10,000 to 20,000 people watched as a movie company filmed a fake train wreck. The article's subtitle reads: "Four Players Nearly Drown After Engine and Cars Fall Forty Feet from Trestle. Train Plunges Too Far. 10,000 Mistake Actor's Cries for Part of Drama Heavy Loss in Spoiled Film."

**324.** "Filming Tiny-Tad Pictures with the Aid of a Microscope." *Current Opinion* 64.3 (1918): 186-87.

This article reports on a recent article in *Scientific American* by Austin C. Lescarbourea on microphotography, and its subtitle reads: "Micro-Photoplays Are the Newest Things Recorded in the Rapid Development of Cinemaphotography." (186) It starts by saying that "A drop of water taken from a stagnant pond is rich in motion-picture possibilities," and notes that prior to World War I, this kind of cinematography was practically monopolized by the French. (186) "As the French have already proven, among other unique demonstrations, it is possible to show various disease germs and how they affect the human system. The circulation of the blood can be filmed along with other functions of the human body that in performance are invisible to the naked eye." (187)

**325.** "Film-making Means Millions to Los Angeles." *Los Angeles Times* Jan. 1, 1916 1916, sec. III: 66.

The subtitle to the article says: "Enormous Expenditures. 20 producing companies spend more than \$1 million a month in L.A.; employ 12,000 people."

**326.** "Films Thrive Here on Quintuple Lines." *Los Angeles Times* Oct. 16, 1910 1910, sec. II: 1, 9.

This article talks about "every man with his own picture machine." It costs about \$225 and can be "purchased as readily as chalk or cheese." (II, 9) The article also says that Los Angeles is predicted to be moving picture center of U. S. next year. It talks about the rise of privately owned film companies (p. 9), and also French films in U. S. The subtitle to the article reads: "Moving Picture Enterprises Develop Rapidly Along Educational, News, Advertising, Private and Theatrical Ways. Headed for Los Angeles."

**327.** "Films Used to Stop Crime; Bertillon System Workings Are Shown by Moving Pictures." *Chicago Daily Tribune* Jan. 12, 1911 1911: 2.

This article discusses using film to identify criminals and the Bertillon System. The subtitle to the article reads: "Hope to Warn Children; Police Expect They Will See How Easy It Is to Be Detected."

**328.** "Find Evil Effects from Cinema Shows. English Investigators Believe Their Education Value Much Exaggerated." *New York Times* March 23, 1913 1913, sec. C: 4.

This article says that moving picture shows tend "to exert an evil influence on the young." The subtitle of the article reads: "American Films Disliked. Characters Called 'Inane' and 'Sticky' Manchester Makes Regulations as to Children's Admission."

**329.** "Firemen Go Raiding the Picture Shows." *New York Times* Feb. 10, 1913 1913: 3.

This article reports on movie theaters thought to be unsafe by fire officials. Part of the article subtitle reads: "Prisoners Charged with Maintaining a Nuisance -- 'Movies' Seemed to be in Communication."

**330.** "First Photograph In Colors of a Living Woman to be Taken in America." *Chicago Daily Tribune* Jan. 5, 1908 1908, sec. A: 8.

This article discusses the first color photograph taken in America using the Lumiere process. "The *Tribune* today prints the first successful photograph in colors of a living woman to be taken in America. This remarkable photograph was taken on a Lumiere autochromen plate by Emmett V. O'Neill, staff photographer of *The Sunday Tribune*. The subject is Mrs. Edward T. Breitung in the wonderful gown in which she appeared as Madame La Pompadour in the *Tableux Vivant*."

"The autochrome plate of the Lumieres has made the taking of photographs in colors not only a possibility for professionals but it has given into the hands of even the amateur photographer the power to reproduce even the most delicate shades of color found in still life and in nature."

"The color photographic plate is the invention of the Lumiere Brothers of Lyons, France, and bears their name. It is not merely a scientific experiment, as the other color processes in photography have been. It does not involve the long and intricate processes the tedious hours or work in the dark room, the expert knowledge, the keen eye for color, the extravagant use of chemicals that other inventions for photographing color have demanded." Until O'Neill's photograph, "no color photograph had been taken in America by the Lumiere process." (Mrs. Breitung was the wife of Edward Breitung of Marquette, Mich., a millionaire copper mine owner.)

**331.** "The Five Best Photographed Motion Pictures of 1967." *American Cinematographer* 49.4 (1968): 262-64.

This article discusses the Academy Award winners for Cinematography for 1967: *Bonnie and Clyde*, *The Graduate*, *In Cold Blood* (based on Truman Capote's novel), *Doctor Dolittle*, and *Camelot*.

**332.** "The Five Cent Theaters." *Chicago Daily Tribune* April 14, 1907 1907, sec. B: 4.

This article maintains that "The 5 cent theaters are great educators. Unfortunately the education they supply is not that of which the young people who are the main supporters of the 5 cent theaters are in need. They are worse than the cheap fiction which has long been a power for evil, by so much more as moving scenes in real life are more stimulating to the imagination than printed words. They are worse, too, because often the moving pictures shown are of scenes the description of which in a book would not be tolerated."

**333.** "Five Dollar Movies Prophesied." *New York Times* March 28, 1915 1915, sec. SM: 16.

The article's subtitle is: "D. W. Griffith Says They Are Sure to Come with the Remarkable Advance in Film Productions." D. W. Griffith when asked if he was going to do away with words in his films responded that on the contrary that more attention than ever is given to words used and that in one of his films he put on the screen more than 7,000 words (four pages) from Woodrow Wilson's *History of the United States*. Article says that Griffith's annual salary was \$100,000.

**334.** "Five-Cent Theaters Schools of Crime." *Los Angeles Times* Dec. 21, 1906 1906, sec. II: 1.

This article quotes Chief of Police Kern as saying: "I do not propose to allow the moving picture theaters of this city to conduct schools of crime. That is what picture films showing robberies, theft and diamond nipping amount to. On account of the low price of admission, these shows are attended by young boys of an impressionable age. Some sort of city ordinance must be found to stop these exhibitions of crime."

The subtitle of the article reads: "Cheap Moving Pictures Appeal to Boys' Wrong Side, and Chief of Police Says They Must Be Stopped. How They Operate."

Next to this article on the same pages is an article "Making Crooks," by Fred R. Bechdolt.

**335.** "Freakish 'Movie' Posters. A Riot of Strange Art Advertises the Pictures at the 5-Cent Theatres." *New York Times* May 25, 1913 1913, sec. X: 4.

According to this piece, "Moving picture posters powerfully reinforce the attraction of moving pictures for their peculiar public and casual pedestrians who are not remotely interested in moving pictures stop to marvel at the amazing posters which simply obliterate every other feature of the surrounding neighborhood. Often the posters are atrocious in every detail that goes to form the subject and execution of a picture. There need no school of new art to challenge the world by means of sensation in line and color. Moving picture posters are postier than post art of any nomenclature whatsoever." This article is a reprint of the article "Gaudy Posters Lure to 'Movies,' published in the *Chicago Daily Tribune*, May 4, 1913, p. B 4.

**336.** *Freedman v. Maryland*. 380 U. S. 51 (1966) 1966.

In *Freedman v. Maryland*, and exhibitor, Freedman, had shown *Revenge at Daybreak* (France, 1954; U.S., 1964) without obtaining a license from the Maryland censorship board. Although the board did not consider the film obscene, Freedman was convicted of violating state law. The Supreme Court overturned his conviction saying that the burden of proof for obscenity rested with the censor. The latter had to assure the exhibitor that the film would be proscribed or allowed to be shown within a brief, specified time, and that any judicial decision would be promptly delivered. Henceforth, any state law that tried to limit pornographic films had to satisfy the requirements set out in this case or be guilty of illegal prior restraint.

**337.** "Freedom of Speech and Boards of Censors for Motion Picture Shows." *Central Law Journal* 80.17 (1915): 307-08.

This rather poorly written article explains the judicial reasoning justifying the censorship of moving pictures. It says it is "startling ... in its novelty" the "claim .. made for freedom of speech in the product of a mechanical device on a curtain in a motion-picture theater." (307) It discusses the displaying of "personality" by a machine and quotes U. S. Supreme Court Justice McKenna on the difference between books and writings, and motion pictures. McKenna said (quoting him) that moving pictures "may be mediums of thought, but so are many things. So is the theater, the circus and all other shows and spectacles." (307) McKenna says that "common sense" does not support granting movies protection as a form of free speech. Films may be entertaining but (perhaps quoting McKenna) they are "capable of evil, having power for it, and greater because of their attractiveness and manner of exhibition." (307)

This article notes that like one who writes books, the maker of films may also encourage "obscenity, anarchy or revolution," but unlike the writer who appeals to the intellect, the film maker "produces something for the other senses than the intellectual sense, which the state in the interest of decency, order and government may regulate or suppress." (308) Thus, it is justifiable that "the state ... appoint its administrative boards and give them large discretion to the end of obtaining results which are the aim of legislation, but not in said boards legislation itself." (308) The article goes on to say that "it ought to be that a film to be sold for exhibition ought to be deemed as much in the mass of local property as a barrel of whiskey or a sack of flour in the hands of a local merchant ...." (308)

**338.** "The French Novel and the American Public." *New York Times* Sept. 28, 1907 1907: BR584.

This article notes that "there is observable in recent publications in England and America a disposition to enter the field of the French novel... There have lately appeared, and have been published in this country, several English novels, which, it appears to us, no clean-minded man or woman can read without loathing. This condemnation involves no assertion that fiction must close its eyes to a single fact of human existence.... To present pornography and perversity as a picture of the whole of life is to set up in the stead of sober art a monstrous and hideous caricature.

"It isn't, therefore, in the interest of morality especially that a stand should be made against the surrender of the Anglo-Saxon for the French idea of the novel it is in the interest of sound art. By all means let us emancipate ourselves from the silly prudishness which has wrought the literary neglect of the fact that the world is peopled by men and women, but by equal means let us keep our senses and refuse to allow the erotic to shatter the rounded integrity of true art."

**339.** "From Behind the Screen." *New York Times* Oct. 12, 1919 1919: 45.

The author of this article is reviewing a book by Austin C. Lescarbourea entitled *Behind the Motion Picture Screen* (Scientific American Publishing Co.). He quotes Lescarbourea saying of Edison's view of movies and teaching history:

"It was Edison, if our memory serves us correctly, who once said that he could teach more history in fifteen minutes by means of motion pictures than could ever be learned from any book. That statement is precisely true.'

"The writer believes in the great capacity of the screen to teach history, but 'more history in fifteen minutes' than can 'ever be learned from any book'? Precisely true? Precisely absurd."

**340.** "Funny Thing Happened." *Newsweek* 58 (1962): 58.

This piece discusses Richard Heffner and public television. Heffner, who described himself as a Jeffersonian liberal, later became head of the motion picture industry Classification and Rating Administration.

**341.** "Gaudy Posters Lure to 'Movies'." *Chicago Daily Tribune* May 4, 1913 1913, sec. B: 4.

This article says that "Moving picture posters powerfully reinforce the attraction of moving pictures for their peculiar public and casual pedestrians who are not remotely interested in moving pictures stop to marvel at the amazing posters which simply obliterate every other feature of the surrounding neighborhood. Often the posters are atrocious in every detail that goes to form the subject and execution of a picture. There need no school of new art to challenge the world by means of sensation in line and color. Moving picture posters are postier than post art of any nomenclature whatsoever."

The article notes that the "underworld is a favorite theme of the moving picture poster." Poster different from the content of the film; sensationalizes sex and infidelity. The article gives examples of suggestive phrasing.

This article also appeared in the *New York Times*, May 25, 1913, p. X 4, under the title "Freak 'Movie' Posters: A Riot of Strange Art Advertises the Pictures at the 5-Cent Theatres."

**342.** *Gelling v. Texas*. 157 Tex. Crim. 516, 247 S. W. 2d 95 (1952), rev'd per curiam, 343 U. S. 960 (1952) 1952.

This case, decided after the *Miracle* case, further weakened motion picture censorship as the Court rejected the rationale that a movie could be suppressed as "prejudicial to the best interests of the people."

**343.** "Giants at Dinner See a Camera Game." *New York Times* Oct. 29, 1911 1911: 13.

The New York Giants baseball team watched moving pictures of the World Series from that fall. The article's subtitle says: "Moving Pictures of the World's Series Thrown on a Screen at the Imperial. Everything Was Baseball."

**344.** *Ginsberg v. New York*. 390 U. S. 629 (1968) 1968.

Between the *Roth* decision in 1957 and 1968, the year of *Ginsberg v. New York*, the U. S. Supreme Court in the thirteen obscenity cases rendered no less than fifty-five separate opinions. "The upshot of all this divergence in viewpoint," Justice John M. Harlan wrote in the *Ginsberg* case, "is that anyone who undertakes to examine the Court's decision since *Roth* which have held particular material obscene or not obscene would find himself in utter bewilderment."

**345.** *Ginzberg v. New York*. 383 U. S. 463 (1966) 1966.

This case was one of several during the late 1950s and 1960s involving obscenity.

**346.** "Girls Protest to Film Makers." *New York Times* March 25, 1913 1913: 5.

About 3,000 stenographers protested movies showing them "as chewers of gum and wearers of 'rats.'"

**347.** "Gleason Doooms 'Movie' Signs." *Chicago Daily Tribune* Feb. 17, 1914 1914: 11.

Movie posters without permits must be removed from Chicago theaters.

**348.** "The Great Sensation This Season: The Cinema at Home." *The Times [London]* Dec. 5, 1912 1912: 11.

This is an advertisement for the Pathéscope and home movies.

**349.** "The Growing Fascination of the Film Play." *Current Opinion* LVII.3 (1914): 176-78 (APS Online).

This article discusses the growing influence of motion pictures and the growing relationship between the movies and newspapers and advertising. "We reproduce half a page from a single newspaper in Chicago in which almost four hundred cinema 'first nights' are announced for one day! The movie, for better or worse, is growing to be one of the greatest influences in our national life." (176) Part of the popularity of movies is traced to "a feasible and accessible revolt against drawing-room drama...." (176)

The articles points to criticism that "everything in the motion picture ... is sacrificed to attention." Even the story of the birth of Christ is filmed with a "bacchanalian feast" and "highway robbery." (178) The article suggests, though, that the problems of movies will "eventually solve itself, without censorship." (178)

**350.** "The Growth of the Drama." *Living Age* 267.3459 (1910): 239-43.

This article reviews volumes V and VI of the *Cambridge History of English Literature*, edited by A. W. Ward and A. R. Waller. It notes that one chapter is devoted to "Puritan Attack Upon the Stage." (243)

**351.** "The Growth of the 'Movies'." *Outlook* 104.7 (1913): 348.

This article says that each day five million visit the 20,000 theaters in the United States. The movie industry employs about a half million people and as an industry ranks with copper, tin, iron, petroleum, coal, and furniture. "Perhaps an even more striking comparison is with the printing and publishing business, which is one of the oldest and most widely distributed of all industries. Motion pictures utilize more than a third as much capital as is used by that great business." Only the automobile industry has shown such amazing growth in recent years.

The movies are potentially a powerful educational tool and "a new weapon in the hands of social reformers and sanitary engineers."

The article ends by quoting an excerpt from the National Board of Censorship which reads in part:

"The motion picture is a form of book, a form of art museum, a method of propaganda, and a method of scientific instruction. It is more economical, being a labor saving device, than any other available form of public instruction. It appeals to the interests, where a book may only appeal to the abstract faculties of the mind. Before many years have passed, the motion picture will have created somewhat of a revolution in methods of public school instruction.

"Even from the standpoint of moral regulation, it is likely that more can be accomplished ultimately through a large development of the educational film than through any conceivable censorship.... If motion pictures became extensively used in churches, schools, and social centers, a new motion picture audience would be created and a new standard of taste would quickly ensue."

**352.** *Hannegan v. Esquire*. 327 U. S. 146 (1946) 1946.

In a case that had implications for Hollywood publicity, the Supreme Court in 1946 narrowed the federal government's power to regulate sexual images in magazines when it unanimously overturned the postmaster general's decision in 1943 to deny mailing privileges to *Esquire* on the grounds that it included cartoons, pictures, and other sexual material that reflected a "smoking-room type of humor." Written by Justice William O. Douglas, the decision contributed to proliferation of so-called girlie publications.

**353.** "Hard Work for the Machines." *New York Times* Dec. 26, 1911 1911: 8.

Both the camera and the phonograph will be used to cover the 1912 political conventions. The article laments these media were available for earlier important events in the nation's history. "Much can be done, nowadays, with the moving picture machine and the perfected phonograph." However, there were still major limitations: "As for the phonograph, it can make nothing worth preserving of a Babel of sounds. A complete record, pictorial and vocal, seems out of the question. A charge of cavalry on a battlefield the moving picture man might catch, but never a wild stampede in a convention hall."

**354.** "Harvard Faculty Changes." *New York Times* July 2, 1922 1922: 5.

This article reports that Leonard Troland has been appointed assistant professor at Harvard after serving six years as an instructor in psychology.

**355.** "Has a Plan to Photograph Colors." *Chicago Daily Tribune* April 7, 1894 1894: 7.

The subtitle for this article says: "Edward Stigleman of Richmond, Ind., Claims to Have Perfected an Invention."

**356.** "Have You a Camera Face? If Not, Do You Ever Wonder Why?" *Current Opinion* 64.4 (1918): 259-60 (APS Online).

This article begins by saying that "It is said that out of one thousand girls in a given area, nine hundred have at one time or other secretly or openly craved prominence on the screen." And sometimes directors have hired inexperienced people because "a man or woman simply ... has a camera face." (259) Personality is often more important than beauty in explaining an actor or actress's appeal, personality that is expressed by the face.

"The essential requirement, of course, is to have features that photograph well. In every-day life, a little droop of the mouth or a peculiar angle to the eyebrows may add charm and character to a face, yet on the screen, we read, these lines may have the very opposite effect. As to eyes, certain shades of blue will not do at all, and we are told that as a rule black eyes photograph dull and lifeless. Brown eyes are better, while 'blue-green eyes, with a rim of yellow around the pupil, are best of all, as they retain their expression and animation.' Also 'black hair is not apt to photograph so well as brown, red and blond, tho much depends upon the shade and quality.'..." (260)

"...Thomas Ince, speaking for the producers, insists that **'the homely woman with character and lively intelligence has a better chance to become a photoplay star than the pretty, expressionless vacuum with neither,'** and this shrewd producer points to the growing number of people seen on the screen who are barely good-looking, but **'who are able to run the gamut of human emotion by merely altering the expression' and who, by reason of the personality expressed in their faces, 'are rendered more than handsome and more than beautiful.'** They are in greatest demand and, with few exceptions, draw the biggest salaries. Upon them to a large extent depend the great vogue of the movies." (260) (emphasis added)

**357.** "Head of Film Code at House Hearing." *New York Times* Feb. 4, 1960 1960: 34.

When grilled by U. S. House Post Office subcommittee in early 1960 about homosexuality references in a movie then being made based on Allen Drury's 1959 novel *Advise and Consent*, Shurlock assured members: "That will come out. That will come out."

**358.** "Hearst Canned Speech Opened at Kinston." *New York Times* Oct. 30, 1906 1906, sec. A: 3.

This article relates to William Randolph Hearst's use of movies and the phonograph in his 1906 election campaign. The article's subtitle reads: "It's Cold and Moving Picture Sauce Fails to Give Warmth. Vaudeville in Between. Lantern Slide Maker Causes the Crowd to Laugh by Twisting the Candidate's Idea."

**359.** "Hearst Oratory for London. Music Hall Manager Sends Here for Phonograph Records." *New York Times* Oct. 18, 1906 1906: 1.

This article relates to William Randolph Hearst's use of movies and the phonograph in his 1906 election campaign.

**360.** "Hearst Speech 'Canned' for Up-State Farmers." *New York Times* Oct. 10, 1906 1906: 1.

This article discusses William Randolph Hearst's use of movies and the phonograph in his 1906 election campaign. The article's subtitle reads: "He Talks It and Gestures It Into Phonograph and Camera. A 12-Cylinder Harangue. The Absent-Treatment Candidate Will Be Projected in Sound and Shadow Before the Voters of the Remoter Regions."

**361.** "'Heart of Russia'; Dr. De Kannel Lectures at the State Normal School." *Los Angeles Times* Jan. 24, 1899 1899: 14.

In this lecture, Dr. De Kannel showed a moving picture taken in Russia.

**362.** "[Heffner to Study TV's Impact on Americans' Attitudes about Environment]." *New York Times* March 23, 1971 1971: 75.

The study announced that the Ford Foundation will spend \$240,000 for an intensive 18-month study of how network TV is affecting Americans attitudes toward the environment. The project will be under the direction of R. D. Heffner, former general manager of WNDT-TV. It will videotape 400 hours of programming on three networks. These studies are part of Heffner personal papers. Heffner was also a communications professor at Rutgers University and headed the motion picture industry's Classification and Rating Administration from 1974 to 1994.

**363.** "Hewitt's Patent Granted." *New York Times* April 20, 1910 1910: 6.

This article reports that "Peter Cooper Hewitt, inventor of the well-known mercury vapor electric lamp which bears his name, grandson of Peter Cooper, and son of the late Mayor Hewitt, has at last won a hard-fought legal battle which has been waged in the Patent Office and the United States courts for six years over the question of priority of invention of another electrical device, perhaps even more important than the lamp." That is "a remarkable static device for transforming alternating currents into direct currents."

**364.** "Highlights of Lab History." *American Cinematographer* 50.1 (1969): 104-05, 167, 174-76.

This 1969 piece is part of an issue devoted to the previous fifty years in the technology of cinema. This article discusses major development in the processing of film. The article concludes by noting that the "probably the most significant postwar [World War II] development occurred in 1962 with Bell & Howell's introduction of an automatic additive color printer. This type of equipment has done more to influence the control and quality of uniformity than any other single recent development."

**365.** *Highlights of Opinion Research Corporation 1970 Survey on Code and Rating System.*

This was an early study done for theater owners evaluating the new motion picture rating system. It is located in Box 5, Mss 1446, Records of the National Association of Theaters Owners (NATO), Special Collections and Manuscripts, Harold B. Lee Library, Brigham Young University, Provo, UT.

**366.** *Historical Statistics of the United States: Colonial Times to 1957.* 1960. Washington, D. C.: U. S. Department of Commerce, 1961.

This important work has a great deal of information about Americans use of mass communication.

**367.** Committee on Science and Technology, U. S. House of Representatives, Ninety-Ninth Congress, Second Session (Serial R). *A History of Science Policy in the United States, 1940-1985: Report Prepared for the Task Force on Science Policy*, United States House of Representatives, Committee on Science and Technology.

This 77-page Report provides a useful history of United States science policy, beginning with the impact of World War I and its aftermath, then moving to World War II and the Cold War. Chapter VI is devoted to "Sputnik and Its Aftermath, 1957-1965." Chapter VII is entitled "The 'Crisis' in Government/Science Relations, 1965-1975." The last chapter (VIII) looks at science policy under Presidents Carter and Reagan. The work contains a detailed "Chronology of Federal Science Policy Developments, 1787-1985." (79-120)

**368.** "Hoax in Color Line. Minstrel Plays Unique First Act Near White House." *Chicago Daily Tribune* May 20, 1904 1904: 1.

This article reports that actors dressed as TR and negro make film next Capitol. "The story soon spread throughout the city and many people imagined the act was intended to put the president in an attitude of 'overpoliteness' to the negro, to emphasize the Booker Washington dinner incident for campaign purposes." The article's subtitle reads: "Pal (?) Appears as Roosevelt. Plan to Grind Moving Pictures Believed Advertising Dodge."

**369.** "Hollywood Film Makers Protest Rating System." *New York Times* July 21, 1990 1990, sec. 1: 14.

This brief article discusses film makers' dissatisfaction with the motion picture rating system in the months before the movie industry abandoned the X-rating for a new category, NC-17. Prominent directors presented a petition to Jack Valenti.

**370.** "Hollywood: The First 100 Days." *Time* 88.10 (1966): 38.

This article discusses Jack Valenti, former assistant to President Lyndon B. Johnson and then the new president of the Motion Picture Association of America.

**371.** *Holmby Prod., Inc. v. Vaughn.* 177 Kan 728, 282 P. 2d 412 (1955), rev'd per curiam, 350 U. S. 870 (1955) 177 Kan 728, 282 P. 2d 412 (1955), rev'd per curiam, 350 U. S. 870 (1955) 1955.

In this 1955 case, the U.S. Supreme Court struck down a Kansas state censors' ruling that *The Moon Is Blue* was "obscene, indecent and immoral," and tended "to debase or corrupt morals."

**372.** *Home Box Office, Inc., et al. v. Federal Communications Commission.* 190 U. S. app. D. C. 351 (1978) 1978.

In a case involving Home Box Office (HBO), a United States Court of Appeals held that the Federal Communications Commission had exceeded its authority when it attempted to limit the ability of cable systems to show certain kinds of movies and sporting events. The decision eliminated the Commission's restrictions on pay TV's use of feature-length movies.

**373.** "Hopkins' South Side Theater." *Chicago Daily Tribune* July 19, 1896 1896: 31.

This article mentions that "Picture of a Kiss" was shown on vitascope.

**374.** "Hopkins' South Side Theater." *Chicago Daily Tribune* June 28, 1896 1896: 36.

This article is on what was shown on Edison's Vitascope. See also Charles Musser's, *Emergence of Cinema* (p. 122) on the dates the Vitascope premiered in various cities.

**375.** "House of Lords: Coloured Moving Pictures: Validity of Patent." *The Times [London]* March 23, 1915 1915: 3.

**376.** "How Newspaper Picture Are Made." *Scientific American* 64.7 (1891): 101.

This article, which first appeared in the *Washington Star*, discusses three methods used to illustrate newspapers. "The illustration of newspapers is a new branch of art," it says. The article explains how the three methods work. They methods are: 1) the "chalk method"; 2) the "zinc process," which was superior for fine work such as portraits and sketches; and 3) photo engraving, "which somewhat resembles the zinc method."

**377.** "How Nickel Eats Penny. How Arcade Microbes Prey on Each Other." *Los Angeles Times* May 31, 1907 1907, sec. II: 8.

This article says that "The nickel theater and penny arcade furnish most of the distinctive features connected with the mechanical side of theater development. They came into being about the same time, and have grown, mushroom-like, into a noisy popularity." The article's subtitle reads: "'Store Shows' Throttle the Picture Machines. Malevolent Little Pests May be Self-Destroying."

**378.** "How Rotogravure Makes a Picture." *New York Times* Nov. 27, 1913 1913: 4.

This article is on a new technology, rotogravure, that allows newspapers to reproduce photographs faster. It is also adaptable to the rotary press. The subtitle to the article reads: "Photogravure Process Adapted to a Cylinder for Printing at a Rapid Rate. Shown in Christmas Times. All Times Pictorial Sections Will Soon Be Made by This New Method."

**379.** "How Technology from the Moon Will Advance Photography on Earth." *American Cinematographer* 48.1 (1967): 48-50.

This interesting article discusses early efforts to enhance moon photographs by digital means. It covers the work of such people as Dr. Robert Nathan, who headed Caltech's Jet Propulsion Laboratory (JPL) video digital (computer) data research for the National Aeronautics and Space Administration (NASA). It notes that the quality of enhancement pictures is constantly being improved by computer research engineers at JPL at the California Institute of Technology. The article says that "computer enhancement began in 1963 after Nathan saw Russian pictures of the Moon's far side." (48) Ranger VII first video-scanned the moon's surface for the United States in July, 1964. During 1964 and 1965, Rangers VII, VIII, and IX took more than 17,000 pictures of the moon's surface. Researchers at the JPL increased the yield of photo data analysis from 5 percent to 95 percent of its maximum potential.

The article notes the future potential for film makers. "Although the application of this technique of resolution enhancement to cinematography might, at first appraisal, seem remote, the method actually represents an

enormous potential in certain specialized areas of film production. The unique demands of instrumentation, medical and technical documentation are often such that really sharp original cinematography becomes all but impossible." (49)

As for obstacles to progress in this areas, the article says that "to date, the methods has been confined to single-frame photographs. However, since a motion pictures is nothing more than a multiple series of single 'still' frames, further extension of the process is technically quite feasible." (40) The article goes on to say that: "The main drawback, at present, is one of volume. The enhancement technique currently in use is a slow process. It is likely that an Analog Hybrid capability would have to be designed in order to accelerate this technique for use with motion pictures. Such thinking on the problem is being followed through at the moment." (49)

The technology involved at this time was quite large. The process involved a "reassembly printer -- a huge machine about the size of a truck (7 feet high by 5 feet wide by 12 long)." (50) The article notes that Boeing was the prime contractor for NASA and that Eastman Kodak was involved with the film processing.

**380.** "How Thos. A. Edison Plans to Cure Hookey." *Chicago Daily Tribune* Dec. 10, 1911 1911, sec. G: 4.

Thomas Edison believed that moving pictures would be a great tool for education. On teaching geography, physics, natural history and other subjects by using movies, this article says: "Make Every School Room a Motion Picture Show for the Children, in Which Instructive Films Are Shown and You Have Solved the Problem of Effective Education of the Small Boy,' Says World's Greatest Inventor."

**381.** "How Those Amusing Freak Moving Pictures Are Made." *New York Times* Aug. 21, 1910 1910, sec. SM: 11.

This article notes that special effects make it possible for one to enjoy "Alice in Wonderland" as a child again and "in life-size and startling realism." Notes that live events are sometimes filmed by accident or chance and that movie stories are then build around these pictures. Talks about the technical qualities of the camera that makes tricks possible. It mentions double exposure of film.

The article's subtitle reads: "Ingenious Devices Make It easy for a Man Apparently to Walk on the Ceiling, Climb Up the Side of a House and Work Other Impossibilities."

**382.** "How to Make Magic Lantern Slides for Your Own Entertainment." *Chicago Daily Tribune* Sept. 25, 1904 1904, sec. E: 3.

This articles says that "By means of the magic lantern, or stereopticon, the smallest Kodak views can be reproduced in brilliant pictures of life size, or larger, for the enjoyment of family and friends, and a little skill with colors will enable the amateur to reproduce in vivid hues and with striking fidelity as to actual size and color all of the characters, incidents, scenes, and experiences met with during a summer vacation or in the fishing, hunting, or traveling adventure which are the delight of all true amateur photographers." Article goes on to say that "Slides Easily Colored."

**383.** "How We Reading." *Independent* 64 (1908): 982-83.

This article discusses recent research about how people read. It says that with training one can cut the amount of time they spend reading by half or three-quarters. "That such an economy is attainable is indicated by investigations in the psychology of reading that have been recently carried on in many laboratories in this country and Europe. These show that ease and rapidity of reading depend more upon the knack of managing the movements of the eyes that on intellectual ability or quickness of perception. Among men and women of the same degree of education some read four or five times as fast as others, and in general the rapid readers can remember more of what they read and also reproduce it with fewer mistakes than the slow readers." (982)

The article discusses eye movement in reading and says that the eye "has to come to a full stop and focus at intervals of ten letters so." (982) It compares eye movement with a motion picture saying that it "is the same as with motion pictures. If the ribbon of photographic films were run thru the machine continuously there would be only a blur on the screen. Each picture has to be brought to a full stop for an instant and then the films jerked along to the next." (983) According to this piece, "in reading the eye is at rest much more than it is in motion; about ten times as long." (983)

Such research suggests that shorter lines are more easily read than longer one in newspapers and in other printed material. "If the lines are of unsuitable length, and especially if they are irregular, as those alongside of inserted cuts, the reading is slow and tiresome. The best length of line has been found by laboratory tests and practical experience to be that adopted in *The Independent* and the best newspapers; that is, about 64 millimeters. A line longer than 90 millimeters should never be used, altho if the type is enlarged in proportion and the page is held far enough away the angular movement may be the same." (983) Still "it requires more time to read the same number of words in a long line than in a short one, and the eye is frequently confused on swinging back to the left in finding the proper line. Besides this, the eye is strained in reading in a wide column, because the focus has to be changed from the ends to the middle, and differently for the two eyes, especially if the book is not held squarely in front.

"Theoretically a still shorter line than those here used would be better...." (983)

The article speculates that it is easier to reading lines arranged "perpendicularly instead of horizontally" as in Japanese or Chinese. (983)

**384.** "'Human' Picture of King." *New York Times* Oct. 19, 1913 1913, sec. C: 3.

The subtitle of the article reads: "Monarch Throwing Rice at Royal Couple Caught by Camera."

**385.** "Ice Box for Cineographs." *Los Angeles Times* Feb. 12, 1905 1905, sec. I: 16.

This article talks about the danger of fire from cellulod film and other materials.

**386.** "Illustrated Newspapers." *Littell's Living Age* 1351.204-06 (1870).

This piece is reprinted from *Gentlemen's Magazine* and comments on the appearance and spread of illustrated newspapers in Great Britain. It begins: "A new mania in journalism. The newspaper has arrived at the illustrated phase. Comic literature has come out of this epidemic tolerably successfully; the magazines have got down to a dead level of bad drawing and worse engraving; and now comes the turn of the more serious publications -- the newspapers. We shall soon see what they make of it. The growing taste for pictures, and the demand for art education, has recently brought into existence to illustrated papers, which are, in every respect, novelties in journalism. We allude to the *Graphic* and the *Illustrated Midland News*." (204)

**387.** "The Image of the U. S." *Time* 66.11 (1955): 26.

This article defends U.S. ambassador to Italy Clare Booth Luce's decision to oppose the showing of MGM's movie *The Blackboard Jungle* at the Venice film festival. The article begins: "Probably the deepest trouble of the contemporary U. S. is its inability to produce a reasonably accurate image of itself. In plays, movies, novels, it cruelly caricatures its life, parades its vices, mutes its excellences. This tendency, far more than Communist propaganda, is responsible for the repulsive picture of U. S. life in the minds of many Europeans and Asians." Luce, refused to attend the Venice Film Festival because she felt the movie showed the U. S. in a bad light. The Festival dropped the film from its program and producer Dore Schary accused Luce of censorship.

**388.** Committee on Science and Technology, U. S. House of Representatives, Ninety-Ninth Congress, Second Session (Serial T). *The Impact of Information Technology on Science: Science Policy Study Background Report No. 5*, Congressional Research Service, Library of Congress.

This Report was prepared by Jane Bortnick and Nancy R. Miller of the Congressional Research Service, Library of Congress, and transmitted to the Task Force on Science Policy in the Committee on Science and Technology in the U. S. House of Representatives (99th Congress). It attempts to assess the impact, "in some cases revolutionary impact on science," by information technologies during the previous quarter century. The Report discusses Federal support for university research, the recent relationship between universities and industry, computers and telecommunication networks, electronic publishing, and databases. The work also mentions recent money allocated for the Reagan administration's strategic computing initiative (e.g., p. 20).

**389.** Committee on Science and Technology, U. S. House of Representatives, Ninety-Ninth Congress, First Session. *The Impact of the Information Age on Science: Science Policy Study -- Hearings Volume 10, Sept. 10, 11, 12, 1985*. United States House of Representatives, Committee on Science and Technology. 1985.

Among the topics that witnesses tackled in these hearings were such questions as how supercomputers help scientists to solve complex problems more rapidly than was possible in the past.

**390.** "An Improved Hand Camera." *Scientific American* 95.24 (1906): 452-53.

This article offers a description of how an improved hand camera works.

**391.** "In Hues of Nature." *Chicago Daily* April 4, 1897: 45.

The subtitle for the 2-page article reads: "New Color Photography Now Officially Recognized. Is a Chemical Process. Certain Secret Solutions and Pigments Are used. Invention of Frenchman. Tested by English Scientists with the Greatest Success. Chance for Counterfeiters."

**392.** "In the Limelight." *Los Angeles Times* Dec. 27, 1908: 7.

The subtitle of the article reads: "More Than Hundred Theatres to Exhibit Moving Pictures of Los Angeles Winter Wonders."

**393.** "The Inauguration Rapidly Pictured." *New York Times* March 2, 1913: 2.

This article reports that the *New York Times* will offer four full pages of photographs of President Woodrow Wilson's inauguration, five days after that event, and thus will beat the paper's Sunday magazine in providing pictures. The paper will provide half-tone pictures using faster presses and "specially made paper of high quality." The Sunday *Times* will also provide photographs of new spring fashions.

"Readers of next Sunday's *Times* will not have to wait a couple of weeks for the magazine to furnish them with an adequate pictorial review of the inauguration, finely printed on smooth surfaced paper. The *Times* has taken care of that. The fifth morning after the great National celebration is over every *Times* reader will have spread before him four great newspaper pages of wonderful photographs -- pictures so well chosen and so well produced that no desires will be left for the formal magazine to satisfy later on...."

"To accomplish this the *Times* has made extensive preparations. Special photographers will be everywhere in Washington to-morrow snapping pictures which together will constitute a pictorial history of the entire inauguration.

"These will be rushed to the *Times* office in New York City where, the next day, they will be converted into special metal plates. Fast presses will stand ready with specially made paper of high quality on the reels in readiness for a run at a speed which will make still another record for half-tone pictures of the quality of these.

"The *Sunday Times* of next Sunday will be notable for another reason, also. It is the occasion of the Spring Fashion Number.... The half-tone pictures were reproduced from exclusive hats and gowns, and will be seen then for the first time in America." The work of some of the most famous Parisian dressmakers will be shown.

The subtitle for the article reads: "The Sunday Times Will Make a New Record in Publishing High Quality News Pictures. Special Paper, High Speed. With Same Issue Will Appear the Annual Authoritative Spring Fashion Section."

**394.** "Installing Veriscope Exhibition." *Chicago Daily Tribune* June 7, 1897 1897: 7.

This article discusses the camera technology used to film the Fitzsimmons-Corbett heavyweight boxing match. The machine and filming equipment weighted over a ton. To reproduce the fight used over two miles of film. With 48 pictures to each foot, there were about 513,600 pictures. The article's subtitle reads: "Grand Opera-House Temporarily Closed to Set Up Reproduction of Fitzsimmons-Corbett Fight."

**395.** *Instant World: A Report on Telecommunications in Canada*. Ottawa, Ontario: Information Canada ?, 1971.

This work examines telecommunications in Canada -- the complex problems it faces, social context, history of the industry and its corporate structure, the need for future innovations, and the government's responsibility to protect the public interest. Among the topic covered include satellites and the growing role of computers (as of 1971) in communications.

**396.** "Instantaneous Portraiture." *New York Times* Oct. 28, 1900 1900: 20.

This article notes the difficulty capturing Theodore Roosevelt's personality in facial photographs because his expressions changed so quickly. "Of the two Republicans Mr. Roosevelt suffers the more because his countenance is at all times so influenced in its expression by the swift and changing play of his emotions that its appearance at any one instant cannot be isolated and fixed without a real perversion of the effect it actually produces on those who are watching and hearing him. We all recall the impression of grotesqueness imparted by the instantaneous photographs of a horse in motion when they were first produced.... There is a like miscarriage in the photographs of our Governor 'in motion.'..." William Jennings Bryan's photos are also unsatisfactory, the article says.

**397.** Committee on Commerce, Science, and Transportation, United States Senate

Subcommittee on Communications. *International Satellite Reform*, (Washington, D.C.: Government Printing Office, July 30, 1997). Gleason, Jack. 1930.

Testimony of Jack Gleason, Acting Associate Administrator, Office of International Affairs, National Telecommunications and Information Administration, ... before the Subcommittee on Communications, Committee on Commerce, Science, and Transportation, United States Senate, July 30, 1997

**398.** United States Senate, Committee on Commerce, Science, and Transportation. *Internet Filtering Systems : Report of the Committee on Commerce, Science, and Transportation on S. 1619*, United States Senate, Committee on Commerce, Science, and Transportation.

**399.** *Interstate Circuit, Inc. v. Dallas*. 390 U. S. 676 (1968) 1968.

In Dallas, a film classification board, the first of its kind in the United States, attempted to use age as a means of rating the appropriateness of films. Even though the movie industry successfully challenged this plan before the United States Supreme Court in *Interstate Circuit, Inc., v. Dallas* (1968), the Court did not declare classification invalid and many believed the case encouraged other cities to create their own classification boards.

Indeed, Jack Valenti thought that as many as forty local regulatory boards were ready to move into action by 1968. In late 1968, the motion picture industry adopted a rating system.

**400.** "Invasion of Privacy." *Zion's Herald* 78.32 (1900): 996.

This article discusses a case before the Supreme Court of New York regarding a woman whose photograph was used in an advertisement even though the woman had not given her permission. The article says that "To print the likeness of a young woman and post it in public places is to invite public criticism and inflict an injury to her feelings by giving her an unenviable notoriety." The article goes on to say the case will apply "only to private individuals, but it might well be extended to men of public fame." (996)

**401.** "Is the Moving Picture to be the Play of the Future?" *New York Times* Aug. 20, 1911 1911, sec. SM: 8, 11.

This article draws distinctions between the motion picture and the live stage. "The stage has always been handicapped by the fact that you can't tell the story as the novelist can." (8)

It considers motion pictures and their relation to modernity. "We are just at the dawn of the moving picture as a feature of modern life. As has been said, its utilization in the drama is only a thing of five years. Sociological and philanthropic organizations are beginning to make use of it in a limited way. One enthusiastic moving picture man looks forward to its use in the schools. (11)

"'Why not?' said he. 'Picture are the best way of impressing things on the mind of a child. Properly speaking, there is no other methods. I read about Niagara Falls in my school geography, but I read only words. When I saw the falls it was a revelation to me. If it had been put on the screen in the classroom I would have understood what the teaching was telling me. (11)

"'Then think of the possibilities in the way of teaching history and, for that matter, of teaching almost any branch. There is no end to them.'

"There is, by the way, a strong demand for historical plays... Many other scenes in European and American history which have defied production on the regular stage because of intrinsic difficulties offer no obstacle to the moving-picture man. The education possibilities of this new form of drama are seemingly limitless. (11)

"It is impossible to conjecture how great a part it may play in our civilization by, say, the dawn of the twenty-first century." (quotations, p. 11)

This article notes that movie actors lack fame but that this state of affairs is changing. Notes the creation of a fan magazine, *Motion Picture Magazine*. As movies become more technically sophisticated, they will rival the stage. Up to this point, theater managers treated movies as only an "interlude" to the live performance on stage. The article notes the limitations of the stage and the advantages of film e.g., movies are more flexible than the stage and have better scenery. There is better pay in the movies. However, movie actors can use their voices and must use pantomime. The article mentions efforts to add sound to moving pictures. It says movies are a way to teach history. Movies are "just at the dawn ... as a feature of modern life." (11)

**402.** "Is the Photoplay Heading toward Disaster -- and Why?" *Current Opinion* 66.6 (1919): 369-71.

This article presents excerpts from three people: Richard A. Rowland who was covered in the *Motion Pictures Magazine*; Channing Pollock, who wrote in *Photoplay Magazine*; and Arthur Stringer, the novelist, poet, and playwright for films, who also wrote in *Photoplay Magazine*. Quoting from Stringer's excerpt on the photoplay:

"'Since it feeds the mind through the eye, and not through the ear, we have fallen into the habit of speaking of it as the silent drama, and we have hybridized its methods by imposing upon it the emotionalizing accompaniment of music and the elucidating sign-post of the sub-title, overscrolling the picture itself with printed text precisely as the medieval painters once overscored their paintings with verbal explanations. But the motion-picture is not silent

drama. It is not drama, in the first place, any more than it is animated sculpture, and we can call it silent only as we confuse it with drama, wherein of course, the actors have the power of speech. But this new, this novel, the revolutionary art which has been tossed 370/371 into the world speaks, not in words, but in action and scenic impression. It is quite vocal enough, only we haven't yet taken the trouble to acquaint ourselves with its amazingly impressive alphabet. In other words, we have deferred fixing on settled values for its different counters of expression. (370-71)

"We have vacillatingly put off honoring it with a technique of its own, with that give and take between artist and audience essential to all art, in which so much of the human response hinges on making the spectator an unconscious co-worker with the creator himself. This give and take we have readily enough recognized in the older arts, where a sculptor cannot carve an eyelash, or a painter on a flat canvass cannot show a drawing-room relief, or a playwright cannot show a drawing-room without one of its walls knocked out. We accept those limitations and glory in the illusion whereby they are overcome. But this marvelous new art of sun-writing has been the Orphan-Annie of the older arts. We have tried to tog it out in the buskin of the drama and lace it up in the slightly shoddy shoes of the written story. In do so, we have mongrelized its technique, insinuating into it the mechanics of the stage and imposing upon it the clumsily spelled-out textual legends of the story-writer -- which, after all, is a good deal like sticking real chicken feather in the tail of an oil-painting of a golden eagle." (371)

**403.** *Jack Block, Nathan Wolf, et. al. v. The City of Chicago.* 239 *Illinois Supreme Court Reports* 251. Illinois Supreme Court 1909.

Among the issues in this case, which involved the films *James Boys in Missouri* (Essanay, 1908) and *Night Riders* (Kalem, 1908), was what constituted obscenity and immorality, and also what portrayal of history might be consider immoral. The lawyers who fought these charges maintained that movies were depictions of the "American historical experience" and thus could not be censored as immoral or obscene.

Lee Grieveson in *Policing Cinema* (2004), writes of this case:

"Chief Justice James H. Cartwright dismissed these claims in the Illinois Supreme Court in early 1909. It was the purpose of the law, Justice Cartwright asserted, 'to secure decency and morality in the moving pictures business, and that purpose falls within the police power.' Notions of 'decency,' 'immorality,' and 'obscenity' were central to this power, and although it is 'doubtless true,' Cartwright noted, that there are differences as to what is immoral and obscene, 'the average person of healthy and wholesome mind knows well enough what "immoral" and "obscene" mean and can intelligently apply the test to any picture presented to him.' Cartwright's logic assumed a universal subject of moral judgment.

"Even though the ordinance focused solely on moving pictures, Cartwright noted, it did not necessarily license other immoral representations; furthermore, there is something specific to the regulation of moving pictures -- 74/75 the audience. 'On account of the low price of admissions,' Cartwright claimed, nickel theaters 'are frequented and patronized by a large number of children, as well as by those of limited means who do not attend the productions of plays and dramas given in the regular theaters. The audiences include those classes whose age, education and situation in life especially entitle them to protection against the evil influence of obscene and immoral representations.' He thus concluded that exhibition of the pictures 'would necessarily be attended with evil effects upon youthful spectators.' A concern about the effects of moving pictures on children and those rather enigmatically characterized as 'of limited means' that had animated the development of reform concern in early 1907 and led to the establishment of the police censor board was central also to the establishment of the board's constitutionality. Discourse creates institutions that come, in turn, to sustain those discourses. Important precedents were set here, paving the way for the proliferation of municipal and state censor boards from this moment on.

"Responding also to the claim that the films depicted 'experiences connected with the history of the country,' Cartwright suggested that it did not follow that they were 'not immoral' since they 'necessarily portray exhibitions

of crime.' Representations of history in moving pictures -- at least if they portray 'crime,' that central motor force of history -- could be immoral and obscene and could thus have damaging effects on those of 'limited means' and on the children of an urban immigrant population who were seen to be the most frequent moviegoers. Of course, the representation of the history of the United States -- or, for that matter, the immorality of elites -- to those groups had critical ideological import. The representation of criminal events in moving pictures was of a different order from their depiction on the stage. For Justice Cartwright clear distinctions needed to be drawn between moving pictures and historical and theatrical accounts. Even though it is almost certain that the two films under consideration -- like *The Unwritten Law* -- replayed historical actuality through fictional conventions, that they were only retrospectively discursively positioned as straightforward representations of historical actuality, the decision took that positioning at its word and disallowed it."

"Untangling the complicated layers of this case is important to our understanding of the interaction between regulatory forces and the film industry at this moment. Allying cinema on the one hand with the theater and on the other with nonfictional discourse -- the at least ostensibly nonfictional discourse of history -- seemed to offer a way for Block to circumvent the powers of the police censor board. Yet these alliances were de- 75/76 nied by the state Supreme Court amid fears about the effects of films on audiences. Film was, this suggested, distinct from the theater and from history and uniquely a target for regulatory concern principally because it could have damaging effects on vulnerable (and potentially dangerous) audiences. The audience base for cinema meant that it could not simply represent controversial real-life events. Cartwright's concerns can be situated clearly in the context of the anxieties about 'sensational' films such as *The Unwritten Law* and the effect of moving pictures and nickel theaters on children, and indeed on those of 'limited means,' that emerged so forcefully in early 1907. Legal discourse is a cultural text, evidently enmeshed with the shared knowledge of the culture traced out in this chapter." (Grieverson, *Policing Cinema*, 74-76)

**404.** *Jack Block, Nathan Wolf, et. al. v. The City of Chicago*. 239 Illinois Supreme Court Reports 251. Illinois Supreme Court 1919.

This Illinois Supreme Court case dealt with motion picture censorship.

**405.** *Jacobellis v. Ohio*. 378 U. S. 184 (1964) 1964.

In 1964, *Jacobellis v. Ohio*, the U.S. Supreme Court overruled a decision to prohibit Louis Malle's film *The Lovers (Les Amants)* (France, 1958; U.S. 1959), about a bored young woman who fell in love with an archaeologist and abandoned her husband and family. Ohio censors had found a love scene in the final reel particularly objectionable. In trying to ascertain the "dim and uncertain line" between protected expression and obscenity, the Court in a 6-3 decision judged the picture not obscene. Brennan, joined by Justice Arthur Goldberg, reaffirmed, and even expanded the *Roth v. United States* (1957) ruling, when they said that a work could not be outlawed unless it is "utterly without redeeming social importance." Brennan and Goldberg also said obscenity had to be "determined on the basis of a national standard." Douglas and Black concurred on the ground that the First Amendment permitted no restrictions. Justice Potter Stewart concluded that the *Roth* test applied only to hard-core pornography. He did not try to define the term, but did say in the now famous phrase, that "I know it when I see it." Chief Justice Earl Warren dissented, rejecting the idea of a national standard for obscenity, and saying that when *Roth* said "community standards" should be the basis for judgment, it meant just that.

**406.** *Janet Reno, Attorney General of the United States, et al. v. American Civil Liberties Union, et al.* 521 U. S. 844 (1997) // 117 S. Ct. 2329; 138 L. Ed. 2d 874; 1997 U.S. LEXIS 4037; 65 U.S.L.W. 4715; 25 Media L. Rep. 1833; 97 Cal. Daily Op. Service 4998; 97 Daily Journal DAR 8133; 11 Fla. L. Weekly Fed. S 211. U.S. 1997.

This case overturned the Communications Decency Act (CDA). In 1996, Congress passed the CDA. The CDA was part of the Telecommunications Act and it had two provisions that attempted to protect those under 18 years of age from harmful communications sent on the Internet. One provision made it a crime to knowingly transmit "obscene or indecent" materials to minors. The other made it illegal to use deliberately a computer service to

send messages to those under 18 that depicted or described "sexual or excretory activities or organs" in a "patently offensive manner, as judged by "contemporary community standards." The U. S. Supreme Court declared these provisions unconstitutional, in part because they amounted to an abridgment of free speech protected under the First Amendment. The scope of the CDA was too broad, the Court said, and such terms as "indecent" and "patently offensive" were so ambiguous as to "silence speakers whose messages would be entitled to constitutional protections."

**407.** "Japanese Urged to Control Video Cassette Tape Piracy." *Journal of Commerce* (1987): 4A (Foreign Trade Section).

This article deals with the American film industry's attempts to combat video piracy. Jack Valenti, president of the Motion Picture Association of America, estimated that 9,000 to 10,000 video rental stores in Japan handle tapes that have pirated, and that the stores often make copies for customers. Worldwide, Valenti estimated that the American movie industry loses about a billion dollars each year to illegally copied cassettes.

**408.** *Jenkins v. Georgia*. 418 U. S. 153 (1974) 1974.

This Georgia case involved Mike Nichols's film *Carnal Knowledge* (Avco Embassy/Icarus, 1971). A theater owner in Albany, Billy Jenkins, had been convicted for showing the movie, which starred Jack Nicholson, Art Garfunkle, Ann-Margaret, and Candice Bergen. A divided Georgia Supreme Court held that the conviction was within the guidelines set down by the U.S. Supreme Court in the *Miller v. California* case. The test for obscenity in *Miller* required that the work in question "portrays, in a patently offensive way, sexual conduct specifically defined by the applicable state law; and, taken as a whole, does not have serious literary, artistic, political, or scientific value." It was difficult to argue that *Carnal Knowledge*, which was not a hard-core film, fell into that category. The Motion Picture Association of America backed Jenkins's appeal to the United States Supreme Court, where Louis Nizer argued that the film deserved protection under the First Amendment. The Court agreed and, in setting out the decision, Justice William H. Rehnquist said that "juries do not have unbridled discretion in determining what is 'patently offensive'" In short, the First Amendment, which the Court uniformly applied across the nation without consideration for whatever cultural differences might exist from one locale to another, took precedent over community standards.

**409.** "[Jewish Control of the Theaters]." *McClure's Magazine* 40.5 (1913): 144-45.

This section, part of a longer article on Jewish influence, says that "the activities of American Jews ... extend far beyond the borders of New York," and that "the business of relaxation and entertainment for more than 90,000,000 Americans is almost exclusively a Jewish industry." (144) It continues: "One needs to go back only twenty-five years to discover how completely Jews have eliminated all other races in the amusement field. Just glance, for a moment, at the names of the great theatrical 'magnates' of a generation ago. They were nearly all Irish or plain Anglo-Saxon.... A similar roster now would show an overwhelming majority of Jewish names. It is not only in the matter of race, however, that these old-time 'magnates' differed from the new. In many cases they represented an altogether different theatrical type. Nearly all were primarily theatrical managers and only secondarily business men; many, indeed, had earned their apprenticeship as actors and playwrights. They understood writing as a technical art, and approached the business of entertaining the public largely from an artistic standpoint. The Jewish managers who control the industry now, however, are nothing but business men. A few exception, of course, must be made; certainly no one would say that such men as David Belasco and Charles and Daniel Frohman are primarily commercialists. With practically all the rest, however, the modern theater is simply merchandise, like ready-made clothing and women's cloaks. Whereas the old managers started their careers on the stage, it is significant that nearly all of the new managers started in the box-office or in one of the occupations closely allied to the theater." (144) Later, the article says that "In vaudeville and moving pictures the Jews have likewise made large fortunes." (145)

Other subheadings in this piece are entitled "Protestant and Catholic Children Now Taught by Jewesses; Jewish Policemen and Firemen" (143-44); "Jews in Control of the Big Department-Stores" (145-46); and "Jews Control the Whisky Business." (146-47).

**410.** "Jews Wage Battle on Stage Caricature." *Chicago Daily Tribune* Sept. 3, 1913 1913: 9.

This article reports that the "Anti-stage Jew vigilance committee of Chicago has sent out an appeal to 10,000 citizens asking assistance in abolishing the caricaturing of the Hebrew on the stage." The appeal, reprinted in full, reads in part: "If, inadvertently, you should attend a playhouse where the Jew is the target of the comedian's vulgar horse play for the gusto of the audience, register at once a vigorous protest to the management. The Jew has submitted long enough to public slurs and insults on the stage."

**411.** "Joe I. Breen Dies; Former Code Head." *Hollywood Reporter* Dec. 7, 1965 1965.

The obituary for the former head of the motion picture industry's Production Code Administration.

**412.** "John Bunny Dies." *New York Times* April 27, 1915 1915: 13.

The sub-title to the article reads: "Movie Funmaker. Fat, Big, Round-Faced Actor Who Made Millions Laugh Succumbs at 52."

**413.** "Johnston Joins Film Censor Talk: Starts Producer Parleys -- Weighs Proposal for the Classification of Movies." *New York Times* Oct. 6, 1959 1959: 45.

This article points out that only the United States and Japan do not have a classification system for motion pictures. Eric Johnston is quoted as saying "I am against any system which involves censorship." Reacting to criticism from religious groups and women's organizations, Johnston said: "From most of the critical letters I received, it is evident that the bulk of criticism is aimed at picture without Code seals. ...More than 760 foreign pictures were imported last year, while 218 were produced in Hollywood. Only 280 Production Code Seals were issued. Pictures without the Code Seals are by far the largest offenders."

**414.** "Johnston Maps M. P. Institute: Johnston MPPDA President; Hays, Consultant." *Film Daily* Sept. 20, 1945 1945, sec. 88: 1, 7, 8, 13, 15.

A piece about the new president of the Motion Picture Association of America, Eric A. Johnston.

**415.** "Johnston Sees End to Film Censorship." *New York Times* April 11, 1961 1961: 41.

Speaking to about 90 MPAA representatives on the fifteenth anniversary of his becoming MPAA president, Eric Johnston said: "I predict that long before another fifteen years pass, the Supreme Court will have declared once and for all that no one has the right to censor a motion picture."

**416.** "Johnston Will Seek Film Pact in Soviet." *New York Times* Sept. 5, 1958 1958: 23.

Eric Johnston, president of the Motion Picture Association of America, will travel to the USSR to negotiate an agreement for the exchange of American and Soviet films. The article notes that he "will be traveling as an official United States representative by State Department designation and not as an officer" of the Motion Picture Export Association, of which Johnston was also president.

**417.** "Jolson Screen Tests 'Rotten,' Lawyer Says." *New York Times* Sept. 15, 1926 1926: 26.

The subtitle to the article reads: "Comedian Refused to Enter Movies When He Saw Them, He Tells Court."

**418.** *Joseph Burstyn, Inc. v. Wilson*. 343 U. S. 495 (1952) 1952.

**419.** "Joseph Jefferson on the Actor's Fame." *Forest and Stream* 66.21 (1906): 842.

Joseph Jefferson, who was an accomplished comedian of the English-speaking theater, maintained that it was "absurd" that literary men should envy the popularity accorded actors. Quoting Shakespeare to show the actor's plight ("The poor player that struts and frets his hour on the stage and then is heard no more."), Jefferson says: "Yes, sir, there is nothing so useless as a dead actor." An actor's fame begins to die when the actor dies. He "lives only in the memory of those who saw him act, but ... is dead as dead can be in the memory of the sons whose fathers saw him play." This reality is in contrast to "the painter, the sculptor, the author," who "all live in their works after death." Actors should live in the moment. The "must have their reward now, in the applause of the public, or never. If their names live, it will be because of some extraneous circumstances," said Jefferson.

One might compare this assessment of the actor's fame with that given in "The Tragedy and the Compensations of the Actor's Career," *Current Literature*, XLII, No. 2 (Feb. 1907), 188-89.

**420.** "Journalism and the Cinema." *The Times [London]* Nov. 18, 1913 1913: 5.

This article announcing that a special issue of *The Times* will be devoted to the cinematograph as part of the papers celebration of its 10,000 number. This article also discusses an exhibit from the day before of films dealing with medical and scientific topics.

**421.** "Judge Adds A.P. S. to X-Rated Film Ruling." *Bergen County Record (New Jersey)* July 22, 1990 1990: E03.

This piece deals with the court case that had challenged the motion picture industry's X rating given to the movie *Tie Me Up! Tie Me Down!*

**422.** "June." *Harper's Bazaar* 13.25 (1880): 386.

This brief article makes reference to "chromo-civilization," a term used by E. L. Godkin, and compares it to "green fruit." "As a people, we have passed the salad days when we were green in judgment. Our taste is ripening. Our sense of fitness is maturing. That sort of intellectual green fruit -- of immature poetry, art, music, ornament -- that 'chromo-civilization' in which we once took delight, is losing its power to hold us." (386)

**423.** "Just What Is So Mysterious about Color." *American Cinematographer* (1936): 414, 424-26.

**424.** *Hearings*, Committee on the Judiciary, United States Senate, Eighty-Third Congress, Second Session

Subcommittee to Investigate Juvenile Delinquency. *Juvenile Delinquency (Motion Pictures)*, (June 15-18, 1955). United States Senate. 1955.

This hearing, chaired by Senator Estes Kefauver, investigated the possible connection between motion pictures and juvenile delinquency. Geoffrey Shurlock, the head of the Production Code Administration, was among those who testified.

**425.** *Hearings*, Committee on the Judiciary, United States Senate, Eighty-Third Congress, Second Session

Subcommittee to Investigate Juvenile Delinquency. *Juvenile Delinquency (Obscene and Pornographic Materials)*, (May 24, 26, 31, June 9, 18, 1955). United States Senate. 1954.

This hearing, chaired by Senator Estes Kefauver, investigated the possible connection between pornography and obscene literature and juvenile delinquency.

**426.** *Hearings*, Committee on the Judiciary, United States Senate, Eighty-Third Congress, Second Session

Subcommittee to Investigate Juvenile Delinquency. *Juvenile Delinquency (Television Programs)*, (June 5, Oct. 19-20, 1954). See also: violence See also: sexuality

United States Senate. 1905.

This hearing, chaired by Senator Estes Kefauver, investigated the possible connection between television programs and juvenile delinquency.

**427.** *Hearings*, Committee on the Judiciary, United States Senate, Eighty-Fourth Congress, First Session

Subcommittee to Investigate Juvenile Delinquency. *Juvenile Delinquency (Television Programs)*, (April 6-7, 1955).

See also: violence See also: sexuality

United States Senate.

This hearing, chaired by Senator Estes Kefauver, investigated the possible connection between television programs and juvenile delinquency.

**428.** "Kefauver Lauds Code: Says Changes in Film Rules Parallel Committee Ideas." *New York Times* Dec. 15, 1956 1956: 21.

Democratic Senator Estes Kefauver (D-TN) and the members of his subcommittee who were investigating possible links between the movies and juvenile delinquency, believed that violent films provided possible "trigger mechanisms" for some youth. Kefauver praised the revised Production Code in 1956. Kefauver was also pleased by another revision in the Code. His subcommittee had called for a relaxation in the Code's restrictions that forbade treating such topics as drug addiction and kidnapping.

**429.** "Khrushchev, Johnston Talk." *New York Times* Oct. 7, 1958 1958: 42.

Eric Johnston, president of the Motion Picture Association of America, traveled to the USSR as an official representative of the U. S. State Department to negotiate an exchange of American and Soviet films. This article says that Soviet Premier Nikita Khrushchev invited Johnston to have dinner with his family, the first time, it was believed, that Khrushchev had ever introduced an American to his family.

**430.** *KI [Kinsey Institute] Stag Film List*. Kinsey Institute Library Film and Video Collection.

This list, compiled by the Kinsey Institute, gives an indication of how many pornographic movies were shot on 8mm and 16mm motion picture cameras prior to the late 1960s. It is at the Kinsey Institute Archives, Indiana University, Bloomington, IN.

**431.** "The Kinetophone." *The Electrical World* XXIII.24 (1894): 799-801.

This article attempts to provide an explanation for the new invention of moving pictures. One interesting piece of information is the speed with which photographs can be taken and then shown when run through a projector. "Forty-six impressions are taken each second, which is 2,760 a minute and 165,600 an hour; or, as Mr. Dickson has graphically put it, 'were the spasmodic motions added up by themselves, exclusive of arrest, on the same principle that a 800/801 train record is computed independent of stoppages, the incredible speed of twenty-six miles an hour would be shown.'" (quotation pp. 800-801)

The article goes to conclude: "As to the future of this most ingenious and interesting bit of mechanism, time only will demonstrate whether it is to be a mere scientific toy or an invention of real practical value." (801)

**432.** "The Kinetoscope." *The Times [London]* Oct. 18, 1894 1894: 4.

This article discusses Thomas Edison's new invention, the Kinetoscope.

**433.** *Kingsley International Pictures Corp. v. Regents of the University of the State of New York*. 360 U. S. 684 (1959) 1959.

Several decisions by the U. S. Supreme Court made it more difficult to prosecute obscenity and exercise control over immorality during the late 1950s and 1960s. In 1959 the Court lifted a ban on the showing of the French film *Lady Chatterley's Lover* (1957). New York censors had rejected the movie because it presented adultery "as being right and desirable for certain people under certain circumstances." The Supreme Court ruled that the state had tried to regulate advocacy of an idea and "thus struck at the very heart of constitutionally protected liberty." The Court said, in effect, that showing immoral activity, even in a favorable manner, was not obscene.

**434.** "Korn's System of Electrical Telephotography." *Scientific American* 93.22 (1905): 417-18.

This article explains Arthur Korn's invention for sending picture electrically over telegraphy wires. "The problem of transmitting pictures, drawings, signatures, and the like over considerable distances is old; in fact, it dates back to the fifties of the nineteenth century. Many attempts have been made to solve it, but with scant need of success. Now, however, the difficulty seems overcome, judging from a lecture given on October 28, 1905, by Prof. Korn, of Munich, before the Electrotechnischen Verein (Electrotechnical Union) of Berlin, accompanied by demonstrations with the apparatus itself. Prof. Korn's apparatus is able to transmit a perfect copy of a *carte de visite* within a brief space of ten minutes, and, should it be found practicable by the German postal authorities, who are now testing it, it will inaugurate a new era in connection with press work, criminal investigation, transmission of photographs of fugitives from justice, etc. We will now describe the apparatus itself...." (417)

As regard the speed of this invention which "can also be used for the transmission of handwriting": "At present from 500 to 600 words can be transmitted per hour, giving an exact replica of the original; or a stenographed message of 3,000 words can also be telephotographed in the same time." (418)

**435.** "Largest Rotogravure Roller in World -- for Next Sunday's Tribune; 'Tribune' Makes World's Largest 'Roto' Cylinder." *Chicago Daily Tribune* Feb. 28, 1915 1915: 5.

This article says that the "largest and heaviest rotogravure cylinder ever made was 'put to bed' last night in the *Tribune's* engraving department. Etched on its copper surface are the pictures which will be printed next Sunday in the *Tribune's* special eight page pictorial supplement, just a small sample of which is furnished with the paper today. The Mary Pickford picture was run off on the smaller auxiliary press for printing two-page inserts.

"The larger cylinder is 60 inches long and 47 1/2 inches in circumference. It weights 2,500 pounds....

"The *Tribune* is the only newspaper in Chicago to own and operate a rotogravure plant. It has taken experts six months to get the delicate and intricate machinery into shape to give the public the best and most accurate service attainable both as to art and to faithful reproduction.

"Adolph Boltz, who has been at work for weeks placing the heavy machinery in position and assembling the many part, left Germany two days before war was declared. Fred Geiger, New York representative of the company which has the American rights of the Martens methods, has been directing the work.

"Many of the special chemicals and delicate gelatin and carbon papers used in transferring the pictures to the copper surface have to be imported."

**It is perhaps noteworthy that the *Chicago Tribune's* first rotogravure supplement was used to publicize a movie star, Mary Pickford. The *New York Time's* first rotogravure supplement, which appears in April 1914, was used to publicize the art work in the Altman collection.** (emphasis added)

**436.** "The Latest 'Triumph of Science' for Western Towns." *New York Times* June 30, 1907 1907, sec. SM: 5.

This article describes the showing of a moving picture in a tent. "At the rear of the tent is a moving picture machine mounted on a tripod, and a roll of film is brought from some hiding place of art treasure and put in place. Then follows the low hum of the machine, and more flickering upon the white muslin. The manipulator of the machine is equally erudite and recondite with the barker in front, and accompanies the pictures with an eloquence of description not to be imitated, except feebly, as I shall attempt to do. He keeps a few second ahead of the pictures that flash upon the muslin, so that no part of the thrilling story may be lost, and preliminary to the portrayal of the 'tragedy' he explains how the 'great mori, spirchewel, and elevatin' lesson' came to be save to the world about as follows:....

"The machine stops buzzing, and we have see 'de great mori tragedgy' in all its verisimilitude. We will come again and bring the children."

The subtitle for the article reads: "Moving Pictures, and a Barker with a Copious Imagination that Deals with History, Portray the Killing of Stanford White."

**437.** "Laughter and Color in the New Italian Drama." *Current Opinion* 67.1 (1919): 28-29.

The subtitle for this article reads: "The New Drama of the Grotesque and the New Theater of Color." The latter part of the article discusses the Italian Achille Ricciardi, who as early as 1906 called for a "theater of color." The article reprints an excerpt from the *Boston Transcript* (perhaps by Isaac Goldberg) concerning Ricciardi's ideas. Quoting from the *Transcript* article: "...We have too long been content to use color merely as a decorative element, overlooking the fact that, so to speak, it has a life of its own, a rich treasury of emotive connotations, and may be employed as a distinctly psychological factor, with traditions, combinations and climaxes all its own. In a fairly long preliminary discussion he [Achille Ricciardi] enters into an abridged history of color-values, carefully distinguishing previous attempts from his own. He insists that his innovation possesses primary esthetic significance. "Even the color of the clothes determines the psychology of the dramatic person .... In the development of the drama the color of the costumes follows the ascent of the emotions. Every event takes place in the special atmosphere, with its individual color...." (29)

"...Do colors affect all persons the same way? And granted this, do colors affect all persons in the same way at the same time? If not, how can full use of the colors as a psychological factor be made? It should be remembered that Ricciardi is not concerned primarily with color as decoration or as symbol, but as a vital factor such as sound is in music. The innovator seems to feel the validity of this objection, for toward the close of his exposition he asserts that certain values of color -- he call them moral -- are widespread, such as red and blue for happy moods, and white for purity. Moreover, color in motion, production of contrasts, and so on, possess psychological effects of their own, and doubtless the words of the piece could suggest subtly the influences intended. Color, then, is here not the equivalent of other sensations; "but it modifies their tone and thus creates something *sui generis*." (29)

"Ricciardi seems to establish very firmly this position as the genuine innovator in this regard. By this time his experiments, intended to be made in France, may have already taken place. It is of interest to note how constant is the deference of both Scardaoni and Ricciardi (as well as more than one other of the innovators) to Greek models and ancient procedure. Behind all the agitation is a yearning for freedom. To Ricciardi, as to Scardaoni, there is something of the rite in drama; the former would even seek his ideal stage upon the Mediterranean, thus returning to the open air of the ancients. What better stage, indeed, for the pageantry of color!" (29)

**438.** "Lecture by Burton Holmes." *Chicago Daily Tribune* Nov. 20 1897 1897: 4.

During the lecture Holmes "regaled their eyes with richly colored stereopticon views of the blood-red granite cliffs of Corsica and its picturesque villages and castles..." "The moving pictures at the close are of the best. The most laughable one given last night was that of Neapolitans eating macaroni, and the best was the dash to a fire by the Omaha department."

The subtitle of this article reads: "Takes an Audience at Central Music Hall on a 'Cycling Trip Through Corsica'."

**439.** "Legion Labels Film: 'Suddenly, Last Summer' Is 'Separately Classified'." *New York Times* Dec. 4, 1959 1959: 36.

This article notes that the Legion of Decency has give Columbia's movie, *Suddenly, Last Summer*, which had such themes as homosexuality and cannibalism, as "Separately Classified" rating. Other films recently given this rating were *Anatomy of a Murder*, *The Case of Dr. Laurent*, and *Martin Luther*.

**440.** "Liberties Group Scores Film Code: Recent Changes Would Serve to Tighter Curbs on Movie Content, A.C.L.U. Says." *New York Times* April 24, 1957 1957: 29.

In 1956, the Motion Picture Association of America revised its Production Code, relaxing restrictions on several topics including drug addiction, abortion, prostitution, and child kidnapping. The ACLU argued, however, that the changes actually served to give the censors greater power over films. The ACLU favored abandoning the movie Production Code.

**441.** "Librarians in Court, Again [editorial]." *Washington Post* Feb. 26, 1991 1991, sec. A: A20.

This article deals with the opposition of the American Library Association to the record keeping provision of the Child Protection and Oscenity Enforcement Act of 1988.

**442.** "'Lightless' Nights Will Begin Here Tomorrow." *Los Angeles Times* Aug. 4, 1918 1918, sec. II: 7.

This article reports on efforts to conserve electricity during World War I. The subtitle of this article reads: "There Will Not Be So Many, However, as in Northern Part of the State."

**443.** "Like a Dream But It's Real. Fiesta's Dazzling Light Glow to Heaven." *Los Angeles Times* May 1, 1902 1902: 5.

This article offers a description of electric lighting at a fiesta in Los Angeles. "It was a dream that man, the alchemist, had stored within the carbon's subtle coil and loosed to share the splendor of the starry night. It was born with a gentle murmur and came upon the town by stealth. The streets were charmed with light and flame, and every passer was lured by color's wondrous robes. The chancel of the evening's worship was new lighted for a festival.

"The spectacle was one of varied beauty. Pendants of luminous bulbs stretched from pole to pole through the principal thoroughfares. From the hills that overlook the downtown portion it was a scene of fairy splendor. It lay palpitant [sic] in the breathing night like a great lily pad, gemmed with jewels, and from time to time the cyclopean eye of a search light stabbed through the gloom and pierced it with ivory....

"Shortly after 6 o'clock the lights on Broadway were tested, and at 7:15 all were turned on. A man was stationed in the middle of each block on each side of the street.... One Main and Spring streets Woodill & Hulse installed 4500 lamps, and on Broadway G. T. Bennett placed 2200...."

Note: Sub-headline: "Glory of Coloring; City Bright and Pretty"

"Los Angeles never looked prettier.

"Always a queen of beauty as a city, she can yet enhance her charms like a lovely woman by donning her most stunning gown. That is what she has done.

"The effect speaks for itself.

"The principal streets and stores are like miniature poppy pastures in their blaze of orange and green, the colors always indicative of Southern California spring. There is read, too, lots of it not the rosy red of the maiden's

blush, for Los Angeles has nothing to blush for save pride; but the rich, wine-red of the heart's blood in its joyousness."

The sub-title of this article reads: "Los Angeles Beautiful for Great Fete. Streets and Stores Wondrous With Color Elks Will Show Today."

**444.** "Links Psychology to Study of Optics." *New York Times* Nov. 4, 1928 1928: 12.

This article reports on an address given by Prof. Leonard Troland to the Optical Society of America on disagreement between two camps of psychologists, the "behaviorists" and the "introspectionists." Troland says that psychologists do not give property importance to optics and that optical scientists are (quoting Troland) are "even more blind to the nature and the importance of psychology than the average psychologist is to the significance of optics." In his talk, Troland disagreed with the "behaviorists" whom, he said (quoting Troland) believed "that the concept of mind is difficult if not impossible to use in scientific research." Troland claimed that several problems "are not intentionally or adequately considered by any physical science." (Troland quoted) Among these problems "were color, musical tones and noises, and many qualitative phenomena, like those of feeling." (quoted from NYT article)

The subtitle to the article reads: "Dr. Troland of Harvard Urges Research Into Effect of Light Upon the Mind."

**445.** "Literary Perversities of Modern Novelists." *The Independent* 55.2857 (1903): 2126-27.

This article, appearing in a Congregationalist magazine, attacks what it sees as the perversity of modern novelists and their tendency to "agitate us with bloodstains, impossible situations and startling results. This is not literature. It is sensationalism reduced to a literary formula," the article contends. (2126) The authors of modern "fiction are not masters of the wisdom of life. They are primary interpreters who show only the prominent, bizarre features of existence." (2127)

"To see things in their true relation is intelligence, to be able to depict them so is art. This is why novels dealing with plague spots in society never are the best forms of fiction. Writers of this class have their minds focused upon excesses and abominations, things exceptional to the common order, and so developed as to sustain no true relation to the whole of society as it really exists." (2126) The article concedes, however, "That such novels do good is beyond question, even when, as Maurice Thompson once complained, the 'moral purpose' sticks out 'like the sting of a wasp.'" Still, the article says, that in present-day "such novels are not nearly so interesting or so effective as they once were." (2126)

The article describes the typical man and woman in the modern novel. "But not only is the modern novelist disposed to select extreme situations where there is some moral sickness, or where social disorder or political congestion renders conditions abnormal, but he shows a preference for artificially developed types. If not the more vulgarly vicious, it is the elegantly sensuous man and the exquisitely pagan woman who figure most frequently as the leading characters in his books. And when we 2126/2127 meet one of these calmly poised scamps wandering about in the ball room of the numerous society novels, we generally understand that he has a satyr hoof, concealed somewhere, and that often his lovely companion is only a poetic variation on the well-known scarlet women." (2126-2127)

The article suggests that depicting people in a natural, rather than artificial, setting is best. "Just so, the legitimate business of the literary artist is to select a credible situation, and to depict the individual in it who is typical of his kind. And the best setting for such characters is the original one of woods and fields. These are the only really native environment of mankind." (2127) The article contends that the modern novelist is uninterested in depicting the "the average life, the commonplace." (2127)

The article compares the modern novelist's "charlatan imagination" and stories to the colored billboard. "His conditions are false, and his characters are posters that flare out upon the billboards of literature, highly colored prevarications of the human nature they are supposed to represent." (2127)

**446.** "A Little About 'Little Mary'." *Chicago Daily Tribune* Feb. 28, 1915 1915, sec. B: 11.

This article gives a short biography of Mary Pickford and then discusses the photograph of her that will be shown in the *Tribune's* using the paper's new rotogravure process.

**447.** "The Little Man Who's Always There." *Time* 83.14 (1964): 25-26.

This article profiles Jack Valenti, then assistant to President Lyndon B. Johnson. Valenti became president of the Motion Picture Association of America in 1966.

**448.** "The Living Picture Revealing Nature." *Moving Picture World* 7.3 (1910): 132-33.

This article, which uses racist language no doubt common for its time (e.g. Asians are referred to "the yellow races"), notes that instantaneous photography which, for example, can capture the opening of a rose, reveals that "Oriental Art" had captured something of the natural world that western art had missed. "Instantaneous photography catching animals and birds in every possible motion, has shown that some how the slant eye of the Oriental had caught some of those positions the European eye had failed to detect; the 'grotesque' position were positively true; the 'impossible' was actually life like.

**449.** "Living Pictures at Home." *Chicago Daily Tribune* Dec. 26, 1897 1897: 28.

Written in 1897, this article reports on the invention of a home movie camera and how it allows the user to recall dead family members. "The pang of death's parting is somewhat lessened by the fact that we can now have a photograph album around the house by which it is possible to reproduce not only the face and form of some loved one, but also their every characteristic, as shown in their walk and other movements. S. Lubin of Philadelphia has succeeded in designing a machine for taking these picture and for showing them, which is so compact that it can be carried into one's parlor or favorite lounging-room and a sheet of pictures secured that will in after years show departed kinsmen or some domestic scene in which a family group may be shown, all as in life. Mr. Lubin has designed a cineograph which is so compact that it is exceedingly portable, and can be set up in any room without any special arrangement.

"A picture of this kind proves more satisfactory than an expensive oil painting, which can never portray the love and affection that goes with a fond glance or the merry twinkle of the eye of a 4-year-old." A drawing of this camera accompanies the article.

The subtitle to this article reads: "Philadelphian Invents a Portable Cineograph for Use as a Family Album."

**450.** "The Loss of Bunny." *New York Times* April 27, 1915 1915: 12.

The *New York Times* commented on comedian John Bunny's fame as a result of film: "Thousands who had never heard him speak, in numberless [sic] towns he had never visited, recognized him as the living symbol of wholesome merriment. Therefore his loss will be felt all over the country, and the films which preserve his humorous personality in action may in time have a new value. It is a subject worthy of reflection, the value of a perfect record of a departed singer's voice, of the photographic films perpetuating the drolleries of a comedian who developed such extraordinary capacity for acting before the camera."

**451.** "A Lot More than Meets the Eye: Critics to the Contrary, B. B.'s Appeal Is Not Limited to Her Body." *Life* 44 (1958): 57-58.

One of several articles in mainstream U. S. magazines publicizing Brigitte Bardot after her movie *And God Created Woman*.

**452.** "Lurid Signs of Movies Flaunt Bid to Prurient. Promises Scenes of Immorality, but Fail to Make Good." *Chicago Daily Tribune* Aug. 25, 1918 1918: 10.

This article notes that "Saturday night pedestrians in the Madison street movie Rialto blinked their eyes last evening and looked again. In a blaze of electricity their gaze met lurid signs and wild pictures suggestive of all the scenes of immorality that a film could well show to a curious public.

"Shortly after the suspension of Maj. Funkhouser as inspector of city morals The Tribune exposed the billboard methods of many movies houses in trying to tempt the public inside to set a scandalous bit of high life or a girl gone wrong. For a few weeks the signs disappeared. But they are back in force now....

"'Will a girl go wrong for bread?' was one subtle question with which it worked on the psychology of the man with a little time and the price of admission, plus war tax. 'See traps of the underworld exposed' was another sign, and 'See the lure of the country girl to wine rooms.' Under a picture of wild night life is another caption: 'Exposure of the fast life of the bohemian set.'

"Working back toward State street another large electric sign used the old drawing card of 'For adults only.' ...and 'No children admitted.'"

**453.** "M.P.P.D.A. Is Organized With Will H. Hays at Helm." *Exhibitors Herald [-World?]* [March 18, 1922?] 1918: 37.

This article deals with the appointment of Will H. Hays to head the Motion Picture Producers and Distributors Association.

**454.** "Machines Talk for Hearstites; Graphophones and Moving Pictures Enter Campaign." *Los Angeles Times* Oct. 10, 1906 1906, sec. I: 4.

This article discusses William Randolph Hearst's use of movies and the phonograph in his election campaign.

**455.** "The Magic of a Book." *Methodist Review* (1914): 696-706.

This article has some lovely quotations and metaphors about the values of books. "In coming with golden keys to the great doors of life, in opening the ways to long vistas of wonder and beauty, in the interpreting and transforming and glorifying touch, mighty magicians are to be found in the libraries of the world. Books are full of magic. 697/698 They come to us with a mystic wand, and if we surrender to their spell they transport us to a new world. It will be worth our while to think informally and somewhat discursively of the Magic of a Book. In the first place, a library is like an enchanted forest. In the branches of its trees there perch large flocks of ideas, like flocks of birds, and the skillful hunter can come home after a day of sport, his hunting bag full of game. He can bring home as many ideas as he can carry. To go hunting for ideas is the rarest sport in all the world and to capture a live idea makes a day indeed notable." (697-98) This article continues: "Another characteristic of the magic to be found in libraries is the fashion in which some books have imprisoned emotions and set them singing like birds in a cage...." (700) Then: "Going farther, we may say that the magic of a great book is seen in the subtle metempsychosis by which it can take us inside other lives.... The power of cutting an entrance into men's souls was the possession of Robert Browning....." (701)

Books can expand our experience and allow us to transcend time and place. "Now the thing which ... books do is just the thing we need to do and find it hard to do, the breaking of the barriers of our own lives so that we actually experience the meaning of other lives. In exact literalness you can speak of the thousand-souled Shakespeare; but the important thing is that he makes the reader have a thousand souls. He multiples his

personality -- or, rather, he increases it -- by a sort of amazing geometrical progression. Then a book has the power of abolishing time and space....

"Historical novels may be both good history and good fiction and a revelation of human life at the same time...." (703)

"But space as well as time is abolished if in the sense of which we are speaking space is not a sort of time spread out geographically.... The supreme books of the world not only bring ideas for the mind, an enrichment of the emotional nature and an enlargement of the sympathies; they also bring food for the will." (703)

Finally, although "Thought and feeling and purpose and power are imprisoned in the books of the world," (706), the this article also concludes that "the magic of the book may be seen in the books which have the keys to Paradise." Here the Bible is held up as the "apex and supreme glory," a library in itself.

**456.** "The Magic Wand of Color." *Reader's Digest* 35.208 (1939): 112.

This brief piece talks about how the use of color transformed a dinner party and how color was being used in factories.

**457.** "Makes Moving Pictures Talk." *Chicago Daily Tribune* Sept. 2, 1903 1903: 1.

This article claims that a German inventor has succeeded in making a talking moving picture. The subtitle to this article reads: "German Inventor [Oskar Messier] Succeeds in Efforts to Combine the Phonograph and Photograph Machine."

**458.** "Making a Motion Picture of a One Hundreth Second Shutter Exposure." *Scientific American* 114.1 (1916): 589.

This brief article begins by saying that "Producing a motion picture film containing 100 pictures of a camera shutter exposure of the order of 1-100th second, each picture showing a distinct location of the shutter leaves at intervals of 1-1000th second and allowed an exposure of but 1-30000th second, appears at first to be a difficult task. Yet an apparatus for just such a purpose has been developed in the research laboratory of a leading American camera manufacturer for the purpose of testing camera shutters." (589)

**459.** "The Making of Advertising Pictures Has Become a Genuine Art." *New York Times* May 17, 1914 1914, sec. SM: 4.

In this interview, illustrator Mortimer W. Loewi talks about the changes that have occurred in display advertising over the past 12 or 15 years (since the turn of the century). They involved using photographs, "star" actors, and color, among other things.

"In a dozen years the business of display advertising has been more than evolved, it has been revolutionized," the article says. Loewi recalls that "'When I was studying... it was taken for granted that there was a great gulf between commercial work and any sort of art.'" In 1914, Loewi says that one word that summed up advertising demand was "suggestion." The older advertising set out a commodity "in great detail" where as "the advertising of to-day suggests it," according to the article. "An illustrated advertisement used to present an article. Now it suggests it benefits. And sometimes the suggestion if very subtle indeed." In advertising men's fashion, Loewi explains that he "had a lot of photographs made. And then I painted the fashion picture right on the photograph. The fashion picture was just the same old type of advertising, but I gave it a background."

Loewi notes that advertising drew on developments taking place in the world of theater and acting. **"Then we got a new idea. We showed our clothes with pictures from popular plays. That was about the time, I think, that magazines were beginning to make such a feature of theatrical photographs. We ran a series of advertisements with scenes from the play on one side, and the star dressed in our clothes on the other. You see, that was**

interesting. It gave a new idea to clothing advertisements -- the idea of connecting them with something of general interest and association. People looked at those pictures. They read those advertisements. They were interested in them, couldn't help being.

**"And all this time the pictures of the people in the advertisements were getting humanized...."**

Loewi says that he did scenes from Europe (e.g., Rome, Paris) "in color, and they were used as posters and showcards as well as prints in magazine advertisements. The picture of the place was the background; in the foreground was a man or a group of men dressed in the clothes we were advertising. The idea was "to convey the suggestion or something cosmopolitan and distinctive." (emphasis added)

Loewi notes the pay for his field has gotten much better. Often a \$1,000 for a picture large enough for a double-page ad and \$500 for smaller paintings.

**460.** "Making the Night Bright." *Los Angeles Times* Nov. 28, 1915 1915, sec. VIII: 8.

This article describes the way in which electric lighting has transformed night life along the Great White Way of Los Angeles. It talks about the use of electricity in advertising and the use of "sign language art." It observes that there are three ways of lighting buildings -- high-candle-power lights that are placed on the sides of buildings; using many small lights to outline the structure of buildings; and the use of flood lights. The article quotes extensively Charles M. Masson (?) of the Edison. Of motion pictures use of high-candle-power gas-filled lamps attached with reflectors, he said: "Our friends the "movies" have adopted this scheme, and it is these sort of lights at Universal city which make possible "electric sunshine.""

**461.** "'Making-Up' for Movies; Regard Must Be Had for Vagaries of the Photographic Film." *Los Angeles Times* July 9, 1916 1916, sec. II: 2.

This article notes that the use of color by actors for make-up produces various shades of gray. It discussing its use for mulattos and blacks.

**462.** *Maljack Productions, Inc. v. Motion Picture Association of America*. 311 U.S. App. D.C. 224; 52 F. 3d 373; 1995 U.S. App. 1995.

This case involved a 1990 suit in Federal court in Washington, D. C. challenging the X rating that the motion picture industry gave to Maljack Productions' film, *Henry: Portrait of a Serial Killer*. The movie was a brutally explicit docudrama based loosely on the story of mass murderer Henry Lee Lucas. Maljack, an Illinois-based independent film producer involved primarily with distributing videocassettes, was not an MPAA member. Filmed with then little-known actors during the winter of 1985-1986, the movie was about a psychopathic drifter, Henry (played by Michael Rooker) and his former prison buddy, Ottis (played by Tom Towles) who savagely murdered strangers and did so utterly without remorse. In one scene, the pair invade a home and record their murder of a family on videotape. The movie seemed too realistic for a typical slasher picture. The Classification and Rating Administration gave the movie an X in March, 1988, because of its violence. Early the next year, Maljack surrendered its ratings certificate and released the picture unrated. When it was shown in Chicago and New York it sparked exchanges between those who thought it exemplified brilliant film making and those who thought it too gruesome to watch. Because it lacked an R rating, *Henry* played in relatively few theaters. The 1990 suit was originally dismissed. Maljack appealed the dismissal. See *Maljack Productions, Inc. vs. Motion Picture Association of America*, 311 U. S. App. D. C. 224; 52 F. 3d 373; 1995 U.S. App. LEXIS 9675 (April 28, 1995) (No. 93-7244). This case (1995) reversed the district court's order dismissing the original complaint. The court now remanded the case for additional proceedings.

**463.** *Maljack Productions, Inc. v. Motion Picture Association of America*. 1990 U.S. Dist. LEXIS 13284 (Oct. 3, 1990) (Civil Action No. 90-1121) // 311 U. S. App. D. C. 224; 52 F. 3d 373; 1995 U.S. App. LEXIS 9675 (April 28, 1995) (No. 93-7244) 1990.

This case involved a 1990 suit in Federal court in Washington, D. C. challenging the X rating that the motion picture industry gave to Maljack Productions' film, *Henry: Portrait of a Serial Killer*. The movie was a brutally explicit docudrama based loosely on the story of mass murderer Henry Lee Lucas. Maljack, an Illinois-based independent film producer involved primarily with distributing videocassettes, was not an MPAA member. Filmed with then little-known actors during the winter of 1985-1986, the movie was about a psychopathic drifter, Henry (played by Michael Rooker) and his former prison buddy, Ottis (played by Tom Towles) who savagely murdered strangers and did so utterly without remorse. In one scene, the pair invade a home and record their murder of a family on videotape. The movie seemed too realistic for a typical slasher picture. The Classification and Rating Administration gave the movie an X in March, 1988, because of its violence. Early the next year, Maljack surrendered its ratings certificate and released the picture unrated. When it was shown in Chicago and New York it sparked exchanges between those who thought it exemplified brilliant film making and those who thought it too gruesome to watch. Because it lacked an R rating, *Henry* played in relatively few theaters. This case was dismissed and the dismissal was later appealed.

**464.** "Many Minds. Opinions Vary on Movies in Schools." *Los Angeles Times* April 4, 1916 1916, sec. II: 5.

This article reports on conflicting views about using motion pictures in the classroom. The article's subtitle reads: "Board Can't Agree, Therefore Asks More Light."

**465.** "Marvelous Electrical Inventions Displayed." *New York Times* April 13, 1901 1901: 2.

This article discusses several inventions on exhibit including the Cooper Hewitt mercury vapor lamp and "H. R. Palmer's 'fac simile [sic] picture telegraph." The latter "instrument is worked on a system whereby half-tone pictures, sketches, handwriting, and the like can be transmitted over long distances by employing ordinary telegraph circuits. The original picture is enlarged for transmission, but is photographically reduced to its normal size when received. The enlargement is for the purpose of obtaining a greater contact surface for the transmitting stylus.

"An attempt was made to send three pictures to Chicago, the instrument on exhibition having been connected with telegraph wires, but the experiment failed this time, although the efficacy of the appliance has previously been demonstrated over great distances. Late at night word was received from Chicago that attempts had also been made to send pictures here [New York ] from there, and the explanation for the failure was that the wires had been rendered useless by too much induction at this end."

The subtitle of this article reads: "Attractions at a 'Conversazione' at Columbia University; Effect of Peter Cooper Hewitt's New Light -- The Deaf Made to Hear -- An Experiment that Failed."

**466.** "'Mature' Films % Jump in 1968." *Hollywood Reporter* July 2, 1968 1968.

This article discusses the increase in motion pictures with so-called "mature" themes. This article appeared four months before the motion picture industry adopted its rating system.

**467.** "The Maude Adams of the Moving Picture Drama." *Chicago Daily Tribune* March 20, 1910 1910: G7.

The subtitle for the article reads: "Florence Lawrence, at Present Credited with Being the Most Popular and Highest Salaried Emotional Pantomimist in America, Plays 300 Roles a Year, Is Photographed 4,000,000 Times and Is Mistress of a Thousand Faces."

This article offers interesting information on motion picture acting and the role of the camera. In it, Lawrence talks about performing before movie cameras and mentions that her first moving picture was "Daniel Boone." In a time before sound film was commonly used, pantomime was an important skill and this article notes how this actress was able to use her facial expressions to convey many moods (hence the subtitle "Mistress of a Thousand Faces") She emphasizes the importance of not looking directly at the motion picture camera.

Perhaps most interesting is how often the actress was photographed. For every foot of moving picture there were "fourteen separate and distinct photographs" and in a typical film of about 1,000 feet, there were therefore 14,000 photographs. "This is one day's work!" the article says. Over the course of one year, she will play perhaps 300 roles and she will have been photographed 4,000,000 times. The article notes that she is known worldwide and that she receives "'Mash Notes' from the World Over." The article is encircled with ten different pictures of the actress showing different facial expressions.

**468.** "May Use a Kinetoscope. To Show Prosperity by Aid of Moving Pictures." *Chicago Daily Tribune* Aug. 25, 1900 1900: 4.

The Republican Party considers using moving pictures to convey its message to the public. The subtitle of the article reads: "Republican National Committee Considers Proposition to Supply Novel Campaign Argument in Photographic Reproductions of Evidences of Returned Good Times Chairman Payne Says Letter of Contractors Will Not Change Labor Day Plans."

**469.** "Mazie the Motor Maid." *Los Angeles Times* Jan. 18, 1914 1914, sec. VIII: 5.

This is a humorous story about a woman who goes to movies and sees film of herself being arrested by the traffic cop.

**470.** "McClellan Stops Moving Pictures." *Chicago Daily Tribune* Dec. 25, 1908 1908: 2.

This article reports on censorship efforts in New York City. The article's subtitle reads: "New York Mayor Yields to Ministers and Fills Showmen with Dismay."

**471.** "Medical Cinematography." *The Times [London]* Oct. 29, 1910 1910: 8.

This article reports on developments in using moving pictures in medicine.

**472.** "Meet the Color Engineer." *Reader's Digest* 38.239 (1941): 134-35.

These excerpts taken from *Future* consider how color is being used in packinghouses, restaurants, operating rooms, classrooms, and in shoe manufacturing.

**473.** *Memoirs v. Massachusetts [A Book Named "John Cleland's Memoirs of a Woman of Pleasure" et al. v. Attorney General of Massachusetts]* 383 U. S. 413 (1966) 1966.

**474.** "The Mercurians: Society for the History of Communication Technologies". Nov. 7, 2005. <<http://www.mercurians.org/>>.

The Mission statement for the Mercurians reads: "The Mercurians began meeting in 1986 for the purpose of generating networks between people who share work and interests in the history of communication technologies, defining the field broadly. Our activities include publishing a semi-annual newsletter, Antenna, meeting annually at Society for the History of Technology (SHOT) conferences, organizing paper sessions for SHOT meetings, and pursuing contacts between meetings. Antenna serves both as a clearing house for readers and an informal forum for their ideas. We welcome contributions, including notices and queries about Mercurians' projects as well as short essays on their work. Antenna includes book reviews and other materials about conferences, museums, publications, archives, funding, and other pertinent materials." The Mercurians are a branch of SHOT, Society for the History of Technology. "Antenna" is the Society's newsletter.

**475.** "Mercury Vapor May Work Wireless Marvels." *New York Times* Nov. 22, 1914 1914, sec. SM: 9.

This article reports that "Peter Cooper Hewitt Has Been Making Studies for Eighteen Years Which Promise to Result in Telephoning Between America and Europe, and in Other Miracles."

**476.** "The Mercury-Vapor Electric Lamp." *American Catholic Review* 28.112 (1903): 818-19.

This article comments on the invention of Peter Cooper Hewitt's mercury-vapor lamp. "This light is considered beneficial on account of the absence of red rays, which are considered injurious to the eyesight. Its chief claim to consideration is its high efficiency, as seven times the amount of electrical energy would be consumed to obtain the same illumination from the ordinary incandescent lamp. As a practical source of illumination the lamp seems up to the present [1903] to be only moderately successful." (818) The article also says that the mercury-vapor lamps can be useful in the area of wireless telegraphy. (819)

**477.** "Met Old Chief Lobo; Moving Picture Man Saw Stanley Guide in Africa." *New York Times* May 28, 1914 1914: 9.

This article notes that a film has been made of the Congo River: "The distance traversed was 5,000 miles, the longest journey through a savage country that has so far ever been made by a moving picture outfit, he [explorer James Barnes] said."

**478.** "Milestone Movie Cameras." *American Cinematographer* 50.1 (1969): 78-79, 116.

This 1969 piece appeared in an issue devoted to the previous fifty years in the technology of cinema. This article deals with movie cameras and concentrates largely on the period before World War I (1914-18).

**479.** "Military Photography." *Scientific American* 87.7 (1902): 101.

This article discusses the growing importance of military photography and notes that during the Spanish-American War and the Boer War that pictures were widely used in the illustrated press. Most military photographs, though, were not shown to the public. Many were of mundane matters which might give an idea of enemy terrain and troop movements and progress. The article discusses the use of cameras in balloons used by the American, British, and Russian military. The article also devotes a paragraph each to the use of camera technology by France and Germany. Cameras are becoming an important part of many military units. In addition to balloons, the article notes that bicycles were also mounted with cameras used for surveillance purposes. Other modern improvements include the use of magnesium lamps for night photography, better dark room tents, and telephotographic attachments for cameras. In short, much had changed over the past 10 or 15 years.

**480.** *Miller v. California*. 413 U. S. 15 (1973) 1973.

In *Miller vs. California* (1973), the U. S. Supreme Court upheld, in a 5-4 decision, a California law banning the knowing sale of obscene material. Chief Justice Burger rejected the Warren's Court's test for obscenity which required the matter in question to be "utterly without redeeming social value" – a standard that made it almost impossible to obtain convictions. Burger noted that this test which Justice Brennan had articulated in *Memoirs vs. Massachusetts* (1966) had never been supported by more than a plurality of the Court (no more than by three justices at any one time). In the *Miller* case, the Court also rejected a national standard for defining pornography and said instead that local community standards could be used by trial courts in obscenity cases.

**481.** "Mini-Gadget Movie Van Rolls into Hollywood." *Business Week* (1969): 152-54.

During the late 1960s, an Egyptian-born cinematographer, Fouad Said, created the Cinemobile, which made it easier to shoot movies and television programs on location. With the aid of the Bendix Corporation, a company that specialized in automobile and aviation equipment, and Lockheed, Said built a mobile movie studio about the size of a paneled truck that at first was used to film television shows and low-budget motion pictures. By 1969, the Cinemobile Mark V, which was built in Europe and shipped to Hollywood, was the size of a double-deck bus. It

carried several hundred pieces of equipment, had an electronic kitchen that served sixty people, and could be loaded into a cargo jet and flown to most locations within 24 hours. Such studios as 20<sup>th</sup> Century Fox and Warner Bros.- Seven Arts saw that this studio on wheels could save them significant sums in larger budget productions.

**482.** "Miss Bates Tells How to Beat Movies." *New York Times* March 14, 1914 1914: 11.

This article contains advice given to a graduating class of actors on how to "make your voice clear and distinct..." It also advises marrying someone outside their profession "as interests may clash."

**483.** "Miss Rankin Bans Cameras." *New York Times* Nov. 17, 1916 1916: 4.

Jeanette Rankin, the first woman elected to Congress, is hounded by cameramen, this article reports. Rankin is quoted as saying that "I positively refuse to allow myself to be photographed and will not leave the house while there is a camera man on the premises." The article's subtitle reads: "Woman Congressman Elect Doesn't Want to be Classed as a Freak."

**484.** "Modern Miracle Plays." *The Independent* 63.3062 (1907): 351-53.

The article begins by saying: "It is generally supposed that miracle and morality plays exist nowadays only survivals in such isolated communities as Oberammergau and as revivals on such occasions as the Oxford Pageant and the Been Greet performances. Really they have sprung up as a form of popular entertainment in the United States, quite spontaneously, ignored by antiquarians and without benefit of clergy. No summer resort, street fair, or recreation annex of an exposition is regarded as complete without one, and some of the amusement parks have two or three, running continuously afternoon and evening, seven days a week...."

"The effective display of modern stage effects and electric lighting demanded grander themes than ordinary life afforded, so the Bible was drawn upon for appropriate material. At the Louisiana Purchase Exposition 'Creation' was introduced on the Pike and drew immense crowds at the unusually high price of fifty cents apiece. This was a revolving panorama presenting tableaus of the seven days of creation, beginning when the earth was without form and void and ending with the honeymoon of Adam and Eve. Appropriate passages from the first chapters of Genesis were recited during the spectacle. The success of this led to the establishment of other biblical spectacles and finally plays in which the vices and virtues were personified.....(351)

This article notes that some of the miracles plays use "life-size colored moving pictures of scenes in the life of Christ." (352)

**485.** "Mojonier of Photo Fame Treks Over to Broadway." *Los Angeles Times* March 26, 1911 1911, sec. II: 2.

Mojonier is described as "one of the leading photographic figures in the West." The article says that "there isn't a daily newspaper in Los Angeles that doesn't decorate its columns, every few days, with Mojonier pictures."

**486.** "Molecular Motion Shown by Cinematograph." *The Times [London]* May 21, 1914 1914: 7.

A report on a French physicist's invention.

**487.** "The Morals of the Movies." *Outlook* (1914): 387-88.

This story begins with the parable of a fisherman who finds a bottle on the seashore and opens it to release an evil "jinn" who vowed to take revenge on whoever releases him. The fisherman manages to trick the jinn into returning to the bottle. In modern time, the jinn represents the movies. "This is a parable, it is plain to see, of the motion picture. Man's scientific curiosity is always getting him into trouble. It got him into trouble when he discovered gunpowder, the printing-press, the steam-engine; it has got him now into trouble when he has discovered the means of picturing motion on a screen. This modern jinn, which has been dubbed the movie, seemed as innocuous at first as so much smoke; but it has threatened something more valuable than life -- good

morals and good taste. It is like every other such discovery -- it has incalculable potency for service. The thing to do is not to deplore the discovery, but to follow the example of the fisherman, and by the exercise of quick wit and sound judgment make this huge force a ready slave of humanity." (387) This author goes on to say that "In some way the moving-picture business must be put under restraint by the public." (387)

**488.** "Morals Thru the Movies." *The Independent* 82.3471 (1915): 484 (APS Online).

This brief article comments on a series of films designed to persuade girls to conform strictly to "the moral code and the conventions...." (484) "The films bring out clearly the point that 'who pays' for any deviation from the path of propriety is not the one most to blame, but that the disastrous consequences spread widely." (484)

**489.** "More Altman Gems For Times Readers." *New York Times* March 30, 1914 1914: 9.

This article reports that the *New York Times* will publish a special edition of 250,000 copies with color pictures of art work using the rotogravure process. The article's subtitle reads: "Another Special Number Next Sunday to Contain 38 Rotogravure Reproductions. Easter Number Sold Out. 250,000 Copies with Splendid Color Section, Quickly Bought Up -- Praise from Art Experts." The article notes that the first rotogravure pictures had been published four years earlier (about 1910) in Germany in the *Freiburger Zeitung*.

"If the unqualified approval of artists and critics of art and the eagerness with which the general public bought out the newsdealers' supply all over the city may be accepted as proof, the *Times* achieved another notable triumph yesterday with its Easter Number containing thirteen gems of the Altman collection of old masters reproduced in color.

"The edition was limited to 250,000 copies and orders for more than that number were received at the *Times* office by Friday night. By yesterday afternoon very few copies were on sale anywhere in the city, and many newsdealers who had underestimated the demand for the paper were disappointed in their efforts to obtain an emergency supply. Telephone orders for 'more papers' began coming into the *Times* office at 6 a. m. and continued through the better part of the day, but no one was supplied. The *Times* did not have a paper to sell.

"But yesterday's Easter Number was only the forerunner of another special number to be published next Sunday which, in the opinion of many, will even surpass the Easter Number as an artistic achievement. Thirty-eight additional old masters from the Altman collection will be reproduced by the famous German rotogravure process. Rotogravure press built in Germany and having the latest improvements devised by Karl Klic, who perfected the process, have recently been installed in the *Times* Annex.

"The pictures to be printed will closely resemble original etchings, the rotogravure process being an elaboration of intaglio engraving combined with the highest development of the modern art of photography. The *Freiburger Zeitung* caused a stir in Europe four years ago when it published the first rotogravure pictures, and the improvements in the process have since been many and important."

The articles says the pictures will be suitable for framing and art experts praised the color. "In praise of the color section Robert W. de Forest, President of the Art Commission and Trustee of the Metropolitan Museum, said:

"The reproductions are exceedingly fine. I consider them a very important contribution to the art education of the country. The *Times* has made it possible for thousands of people to have and display on their walls much of the best in the work of the old masters. I think that the service is of the highest importance...."

**490.** "More Cites Bar Fight Pictures." *Chicago Daily Tribune* July 7, 1910 1910: 3.

This article deals with the showing of the film of the Jeffries-Jack Johnson heavyweight title fight. It lists cities where the fight cannot be shown. The article's subtitle reads: "Nine States and Twenty-five Municipalities Closed to Film Shows Now. Owners Plan to Fight. Gov. Deneen Says It Is Not in His Power to Prevent Exhibits."

**491.** "Morning Report: Movies." *Los Angeles Times* July 13, 1987, sec. 6 (Calendar).

This article reports on Nancy Reagan, Jack Valenti, and such movie stars as Clint Eastwood and Dudley Moore and their efforts in the war on drugs.

**492.** "The Most Beautiful Models in Germany." *Chicago Daily Tribune* July 26, 1903, sec. A: 5.

This article is about an artist who uses moving pictures of model who has grown tired of posing. The moving pictures helped to capture the real person.

**493.** "The Motion Picture Industry." *World's Work* 26 (1913): 29.

This brief article attempts to assess the extent of the motion picture industry in 1913. It says there are more than 20,000 theaters and they attract about 5 million people each day. The movie industry already ranks with investments made in copper, tin, and sheet iron product, with petroleum refining, and anthracite coal mining. "Perhaps an even more striking comparison is with the printing and publishing business, which is one of the oldest and most widely distributed of all industries. Motion pictures utilize more than a third as much capital as is used by that great business." (29)

This piece says that only "the manufacture of automobiles has recently shown such astonishing growth" (29) as movies which were shown commercially for the first time only 17 years earlier. Films also have become influential in education. "They reveal new possibilities to teachers of history and science, and they put a new weapon in the hands of social reformers and sanitary engineers.... Both commercially and educationally they are a remarkable and most useful addition to the resources of modern civilization." (29)

**494.** *Motion Picture Research Council Papers.*

The Motion Picture Research Council Papers have information pertaining to the Payne Fund Studies, one of the earliest efforts by social scientists, to measure the effects of movie on American youth.

**495.** "Motion Pictures Are Made to Talk." *New York Times* Aug. 27, 1910, 8.

This article reports that Thomas Edison has improved talking film. "In the newly perfected process the records and pictures are taken at the same time, a sufficiently sensitive record having been devised to catch and retain the slightest sound accompanying the portrayed action. Here has been the stumbling block in the effort to accomplish this result. Hitherto the pictures and records had to be taken separately. In the face of the difficulty of receiving in the horn the voices of the actors, and at the same time, having them move freely and as far as possible, dramatically around in an unobstructed range of the camera. The special recorder used for the kinetophone permits of the speaker being twenty feet away."

The article reports that Edison also "hopes soon to have the pictures reproduce the natural color of the originals." The article's subtitle reads: "Edison Invents a Machine that Combines the Kinetoscope and Phonograph; Records Taken Together; When the Pictured Man Acts the Voice in the Box Speaks, and Illusion Is Perfect."

**496.** "Motion Pictures: A Brief for Debate." *The Independent* 89.3561 (1917): 426-27.

This article offers a useful summary, in outline form, of the case both for and against motion pictures as seen by many people in early 1917. On the affirmative side that movies provide a "desirable" form of entertainment are arguments that they fulfill a need for inexpensive amusement, are valuable for educational purposes in numerous

areas, are socially valuable in reform and health campaigns, are good because liquor dealers oppose them, are useful because they can be used for good purposes by schools, churches, government, and industry. On the negative side are arguments that the movies are immoral, lower public taste and standards, harmful socially and physically, are a factor in causing Americans to behave extravagantly, and are a form of entertainment with minimal educational value. At the end of this article is a bibliography that supports both the affirmative and negative sides.

**497.** Hearings before Subcommittee of the Select Committee on Small Business, United States Senate, Eighty-Fourth Congress, Second Session. *Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*,

These hearings contain testimony from movie industry leaders about foreign markets for American films and the effect of those markets on film making. Several people note here that movies were now being made that appealed to international audiences rather than to strictly U. S. audiences. At this time, few Hollywood studios could break even on just the U. S. and Canadian market and foreign receipts accounted almost 50 percent of the studios' revenue.

**498.** "Motion-Picture Schoolhouses to Prevent Future Wars." *Current Opinion* 66.4 (1919): 234-35.

This article quotes extensive from Thomas A. Edison on the educational value of motion pictures. "The best schoolhouse is the screen; the best teacher is the film," the Wizard of Menlo Park claimed. "Human teachers will be needed only to help guide and direct the minds of the pupils, but the pictures will do the instructing." (234) Edison thought the movie schoolhouse was one of the best hopes to prevent future wars. Edison saw movies as a pictorial supplement to newspapers. "The newspaper is the university of the masses," he said (234) He did not believe the daily newsreel would ever supplement the newspaper in the United States. "This is the land of the newspaper; we are a nation of newspaper readers," said Edison. (234)

The subtitle of this article is "Thomas A. Edison Foresees the Day When Movie Films Will Supplant Text-Books."

**499.** "Motograph History in the Making." *Moving Picture World* 7.5 (1910): 235-36.

This article discusses the growing number of periodicals and books that cover moving pictures. "The periodical literature of the moving picture increases and expands with its popularity. Four years ago no periodical publication, specially treating of the moving picture, was in existence. Now, throughout the world, there are probably twenty or thirty publications which take charge of the interests of the industry. In the United States there are four; in Great Britain there are two; in Paris there are one or two; Germany, two or three; Italy, one or two; Sweden, Russia, Spain, Australia, each have moving picture publications." (235) The article also cites growing number of books and specific authors such as Marey's work on Movement, Hopwood's book *Living Pictures*, and others including C. F. Jenkins and Cecil Hepworth.

**500.** "Move As If Alive; How Pictures That Show Life Are Now Produced." *Chicago Daily Tribune* April 4, 1897 1897: 37.

This article discusses how the moving picture camera works. "The projecting machines known as the variscope, magniscope, vitascope, biograph, cinematograph, and similar names consist essentially of a bright light, some lenses, and a means of moving the film across in front of the light." Filming the recent prize fight in Carson City required about 8,000 feet of film using at least 125,000 pictures. Types of scenes filmed: "The picture of Dearborn street in the busy hours is only one of the numerous subjects constantly being reproduced by the moving picture machine." "Photographing a moving train is one of the hardest of the views attempted so far by the moving-picture artists, and the great success met has encouraged them to try many other pieces of rapid motion. The wave rushing over the breakwaters along the lake shore, the exhibition of blooded animals at the Stock-Yards, snowball fights, fire drills," and many others.

E. H. Amet, whose moving picture machine is discussed, "is convinced that the production of moving pictures is yet in its infancy, and hopes for great things. The introduction of some successful method of color photography, such as that reported to have been discovered across the water, will greatly add to the attractiveness of the views.

"By a possible phonographic attachment these colored views may be run with the sounds which actually accompany them. Speeches, songs from prima donnas, the roar of a waterfall, or a train, or even the noise of a crowded street would then become possible adjunct to these lifelike representations, resulting ultimately in one of the greatest sources of popular amusement ever devised."

Article notes efforts for censorship and prevention of showing film of prize fight in Carson City, NV. "It is the kinosopic pictures of the recent prizefight at Carson City that are so agitating the lawmakers. In Illinois, Minnesota, Massachusetts, New York, and Washington bills have been introduced looking to the prohibition of these inoffensive appearing bits of transparent film."

The subtitle for this article reads: "Done Here in the West; Factory Making Much-Talked-Of Views in Waukegan; Camera Turned by Crank; Films Sixty Feet Long Easily Developed and Printed; Machines for Exhibiting Them."

**501.** "The Movie Here to Make the Spoken Drama Behave." *New York Times* May 9, 1915 1915, sec. X: 6.

This article notes that theaters such as the Strand have elevated "the standard of entertainment." But Daniel Frohman, who was an experience manager and producers, says that the popularity of movies has peaked and that they need sound and color to hold their audiences.

The article's subtitle reads: "So Says Daniel Frohman, Who Believes That the Popularity of the Motion Picture Has Already Reached Its Zenith."

**502.** "'Movie' Manners and Morals." *Outlook* (1916): 694-95.

This article about the movies reflects class and racial biases of the time. The writer says that the "influential potentialities of the moving picture cannot be too seriously considered. **Undeveloped people, people in transition stages, and children are deeply affected by them.**" (694) **Children are presented in the movies with "changed and sometimes viciously altered versions of the classics and history...."** (695) It goes to say that "Especially is this injurious to the more or less rudderless being whom we must educate into a good citizen, the child of alien parents who too often is contemptuous of the habits and maxims of his parents and ignorant of anything American but the hybrid pavement life of a polyglot city. **The version of life present to him in the majority of moving pictures is false in fact, sickly in sentiment, and utterly foreign to the Anglo-Saxon ideals of our Nation.** In them we usually find this formula for a hero: He must commit a crime, repent of it, and be exonerated on the ground that he 'never had a mother' or 'never had a chance' -- or perhaps because he was born poor. The heroine is in most cases the familiar passive, persecuted heroine of melodrama." (695) While there are exceptions to this kind of entertainment, so of high quality, in most movies of the day "the average screen drama plays upon the weakest, most illogical prejudices and sentimentalities of **the less thinking classes** far more than the old-fashioned melodrama." (695) (emphasis added)

**503.** "Movie Men Form a Board of Trade." *New York Times* Sept. 10, 1915 1915: 11.

The subtitle to this article reads: "Fighting of Hostile Censorship Legislation the Chief Aim of New Body. Big Firms Represented. Plans Publicity Campaigns to Further the Industry and the Holding of Expositions."

**504.** Committee on Small Business, House of Representatives, Ninety-Fifth Congress, First Session

Subcommittee on Special Small Business Problems. *Movie Ratings and the Independent Producer, March 24, May 12, June 15, July 21, 1977 (Washington, D. C.); April 14, 1977 (Los Angeles, CA)*. United States House of Representatives. 1977.

These hearings considered charges that the motion picture industry's Classification and Rating Administration gave harsher ratings to independent producers than it did to the large movie studios that were members of the Motion Picture Association of America. Among those who testified were Jack Valenti and CARA chairman, Richard D. Heffner

**505.** Committee on Small Business, House of Representatives, Ninety-Fifty Congress, First Session

Subcommittee on Special Small Business Problems. *Movie Ratings and the Independent Producer*, Farber, Stephen  
ProCite field[2]: Testimony.

Farber, who had worked for the movie industry's Classification and Rating Administration (CARA) as an intern and who had written a book entitled *The Movie Rating Game* (1972), testified before this hear which heard charges rated movies from independent producers more severely than it did films from major studios who were MPAA members.

**506.** "'Movie' Records of War." *Los Angeles Times* Nov. 20, 1914 1914, sec. I: 6.

This article says that former President William Howard Taft is the honorary president of the Modern Historic Records Association.

**507.** "Movie Revolution Predicted by Gest." *New York Times* March 27, 1927 1927, sec. E: 3.

In this article, Jewish American producer Morris Gest discusses movies and Hollywood as an art and intellectual center. The article's subtitle says: "Within Two Years the Greatest Minds of the World Will Be at Work in Hollywood, He Says. Art Gaining in Industry. Producer Declares He Will Divide Time Between Films and Stage Already Has Picture Planned."

**508.** "The Movie Star." *Puck* 81.2083 (1917): 24.

This poem reads: "She shows all emotions -- love, anger, surprise,  
Fear, hatred -- the way she knows best:  
By rapidly blinking her beautiful eyes  
And gracefully heaving her chest."

**509.** "The 'Movie' Movement." *Los Angeles Times* April 7, 1915 1915, sec. II: 4.

This article discusses a movie theater that was once an opera house. "Where once he heard the voice of Melba, of Schumann-Heink and Calve one sits and looks at something he cannot hear at all. At the Majestic, where once Sothorn and Marlowe reigned, where Mantell towered in strength, where Faversham and Forbes-Robertson moved with grace, and Nazimova blazed like a gem, we are now to see a procession of shadows. They are interesting shadows, but we shall miss the compelling magnetism and vibrant voices of the rich personalities who have in the past brought life to the stage of that beautiful house. It is the mood of the public to people their erstwhile temples of dramas with these ghosts of today. For some of us this will be like returning to a beautiful home, where we once lived in happiness, to find our garden gone to seed and indifferent renters occupying the property that once we cherished. On the other hand, the moving pictures have made their place with us and that place is too large to be confined in houses of small capacity." The reference to silent film "ghosts" brings to mind

Maksim Gorky's similar comments on seeing silent film, discussed in Matt K. Matsuda, *The Memory of the Modern*, p. 175.

**510.** "Moviegoer Habits Traced in Survey: Film Industry's First Canvass of Its Audience Shows Loyal Core Despite TV Inroads." *New York Times* Jan. 17, 1958 1958: 15.

This article reports on a survey conducted by the Opinion Research Corporation in Princeton, NJ, for the movie industry. It found that by 1957 more than half of the 54 million people who went to movies each week were under 20. About 75 percent of the audience was under 30. The report said that TV had become "a prime reason for the decline in theatre attendance." The South was the region of the U. S. "most enthusiastic" about going to the movies.

**511.** "The Movies Are Forty." *New York Times* May 19, 1918 1918: 53.

Commenting on the historical evolution of motion pictures, this article says: "In the beginning the moving picture play was not thought of, the first pictures being photographic representations of ordinary life. The idea of telling a story by means of pictures came later, but early attempts at this were confined to slap-stick comedy. Then producers turned to serious work and sought to make screen plays that should have real dramatic and spectacular value, and some of them sometimes have succeeded tremendously."

**512.** "Movies at Home." *Outlook* (1913): 784.

This article discusses the status of home movies, especially in Great Britain. It notes that "the difficulties as regards cost, insurance, safety, and other elements are great," but that it has already been demonstrated that moving pictures can be used for educational purposes in small school rooms. Two inventions in Great Britain, the pathoscope and the Bettini machine, show promise for home use. Among the problems with home movies are fire hazard from using celluloid film. This has been solved by using acetate film and film with different perforation than normal celluloid film. Another problem is the cost and to alleviate this issue the idea of film libraries where movies can be exchanged is proposed. The article reprints an excerpt from *Chamber's Journal*:

"The pathoscope is a small machine, occupying no more space than a phonograph, which can be set up on a table, and, as with the magic lantern, the size of the picture may be varied within certain limits by the distance between the projector and the screen. Hitherto the great objection against this development has been the combustible nature of the celluloid film; but this drawback has been completely overcome by the use of a non-inflammable film made from acetate of cellulose. Though the picture thrown from this base is not so clear and fine as that obtainable with the celluloid, with the home machine and the small picture the defect is not so pronounced as in the case of a large picture in a hall. In order to insure that only a non-inflammable film shall be used, the edges of the film have a varied perforation; that is to say, there are more holes on one edge than on the other. Accordingly the inflammable film with the standard perforation gauge cannot be used. This is a very interesting development, but it suffers from the great disadvantage that the films are costly. To meet this objection, the idea of a library has been evolved, the films being exchanged from time to time as is done with books. The establishment of depots in the large centers will facilitate the exchange of films; but as users in country districts can effect an exchange only by post, it is doubtful if the project will survive the first wave of enthusiasm. Mr. Edison has perfected a similar small machine for the home; but as the films must also be purchased, the expense, coupled with the fact that the novelty soon wears off, is an adverse factor. The true solution of the kinematograph-at-home idea would seem to rest in the Bettini invention, as the cost is trifling. The inventor of this system has discovered a means of using a non-inflammable film base, in preference to glass, so that the disadvantage of breakability is absent. The pathoscope, however, is the first commercial application of the idea upon rational lines, and undoubtedly there are many homes in which animated pictures will appear as a diversion."

**513.** "Movies' Decline Held Permanent: Survey by Film Unions Finds '46 Status 'Gone Forever'." *New York Times* April 7, 1958 1958: 1, 25.

This article reports on a survey conducted by Hollywood film unions and published in 1957 (see Irving Bernstein, *Hollywood at the Crossroads*). The study found that attendance in the United States had dropped from 90,000,000 in 1946, to less than 47,000,000 by 1956, and that when drive-ins were subtracted, that fewer than 12,000,000 people went to four-wall theaters. The article gives several reasons for the decline in attendance -- eg., increased leisure time, blockbuster films, and television which had "changed living patterns." (25) It also noted the jobs lost to so-called American-interest films -- movies in which American producers went abroad to film. The study also commented on the potential for future movie attendance during the 1960s and 1970s from the baby boom generation.

**514.** "'Movies' Improve Our Fiction." *New York Times* July 11, 1915 1915, sec. SM: 9.

Novelist Rex Beach is quoted in this article saying that "the tendency of the moving picture has been to make authors visualize more clearly than ever before their characters and scenes that they are writing about." The article's subtitle reads: "Rex Beach Says They Have Made Authors More Careful Regarding Actuality and Vividness."

**515.** "Movies of the Future." *McClure's Magazine* 47.6 (1916): 14-15, 87.

This article discusses the remarkable growth and changes in moving pictures over the past five years or so. "From a chaser in a vaudeville show to seven hundred nights on Broadway is a long way for the motion picture to go in five short years. From a free and rather unwelcome supplement to a ten-twenty-thirty variety to a two-dollar admission price in a famous theatre; from a vulgar mechanical chase to a gigantic dramatic play; from an eye-straining blur to an eye-filling spectacle; from slapstick to Shakespeare; from a theatrical by-product to a six-hundred-million-dollar industry -- that's where the motion picture has gone." (14) What did audiences like to see and what was the future likely to hold, the article asks? Based on mail, "house to house ... investigations," (15) and reports from theater managers, about 70 percent of audiences went to movies for drama. Another 15 to 20 percent liked comedy best. "Stray individuals find most nourishment in the cartoons, the news weeklies, the travelogues and the educational pictures. The play, in pictures as on the stage, is the thing!" (15)

This article says that publicity is important in letting audiences know whether or not the film is of sufficiently high quality that they will want to see it. McClure Pictures will let people know the picture is up to McClure's high standards. "The motion picture of the future is to be the advertised picture, the real Superpicture!" this article concludes. (87)

**516.** "Movies' Own Censor Lifts Some Taboos: Hollywood Adopts New Film-Making Code." *Chicago Tribune* Sept. 21, 1966 1966: 2.

This article discusses the new Production Code that Hollywood adopted in 1966. It added a "suggested for mature audiences" rating. "As they come down the chute," Valenti said of new films, "we'll label them."

**517.** "Movies to Be 'Felt' and 'Smelled' Forecast in New Era by Jones." *New York Times* Jan. 23, 1938 1938: 39-40.

The stage and color designer Robert Edmond Jones predicts that within 25 years movies will be "felt" and "smelled." He also predicted there would be "time machines" that would "shatter all privacy by projecting themselves into the past and present.

Quoting Jones: "'I, as Mr. Priestley in his play 'Time and the Conways,' believe the time will come when we will be able to see, hear, feel and smell the present, past and future, all in one flash,' Mr. Jones declared. (39)

"It even may come to where there will be no privacy -- a horrible thought to me, but it may become a reality!" (39)

Jones noted that perfume was already being used in theaters during romantic movie scenes.

As for the time machine, Mr. Jones later amplified his remarks with the assertion that he believes 'we actually will have' in twenty-five to fifty years such inventions as H. G. Wells and Aldous Huxley have described in their imaginative writings. The senses of 'touch' and 'smell' will be added to the 'talkies,' he declared....

"He visualized a 'time machine,' such as Maxwell Anderson fancifully describes in his play, 'The Star Wagon,' which will transpose events of the past to the present.

"By this machine,' he [Jones] 'I believe it will be possible, say, to wonder what the Prince of Wales or the President is doing, turn your machine on them, and actually see what is going on. Impossible? Why? Television is here today, isn't it?'" (39)

**518.** "'Movies' by Auto Now; Novel Scheme Uses Car Motor to Show Films in Rural Districts." *New York Times* Dec. 27, 1914 1914, sec. X: 5.

This article reports that the automobile is used to take movies even to the remotest village; where electricity is a problem, the car can be used as a generator. "The most remote hamlet can now have a moving picture show." These were movies on farming made for/by universities and government.

**519.** "Movies' Exposition. International Show to Open at Grand Central Palace June 8." *New York Times* May 18, 1914 1914: 9.

This article notes that at the second annual International Moving Picture Trades Exposition that Cooper Hewitt Co. was "installing an extensive lighting plant, and there will be shown the rehearsing, playing, talking and developing in the studio of a playlet and then the finished picture on a screen will be run." Among the actors taking part: Mary Pickford, John Bunny, Pearl White, and others named.

**520.** "'Movies' to Aid Doctors." *New York Times* April 7, 1914 1914: 6.

The subtitle of this article reports: "French Physician Shows Films Illustrating Action of the Muscles."

**521.** "'Movies' To Solve Problem of Getting Army Recruits." *New York Times* July 13, 1913 1913, sec. SM: 11.

This article talks about movies being used to get new recruits in the Army.

**522.** "Moving Picture Advertising." *Bankers' Magazine* 93.1 (1916): A2-A4.

This article refers to a movie called "All Aboard the Magic Carpet," which advertising the advantages of "A.B. C. Travelers' Cheques." (A2) The magic carpet apparently refers to the cheques, not movies as a form of communication.

**523.** "Moving Picture Drama of People." *Chicago Daily Tribune* Nov. 23, 1910 1910, sec. A: 14.

This article compares cinema with printing press. It is also more accessible to masses; more "spaciousness" than stage. It can show things not possible on stage; it has a magical quality. In 1910, this article estimates that in Chicago there were 650 moving picture theaters and another 50 vaudeville houses that show movies. It costs \$10,000 to produce movie in Chicago; perhaps 150,000 daily attendance in 1910 that brings in \$12,000 daily. The article predicts that there will be motion pictures in color and with sound. This article claims, rather naively, that movies will have permanence of paintings and statues.

**524.** "'Moving Picture Eye'; The Strange Affliction Caused by Electric Theaters." *Chicago Daily Tribune* Sept. 29, 1907 1907, sec. F: 2.

This article says that "The moving picture machine has gone around the world. On every side cheap theaters are springing up like the soldiers from the dragon's teeth, and German scientists and occultists have characterized them as a positive peril to the eyesight of the next generation. No nation of the earth, they say, will escape the

torture of defective eyesight if the use of the moving picture as a form of amusement becomes general, as it threatens to become, and one occultist adds 'The next generation may be incapable of using the sense of sight with exactitude....'

"From Germany the warning has been sent out, and in Chicago there are more moving picture machines and nickel theaters than in any city in the world. The streets are dotted with them, they are penetrating into the residential districts, they have swooped down upon State street with their electric pianos, their hoarse voiced spielers, their lurid posters, their hair raising portrayals of crime and murder, their sensational pictures of train robberies and the mad pursuit of the bandits attracting throngs of children into their doors. And will these children who squander their pennies and nickels in the pursuit of the excitement of the moving picture show grow to manhood with worthless eyesight? Will they become recruits in the great and growing army of physical defectives? This is a question that the Berlin occultists already had undertaken to answer.

"...The German scientist suggests that the peril to the eyesight of the moving picture is greater than the danger of moral corruption. The peril is one that the police cannot check."

"At no time in the history of the race was the sense of sight more essential to man's reconciliation with his physical environment; but at no time, complains the Berlin authority, has the aid of science been more readily given to make man, through the medium of his eyes, a stranger to reality."

**525.** "The Moving Picture Hazard." *The Independent* 63.3065 (1907): 527.

This piece quotes from a circular distributed by the Southeastern Tariff Association about the dangers of fire from celluloid films.

**526.** "The Moving Picture Man." *Chicago Daily Tribune* Aug. 4, 1902 1902: 12.

This article reports on the difficulties of capturing live fighting in the Spanish-American War and in the Philippines. Some film purporting to show charges up San Juan Hill were actually filmed in the Philippines. Also notes movie cameras vary from electric ones used by big companies that weigh 800 pounds, to one turned by hand crank that weigh perhaps 20 pounds.

**527.** "The Moving Picture Movement." *The Independent* 72.3293 (1912): 108-10.

This article begins by discussing the kinematograph and the "problem of color reproduction. We believe it may be fairly called solved, for moving objects are now photographed in their natural colors, altho not all of them are correctly represented." (108) It notes that the "Italians have taken most enthusiastically to the motion picture," (109) and it gives several examples of spectacles that have been filmed. "The kinetoscopist seems competent to make real anything in the lower regions that Dante or Doré could imagine; the demons fight in mid-air, doomed souls see visions of the sins that brought them there...." (109) The scenes are filmed with "sufficient of the horrible to send women of very sensitive nerves into a faint or out of the theater." (109)

According to the author of this article, the kinetoscropy "is not only a new form of the drama and a new method of journalism," but also "a new instrument of science, comparable in importance to the telescope and microscope." (109) Film has enabled man to control space and time. "When man acquired control of spatial relations by means of lenses enabling him to enlarge or reduce to suit his purpose, the realm of the invisible was opened to his gaze in both directions, toward the stars and toward the atoms. Now he has for the first time brought time under the same control as space, and by means of the magic strip of film can retard, accelerate or reverse the course of events at will. He has acquired a 'time machine' almost equal to that imagined by Wells years ago." (109)

The article argues that "it is wrong to regard such an instrument as this as a mere means of entertainment, and it is a great mistake to impose upon it, now in its infancy, such legislative restrictions as would confine it to the theater and practically exclude it from the school, the church, and the family circle." (110)

528. "Moving Picture of Ito Murder; Photographer Catches the Assassination Scene." *Los Angeles Times* Dec. 10, 1909 1909, sec. I: 5.

This article reports that the assassination of Prince Hirobumi Ito in Japan was captured by moving picture camera. The article's subtitle reads: "Japan Will Use Films in Prosecution of Korean Slayer of Former Premier One Roll Will be Exhibited China Fears Ito's Death Will Cause Trouble."

529. "The Moving Picture of To-Morrow." *Outlook* (1914): 444-45.

This article contrasts motion pictures and the more limited possibilities of the stage. **"This new art holds out to us the promise of escaping, not only from the constricting unities of time and place, but also from the immediate hamper of mechanical contrivances. It borrows the world itself for its stage, the high Alps for its proscenium arch, and the deserts of the earth for the boards upon which it plays.** In the flicker of an eyelash it bring together the eternal ice and the sun-scorched tropics. With its magic of light and shade it can bring forth at command the legions of Titus storming the walls of Jerusalem or the mordant jaws of a modern dredge gnawing a pathway across the backbone of a continent. **For it a thousand years are as a day. The fall of an empire and the fading of a rose, the tides of Fundy and the spring-drawn sap in a growing vine -- these are one and all within its field. With the pageantry of life itself for stage property and all history for a back-drop, who is bold enough to prophesy the final limitations of the moving-picture machine?** (444) (my emphasis) The author says that movie makers are adding "Pageantry to pantomime," and that few actors of the stage are able to make the transition to motion pictures.

The author says that **"In the moving-picture world an hour ago is almost ancient history. What to-morrow holds is only a matter for prophecy."** (445) (my emphasis)

Motion pictures will bring history alive, the article argues. **"History under the skillful touch and dramatic genius of moving-picture artists may for all of us thus become a present fact.** The school-boy of to-morrow may read his Caesar with eyes fixed upon the soldiers of Vercingetorix, may watch the camp-fires along the Roman wall, may see Michael Angelo [sic] building the defenses of Florence, may march with bloody Alva through the stricken Netherlands, follow the fortunes of Hudson to the north, suffer hardship with Marion the Swamp Fox, or camp with Grant at Appomattox. **History, a thing alive, will come to him out of the brains of scholars, a ray of prisoned light and a flickering procession of ghostly shadows thrown upon a whitened screen."** (445) (emphasis added)

530. "Moving Picture War Starts in Germany." *New York Times* March 24, 1912 1912, sec. C: 5.

In Germany, there was an effort to confine movies to scientific and educational areas and to keep it out of drama. "Kintopps," as they were called there, had "brought the theatre business to the brink of ruin." Actors were being tempt away from stage by lure of high salaries.

This article's subtitle reads: "Theatre Managers, Alarmed at the Invasion, Call for United Defense of the Drama; Leading Actress Deserts; Tempted by Big Salary, She Plays for the Picture Men in a Stirring Lake Drama."

531. "The Moving Picture World and the Periodicals." *Moving Picture World* (1910): 340-41.

This article discusses a recent article in *Harper's Weekly* on "Morals and the Moving Pictures," and said that this publication (*Moving Picture World*) had already thoroughly covered this subject. It also notes a recent piece in the *Review of Reviews* (July 16, 1910) on "The Living Picture Revealing Nature." The article concludes by saying that these reviews and others "are interesting, showing the growing power of the moving pictures everywhere, and

when journalists and periodicals write so truthfully and commendatory they may depend upon help from the *Moving Picture World*." (quotation, p. 341)

**532.** "Moving Pictures." *Youth's Companion* 84.31 (1910): 402.

This brief article criticizes the recent showing of the Jack Johnson heavyweight boxing match and applauds the exhibitors who withdrew the film. "Much criticism has been made of the moving picture theaters, and doubtless much has been deserved. It is, however, a fact that the past few years have brought a decided improvement. There is yet much of melodrama and crude humor, but there is also a great deal that is artistic and instructive." This piece talks about the uses of film for educational purposes in the U.S., France, Germany, and Belgium. It notes the powerful impact motion pictures have had on scientific study. It concludes: "No one pretends that all the moving pictures are worthy of approval. Many persons believe in a rigid censorship. In the absence of it, parents can exercise a wise supervision for their own families."

**533.** "Moving Pictures and the Right of Privacy." *Yale Law Journal* 28.3 (1919): 269-72.

This article provides an account of legal thinking about the relationship between movies and privacy at the end of World War I.

**534.** "Moving Pictures Depict Fairbanks." *Chicago Daily Tribune* Aug. 27, 1904 1904: 5.

Senator Charles W. Fairbanks (Indiana) who was Theodore Roosevelt running mate for Vice President, reluctantly allows himself to be film, according to this report. Fairbanks did not think posing in front of a moving picture camera was "dignified." However, "the pictures will be in the theaters next week and the republican managers believe that they have hit on an effect scheme of making the vice presidential candidate known to about thirty times the number of people he possibly could have met by touring the state."

The article's subtitle reads: "Vaudeville Stage to Be Medium of Showing Candidate to Public. Dignity Yield a Point. Senator Finally Consents to Let 'Political Exigencies' Command."

**535.** "Moving Pictures for Science." *New York Times* July 3, 1899 1899: 2.

The article's subtitle reports: "Agricultural Department Engaged in a Series of Experiments."

**536.** "Moving Pictures for Voters." *Chicago Daily Tribune* Oct. 17, 1902 1902: 7.

Republican party is using moving pictures to attract voters, according to this piece. The article's subtitle reads: "Feature of Big Republican Mass Meeting Where Political Issues Are Discussed."

**537.** "Moving Pictures in China." *New York Times* Aug. 31, 1906 1906: 8.

This article discuss the reaction to American films in China (note the racist language): "China has always been shy of the devices of the outside barbarian, and it is little wonder that a moving picture show with a gasoline attachment which blew up as soon as the concern was arranged for business should have created a local panic in that country and an apprehension that the machine was some diabolical instrument of invasion intended to overthrow the empire and cut off every pious pigtail pendent therein."

**538.** "Moving Pictures in Color." *New York Times* Feb. 22, 1917 1917: 9.

The subtitle to this article reports that "Dr. [Herbert T.] Kalmus Exhibits Technicolor Films at Engineering Building." The articles says that about 2,000 feet of film was shown.

**539.** "Moving Pictures in Natural Colours." *The Times [London]* Dec. 10, 1908 1908: 12.

This article gives an account of the state of films in color in 1908.

**540.** "Moving Pictures in Natural Colours: A New Process." *The Times [London]* Jan. 17, 1913 1913: 44.

This article discusses the status of color motion pictures in 1913.

**541.** "Moving Pictures in Science." *New York Times* Oct. 11, 1909 1909: 9.

This article reports that surgery, agriculture, and metallurgy are already being taught by moving pictures.

**542.** "Moving Pictures in Surgery." *Chicago Daily Tribune* July 4, 1899 1899: 1.

This article's subtitle reports: "Operations Shown in Germany by Means of Cinematograph P. D. Armour Recovered." A French surgeon name Doyen who was dissatisfied with the limited number of people who could watch clinical demonstrations took "had a special cinematograph made and took instantaneous photographs of a variety of operations, showing every detail." They were then shown to a "large scientific audience."

**543.** "Moving Pictures Menaced by War." *Chicago Daily Tribune* March 9, 1908 1908: 5.

This article reports on efforts to control moving picture patents. The article's subtitle reads: "Contest Over Patent Rights Threatens Temporary End to 10,000 Theaters; Fight to Center Here; 'Trust' and 'Independents' Each Desires Other Put Out of Business by Courts."

**544.** "Moving Pictures of the Pope." *Chicago Daily Tribune* Jan. 9, 1899 1899: 7.

This article discusses the filming of Pope Leo XIII. The article's subtitle says: "Leo XIII. Represented Amid the Scenes of His Daily Life Exhibition at Studebaker Hall."

**545.** "Moving Pictures Show Reptile Life." *New York Times* Oct. 23, 1914 1914: 18.

This article reports that a film showing reptilian life took three years to make and reptiles filmed at night under electric light because that was the only way they could be made to act naturally.

**546.** "Moving Pictures Shown in Court." *New York Times* March 5, 1914 1914: 2.

This article says that "For the first time in history of criminal procedure a moving picture exhibition was made part of a criminal trial last night." The article's subtitle reads: "Room in General Sessions Transformed for Trial of Producers of White Slave Play."

**547.** "Moving Pictures Sound Melodrama's Knell." *New York Times* March 20, 1910 1910, sec. SM: 7.

This article notes differences between the stage play and the movie. Live plays are only given occasionally while the movie is shown constantly; movies appeal to millions who never read books. The article also discusses a different class of people who attend movies. It makes other points such as acting is a "wonderful business." It considers acting before a machine -- more has to be expressed by pantomime. An actor says "'Yes, the old order changeth. Melodrama belongs to the dark ages now, and this thing [moving pictures] has come to stay.'"

**548.** "The Moving World." *The Independent* 82.3461 (1915): 21.

This article begins by referring to an editorial in *The Independent* after the appearance of *Birth of a Nation* and saying that the motion picture ranked "printing in the scope of its influence and that it possess [sic] possibilities of artistic development which would enable it in some respects to surpass painting and stage drama." The article comments on the progress made during the past year by cinema and notes that "crowds are not drawn by novelty or by scientific interest, they are not tricked into coming by advertising; they have compared the motion picture with the melodrama, the problem play or the musical comedy as an evening's entertainment and prefer it."

The author compares and contrasts movies and live theater. Unlike the live theater, films lack sound and color. However, motion pictures have certain advantages over theater: 1) they can use the outdoors for background; 2)

they can change scenes often; 3) they are like H. G. Wells's time machine in that they can go back in time and also into the future; 4) they can reveal the mind of character in two ways, one may bring the camera close to show facial expressions, the other by "visualizing his memories or imaginings"; 5) they can show the same special effects every night with no additional cost over the original showing.

There are problems with this new art form. For example, there is a tendency "to put in too much motion." Too often the filmmaker "employs a sensational catastrophe as a substitute for a logical plot."

Nevertheless, the movies have come to stay this article says. "The motion picture has established itself and in some form or other will become a permanent part of the intellectual and esthetic life of the nation."

The subtitle of this article is "A Review of New and Important Motion Pictures. The Progress of the Motion Picture."

**549.** "Moving-Picture Manufacture. Ten Thousand Theaters Using the Picture Films." *Los Angeles Times* Nov. 7, 1909 1909, sec. VI: 4.

This article comments that "The scope of the motion picture camera is unlimited. Not only can the little machine, probably twelve pounds in weight, with which the negatives for the films are taken, faithfully record everything that can be reproduced with photography, but by clever manipulation the films can be so doctored as to make pictures do the impossible. That is a sort of Irish bull, but it is true. For instance, the films can be so manipulated as to make a human being actually defy the laws of gravity; make a mere man turn a backward somersault over objects as high as the Washington Monument; even make the tiny house fly apparently juggle stick of cordwood and dumbbells incredibly large."

The article comments on the popularity and accessibility of movies: "The motion-picture theater is frequently spoken of as the poor man's theater, probably because of the extraordinary cheapness of admission, but in all the big cities, as well as in Washington, the most refined of the social circle, the exclusive of the elite, may be found seated side by side with the poor man or the poor woman enjoying a motion-picture exhibit. One evening recently there were twenty-eight automobiles of the finest type lined up against the sidewalk on Pennsylvania avenue while those who came in them were enjoying a motion-picture show on the inside of one of the theaters. One alone, whose seating capacity is 168, had an actual attendance of 14,000 people in one week."

Color films are now possible, the article says: "The manufacturers of films have also succeeded in producing motion pictures in the natural colors of the objects. It is a most difficult and delicate undertaking to color the thousands of these miniature film pictures that go to make up a series, and yet it has been accomplished in a remarkable way."

The article goes on to say: "But it is not the trick pictures that the greatest interest lies. There are films that are instructive as well as entertaining; those that show foreign lands and the customs of the people; those that virtually take the audience to some far-away city or country and give a series of views of its industries...."

"Pictures of this sort are classed as educational. One need not go abroad to see foreign countries; they are brought to his door by the motion picture."

On the relation between moving pictures and history, the article maintains: "Indeed, the development of the motion-picture film has called into play every conceivable factor necessary to the reproduction of historic, dramatic, and national incidents and events."

The subtitle to the article reads: "A Large Industry Developed by the Novel Entertainment System of Exchange of Films Saves Large Cost to Individual Theatre A Trust Now Formed."

**550.** "MPAA's Jack Valenti: Parlayer of Power." *Broadcasting* 87.12 (1974): 57.

This article discusses Jack Valenti's background, including his work with the Lyndon B. Johnson administration. Valenti was president of the Motion Picture Association of America.

**551.** "Murder Gets an R; Bad Language Gets NC-17." *Time* 144 (1994): 68.

This article criticizes the motion picture rating system which appeared to be more willing to give a severe rating (NC-17) to films with bad language and non-violence sex, than it to movies with high levels of violence. The article begins by discussing Oliver Stone's *Natural Born Killers* (1994), and the 150 cuts he had to make in order not to get an NC-17 rating. Time Warner Inc. owned both the magazine in which this article appeared and the studio that made *Natural Born Killers*.

**552.** *Mutual Film Corporation v. Industrial Commission of Ohio*. 236 U. S. 230 1915.

This U. S. Supreme Court case, which defined motion pictures as a business "pure and simple," excluded movies from protection under the First Amendment. Not until 1952, with the Court ruled on the film *The Miracle*, did motion pictures gain First Amendment protection.

**553.** "A Mysterious Invention; Precautions to Keep the Vitascope a Profound Mystery." *Los Angeles Times* July 12, 1896 1896: 9.

This article discusses Thomas Edison's vitascope. It has been popular. "Night after night numbers of people have gone to the Orpheum at about 10 o'clock, going with the sole object in view of seeing the wonderful moving pictures with their startling similarity to real life. The mystery in which it is shrouded doubtless, the more interesting to the public."

**554.** "The 'Mystery' of Electricity." *Current Literature* 38.6 (1905): 557-58.

Well into the twentieth century the general public had "not yet lost its feeling of awe for all things electrical" (558), this article says, and for many people electric energy remained a "mysterious" force. The article reprints an excerpt from a recent piece in the *Electrical Review* which argues that it is mistaken to think of electrical phenomena as incomprehensible.

**555.** "Natalie Kalmus Talks on Color." *Los Angeles Times* April 12, 1935 1935: 13.

This brief article reads: "The new movement of pictures toward color was discussed by Natalie M. Kalmus, leading color authority and executive, before the Hollywood Woman's Club Wednesday noon. Mrs. Kalmus talked on the subject, 'What It Requires to Make a Picture in Technicolor,' and read two papers on 'Color Consciousness' and 'Color Music.'"

**556.** "The Nation." *Los Angeles Times* Oct. 26, 1986 1986, sec. 1: 2.

This brief article discusses the Ronald Reagan administration and pornography. Reagan, in a live satellite address to fifty cities, called pornography "vicious and dangerous" and harmful to children and women. Reagan praised Attorney General Edwin Meese's antipornography efforts.

**557.** "[National Commission on the Causes and Prevention of Violence]." *St. Louis Post Dispatch*: 1A, 13A.

This article covers the report of the National Commission on the Causes and Prevention of Violence in 1969. The article discusses research that had then been done linking violence in mass media (e.g., television and movies) to real-world violence.

**558.** *National Television Violence Study*. 3 volumes, Santa Barbara, Chapel Hill, Madison: Mediascope, Inc., 1994.

In the *National Television Violence Studies*, researchers at four universities tried, through extensive research, to determine the amount violence, its intensity, and its effect on viewers of American television. The results are

based on a research which covered 50 days during which 23 television channels were analyzed everyday from 7.00 am to 11.00 p.m. Researchers proposed a series of measures meant to repress violence on TV because they consider it a serious social ill.

In the television season 1994-1995 the researchers found that 57 percent of all the programs analyzed contained some sort of violence. The violence displayed on television poses three serious threats: learning aggressive attitudes and behaviors, becoming desensitized to real-world violence, and developing unrealistic fear of being victimized by violence. The amount of violence differs from channel to channel; the highest percentage of violent programs is found on premium cable and within the genre of movies specifically; this is also where the highest frequencies of violent interactions are displayed. In contrast, the lowest percentage of violent programming is found on the broadcast networks and especially on public broadcast.

Viewers do not necessarily need to identify with persons on the screen who practice violence. The prototype of such a person resembles the prototype of someone who views the program. In most cases an adult white male attacks another adult white male. The major problem with violence on TV is that it is often sanitized. Negative mental or physical consequences, e.g. paralysis, are often ignored and violence is even often depicted as funny. Within these programs talk shows are to be considered the least violent whereas police reality shows are the most violent. A way to make these reality programs less accessible to children might be to schedule these shows later in the evening. Because, as the research shows us, boys are attracted to shows and movies that they are actually not allowed to see based on the rating. These programs tend not to have the same appeal to girls.

Violence tends to affect younger children even more than adolescents. As opposed to what one might think, cartoons overall contain too much violence suitable for children under the age of seven. Therefore it is not recommended to parents to let their children watch networks as Cartoon Network and Nickelodeon. All in all, the most important mean to reduce the amount of violence on American television, or at least to reduce its dangerous impact, is to inform the audience better about the effects of violence. Networks should offer people an alternative to violent shows, and if they decide to watch them, helplines and help desks should be available if the show or movie happens to cause a traumatic memory.

#### -- Pieter Van Den Berg

**559.** *National Television Violence Study: Scientific Papers, 1994-1995.* Studio City, CA: Mediascope, Inc.

This study videotaped 3,185 TV programs and analyzed 2,693. The study was lead by researchers at the University of California, Santa Barbara, University of North Caroline, Chapel Hill, University of Texas, Austin, and the University of Wisconsin, Madison. Mediascope provided the project administration. Mediascope is a nonprofit organization that attempted to promote "constructive depictions of health and social issues in mass media." The study discusses research that has been done on the effects of violence in mass media.

**560.** "The Nation-Wide Wave of Moving Pictures." *New York Times* Jan. 3, 1909 1909, sec. SM: 10.

The subhead in this article reads: "How It Has Swept Over the Country Until It Represents an Investment of Forty Millions of Dollars and the Employment of 100,000 Persons. Some Moving Picture Tricks. Amusing Incidents Often Occur in Creating 'Magical' Illusions." The text of the article goes on to say that "The old saw that things are seldom what they seem is nowhere more true than with the moving picture...."

**561.** "Natural Colours on the Cinematograph." *The Times [London]* March 31, 1914 1914: 10.

The subtitle of this article reports: "New Process and Its Advantages."

**562.** "NC-17, R or PG-13? How the MPAA Votes." *Chicago Sun-Times* Jan. 23, 1994 1994, sec. Show: 4.

This article discusses how the movie industry's Classification and Rating Administration operates, notes that many theaters in urban malls will not carry NC-17 movies, that the largest video rental chain, Blockbuster, will not carry X or NC-17 rated motion pictures, and the uncut version of *Sliver* (1993) grossed twice as much abroad as it did in the United States.

**563.** "Negative Prints. Actors and Actresses Whose Photographs Are Most Popular." *Chicago Daily Tribune* Feb. 23, 1884 1884: 8.

This article quotes the owner of fashionable stationery store saying that nine out of ten people who get photos of stage people are women.

**564.** "The New Age of Color." *Saturday Evening Post* 200 (1928): 22.

"The effects of our chromatic revolution are everywhere apparent," begins this brief article. It notes an increasing tendency to use color in public buildings, textiles, homes, and in consumer goods. It is the "chemists, laboratory men, and researchers" who are most responsible for "ushering in our new age of color." The chemists liberated "scores of new hues from the gummy darkness of coal tar and other plentiful substances."

The article notes that there have been some "unwelcome innovations, imported crudities which, as to both color and design, smack of Bolshevistic fondness for ugliness in the raw. And yet for the most part our plunge into the field of color has been a happy experience and one which we need not repent so long as we submit to the restraint of reasonably good taste."

This article might be read in conjunction with Alexander Bakshy's "Color in Modern Life," *Current History* (July 1934).

**565.** "A New Art Being Developed in the Movies." *Current Opinion* 56.6 (1914): 438-39.

This article argues that motion pictures are a new art form and that they do "for the drama what printing did for literature." (438) The movies make "possible for the first time the unlimited reproduction of actual events. This world of ours," it argues, "is in constant motion, and no static art can adequately represent it." "We have now for the first time the possibility of representing, however crudely, the essence of reality -- that is motion," the article says, and it goes on to cite Henri Bergson. "'Bergson has shown us what a paralyzing influence static conceptions of reality have had upon history of philosophy and how futile have been all attempts to represent movement by rest.'" (source not given) In short, "the moving picture may mark a new epoch in the history of culture." (438)

The magazine says that henceforth it will review on a regular basis motion pictures just as it would good plays and books. The article notes that there are no standards in the press on what constitutes movie criticism. The article comments on the popularity of movies sets in the western United States, and notes that a new type of actor has emerged, one who be prepared to face real physical danger in filming. "Cleverness in improvization is his chief asset." (439)

This article appeared earlier in "The Birth of a New Art," *The Independent*, 78, no.3409 (April 6, 1914), 8-9.

**566.** "The New Art of Advertizing -- or the Redemption of the Billboard." *Current Opinion* 54.5 (1913): 406--08.

This work reviews Paul Terry Cherington's book *Advertizing as a Business Force* (Doubleday, Page, 1913?). It also notes that the psychologist Hugo Münsterberg has recently analyzed the psychology of advertising. This article says that the "most striking characteristic of the 'new advertizing' is its alliance with art." (406) The article goes on to say that "The invasion of the new spirit of artistic endeavor in the field of the advertisement has been brought about, its champions tell us, by aiming not for the literal illustration of a commodity but to awaken the imagination: not for mere representation but for the creation of a spiritual and esthetic atmosphere by a decorative effect. Thus the new spirit in advertizing seems to parallel quite closely -- and perhaps dangerously --

the new spirit in the fine arts." (406) The article notes that public interest in posters and placards has been revived recently in Europe, especially in Berlin, and in the United States by the International Art Service in the Aeolian Building in New York City.

This article comments on the ever-present billboard and says it "has been despised and rejected by champions of civic beauty...." (406)

**567.** "New Cameras." *Los Angeles Times* Jan 4, 1901 1901: 9.

This article reports that amateur photographers are finding that they have more sophisticated equipment that they can afford. Lenses are improving and cameras are becoming less expensive and more portable. "The cost of cameras has very materially decreased in the last few years, yet the price of a fine instrument must necessarily remain high."

The article says that "fully one-half of the smaller cameras now sold are what is called in the trade cycle cameras. The larger of these come in a box much flatter than that used with the ordinary camera designed to produce like results. This difference in form is that the camera may be swung under the bicycle without coming in contact with the rider's legs. Still other smaller cycle cameras merely have a strap or hook attachment to fasten them on wherever is most convenient. It has about come to the pass that a bicycle that is used for mere pleasure riding is hardly fully equipped for the road unless it has a camera swung from some part of its anatomy, ...."

Amateurs have shown increasing interest in **telephotography**. "A good deal has been printed concerning this branch of photographic work in certain of the foreign magazines, the descriptive articles being accompanied by reproductions of photographs which showed some very remarkable results...."

The article comments on **portable moving pictures cameras**. "One of the latest developments of the camera in small size is an instrument that will take pictures of motion. It is in other words nothing more or less than the attachments of the biography mechanism on a greatly reduced scale. One of these cameras can be carried in the hand as readily as the ordinary Kodak, and the amateur will be able to take a picture of any scene of action about him that he chooses. **Of course, to reproduce this picture the corresponding machinery must be maintained at home, unless as is already the case with the larger biographs, the hand camera is provided with mechanism to project the picture upon the screen as well as take it. As a matter of fact the amateurs have not as yet made intimate acquaintance with this particular form of camera and only comparatively a few of them have been produced.** (emphasis added)

"Probably the next step forward in the matter of inventions touching photographic supplies will be in the way of developers. These will be made much simpler than they now are and hence more successfully handled by those who do amateur work."

The article's subtitle reads: "Costly Instruments Manufactured for Amateur Photographers -- A Hand Biograph."

**568.** "A New Cinematograph Process." *The Times [London]* Dec. 23, 1911 1911: 11.

This piece discusses a new development in making moving pictures.

**569.** *New Color Moods for the Screen*. Rochester, NY: Eastman Kodak Company, 1930.

This document comments on how Eastman Kodak believed that colors could have a stronger influence on the moods of movies audiences than black and white. It begins: "It is certain that many of the emotional moods which the motion picture seeks to capture reside in colors rather than in gray tones. **Psychologically the grays have a subduing, sobering power, and this power is constantly at work upon the observer of a motion picture which is screened in the monochrome of ordinary untinted films.**" [emphasis added]

**"Although gray may deepen certain moods of the screen, the peaks of emotion are usually flattened off by it, an effect which is far from ideal. A wider range of stimulation and depression seems possible through a systematic use of the affective values of different colors.** The language of color as applied to the screen is still rudimentary, but that colors do have certain consistent emotional effects is well established by psychological tests." (p. [3]) [my emphasis] For example, in addition to gray, this document comments on the effects of **"Verdante, a delicate green."** (4) Its impact is "Refreshing. The sunny green of vegetation in spring and early summer. Simply furnished interiors." (11) Its use can also partly nullify "the impression of a somber scene, and ... **it pulls down the mood of a scene that is impassioned and full of excitement."** (5) [my emphasis] As for other colors, "rose doree" is "A rose pink that quickens the respiration. The tint of passionate love, excitement, abandon, fete-days, carnivals, heavily sensuous surroundings." (8) "Peachblow" is "Allegretto vivace. A tint for brief, joyous moments, buoying up scenes of light, sensuous content. The spirit of coquetry. An excellent tint for close-ups." (8) **"Purplehaze"** is best for "dim interiors and outdoor settings obscured with haze. Languorous, dreamy, **narcotic.**" (13) [emphasis added]

The work then discusses Eastman Sonochrome films. "The saturation of all the tints is low enough so that they can not become distracting elements in the scene but remain entirely atmospheric effects." (p. [3]) It notes that "Lighting of realistic color content is a primary emotional source to which the motion picture has never before had such free access." (4)

This 13-page, undated pamphlet was probably prepared around 1930 or shortly thereafter. It is similar to a presentation made by Loyd A. Jones in 1929 ("Tinted Films for Sound Positives," *Transactions of the Society of Motion Picture Engineers*, 13 [May 6-9, 1929], 199-226). Jones worked for Kodak Research Laboratories in Rochester, NY. The sixteen tints, which are similar to those mentioned by Jones in May, 1929, include: sunshine, candleflame, firelight, afterglow, peachblow, rose doree, verdante, aquagreen, turquoise, azure, nocturne, purplehaze, fleur de lis, amaranth, caprice, and inferno. The subtitle of this pamphlet reads: "A spectrum of sixteen delicate atmospheric colors, keyed to the moods of the screen, in the new series of Eastman Sonochrome Tinted Positive Films for silent or sound pictures."

Jones in 1929 had noted that tinting often interfered with sound in the early talking films. Eastman Kodak now maintains that Eastman Sonochrome tinting will not interfere with sound films. The "tints may be used in any sequence, permitting absolute freedom in the shifting moods, without affecting the sound." (5)

**570.** "A New Colour Photography." *The Times [London]* April 18, 1896 1896: 12.

A report on the status of color photography in Great Britain in 1896.

**571.** "New Company Organized to Promote Television." *New York Times* May 31, 1931 1931, sec. XX: 11.

This article reports that "Television activity and possibilities of seeing by radio are said to be the inspiration for the organization of the Freed Television and Radio Corporation...."

**572.** "A New Conception of Color Vision." *Current Opinion* 62.5 (1917): 339.

This article discusses the way selenium cells change their "resistance to a current of electricity when exposed to light."

**573.** "New Device for Moving Pictures." *Chicago Daily Tribune* Aug. 30, 1908 1908, sec. E: 4.

This article explains why talking films were not yet feasible in 1908. It discusses the problems of actors having to speak directly into phonograph and then again before the camera. The two performances must be matched perfectly. "The performance as yet must be limited by the capacity of the phonograph records, which does not exceed three minutes. The phono-cinematograph thus is limited to topical songs or brief dramatic scenes; it cannot yet play the part of a people's theater, which seems to be its manifest destiny."

**574.** "New Edison Films Shown." *New York Times* Dec. 22, 1912 1912, sec. C: 6.

The members of the New England Society of Orange saw one of Thomas Edison's films at a dinner. The article, paraphrasing Edison, said that the inventor expected to "revolutionize education through motion pictures." The article reported that it was first time women were allowed at this meeting.

**575.** "New Field Found for Moving Pictures." *New York Times* Feb. 27, 1910 1910: 4.

This article begins by saying that "The educational moving pictures, so long threatened, have arrived." It then offers examples. "Most highly educational, though not particularly pretty, is the fly film, made up at the request of the Water Pollution Association. Nothing is left to the imagination. First, there is the fly laying eggs in unsavory places, and then, before the eyes of the spectators, the eggs develop into a wriggling heap of maggots...." The subtitle of the article reads: "Scientists Expect Value Results from Photographing Chemical Processes; Already Used in Europe; Geography and History Among the Branches Taught -- Educational Films Show by Censorship Board Here."

**576.** "New Hero for Matinee Girls." *Los Angeles Times* Feb. 6, 1910 1910, sec. II: 3.

This article, which appeared in Feb., 1910, notes the appearance of something new, the "motion picture hero." "There has sprung up a new matinee hero. Unlike the matinee idol of debutantes of a few years ago, the new person, attracting the attention of High School girls and others, performs on the screen. In a word he is a motion picture hero.

"Regular patrons of the many moving picture theaters of the city and the most of the patrons are regulars have learned to know the different characters of the pictures, and no matter what character is assumed by the actors, their mannerisms are easily detected.

"Just to see these persons in the different characters, large parties of young women may be found any afternoon in the places where the pictures are shown...." Goes on to say that to the uninitiated, the different performances may be the same but to those who go to many films, the differences in characters are well known. Often the actors can be found relaxing in the lobbies of L.A. hotels.

The subtitle for this article reads: "They Watch His Actions in Moving Pictures. Regular Patrons Learn to Spot Favorite Posers in the Various Characters in Which They Appear The Real Stars May Be Seen in Los Angeles, Too."

**577.** "A New Medium -- and a Lot of Messages." *Newsweek* 76 (1970): 42-43.

This article notes that the prerecorded video cassette could become "a revolutionary new medium." (42) The article notes that there are several film libraries putting movies on tape -- many of the films are high quality but also such movies as *I'm Curious Yellow* are being put on the new format. CBS's Electronic Video Recording (EVR) sold in 1970 for about \$795 but the price is predicted to come down to about \$300 in 1972.

**578.** "The New Moving Pictures." *New York Times* Dec. 12, 1909 1909, sec. SM: 4.

Pictures that can be magnified 2,000,000 to 76,000,000 times, this article explains in 1909. "Urban has also perfected a device for micro-photography in connection with moving picture machines that enables him to display thousands of things that no one ever sees with his naked eye. He has now reached the point where he can magnify things from 2,000,000 to 76,000,000 times. In order to do this, it was necessary to turn a 2,000-candle power light on the speck that he wanted to photograph, and this without generating enough heat to spoil the speck." Other examples of new photography are given.

This article provides insight into the status of color photography in 1909. In England, Albert Smith, who worked for Charles Urban, worked on making moving pictures that record colors. Parallels drawn to the way the phonograph captures sound. Notes that "colored moving pictures have for months been shown in three of the

most important theatres of Europe at the Palace in London, at the Winter Garden in Berlin, and the Follies Bergera(?) in Paris. Every publication in the British Isles, as well as on the Continent, has testified to the fidelity with which black and white negatives have been made to reproduce all of the colors of the rainbow but the American moving-picture man was skeptical. He didn't believe colored pictures could be made that way." Demonstration given at Madison Square Garden of a vase of flowers, motor boat on open water, and other scenes. The film reproduced a rainbow over Potomac Falls. "And it wasn't a splash out of all the point pots. It was an infinitely delicate commingling of colors -- a rainbow!" "Mr. Smith, the inventor of the color process ... is a short, compact little Englishman of middle age, who has had one of the greatest honors that Englishmen hope to get. He has been commanded to appear before the King" where he "showed his colored moving pictures to Edward VII, and was told he was all right." Smith discussed Urban's efforts at producing education films. "His films are flying text books." They cover almost every subject science, medicine. Notes film important to teaching the art of surgery or art of war. Urban has also perfect micro-photography that can magnify things from 2 to 76 million times. Geographic and historic scenes also shown.

The subtitle to this article reads: "Their Recent Developments and Services to Commerce. Some Interesting Experiments With the Camera That Open Up Suggestive Fields Of Usefulness in Science and Photography."

**579.** "New Multi-Color Press Now Being Built for the Tribune." *Chicago Daily Tribune* Jan. 27, 1901 1901: 33.

The *Tribune* says that four new, unique presses (three octuples and a multi-color printing machine) of "entirely new types" are being constructed for the Tribune by the R. Hoe & Company of New York. When finished, the "combined capacity of the pressroom in the new building, not counting the color press, per hour, will be:

"558,000 eight-page papers.

"324,000 twelve-page papers, all inset.

"279,000 sixteen-page papers, all inset.

"Larger papers will be printed in the same relative ratio. At one revolution of the printing cylinder a sixty-four-page paper, folioed from pages 1 to 64, can be printed by first making an inset of sixteen pages and then collected as four sixteenths in one offset, which is placing each section in its relative position."

Other information provided included: "When running each press will be fed from four rolls of paper at one time, running at railroad speed. To make the plates for one run will require 10,000 pounds of stereotype metal, and 3,000 pounds of ink will be required to fill the fountains. The presses will start with twenty-four rolls of paper in position, each weighing 1,500 pounds, or 36,000 pounds in all.

"Many wonder comparisons might be made to show what such an amount of paper and ink and stereotype metal means in the more common affairs of life. The paper on each roll, if stretched out on the ground, would reach five miles, and there is accordingly on the presses when they start 120 miles of white paper. Counting stereotype metal at six cents a pound, it will cost ??? to furnish the metal to make the plates. The 3,000 pounds of ink, mixed in proper quantity in oil, would paint every elevated railroad structure in town. By supplying new rolls of paper as the old are exhausted and running the presses at full speed it would take but five hours to give a stretch of paper to San Francisco. It run four hours a day the presses would eat up paper from a half-acre of poplar trees."

The new machines are much faster to operate and thus to produce the news, the article says. "As soon as the new plates are put on, all that will be necessary to do will be to slacken the speed of the moving part, while the part receiving new plates is getting under way. But a minute or two is required to make the change."

The article is accompanied by a picture of the new presses.

**580.** "A New Peril to Eyesight." *Current Literature* 41.3 (1906): 336.

This article summarizes research that appeared in the German scientific publication *Prometheus* (Berlin). It argues that the "penny-in-the-slot machines" that showed moving pictures were likely to damage the eyesight of children. "If the use of the moving picture as a form of amusement becomes very general, as it threatens to become, the next generation may be incapable of using the sense of sight with exactitude," this piece says. It recommends avoiding, "as far as possible, all straining of the sight through these instruments. They are accused of lowering the vitality of many children who have frequent recourse" to these machines. The article says that more than ever before, sight is important helping people reconcile with their physical surroundings.

**581.** "New Plays Without Words Are Put on Films Here." *Los Angeles Times* Oct. 10, 1909 1909, sec. II: 16, 20.

There are about 10,000 theaters showing association films and "about 2,000 using the independent films." (p. II 20) The article's subtitle reads: "Southern California Conditions Found to Be Ideal for Moving Picture Work Because of Very Small Size of Negatives and Great Rapidity of Exposures Real Actors in Demand for Pictures."

**582.** "A New Printing Process." *New York Times* April 5, 1914 1914: 14.

This article is about the reproduction in color in the *New York Times* by the rotogravure process of art work from the Altman collection. The paper asks: "Is it not clear that these are the very impressions the original painting makes upon the eye and mind? But if that is the case, then the picture in the *Times* to-day is a faithful reproduction of Hobbema's canvas, it is the landscape Hobbema saw, seen through the medium of Hobbema's temperament indeed, but offered to the eye by a medium other than Hobbema's canvas.

"That is very evidently the truth about the rotogravure process. It is a wonderful interpretative method, rendering with a fidelity hitherto unattainable the very truth, the quality, the beauty, the tenderness, and the sentiment of the painter's own work with the brush. These great pictures are reproduced upon presses which the *Times* has imported and set up in its Annex Building. The success attained in the very first use of these presses, which is extraordinary, encourages the belief that this new method of printing will be in the future very freely employed in the production of this newspaper."

**583.** "New Scientific Marvels That Are Channing [sic] the Habits and History of Humanity." *Chicago Daily Tribune* Aug. 16, 1908 1908, sec. F: 4.

The *Tribune* covers briefly several innovations including "Grand Opera of Future" (about "Preserving Grand Opera Records for Future Generations"), "Ocean Wave Telegraphy," and "Pictures by Telegraph." The latter concerns Arthur Korn's invention in Germany.

**584.** "New Strand Opens." *New York Times* April 12, 1914 1914: 15.

The subtitle of this article reads: "Biggest of Movies; Handsome Theatre at Broadway and 47th Street Seats Almost 3,500 People; Orchestra and Quartet...."

**585.** "New Things in Moving Pictures." *New York Times* June 29, 1902 1902: 25.

Virtually every vaudeville theater has its on moving picture machine, according to this piece, and during the past year the subject matter of moving pictures had changed from natural scenes of water falls and going over bridges, to scenes in which comedy played a large role. It also discuss how movie illusions are created (chicken and egg trick; "Impossible Bathing"; "The Tramp's Miraculous Escape"; "The Photographer's Mishap"; and "One Man Orchestra."

"Of late nearly all the pictures produced have been either of a comic or a mysterious nature. Where a year or so ago those 'in front' were treated to realistic scenes of Niagara Falls, a trip across Brooklyn Bridge, or a view taken from the locomotive of an English railway train, they will now be sow with humorous exaggeration how Mrs.

O'Grady deals with her husband when he come unsteadily home on Saturday night minus his wages, or they will be permitted to gaze upon the remarkable spectacle of a clown ambling about the canvas, detaching his head or limbs at will....

"It is perhaps regrettable that such a wonderful invention as the reproduction of life motion by aid of the camera should have degenerated into a mere toy, but shrewd caterers to the amusement-loving public know that in order to interest they must amuse and mystify at the same time. Hence the retirement of the scenic view and the advancement of the clown with the accommodating organism."

It notes that some of the illusions, such as "the clown with the adjustable head" had been performed on stage. "Views on the order of the clown with the adjustable head are of course made by the aid of mirrors. The same thing is done on the stage, and is familiar to every one. What appears on canvas is simply a photograph of what appears on the stage, only in many cases the mystic effect can be greatly intensified by the way in which the camera may be juggled, so to speak."

This article's subtitle reads: "Recent Development of Mysterious and Puzzling Photographs Apparent Impossibilities Accomplished by the Camera How the Egg-and-Chicken Illusion Is Produced."

**586.** "New Walls Aid Beauty." *Los Angeles Times* April 10, 1939 1939, sec. B: 12.

The *LA Times* mentions that Natalie Kalmus, who was head of Technicolor's color advisory service, has a chapter in a book entitled "Lovely Wall, Lovely Lady," published by "the makers of a new type, washable wall finish which gives a velvety texture to walls." Kalmus says that the color of one's walls should be chosen to accent a woman's natural colors. The paint dealer was apparently a local firm in the Los Angeles area.

**587.** "Newsies Cheer for Lincoln." *New York Times* Feb. 12, 1905 1905: 2.

This article reports that newsboys attended a meeting in which they first heard about Abraham Lincoln's life and "then settled in their seats to take in a series of stirring moving pictures. Among them was a train robbery, with the pursuit and capture of the thieves, after a desperate battle with a Sheriff's posse." The article's subtitle reads: "Three Hundred of Them the Guests of F. Delano Weeks."

**588.** "[Newspaper advertisement for *Birth of a Nation*]." *Chicago Daily Tribune* June 7, 1915 1915: 12.

This newspaper ad for *Birth of a Nation* quotes Richard Harding Davis saying "For the first time in a theatre a battle scene has been presented as it actually is." It quotes Griffith saying that this movie "will never be presented in any but the highest class theatres and at prices customarily charted in such playhouses."

**589.** "[Newspaper advertisement for *Birth of a Nation*]." *Chicago Daily Tribune* June 20, 1915 1915, sec. E: 4.

This ads says: "Night Photography of Battle Scenes, Invented and Perfected at a Cost of \$12,000."

**590.** "[Newspaper advertisement for *Birth of a Nation*]." *Chicago Daily Tribune* June 27, 1915 1915, sec. E: 4.

Newspaper ad for *Birth of a Nation*: "Wonderful Artillery Duels, in Which Real Shells Costing \$80 Apiece Were Used. Miles of Trenches. Thousands of Fighters 'War As It Actually Is.'"

**591.** "[Newspaper advertisement for *Birth of a Nation*]." *New York Times* March 14, 1915 1915, sec. X: 10.

In this newspaper ad for *Birth of a Nation* is an excerpt from the *New York American* (Friday, March 5, 1915) which carried an article by Rev. Thomas B. Gregory entitled "'Birth of a Nation' True and Wonder Work." Gregory wrote: "'Seeing is believing' and in this wonderful photo play we actually see the birth, growth and coronation of this King of Nations, this giant of the Powers of the earth a people compared with whom the Romans were but as pygmies.

"As if by the waving of some magician's wand the great scenes are, one after another, unrolled before us."

**592.** "[Newspaper Advertisement for *The Close-Up*]." *Outlook* (1918): 547.

This is an ad for a new book by Margaret Turnbull, published by Harper in 1918, entitled *The Close-Up*. The description of the book in this ad reads: "Tells the story of a simple, everyday New York girl who became a movie star over night out in the golden West. It is the story of her triumphs and successes -- of her hardships and struggles -- of the friends she makes in this strange world of make-believe -- and of the gay, devil-may-care life she leads for a time.

"The story is big and colorful with very real and very human people -- people who love life and get the most out of it -- in whose natures there are depths of kindness and helpfulness often unsuspected beneath masks of frivolity and temperament. And there are some real actresses in it, too -- people you will recognize by what the book tells about them."

**593.** "[Newspaper Advertising for Rotogravure Supplement]." *Chicago Daily Tribune* Feb. 28, 1915 1915: 1.

This page-one ad reads: "Be Sure You Get the Tribune's Pictorial Supplement Today. Mary Pickford, "Queen of the Movies" -- 8-Page Rotogravure Supplement for Next Sunday."

**594.** "Newspaper Illustration." *Chicago Daily Tribune* April 27, 1890 1890: 36.

This article, written by Mr. De La Pointe of the *Tribune's* pictorial department, explains the process of illustrating a newspaper. "After the etching leaves the engraving room three complete processes are requisite before a copy of it appears on the cylindrical matrix from which possibly an enormous issue is printed." He then discusses electric engraving. Following La Pointe's commentary is a piece entitled "Photographic" (by "Stevens"?). It talks about "print production," "improved paper," "retouching machine," and "color photography." "The production of color negatives is still impracticable..... The discoverer of color-photography will rank with Daguerre."

Just above this piece is P. J. Masterson's commentary on "The Newspaper Printing-Press."

**595.** "Next to Color Photography." *Chicago Daily Tribune* June 18, 1893 1893: 27.

The subtitle of this article reports that "The Hues of Nature Reproduced by the Camera."

**596.** "Nickel Picture Men Must Hurry." *Chicago Daily Tribune* Dec. 30, 1908 1908: 6.

This article reports on the effort to require licenses for people who run moving picture shows. This article subtitle reads: "Operators Warned to Get Licenses by Jan. 15 or Places Will Be Ordered Closed; Police Chief in Haste; Tells Commissioners to Rush the Examinations; Argument on Murder Films."

**597.** "Nickel Theater Pays Well; Small Cost and Big Profit." *Chicago Daily Tribune* April 8, 1906 1906, sec. I: 3.

This article explains that opening a nickel theater to show moving pictures is inexpensive and is likely to bring substantial profits.

**598.** "Nickel Theater Perils Revealed." *Chicago Daily Tribune* Dec. 27, 1908 1908: 1.

This article discusses the dangers of 5-cent theaters and the fact that many of the moving picture shows are run by people who do not have licenses. This article's subtitle reads: "More than 300 Moving Picture Shows in City Are Run Without Licensed Operators; Police May Close Them; Examining Board Displays Little Zeal in Requiring Compliance with Ordinance."

**599.** "Nickel Theaters Crime Breeders." *Chicago Daily Tribune* April 13, 1907 1907: 3.

This article reports that "A number of fires have occurred in the theaters, due to the burning out of some portion of the electric apparatus or to this films catching fire." It notes that "Five cent theaters are springing up all over Chicago like mushrooms." Articles notes that "A big plant where the pictures will be manufactured is now being erected at Belmont and Western avenues" in Chicago.

The article gives the titles of several crime pictures. It notes that "Residence Districts Invaded." It says "Suggestive Picture Shown" and says of a film of "Parisian manufacture" called "Cupid's Thermometer," that "There is enough hugging and kissing in that series of pictures to make a foolish girl dream of love for a solid week." It also discusses the film "The Unwritten Law" about the "Thaw Case." The article contends that: "Influence on Children Bad" from these kinds of films.

This article's subtitle reads: "Judge Cleland Says Children Should Not Be Allowed to Attend Some of Them. Vice Shown in Pictures. Illustrations of the Thaw Case Displayed in Many Places in the City."

**600.** "The Night Display." *Los Angeles Times* Sept. 10, 1895 1895: 1.

This article begins by saying that "Aladdin and his lamp could not have conjured up a more brilliant demonstration than was seen in Sacramento tonight. California's capital city was aflood with light, a light which rivaled the moon. The people were celebrating the introduction of a mighty electric power, generated at Folsom, twenty-two miles away, and brought here in sufficient quantity to turn all of the wheels of commerce and illuminate every house.

"It was a carnival night in every sense of the word.... All the trees in the front of the building were covered with incandescent lamps, in carnival colors, cherry red, apple green and poppy yellow, making them look like an enormous collection of Christmas trees."

**601.** "The Night Parade." *Los Angeles Times* April 21, 1895 1895: 6.

This article begins by saying that "When Aladdin rubbed the magic ring, and by the power of the genii worked his will in such delightfully mysterious fashion, and wandered through the subterranean region where the glint and sheen of myriad-hued shops reflected their light into his eyes, he witnessed no more dazzling array of scenic beauty than was apparent last evening in this city.

"Wander where one might, gay Chinese lanterns twinkled brightly, and cast grotesque shadows on the moving throng beneath. In the dim light the bunting flapped lazily in the breeze, but the quiet color tone later on gave place to a blaze of light than transformed the scene as if by magic. Throughout the streets along the line of march during the time of the passage of the procession, the scene seemed like a little bit of fairyland. The air was filled with fiery bolts of many hues; at intervals the cauldrons of red fire blazed up and cast their weird shadows, which the somber background of foliage only rendered more intense...."

**602.** "Non-Inflamable Cinematograph Film." *The Times [London]* June 25, 1912 1912: 4.

This report is on the fire dangers of celluloid.

**603.** "Non-Inflamable Cinematograph Films: Substitutes for Celluloid." *The Times [London]* Dec. 18, 1912 1912: 21.

This article reports on possible replacement material for flammable celluloid.

**604.** "Not in the 'Movies'." *Chicago Daily Tribune* Aug. 28, 1914 1914: 8.

This article give specific examples of films cut or censored by Chicago authorities.

**605.** "Object to Film Profanity." *New York Times* Dec. 13, 1910 1910: 1.

The subtitle to the article, dateline Cleveland, reports that "Deaf Mute Lip Readers Say Picture Show Actors Use Vile Language."

**606.** "Of Extra Glands, Giant Agony And the Grey Stone Mountain [re Jack Valenti]." *Time* 86.2 (1965): 19-20.

This article discusses Jack Valenti's considerable admiration for President Lyndon B. Johnson.

**607.** "Offensive Moving Pictures Are Barred by New Combine." *Chicago Daily Tribune* Dec. 15, 1907 1907: 2.

This article reports on the formation of the United Film Service Protective Association of the United States. The article's subtitle reads: "Pledge to 'Cut Out' Objectionable Films Made in Manufacturers and Renters' Association."

**608.** "Office of Film and Literature Classification (Australia)". Nov. 7, 2005. < <http://www.oflc.gov.au>>.

This is the official website of Australia's Office of Film and Literature Classification. The Australians approached movie rating differently from the United States. Whereas the Classification and Ratings Administration in the United States generally avoided discussing the quality of films its rated, the Australians gave more weight to such considerations and were inclined, too, to turn to experts for advice.

**609.** "Office of Film and Literature Classification (New Zealand)". < <http://www.censorship.govt.nz/censorship.html>>.

This is the official website of New Zealand's Office of Film and Literature Classification. The Australians approached movie rating differently from the United States. Whereas the Classification and Ratings Administration in the United States generally avoided discussing the quality of films its rated, the Australians gave more weight to such considerations and were inclined, too, to turn to experts for advice.

**610.** "Office of Film and Literature Classification (New Zealand)". May 20, 2010. <<http://www.censorship.govt.nz/censorship.html> (accessed May 20, 2010)>.

This is the official website of New Zealand's Office of Film and Literature Classification. New Zealand (and the Australians) approached movie rating differently from the United States. Whereas the Classification and Ratings Administration in the United States generally avoided discussing the quality of films its rated, in New Zealand and Australia, raters gave more weight to such considerations and were inclined, too, to turn to experts for advice.

**611.** "Old Movie Taboos Eased in New Code for Film Industry." *New York Times* Dec. 12, 1956 1956: 1, 51.

This articles notes that the 1956 revision of the MPAA's movie Production Code eased restriction on showing drug addiction, abortion, kidnapping, and prostitution but keep the bans on "sex perversion" (i.e., homosexuality) and venereal disease.

**612.** "Originality the Crying Need of the Photodrama as Münsterberg See It." *Current Opinion* 62.4 (1917): 258.

Quoting Hugo Münsterberg regarding his apprehensions about the photoplay: "'It is not the dangerous knowledge which must be avoided, but it is the trivializing influence of a steady contact with things which are not worth knowing.'" Münsterberg also is quoted to the effect that simply punishing the villain at the end of the film may not be enough to prevent the film from having a harmful moral influence. "'Certainly it is not enough to have the villain punished in the last few pictures of the reel. If scenes of vice or crime are shown with all their lure and glamor the moral devastation of such a suggestive show is not undone by the appended social reaction. The misguided boys or girls feels sure that they would be successful enough not to be trapped.... The true moral influence must come from the positive influence of the play itself.'" (Münsterberg quoted)

**613.** "Our Geraldine Is Home Again from Movie Land." *New York Times* Aug. 22, 1915 1915, sec. X: 4.

Performer Geraldine [Farrar] comments on differences between live opera acting and film acting; projecting personality; how the gramophone and movies reach many more people than live stage. "I have done now," Miss Farrar answered, "what I have always wanted to do but could not because of the limitations of the operatic stage. To me the acting of a role has always appealed more strongly than the singing, but in opera one must use repression, and indicate while singing a few bars all the play of emotions that one may have a whole scene for in the photo drama. When 'Carmen' was produced at the Metropolitan there were things I wanted to do that were physically impossible on the operatic stage, so my Carmen was much like all the others. When you see my Carmen of the picture you will see my real Carmen, and some day I am going to live things up a bit at the opera."

"Opera in America is for the very limited public, the public that can pay \$6 for orchestra seats. The graphophone reaches a much larger public, and through it my voice has been carried to thousands who will never hear me sing. But the movies reach the millions, and so I have added a vast new public to the restricted one I had before. All of these millions can appreciate to a greater or less degree whatever art I have recorded for the screen; many of them probably could not appreciate my singing. For the eye registers more universally than the ear."

"Would you advise other prima donnas to go in for movies?"

"If they have the face and the figure, yes. The screen more surely than the operatic stage is for the artist while she has youth and beauty and vitality. I have proved what I have always contended, that it is personality that counts whether in 'Carmen' on the screen or 'Carmen' on the stage."

**614.** "Our Pampered Artists." *The Independent* 88.3551 (1916): 515.

This article comments on the changing relationship between the actor and the drama or play. "In the elder days of art it was the custom to admire the work and ignore the artist. Nowadays we admire the artist and ignore his work.... It is like a banquet where the toastmaster takes up all the time by his introduction of the speakers."

**615.** "Over-Illustration." *Harper's Weekly* 55.2849 (1911): 8.

This article, which appeared in a magazine that was one of the early users of illustration, deplores the over use of pictures. "We can scarce get the sense of what we read for the pictures," it says, "we can't see the ideas for the illustrations. Our world is simply flooded with them. They lurk in almost every form of printed matter; they assault from the bill-boards, from the innocent and useful fences and necessary barn roofs; they are part and parcel of every kind of advertisement.... And these pervasive pictures run an extraordinary and comprehensive gamut, from the atrocious and villainous, through many degrees of commonness and mediocrity, up through various stages of good and better, to the really excellent, to the noble and the best."

The images in the Sunday newspapers come in for criticism. "But it is more than a far cry, it is an incalculable distance, from the beauty and perfection of kindred arts and kindred minds, to the pictorial squalor, say, of the Sunday newspapers, of which the 'Funny Page' is the dearest monstrosity ever foisted upon a patient and long-suffering public. For young and undeveloped minds and eyes to come into frequent, to say nothing of constant, contact with this sorry stuff, with its wretched coloring and worse than wretched subjects, is simply to sow the place of taste with *salt*, and to make any later and lovely growth utterly impossible."

More than the quality and more than the sheer volume of pictures posed a problem, according to this editorial. The images could curtail thinking. "But it is not the quantity and quality of to-day's illustrations that may be questioned so much as illustration itself. For even if it were far better than it is, and were more sparingly and effectively used, it would still be of doubtful value. 'You're not seeing that with the eye only,' remarked a scientific man once in the course of conversation, 'but with the eye aided by the brain -- the eye plus the power of visualization.' And he was right! 'All original thought is done in images,' said [Jacob] Molescott: and it therefore become of prime importance not to pre-empt the growing and developing mind by poor, tawdry, and irrelevant pictures. Illustration, rightly used, is a fine mental stimulant; but improperly and over used it becomes simply a

mental drug. And it would be safe to say that a young mind, overfed pictorially, will scarcely be likely to do any original thinking. ...To see and *not* perceive, to give the effects of certain forms of illustration, which are apt to stunt, if they do not kill, the imagination. Indeed, one may often gauge the range and quality of a child's apprehension and imagination by its independence of the pictured page." Unfortunately, only "rarely does an illustration lift and really illumine its subject."

The article draws a parallel between acting and illustrating when it says that "there is close analogy between the art of acting and that of illustration."

There is an important difference between the written text and the illustration. "Compare the average text with the average illustration, and the reflective person will see why illustration may prove detrimental, why it may preclude thought and prevent visualization. To try to image forth for one's self, to become conversant with, and ready in, apt illustrations of a subject, whether they be of picture, symbol, metaphor, or simile, is all part of thinking. And thinking is a living process, both a science and an art: it is the athletics of the mind. Not only are pictures that corrupt the mind to be avoided, but all such as do not actually aid in this process of thinking are reprehensible and enfeebling to the mind."

The editorial concludes by giving examples of illustrations "that call upon the highest faculties of the mind" and says they are "a far cry from the modern illustrator who harshly and superficially reads the matter submitted to him, and then makes a picture bearing little or no relation to the subject."

**616.** Hearings before a Subcommittee of the Committee on Foreign Relations, United States Senate, Eighty-Third Congress, First Session. *Overseas Information Programs of the United States, Part 2*,

These hearings investigated a wide range of media including motion pictures, radio, television, books, and more. It includes the March 6, 1953, testimony and statement of Eric Johnston, president of the Motion Picture Association of America.

**617.** "Owe Life Wreck to Dance Hall." *Chicago Daily Tribune* Jan. 21, 1905 1905: 14.

The subtitle of this article reads: "Six Young Girls in Juvenile Court, Tell Stages in Downward Path. Blame Penny Arcades. Judge Mack Promises Gaston They All the Punishment Law Will Allow."

**618.** "Panic in Five Cent Theater." *Chicago Daily Tribune* Dec. 26, 1908 1908: 1.

This subtitle of this article reads: "Man Burned and People Terrified on Eve of Crusade. Must Take Out Licenses. Mayor Busse Determined to Enforce the Ordinances at Once."

**619.** "Panic Narrowly Averted." *New York Times* Feb. 27, 1900 1900: 1.

This is a report on the fire dangers posed by moving picture theaters. The article's subtitle reads: "Electric Spark Sets Fire to Picture Films and Causes Scare in an Up-Town Theatre."

**620.** *Paris Adult Theatre I v. Slaton*. 413 U. S. 49 (1973) 1973.

In *Paris Adult Theatre I v. Slaton*, a case decided the same day as *Miller v. California*, the U. S. Supreme Court upheld (again 5 to 4) the right of states to prevent the showing of hard-core pornographic films in adult theaters even though the owner had limited the audience to consenting adults. The case, which originated in Georgia, involved two allegedly obscene movies. A trial court had thrown out the complaints on grounds that the theater had restricted minors and that exhibiting the films to consenting adults was permissible under the constitution. The Georgia Supreme Court reversed this decision. Using *Miller*, the United States Supreme Court upheld the Georgia high court, holding that even though "conclusive proof is lacking," states could conclude that "a nexus does or might exist between antisocial behavior and obscene material...." Moreover, the United States Supreme Court said that showing obscene matter in a public place was "not protected by any constitutional

doctrine of privacy." Whatever right to privacy that an adult might have at home did not extend to a commercial theater. Nor was everything shown to consenting adults constitutionally protected; Georgia's obscenity laws and their relation to the First Amendment could therefore be reinterpreted in light of the standards set out in the *Miller* case.

**621.** "The Passing of the Wood Engraver." *New York Times* April 23, 1895 1895: 4.

"With the advent of the half-tone reproduction, engraving on wood bids fair soon to become a lost art," this article says. However much such developments were "to be regretted," the *New York Times* said in 1895, the fact remained that "the future of the engraver on wood offers little promise and few possibilities; the spirit of the age is against him; the photograph brought under intelligent control and utilized by chemicals has usurped his place."

**622.** "Penthouse Fights Moral Majority." *Financial Times (London)* April 21, 1986 1986: 24.

This article deals with *Penthouse's* efforts to counter anti-pornography boycotts that had targeted the magazine.

**623.** "People Like Crime Shows." *Chicago Daily Tribune* Dec. 1, 1907 1907, sec. A: 8.

With regard to crime shows, this article says: "Nothing is more popular on the stage than crime and criminals if one may judge by the titles of the plays that are being presented throughout the country. A Lawyer can hardly find any kind of a law that is not broken every night on the stage, and as often as otherwise the criminal is applauded and becomes the hero before the last curtain drops.

"Sometimes the criminal hero reforms, and sometimes he proves himself innocent, but the managers have proven the public sympathy for the wrongdoer so often that most any kind of crime play seems to have a good chance for success." A list of play titles follows including "James Brothers in Missouri."

**624.** "People Who Buy Photos." *Los Angeles Times* July 16, 1895 1895: 3.

This article talks about who buys photographs and its subtitle reads: "Artists, Architects and Educators Among the Best Customers." The article notes that recent advances in photography have greatly changed the nature of businesses that sell pictures. "The development of photography in the last few years has had the effect of changing entirely the character of the shops in which photographs are sold, and these have become as interesting in many respects as the art stores and studios, says the *New York Sun*. Every dealer in photographs who is up to the times considers it necessary to have a room set apart for his regular customers. The casual customer, who merely wishes to buy a photograph or two, does not see this at all; but the collectors, students, artists, architects and others who seek photographs to complete collections, or for assistance in work they have in hand, find this special room a great convenience. It is fitted as a combination studio and library; is as free from disturbance as possible, and does not look at all like a shop."

Quoting a leading dealer: "The patrons of my shop may be divided into two classes -- those who purchase foreign photographs and prints, as well as domestic productions, for educational or practical use, and those who collect for purely personal pleasure. The former far outnumber the latter. **The magazines and daily newspapers are probably the largest purchasers.** [emphasis added] They come the colleges, museums and other educational institutions. The college professors are among our best customers....

"...There are so many new photographs on special subjects, both foreign and domestic, placed on the market constantly, that those who want them all must be continually looking for them. They do not know what they want until they do look, and cannot rely entirely upon the discretion of a dealer to select them for them."

**625.** "Phonograph to Give Wilson To All of Us." *New York Times* Aug. 9, 1912 1912: 1.

This article reports that Woodrow Wilson will use the phonograph and moving pictures. He send out phonograph of a speech (with things edited and added from the original) along with moving pictures taken of him. The subtitle of the article reads: "Planned to Let Nation Hear Him as the Moving Pictures Show Him in Action; Sits for Portrait Here."

**626.** "Photo-Cinematograph Apparatus." *The Independent* 75.3379 (1913): 584-85.

This article begins with the snide remark that the title "is the Greek for it. In vulgar American it is 'the talky movies.' But whatever we call it it is not yet altogether satisfactory." (584) The words and pictures are still unsynchronized. The article also reports that efforts to produce color films is less than perfect. Too often "the maiden's blush extends over the foliage in the background." (584)

**627.** "Photographic War History." *New York Times* March 7, 1899 1899: 8.

This article notes that government offices have been asked to contribute prints, films, or negatives. The article's subtitle reads: "Government Proposes to Issue the Works Asks for Contributions."

**628.** "Photographing in All Colors. An Alleged Remarkable Discovery by a Parisian Scientist." *Chicago Daily Tribune* Feb. 22, 1891 1891: 6.

This article discusses M. Lippmann (a professor of physics at the Sorbonne) and his process for color photography.

**629.** "Photographing in Colors." *Chicago Daily Tribune* May 26, 1888 1888: 2.

"The latest invention in photography is the discovery of a process by which colors as well as objects may be photographed. By the use of several plates instead of one, three negatives are taken on plates specially prepared...."

**630.** "Photographs and Pictures." *Living Age* 261.3385 (1909): 503-05.

This article considers how photography and compete with paintings and drawings in producing portraits. It says that "the complete imitation of reality is possible in a picture and, except for the absence of color, is achieved as a matter of course in a photograph." (503) Yet, the photograph often fails to capture the personality of the one be pictured. "The very impartiality of the camera lead it into error, since it has to represent in monochrome two different classes of fact -- namely, facts of color and facts of light and shade; and these facts, produced in reality by the action of light, cannot in any pictorial imitation of reality be both exactly and fully represented." (503) The black and white photo often misrepresents color and also light and shade.

If a portrait painter is seeking primarily to "represent character, he will probably find that form is more essential to his subject than color, and he will therefore subordinate color to exact definition." (504)

Even color photography, when it become easily used, will not allow the photo to compete with a good portrait. "Thus it is clear that a photograph cannot in any way compete with a fine portrait, and it will be able to compete even when color photography becomes as perfect as it can be...." (505)

**631.** "Photographs by Telegraph." *Youth's Companion* 86.50 (1912): 690.

This article notes that "in France the transmission of photographs over a telegraph-wire is now practical for newspaper work, and pictures sent in this way appear in the Paris papers. *L'illustration* is taking the lead, and one station is installed at its Paris office and another at Monte Carlo." The article then quotes from an article in the *Scientific American* that describes this process.

**632.** "Photographs by Telegraph: Television Next?" *New York Times* Nov. 24, 1907 1907, sec. SM: 7.

This article talks about sending a photograph of King Edward from England to Paris by telegraph and asks, "If Pictures Can be Flashed by Wire from One Country to Another, Why Not Transfer Views in the Same Way?" The article's subtitle reads: "Successful Test of Prof. Korn's Remarkable Invention Indicates the Possibility of Another Field for Scientific Discoverer."

**633.** "Photographs of Moving Picture Actors. A New Method of Lobby Advertising." *Moving Picture World* 6.2 (1910): 50.

At a time when many actors were reluctant to have their photographs shown in connection with moving pictures, this article suggests that attitudes about movie actors and photography was changing. The article reports that "Numerous have been the requests from exhibitors for photographs of the principal actors in the films. These requests have been showered on all the leading manufacturers and *The Moving Picture World* by exhibitors who desired the photographs for lobby display. For various reasons the manufacturers have held aloof from this form of advertising, but the Kalem Company has solved the problem by preparing a handsome lobby display of the members of their stock company, which they advertise in this week's *Moving Picture World*. It is to be hoped that sufficient exhibitors will avail themselves of the offer to enable the Kalem Company to furnish these frames at the exceedingly low price advertised.

"Managers of picture theaters and nickelodeons all over the country are making repeated urgent requests upon the producers of moving picture subjects for photographs of the principal actresses and actors taking part in them. Heretofore requests of this character have come from love-smitten patrons of the places. The managers of the places now see a big advertising advantage in the display of such photographs in the lobbies of their theaters. ...It is conceded that all good products in the advertising line should receive hearty support from all quarters, but the people who play the parts in the pictures see the matter in a different light, and for that reason the work of transforming the lobbies of the picture places into photograph galleries is progressing very tardily. It is a matter of delicate sentiment with the actors and actresses. While the pictures have attained a distinct prominence in the theatrical field and are now recognized as a standard attraction, the people playing the parts in them are very sensitive about having their identity become known.... These people are only too glad to play the parts and do their work with the same zeal exercised in regular theatrical productions, but all of them try to shield their identity." The use their voices on stage but have to work in pantomime in movies. The article says that "pantomimic work makes the people playing the parts feel that their artistic reputations would suffer should it become known that they were playing parts in moving picture studios...."

**634.** "Photography in Colors at Last." *Chicago Daily Tribune* June 26, 1896 1896: 6.

"It is at last announced in an authoritative manner that photography in colors is an assured fact," the *Tribune* reports. It then discusses a patent held by James D. McDonough of Chicago.

**635.** "Photography Under Difficulties." *New York Times* April 2, 1914 1914: 10.

This article notes that reports from photographers about capturing real scenes of combat are vastly inflated and are but "advance notices" printed for free "as straight reading matter" "We have been credibly informed that movie men have been permitted by Gen. Villa for a consideration, of course to accompany him into as much of danger as they have inclination to encounter, and the exultant reports given out as coming from these representatives of the greatest and most enterprising of new industries are just about what they would be expected to send.

"Skepticism whispers to credulity, however, that only by the luckiest and rarest of chances would a movie man be confronted at convenient distance in real war with a scene that would show up well in a picture, while highly impressive battles could be produced by the adroit manipulation of properly clothed actors in front of skillfully designed backgrounds. Between nature and art the comparison is so often in favor of the latter nowadays

that the former can hardly be credited with holding its own and still less with the catching up of the Whistlerian legend.

"If only these telegrams from the photographers were not such good 'advance notices' all printed free and as straight reading matter, too! confidence in their veracity would be easier. Still, faith is not impossible. The fact that this sort of photography would be dangerous counts for nothing. Fortunately for the welfare and preservation of the human race, a good many of its members like danger and enjoy taking risks, especially when both glory and money can be won by doing it.

"So whoever will may doubt that we are soon to see moving pictures taken in the intrenchments [sic] and streets of Torreon while the most desperate fighting of recent years was going on. The probabilities are, however, that we shall do just that and a fine argument against war they ought to be if they bear out the hideous stories of wholesale slaughter coming from that dreadful city."

**636.** "The Photoplay: It Has Achieved a Distinct Technique and Appeal to the Public." *New York Times* May 1, 1911 1911: 10.

This was a letter to the Editor of the *New York Times* from the Entertainment Director, the Educational Alliance.

**637.** "Physicists Discuss Photo-Electric Cell." *New York Times* Feb. 23, 1930 1930: 21.

This article discusses research related to talking films and television. The article's subtitle reads: "Phenomena Which Produce Television and Talking Films Topic of Society Here."

**638.** "A Physiologist's Analysis of the Mind That Thinks in Colors." *Current Opinion* 57.3 (1914): 181-83.

This article talks about research on people who think in color. Just as some people apparently hear -- e.g. music -- in color, some people associate days of the week or other matters with specific colors. However, this trait appears to be highly individualistic in that different people might associate different colors with a particular day of the week (e.g., Tuesdays). Scientists have little explanation. The answers explaining why some people think in color is "extremely disappointing, for we have no satisfactory explanation of any of these matters," the article says. (182) Thinking in color is something akin to genius because it cannot be taught or "conferred by training or education." (183)

**639.** "Pictorial Photography in Colours." *The Times [London]* Aug. 20, 1908 1908: 6.

*The Times* provides an account of progress in color photography.

**640.** "Picture Men Favor Censors." *New York Times* Oct. 11, 1910 1910: 8.

This report on movie makers who supported some form of regulation on films has the subtitle: "Concur in the Plan to Have a Public Board Pass on Their Films."

**641.** "The Picture Post-Card." *Living Age* 242.3134 (1904): 310-14.

This article says that while the "superior person despises the picture post-card," such people often fail to understand the "charm" and the "imaginative sense" that underlies this form of communication. The intelligent collector of post cards, with their imperfect photographs, "is constantly, in the imagination, traversing the whole world." (310)

**642.** "Picture Shows a Foul." *Chicago Daily Tribune* May 15, 1897 1897: 7.

This article says that film of the Fitzsimmons-Corbett boxing match showed a foul. The subtitle of the article is: "First of Verascope Illustrations of the Carson Fight. Fitzsimmons Appears to Be Striking Corbett While the Latter Is

on His Knees. Referee Silver Declare It Is Not an Accurate Reproduction He Shows Where It Is Wrong and Complains of Talk about Unfairness Since the Battle."

**643.** "Pictures and News." *Outlook* (1915): 577.

This publication notes that it plans to give readers sixteen additional pages of illustrations using "a new process of photogravure printing," and "without diminishing the space devoted to printed matter." Two of the illustrated pages will be devoted to advertising. These pictures will be more than mere entertainment and will try to do for readers "precisely what vivid writing does -- bring vividly before them the character of man, the representation of an action, a historical background, or an event of current history."

The article says that the *Outlook* "proposes to do this once every month; and to combine, by the development of the process of printing photogravures, a fine quality of art with timely news interest. Until very recently it was possible to print the photogravure only on a flat press; it can now be printed on a rotary press; and this makes it possible to extend the use of the process from the art publications to the weekly newspaper."

**644.** "The Pictures and Their Part in Modern Life." *Los Angeles Times* Oct. 7, 1917, sec. II: 6.

Commenting on the impact of motion pictures, this article says that "So great an influence have moving pictures become in the home that it is difficult to appraise the extent of their hold upon the minds and the hearts, the morals and the fashions of us all. Pictures are well-nigh as vital to our thought and entertainment as oxygen and hydrogen to the water we drink and the air we breathe. As an influence they rank with the churches, the schools and the newspapers." The rest of this article continues in the same vein.

**645.** "Pictures by Telegraph." *Christian Observer* 89.22 (1901): 21.

This brief article reports that "a half-tone picture of President Harper of Chicago University was recently sent by telegraph from New York to Chicago." The story was reported earlier in such newspapers as the *Chicago Daily Tribune* (April 13, 1901, p. 1).

**646.** "Pictures by Wire." *New York Evangelist* 69.14 (1898): 35.

This article discusses the invention by Ernest Hummel of St. Paul, MN, to see pictures over telegraph lines. It says that "The Western Union Telegraph Company furnished a wire for sending a picture from Key West by cable to Punta Rassa, a distance of 150 miles, and thence by wire to Jacksonville, and on to Savannah, Washington, Philadelphia, and New York, a total distance of 2,000 miles.

"The [New York] Herald of Saturday contains the result in the shape of a picture of General Maximo Gomez and one of the cruiser Montgomery entering the harbor of Havana.

"Mr. Hummel, who is a jeweler of St. Paul, Minnesota, is the inventor of a receiver and transmitter by which the pictures are sent. The receiving machine is said to look very much like a miniature printing press. The Herald describes the operation as follows: ...." (seven paragraphs are reprinted from the Herald article).

**647.** "Pictures Sent by Wire." *Chicago Daily Tribune* April 13, 1901: 1.

This article reports that "a life-sized portrait of President William R. Harper of the University of Chicago was transmitted by wire from the engineering building of Columbia University tonight to the Quadrangle club in Chicago, and at the same time a similar picture of Seth Low was flashed from Chicago to this city. The experiment was one of the features of the program at the conversazione of the American Institute of Electrical Engineers at the Columbia University this evening.

"The pictures were sent by an entirely new system, which was explained at length by H. R. Palmer. By the system halftone pictures, sketches, handwriting, and the like can be transmitted over long distances, employing ordinary telegraph circuits." The concluding paragraph explains how this invention works.

Other exhibits are discussed here, including Nicola Tesla's experiments with an electric oscillator, and R. M. Hutchison "akouphone and akoulalion" described as "a microtelephonic instrument." The latter might enable the "deaf to hear."

**648.** "Pictures Sent by Wire." *Chicago Daily Tribune* Jan. 9, 1898 1898: 28.

The subtitle of this article reports: "New Device Solves a Difficult Problem and Increases Newspaper Possibilities." The article goes on to say that "Last week the New York Herald made the first use of an invention which enables pictures to be telegraphed to any distance. The tests have been uniformly and completely successful, and the device is now in daily operation. Ernest A. Hummel of St. Paul is the inventor, and he will certainly realize a fortune from his machine.

"The picture to be transmitted is first drawn on a piece of tin four and a half inches square. That piece of tin is placed on a stationary bed in the transmitter and locked in. The drawing is uppermost...." The article goes on to explain how the device works.

**649.** "Plague Spots." *Los Angeles Times* Aug. 9, 1899 1899: 5.

According to the author of this piece, the "city's moral health demands the immediate cleansing of the festering plague spots known as 'phonograph parlors.' Vile pictures are on exhibition there ...."

**650.** "Plan Clean 5-Cent Show." *Chicago Daily Tribune* May 24, 1907 1907: 7.

The subtitle to the articles reads: "Hull House Workers to Operate Moving Pictures; Performances to Continue from 6 to 11 O'Clock Every Night and All Day on Saturdays and Sundays Scheme Announced by Mrs. Gertrude H. Britton and Approved by Judge Mack and Others Improvements in Cheap Amusement Places."

**651.** "Plato and the Movies." *New York Times* Oct. 2, 1926 1926: 18.

This article draws a parallel between the movies and Plato's cave: "...They cannot see each other, the fire or the performers carrying objects to and fro on the low wall behind them any more than the spectators in a modern movie can see the dummy substituted on the floating cake of ice as it nears the dam. They take the capering shadows for reality. It one is released from his bonds and taken into the light where the real persons and objects are pointed out to him, he does not rejoice. The light hurts his eyes. It pains him to turn his neck. He does not believe that he has been seeing silly things and that he is now nearer to reality. He flies back to his dark cavern as fast as he can.

"That pessimistic view of the movies may in time have to be changed. They are now in the romantic stage, falling into the general classification of 'escape' literature. Their patrons, charmed by false glory, are in the habit of identifying themselves with the protagonist, which necessitates a happy ending, no matter how art must be dragged and plausibility outraged. But the movies are camping on the trail of the theatre. A few realistic pictures have been done, some without too much loss of money. Perhaps it will be possible to illuminate the cave if the audience there refuses to be brought out into the light."

**652.** "The Playboy Philosopher." *Newsweek* Aug 4, 1986 1986: 3, 50.

An article about Hugh Hefner, *Playboy*, and the Reagan administration's offensive against pornography.

**653.** "Playboy Sues Meese, Porn Panel, Cite 'Blacklist'." *Adweek* May 26, 1986 1986, sec. Southeast Edition: website.

This article deals with *Playboy's* suit against Attorney General Edwin Meese. *Playboy* was the target of anti-pornography boycotts at the time and several chains stopped carrying the magazine. These developments came at a time when video cassettes were changing the way Americans experienced erotica.

654. "Plays on the Stage by Machinery Alone." *New York Times* April 13, 1908 1908: 7.

This article describes a device that combines the gramophone and moving picture, the "theatorium," presents plays without actors. The subtitle of this article reads: "Charles H. Perry Perfects Deal for Use of the 'Theatorium' in Leading Houses; the Shuberts Take a Hand; Shakespeare's Plays, 'Dr. Jekyll and Mr. Hyde,' and Other Dramas to be Presented without Actors."

655. "Poetry of Nature -- Tintern Abbey." *Nassau Literary Magazine* 36.6 (1880): 239-47.

656. "Police to Censor Shows." *Chicago Daily Tribune* April 30, 1907 1907: 2.

The subtitle of this article reads: "Squad Detailed to Nickel and 10 Cent Places; Chief Says First Class Houses Are Often Just as Bad, but He Will Not Tackle Them If Any Cheap Theater Gives Vicious Exhibitions Manager Will Be Notified to Stop Under Penalty of Immediate Revocation of License."

657. "Pope Calls on Media to Stem Spread of Porn and Violence." *Toronto Star* Sept. 16, 1987 1987: A3.

This is an account of Pope John Paul II's address to entertainment leaders at Universal Studios in Hollywood. He talked about the moral influence in motion pictures, music, and other forms of entertainment. The communication industry should "support human dignity because the world is constantly tempted to forget it," the Pope said.

658. "Pope Leo in Moving Pictures." *Chicago Daily Tribune* Nov. 25, 1898 1898: 7.

This article discusses the filming of Pope Leo XIII. "Pope Leo XIII has posed before a moving picture machine. In pictures now he may be seen to walk, bow, take off his hat, smile, drive in his landau through the alleys of the Vatican gardens, and give, with his right hand raised, the apostolic benediction.

**"To the faithful that apostolic benediction reproduced in the pictures will have the same effect as if it were conferred directly, personally. The camera was blessed.** (emphasis added)

"In Baltimore on Tuesday, in Washington on Wednesday, before Cardinal Gibbons, the Apostolic Delegate; Mgr. Martinelli; Dr. Garrigan, rector of the University of America; the rector of the Georgetown University, and many other dignitaries of the Roman Catholic Church, the moving pictures are to be shown.

"There are to be displayed on these two occasions before they are displayed elsewhere. They may not be displayed elsewhere if they are considered adversely there. The exhibitions are to be absolutely under the control of the church in America."

659. "Pornography: Smut City." *The Economist* Sept. 23, 1989 1989: 28 (p. 58, UK Edition).

This article discusses the rise of pornography as a big business, thanks in part to its exploitation of such new media as cable television, satellites, and video cassettes.

660. "A Pot-Pourri of Film Widths and Sprocket Holes." *American Cinematographer* 50.1 (1969): 98-99, 101, 103.

This 1969 piece appeared in an issue devoted the previous fifty years in the technology of cinema. This article discusses the wide range of film widths used in the history of motion pictures

**661.** "Prefers Shows to Light. Newton, N. J. Couldn't Have Moving Pictures and Light Streets, Too." *New York Times* Oct. 25, 1911 1911: 1.

Places that show moving picture have been drawing so much power it was not possible to light all the street lights.

**662.** "Prepared for the Worst; Little Stories of Fact and Fancy." *New York Times* Sept. 24, 1911 1911, sec. SM: 6.

This article tells of youth selling smelling salts to offset the horrors to be seen inside the movie house.

**663.** Attorney General's Commission on Pornography. *Presentation to Attorney General's Commission on Pornography, Chicago, Illinois, July 24-25, 1985, July 24-25, 1985.* Joseph, Burton. 1985.

*Playboy's* counsel, Burton Joseph, in testimony to the Meese Commission, presented a survey of studies prepared in 1984 for Canada's Department of Justice that stated flatly that "no systematic research evidence available" suggested a causal relationship between morality and pornography in Canada. Nor did research show that there was a link between explicit materials and such crimes as rape or that viewing such materials harmed the average adult. This survey found "considerable evidence of conceptually cloudy thinking related to virtually every aspect of the work on the impact of pornography." This material is found in Folder 22, Box 70, Records of the Attorney General's Commission on Pornography, RG 60 (Justice Dept. Records), National Archives and Records Administration (NARA II), College Park, MD.

**664.** "Presidency: Revolving Door at 1600." *Newsweek* 67 (1966): 26-27.

This article deals with Jack Valenti, Lyndon Johnson, and the origins of Valenti's work with the Motion Picture Association of America.

**665.** "President Roosevelt Opens Electrical Show." *New York Times* Dec. 13, 1905 1905: 6.

This article is about the Electrical Show at Madison Square Garden in New York City and part of that exhibit for President Theodore Roosevelt pressing a key that lighted the exhibit. "Whether one visits the Garden, while electricity reigns there, for the purpose of witnessing the demonstration of its spectacular phenomena, or whether one is drawn by the genuine interest in the manifold uses of the electric fluid in the home of to-day, the factory, the office, or the railroad, there is no chance of disappointment." The article goes on to discuss how electricity can add "to the comforts of home life." One exhibit was the "theatrephone" where one could "listen to the words and music of several performances now going on in New York." Many other types of talking machines were on display. Also mentioned are demonstration wireless to ships at sea by the De Forest Wireless Telegraph Company, and X-rays. The article ends by mentioning that this evening, the new "Moore light" with its changing colors will be on exhibit at the Garden.

The article's subtitle reads: "Golden Key in White House Floods the Garden with Light. Scene a Brilliant One. Show Includes Both the Latest Popular Electrical Devices and the More Technical Exhibits."

**666.** "Pressagenting the Movies." *New York Times* Feb. 3, 1918 1918: 45.

This article discusses how press agents attempt to publicize movies and their stars. It talks about the differences between publicizing stage plays and movies the press agent for a play is concerned with only a limited number of cities; a 150 or more prints of a film will be sent out and the agent doesn't always know where. On the use of photographs "every paper receives a shower of 'stills' each week from local theatres where films are being shown, including a "goodly number of 'star' portraits." One movie company regularly mails five "stills" each week to 400 publications. To cover the country for a film, about 3,000 'stills' are needed to filter down through exchanges to local papers, etc.

"Many other forms of printed publicity are issued, or have been issued, in the still-experimental life of the movies. Some companies, like Metro, publish complete weekly magazines, dressed to imitate the best of the \_'fan' publications, but featuring one line of stars only. Triangle at one time published a very handsome rotogravure weekly of this character." Also used are "house organs." The article talks about press sheets, and press book. It notes that the some press sheets look like newspaper. "Essanay makes up a similar press sheet and dresses it to look like a miniature newspaper. Triangle's press sheet is larger, running to five columns, and carrying four illustrations."

**667.** "Problem of Color Photography About Solved After Many Experiments By the Lumieue [sic] Process, the Discovery of Two French Inventors." *New York Times* Sept. 8, 1907 1907, sec. X: 8.

This article discusses the Lumiere brothers and their process of taking color photographs. "They simplify the process of color photography to such an extent that almost any photographer may make colored negatives." The article's subtitle reads: "It is Claimed That a Simple Methods for Making Colored Prints Has been Found."

**668.** "Production Code Unit Sees Increase in Film Production." *New York Times* April 3, 1963 1963: 42.

This article notes that 55 movie scripts were submitted to the Production Code Administration during the first quarter of the year compared to only 37 during the first quarter during the previous year. The article notes, thought that "very few [films] are turned down" by the PCA.

**669.** "Professor at Rutgers New Film-Rating Chief." *New York Times* July 11, 1974 1974: 24.

This article discusses Richard D. Heffner, recently named to head the movie industry's Code and Rating Administration.

**670.** "[Profile: Dan Glickman]". ([2004?]). July 5, 2004. <[http://ksgfaculty.harvard.edu/Dan\\_Glickman](http://ksgfaculty.harvard.edu/Dan_Glickman)>.

This website at the John F. Kennedy School of Government at Harvard University gives a profile of Dan Glickman, who succeeded Jack Valenti as president of the Motion Picture Association of America on September 1, 2004. It also lists several of expertise on which Glickman and other faculty in the Kennedy School welcomed questions. Civic Engagement, Communications, Democracy, Politics, and the Presidency are among the topics.

**671.** "The Progress of the Motion Picture." *The Independent* 82.3461 (1915): 21.

This article follows up on a earlier editorial in *The Independent* (April 1914) called "The Birth of a New Art." In the year since that editorial, this piece says, "the motion picture has developed so rapidly in beauty and freedom as to leave no room for doubt of its artistic capabilities." Audiences are no longer drawn simply by moving pictures novelty and by scientific interest but because they prefer it over melodramas, problems plays, or musical comedies. Although movies still lack color and sound compared to the stage, they have several advantages over traditional theater. Movies can use all of the out-of-doors, can change scenes more often, can travel easily into the future or back into the past (like "Wells's time-machine"). Cameras can use close-ups and read facial expressions, and movies can visualize an actors thoughts. Special effects can be expensive and spectacular because, unlike in the stage, they only have to be paid for once. The article predicts that movies "will become a permanent part of the intellectual and esthetic life of the nation."

**672.** "Progress of the Race Between Nature and the Scientific Camera." *Current Opinion* 61.6 (1916): 397.

This article comments on the difficulties in taking pictures of extremely rapid movement. **It reports that in Germany, a "picture has been taken ... in one ten millionth part of a second." It also notes that the "fastest moving-picture machine at present takes pictures at the rate of two thousand per second," compared to the "ordinary moving picture" which "takes some sixteen pictures as second, and the interval between exposures is skipped.**" (emphasis added) The camera man who can take 2,000 pictures a second thus "shows us many

wonders of nature which the human eye has never looked upon." The significance of this rapid speed camera work may be no less important than the worlds shown by the microscope and telescope. The article quotes an excerpt from Francis A. Collins' book *The Camera Man* (1916), and notes that a picture has been taken of an electric spark and also a moving picture of a bee's wings in flight. Such visual information may have great practical effect. Quoting Collins, the article says: "It is conceivable that the flying machine of the future may be constructed, or operated on some entirely new principle discovered by the scientific camera man."

**673.** "'Projection' of Audiences Prophesied: Robert Edmond Jones Envisions Ultimate Step in Television." *Los Angeles Times* May 3, 1936 1936, sec. C: 4.

"Color is here. Television is much nearer than any of us think. Three-dimensional photography is one the way," this article begins. "But even that doesn't comprehend everything that may be accomplished in making entertainment available to the public. Probably the day will arrive when the individual, as part of that public, will himself be projected, so that he will be able to witness actual events both in and out of the theater without actually being there in the flesh. And he will be just as much a spectator as the person who is genuinely there." There were predictions made by Robert Edmond Jones, this article says.

Jones foresaw three-dimensional TV. Quoting Jones: "'Television as long as it is just two-dimensional will not completely compensate. We can probably look forward to the day when the semblances of real figures (three-dimensional) will seem actually to be projected into our presence, possibly by means of some sort of light or radio beam, or other electrical means.

"The reverse will probably be even more important -- the individual himself being projected to any part of the world at will. If there be a Metropolitan Opera House he will visit that. If there is a war in Ethiopia he will want to be right on the scene. Just as television gives promise of bringing such events to us; so we, in the future will be able actually to "go" to them."

This will mean the end of privacy, Jones said. "'That be the ultimate, for it will probably become a difficult time for human being to enjoy any privacy,' Jones said."

Jones commented on the color in movies "'In pictures today color is by far the most important thing in lending reality,' he continued. 'The only difficulty is that so far we have produced mostly "colored" pictures rather than "color" pictures. We have not used color for its full emotional value. We are not as yet making color an integral part of the picture -- a necessity. Furthermore we too often select picture subjects which over-emphasize colors. For that reason, nothing would be more beneficial than the production of a modern story.'"

Jones thought too much emphasis had been placed on subduing color and it is interesting to speculate if this was an indirect criticism of Natalie Kalmus who was hired by studios to coordinate color on movie sets. Quoting Jones: "'Subduing colors, which has come much into vogue, is just an expedient. A very happy expedient, perhaps; but still not what will really make color fulfill its proper function. It's an easy way out of the difficulty, but it still isn't using color to the greatest advantage.'"

Jones says that color would change acting, making it not more flamboyant but closer to real life. "'Color is going to change acting. Some think that it will become more flamboyant. Personally, I don't believe that. I think it will take the form of a closer approach to the simplicity that prevails on the modern stage. Color won't demand exaggeration in acting. It will call for a nearer approach to life.'"

**674.** *Hearings*, Committee on Commerce, United State Senate, Ninetieth Congress, Second Session. *Proposing a Study of Film Classification*, Valenti, Jack

ProCite field[2]: Statement.

When the U. S. Senate, led by Senator Margaret Chase Smith, held hearing in 1968 on movie classification, Jack Valenti, president of the Motion Picture Association of America, did not appear. He did provide a statement, however, that called any government classification scheme "intellectual and artistic tyranny." He accused the hearings of duplicating the work of the President's Commission on Obscenity and Pornography, recently appointed by his friend, Lyndon B. Johnson. A copy of this statement is in the Margaret Chase Smith Papers, Margaret Chase Smith Library, The Northwood Institute, Skowhegan, ME.

**675.** "The Psychology of the 'Movies'." *The Dial* LXI.721 (1916): 28-29.

This work is a review of Hugo Münsterberg's book *The Photoplay* (1916). The writer takes exception to some of Münsterberg's arguments. For example, "When the thesis extends to the claim that the popular devices developed conform to extensions of the intrinsic mental movement, giving it a new and precise expression, serious doubts arise. The argument becomes rather academic, like a retrogressive prophecy: what is, must be. The 'close-ups' follow the same mechanism that brought about the opera-glass; while the 'cut-backs,' which picture the reflections of the hero or heroine upon a tender past, represent the play of the reflective imagination of the spectator...." (29)

**676.** "Publicity Campaigning by a Campaigner." *The Independent* 67.3165 (1909): 224-28.

This article discusses the growing trend of corporations to hire press agents in an effort to put forth the most favorable publicity, this at a time when many believed these companies were involved in corruption. "'Publicity Campaigning' ... is a new form of advertising -- the highest form that has yet been developed in this land of the advertiser," the author writes. Starting in late November, 1906, companies began using "Electric Talks," which "took the form of a daily display advertisement, regularly paid for as an advertisement, three columns wide and twelve or thirteen inches deep, a new one every day, printed in each of the three daily newspaper of Roanoke [Va] ... and .. number consecutively." (225) The author, who was involved in these campaigns, continues: "We started out by telling in these 'Electric Talks' just what the company had already done to provide a street railway and an electrical service for Roanoke by extending its lines to new sections and in various other ways it had helped to build up the city, to foster its growth, and to bring more people and more businesses to it...." (225)

**677.** "Queen Victoria's Life on the Cinematograph." *The Times [London]* Nov. 4, 1913 1913: 4.

The highlights of Queen Victoria's life have been captured on moving pictures. The article's subtitle reads: "Striking Events of the Reign."

**678.** "Queens." *Life* 72.1880 (1918).

This article begins by asking: "How about queens after the war? Who will care for them?" It ends: "What is the use of having a queen if she doesn't know how to wear clothes or act like a movie star?"

**679.** "Queer Contracts Made with Actors." *New York Times* Feb. 22, 1903 1903: 21.

This article gives examples of the strict terms of contacts that many stage actors were expected to sign. The subtitle of the article reads: "Some Thrive on the Susceptibility of the Mummies. The Players as a Wage-Earner. Condition of Rhetorical Servitude. Why Successful Acts Say 'Don't' to Stage Aspirants."

**680.** "Queer Germ Contagious. Moving Pictures Inoculate Arizona Cowboy." *Los Angeles Times* Dec. 22, 1908 1908, sec. II: 1.

This story implies that an Arizona rancher (not a child) might have gotten the idea for trying counterfeiting from the movies. Says "A month passed in this city, amid the lurid attractions of crime-depicting melodramas and moving-picture shows, made an alleged counterfeiter of Henry Stove, an Arizona cowboy, now in jail at Tombstone.... he had never thought of passing bogus coins until the idea came to him while he was living here.

After the evil germ found lodgment in his brain, the visitor went to the public library and there passed days poring over books on metallurgy and kindred subjects."

The subtitle to this story reads: "Takes Tip from Film, Make Bad Gold Coins. Has High Old Time, But Is Quickly Jailed."

**681.** "Quick Fashion Changes in Moving-Picture Plays." *New York Times* Aug. 4, 1912 1912, sec. SM: 14.

This article comments on the ability of motion pictures to influence tastes and fashions. "For with the moving picture business has come a new capriciousness to the public mind, a feverish desire for change which is new even to the amusement world. Old fashions in plays lasted two or three seasons; old fashions in books the same. Fashion, with the moving pictures, however, is not a question of two years, or one year. It has come to be only a question of months when a vogue for a certain character of film as utterly passes away as do the snows of yesteryear, or even more undecorative things. It is a strange phenomenon which, as has been said, the possessing competition of the moving-picture companies themselves created, without possibly considering its effect upon the public." The article goes on to say that "... men search the furthest corners of the earth for 'settings' and appropriate scenery for thrilling dramatic event, and an organization, world-wide, like some mammoth industrial machine, spreads absorptive tentacles over the earth in the grim desire to discover new fashions of moving pictures for every civilized people."

This article also mentions changes brought to the coverage of news. Its subtitle reads: "Public Demands New Subjects Constantly Enormous Sums Spent in Organization and in Keeping Pace with Changing Requirements Element of Great Personal Danger in Getting Films."

**682.** "QuVIS Brings Star Wars Into the New Millennium of Digital Cinema". 2002. (May 10, 2002). July 18, 2003. <[http://www.quvis.com/news/pressreleases/051002\\_starwars.htm](http://www.quvis.com/news/pressreleases/051002_starwars.htm)>.

This article in *QVIS News* reports that eleven North American theaters saw *Star Wars: Episode II -- Attack of the Clones* (20th Century Fox, 2002) in digital format. The movie, directed by George Lucas, was the first action major motion picture shot entirely digitally with no film. The article discusses Lucasfilm Skywalker Ranch and Industrial Light & Magic.

**683.** "QuVis Introduces Compression Technology to Southern California Military Community". 2001. (Jan. 23, 2001). Jan. 4, 2003 (3:57 p.m.).

This article, which appeared in *QVIS News*, notes that QuVIS, headquartered in Topeka, KS, "enabled the transfer, storage and play back for the digital premier of Miramax Films' *Bounce*, the first major motion picture to be delivered via satellite." The article notes areas of cooperation and mutual benefit between Hollywood and the military. 1) Developing standards for digital transmission. 2) Helping Hollywood with distribution standards. 3) Helping the modern military deal with "many sources of imagery as a result of the proliferation of small and low cost sensors." One might note, too, that the military looks to Hollywood for innovation in image simulation.

**684.** "QuVIS Introduces QuBit ST 2.1 and QuClips Express to Military Community". 2002. (Jan. 15, 2002). Jan. 4, 2003 (3:59 p.m.). <[http://www.quvis.com/news/pressreleases/011402\\_AFCEA.htm](http://www.quvis.com/news/pressreleases/011402_AFCEA.htm)>.

This news release pertains to compression technology and digital communication, and the benefits they provide to "military simulation and display applications." QuVIS also provides digital cinema server equipment to commercial movie theaters in the United States.

**685.** "QuVIS Raises the Curtain on Digital Cinema Technology at NIST". 2001. (Jan. 9, 2001). Jan. 4, 2003 (4:00 p.m.). <[http://www.quvis.com/news/pressreleases/010901\\_NIST.htm](http://www.quvis.com/news/pressreleases/010901_NIST.htm)>.

This article appeared in *QVIS News* and promotes the advantages of digital cinema. It notes that QuVIS will be demonstrating its new digital cinema recorder/server/player and Quality Priority Encoding compression technology at the National Institute of Standards and Technology (NIST) Jan. 11-12, 2001, at Gaithersburg, MD.

**686.** "QuVIS Server Used in First-Ever Major Motion Picture Satellite Delivery and Digital Cinema Screening". 2000. (Nov. 14, 2000). Jan. 4, 2003 (4:00 p.m.).

This article, which appeared in *QVIS News*, discusses the first digital transmission by satellite of a major motion picture. Miramax Films' movie *Bounce* was sent from Los Angeles to AMC Theatre in New York. In this endeavor, the article says that QuVIS joined with Miramax, Walt Disney Corporation, Boeing, Texas Instruments, EnergyDigital, and Williams Communication.

**687.** "Radio Moving Pictures." *New York Times* April 27, 1924 1924, sec. 9.

**688.** "Radio Show Revealed New Improvements." *New York Times* Nov. 9, 1924 1924, sec. XX: 14.

This article has a picture of "The Most Powerful Loudspeaker in the World." The article's subtitle reads: "Elaborate Radio- Phonograph Machines Among Latest Styles Introduced."

**689.** "Radio, Disk and Talking Film Join for Home Entertainment." *New York Times* June 28, 1931 1931, sec. XX: 9.

This article discusses some of the latest developments in home entertainment in 1931. The subtitle of the article reads: "Receiving Set, Phonograph and Reel Combined in Single Cabinet by Number of Manufacturers."

**690.** "The Rainbow in the Camera." *Chicago Daily Tribune* July 9, 1893 1893: 35.

The subtitle to this article reads: "The Color Negatives Obtained by the Lippman Process."

**691.** "Rapid Photographic Manipulation for Newspaper Illustration." *Scientific American* 90.4 (1904): 63.

This article recounts how the *Newark Evening News* covered a yacht race on Aug. 25, 1903, and using a Kodak camera took pictures which were then developed aboard ship in about ten minutes. The race finished at 11 a.m. The pictures, once developed, were attached to a carrier pigeon which flew them to the paper. By 3:45 p.m. "a half-tone plate was completed, by the usual half-tone process, placed on the press, and a few minutes later the paper appeared, containing a picture of the morning's yacht race." The article notes that using carrier pigeons got better results than "wireless telegraphy."

**692.** "Raps 'Bolshevist' Movie. Secretary Wilson Asks Officials to Bar Make-Believe Riots." *New York Times* April 19, 1919 1919: 6.

This article reflects fears within the Woodrow Wilson administration of motion pictures supporting bolshevism.

**693.** *Hearings, "Television Ratings System,"* Hearings before the Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Ratings and Advisories: Implications for the New Rating System for Television [June 28-29, 1996], (Feb. 27, 1997).* Cantor, Joanne Marina Krcmar. 1927.

This piece discussing communication research on media effects and its implications for rating systems was presented to this U.S. Senate hearing investigating in early 1997 the need for a television rating system. The television industry adopted a rating plan later that year.

**694.** "Ratings and Classification Systems: Canadian Rating System for Home Videos". Nov. 7, 2005.  
<[http://www.media-awareness.ca/english/resources/ratings\\_classification\\_systems/video\\_ratings/can\\_home\\_video\\_ratings.cfm](http://www.media-awareness.ca/english/resources/ratings_classification_systems/video_ratings/can_home_video_ratings.cfm)>.

The Canadian Rating and Classification System is the primary agency rating motion pictures, television programs, video games, and other entertainment in Canada

**695.** "Ratings for Video Games." *New York Times* Jan. 4, 1994 1994, sec. D (Financial): D11.

This article deals with efforts to rate video games which were rapidly become a big business and already widely popular with youth.

**696.** "Read Bad Stories on Lips of Moving Picture Actors." *Chicago Daily Tribune* Jan. 12, 1913 1913, sec. A: 1.

The subtitle of this article reads: "Deaf and Dumb Children 'Hear' Conversation Not Meant for Public on Censored Films."

**697.** "Reagan Signs Two Laws to Combat Pornography." *New York Times* June 27, 1969 1969: 42.

This article notes that Governor Reagan signed two laws making it harder to peddle pornography to children. One established a separate standard for judging what is obscene for those under 18. The other incorporated a "pandering" concept in to advertising in cases involving obscenity.

**698.** "'Real War' and War As It Is." *The Independent* 82.3461 (1915): 5.

This short article says that "we are now getting for the first time real pictures of real war." It is not the romantic, glamorous version given by artists and poets but "now stands revealed in all its dreary nakedness." Real war is "nine-tenths ... ninety-nine hundredths of it," is "mere ditch-digging, and firing at an invisible target and convalescing in the hospital and carting and being cheerful in adversity. "What the painters have palmed off upon us before the rise of photography is not real war, or at most, only a small part of it."

**699.** "Record of Our Time to be Imperishable." *New York Times* Dec. 10, 1911 1911: 17.

The Modern Historic Records Association, the article says, "employing the inventions of our age, purposes to preserve in imperishable form the record of history, heretofore 'writ on water,' in order that future generations may know the exact nature of our wisdom and our ignorance, our achievements and our failures." Alexander Korda, who helped organize this association, is quoted in this article as saying that moving pictures and the phonograph give us "a view taken from actual life...." He says that through these media "we may expect to live again for our descendants with a vividness and accuracy which could not be possible through the medium of the printed word alone." Korda notes that "the problem of permanent storage is not so simple." He proposed a building to house records that would be safe from floods and earthquakes, one made of concrete with reinforced steel. Some of the records were to be "printed on hand-made vellum imported from Japan, and ... deposited in a glass vial, embedded in concrete...."

The subtitle of the article reads: "New Society Will Preserve History in Concrete for Peoples of the Future; Phonograph to be Used; Our Singers and Orator May Be Heard from Records Thousands of Years Hence."

**700.** "The Recording Tendency and What It Is Coming To." *Century Illustrated Magazine* 53.4 (1897): 634-35.

This article laments that new methods of recording human experience means that increasingly trivial or unimportant events and people are being reported to the public. "It is under this reign of recording realism that dialect has been chased up into all its myriad variations. It is the insistence of the recording spirit that has brought not merely the ugly, but the loathsome, into the record. There has been a sort of religion of the commonplace, as well as a religion of the beastly, the putrescent, and the obscene." (634)

Changes in technology have made possible an explosion of cheap publications. "The processes of chemical engraving in the lower forms of the industry have been so cheapened, and ordinary printing is also so much less costly, that there is a glut in the manufacture of pictures, books, and all periodicals. It might at first be thought that the power to print must exceed the material for printing. But it has become evident that the quantity of matter that may be printed is quite sufficient to keep all the presses going; it is only in quality that there is any deficiency. The material for record is inexhaustible," the article says. (634)

The article continues: "As to the recording activity of the new journalism, its frantic attempts to keep pace with the passing human show have already arrived at the stage of epileptic contortion, partly for the reason that the material is endless.... The millions of John Joneses may thus supply the press with enough material to keep it busy; but there are tens of thousands of John Joneses who have become, to some extent, notorious or distinguished. Any day of their lives may furnish material for public record; if nothing else happens, they can at least give expression of an 'opinion.'" (634)

"With the standard of intrinsic values lowered, with little or no selection, except a selection of the unfittest it is no wonder that the sensational press is getting to be the epileptic press, the general excuse for sensationalism being that happens may be printed. Of course, it is not true that anything that happens may be printed. The courts have a word to say about that, and there is a line drawn by the publishers and by the public, though sometimes the line is lost in the mire." (634)

The author concludes: "And as for the printing-press -- but that is settling itself; for the time is at hand when every man will be his own publisher, author, and editor, illustrating his own work with his own snap-shots. When this time actually arrives, every man will simply read his own writings in 'proof,' and no man will have time to read the writings of any other. Then we shall all begin again, and the art of selecting from the world's thought and doings what is really worthy of record and worthy of examination will once more be exalted among men." (635)

**701.** "Recording Vanishing Tongues." *The Independent* 55.2832 (1903): 639.

This article notes that recently study of the phonograph as an instrument of science has started at universities. One use is to record "American dialects and aboriginal languages." It reports that "A standard instrument has been devised called the 'Archive Phonograph,' by which the record of two minutes' speech, taken on a flat wax disk, is made permanent and duplicable by depositing on it by electricity a thin film of nickel." Expeditions have been sent to Croatia, Slavonia, Lesbos, and Brazil.

**702.** "Records for Posterity." *New York Times* July 13, 1911 1911: 8.

Alexander Konta wants a Modern Historic Records Association to preserve movies and phonograph recordings. This article notes the fragility of some records such as paper (unlike Egyptian papyrus).

**703.** "Rector Attacks Decalogue Film: 'Ten Commandments' Called Fundamentalism at Worst in St. George's Service." *New York Times* Dec. 3, 1956 1956: 34.

Making films abroad sometimes offered movie makers freedom to deal with topics in ways that might not have been possible in the United States. Cecil B. DeMille shot much of his epic film, *The Ten Commandments*, in Egypt where new movie making technologies such as 70mm film, CinemaScope, and VistaVision allowed him to emphasize the area's spectacular settings. DeMille took inspiration from classical painters and paid much attention to the use of color in the film. In Egypt, DeMille found it possible to create, according to historian Peter Lev, "a level of sexual display scanty costumes and suggestive scenes which would have otherwise encountered censorship problems in the United States and many other countries," concludes one film historian. There were other matters with which religious purists might have quarreled. DeMille's movie dealt with thirty years of Moses's life not chronicled in the Bible. And in it "emphasis on freedom and the blending of religious and political

discourses," it reflected contemporary American Cold War values. When Eric Johnston, president of the MPAA, negotiated a film exchange with the USSR in 1958, the Soviets declined to take this movie as part of the package.

This article notes that the Rev. Edward O. Miller, rector of St. George's Protestant Episcopal Church in New York City, criticized the sensationalism in this film which he said failed to show the "thrilling, centuries-old struggle and yearning of mankind for moral uprightness." The movie shows God burning the Ten Commandments into the tablets of stone with "a sort of spiritual acetylene torch."

**704.** "'Reflections and Comments.'" *The Critic: A Weekly Review of Literature and the Arts* 25.731 (1896): 123.

In this review of Edwin Lawrence Godkin's *Reflections and Comments* (New York: C. Scribner's Sons, 1895), the reviewer comments on Godkin's essay on "Chromo-Civilization": In "Chromo-Civilization" we have a vivid picture of the results of a 'sentimental religion,' with its 'vague aspiration,' 'lachrymose sensibility' and lack of all that braces and fortifies character. Much the same lesson is conveyed in the essay entitled 'The Church and Good Conduct,' while in 'The Comparative Morality of Nations' the author discusses the specific differentiation of that which we call the normal ethical type...." (123)

**705.** "Reforming the Theater." *Congregationalist* 80.49 (1895): 879-80.

This article states that in late 1895, Boston had nine playhouses and that 9,000 people attended plays each day and perhaps 54,000 attended in a typical week. (879) It goes on to say that "the present condition of the theater is, as a whole, demoralizing," and that during the past two years "the moral decadence of the theater has been startling." It quotes the dramatic critic H. A. Clapp as calling it a "'brainless theater.'" (879) Most Christian churches oppose the theater, the article claims. "The confessed demoralizing influence of the theater has kept the majority of Christian churches opposed to it as an institution, and that is their position today. Yet the playhouse is not now more positively antagonized by the churches than was the novel in the early part of this century; and now, while immoral and intellectually debasing stories have an immense circulation, novels fill our Sunday school libraries and the high and powerful mission of fiction is discussed freely in our churches, novelists themselves being invited to set forth the relation of their work to the life of the spirit." (880)

**706.** *Regina v. Hicklin* (1868) 1868.

The English case, *Regina v. Hicklin* (1868), held material to be obscene if its "tendency" was "to deprave and corrupt those whose minds are open to immoral influences." American courts and legislatures accepted this ruling, which sought to protect society's weakest members. The courts used *Regina v. Hicklin* to repress all manner of material. The United States Supreme Court discarded *Hicklin* in a 1957 ruling on two cases, *Roth v. United States* and *Alberts v. California*.

**707.** "Religion Briefs: Billy Graham Says He Will Not See 'Last Temptation,' Calls It Sacrilegious." *Los Angeles Times* Sept. 17, 1988 1988, sec. 2 (Metro): 7.

This article reports that the Rev. Billy Graham will not see the movie *The Last Temptation of Christ* (1988). "I do not plan to see the film but will not take overt boycotting action by demonstrating in front of a theater that may be showing it," the evangelist said.

**708.** "Report on 8mm." *American Cinematographer* 44.4 (1963): 224, 237.

This article notes that the demand for 8mm film predicted two or three years earlier had not materialized by 1963 and it attempts to explain why this is so. It notes that the Calvin Company marketed an 8mm projector during the early 1950s and that more than 1,000 projectors were sold. Interest in 8mm increased in 1960 with the introduction of a half dozen 8mm magnetic sound projectors.

**709.** *The Reproductions Encyclopedia: Fourth Edition - 1965*. New York: Wolf Business Publication, 1965.

This industry publication has information about the growth of duplicating technologies, especially during the 1960s. "Replicating, which was practically nonexistent 35 or 40 years ago, is now the most dramatic and exciting growth area in the graphic arts," this work maintains. "In this short span of time, replicating has reached true industrial status. It has developed its own processes, technologies, equipment and materials. It has trained a complete set of management and technical personnel to make itself functional. And most significant -- it has developed its own specialized market."

The encyclopedia divides replicating into two primary divisions: copying and duplicating.

**710.** "The Restless Age." *The Independent* 56.2898 (1904): 1399-1400.

Steam power and electricity, said this editorial in *The Independent* in 1904, had helped to increase "mobility, ... infinitely varied opportunity," the "contact of mind with mind," and create a "restless" (1399) era that called for "a new moral education." This call for a "new ... education" brings to mind Henry Adams commentary in his autobiography on the impact of the dynamo, or electricity.

The editorial reads in part: "This is a 'restless' age, and why? Because, in the first place, it is an age in which a marvelous economic prosperity has created an astounding concentration of population. Altho birth rates are diminishing throughout the civilized world, the death rates are falling even more rapidly, and the multiplication of human beings since the beginning of the nineteenth century has been, as the English statistician Lonstaff remarks, 'A phenomenon absolutely unique in history.' Industrial evolution, which has made it possible for a relatively small part of the population to supply food and raw material to a relatively large part, has stimulated the growth of great cities and manufacturing towns. Steam and electricity have made possible a mobility of human beings and a development of communication among them not less amazing than the growth of population itself.

"Now, mobility and communication are necessarily disintegrating. In modern society they are combined with a multiplication of opportunities. One immediate consequence is that while great urban aggregations of population continually grow larger, the individuals composing them are continually arriving and departing....

"We live, then, in a 'restless age because of mobility, of communication, of infinitely varied opportunity, of contact of mind with mind. These conditions have come to stay. We shall not go back to the age of the narrow and sheltered life, of humdrum and stupidity. Efforts to create social stability in the sense of unchanging individual relations are foredoomed to fail. All that we can hope to accomplish is to convert mere restlessness into systematized and progressive activity." (1399)

**711.** *A Retrospective Technology Assessment: Submarine Telegraphy: The Transatlantic Cable of 1866.* San Francisco: San Francisco Press, Inc., 1979.

This work has several conclusions about the importance of the transatlantic cable, among them: "In military strategy, submarine telegraphy reinforced the importance of naval power." It was easier for a nation to be in a state of continued readiness and to mobilize on short notice. It enhanced propaganda, spying, military intelligence, transportation, among other influences.

"The most subtle but perhaps also one of the most important impacts of rapid communications was the general change in the perception of time. For the first time, it became significant that dawn in one country was midday, or midnight, in another. The ability to intervene in events occurring at a great distance, while they were still unfolding, created both opportunity and anxiety, and the pace of society -- and of personal life itself -- seemed to speed up. The simplest institutional response was the creation of international standards of time measurement and time zones. More generally, institutional response was a state of constant readiness to respond and react to distant events."

**712.** "Revised Code -- Approved Pix Up First 6 Months of 68." *Variety* July 2, 1968 1968.

This article discusses to revive the Production Code. The movie industry adopted a rating system in November, 1968.

**713.** "A Revolution in Printing." *Scientific American* 63.12 (1890): 176.

By 1890, several New York newspapers including the *Times*, *Sun*, *Herald*, and *World* had installed Rogers and Mergenthaler typesetting machines. *Century* magazine also soon adopted the machinery as did a syndicate of New York book publishers. The syndicate planned to use 50 to 100 typesetting machines to produce "all the body matter of cheap publications" and it expected to double its annual output of novels, cutting their price in half.

**714.** "Right of Privacy: New York Court of Appeals." *Albany Law Journal* 64.9 (1902): 319-28.

This article is good in that it cites several cases and writings pertaining to "right of privacy" prior to 1902. The author attempts to show "that the right of privacy as a legal doctrine enforceable in equity has not, down to this time [1902], been established by decisions." (321) The author comments on the origins of this phrase: "The history of the phrase 'right of privacy' in this country seems to have begun in 1890, in a clever article in the Harvard Law Review -- already referred to -- in which a number of English cases were analyzed, and, reasoning by analogy, the conclusion was reached that -- notwithstanding the unanimity of the courts in resting their decisions upon property rights in cases where publication is prevented by injunction -- in reality such prevention was due to the necessity of affording protection to thoughts and sentiments expressed through the medium of writing, printing and the arts, which is like the right not to be assaulted or beaten; in other words, that the principle, actually involved though not always appreciated, was that of an inviolate personality, not that of private property." (321)

The article notes that a response to this article in the Harvard Law Review (by Samuel Warren and Louis Brandeis) appeared in the *Northwestern Review* (vol. 3, p. 1). It then discusses several English cases cited by Warren and Brandeis to see if they marked "a departure from the established rule which had been enforced for generations...." (321)

**715.** "Ritter Probe Ends." *Christian Century* 107 (1990): 487.

This article deals with the investigation into charges of sexual misconduct against Father Bruce Ritter, who had been a member of the Meese Commission.

**716.** "Ritter Resigns." *Christian Century* 107 (1990): 273.

This article deals with Father Bruce Ritter's resignation from Covenant House following a sex scandal.

**717.** "The Role of Kodak in Documenting the Space Program." *American Cinematographer* 50.10 (1969): 988-90.

This article notes that Eastman Kodak not only recorded man's first trip to the moon in Apollo 11 but before that Kodak photography systems had covered five unmanned Lunar Orbiter missions. Every manned space flight since John Glenn's Feb. 20, 1962, flight into space, had used film made in Rochester, NY. The article discusses the use of color film in covering the Apollo 11 landing in 1969.

**718.** Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People, Oct. 24, 1985.* United States Senate. 1985.

These hearings investigated the connection between the motion picture industry and the portrayal of substance abuse in the movies. Critics during the period charged that Hollywood depicted drug use in a light or casual manner and rarely showed the negative consequences of substance abuse. Among those who testified were Jack Valenti, president of the Motion Picture Association of America, and Richard D. Heffner, chair of the Classification and Rating Administration.

**719.** "Roosevelt -- In the Movies." *McClure's Magazine* 51.2 (1919): 30-31.

This article discusses a new film which is a biography of Theodore Roosevelt. "The biographical photoplay is a new and intensely interesting development of the cinema art," it says. And this moving picture bring Roosevelt **"into almost personal intimacy with every family in the land."** (30) [emphasis added] The article goes on to say that "as the human and appealing Roosevelt picture flashes across the screen, one drinks in the entertainment and the impressive scenes, without giving much thought to the mechanics of the film.

"Yet, almost as interesting as the picture itself is the story of the way the material was gotten together so that **Colonel Roosevelt as a living, breathing personality might flash before the moving picture audiences of the world."** (31) The article goes on to say that the film is accurate in historical detail and it discusses the actors chosen to play Roosevelt, William McKinley, and John Hay. [emphasis added] The article's subtitle reads: "The Greatest Film of the Year." (31)

**720.** *Roth v. United States*. 354 U. S. 476 (1957) 1957.

This case, together with the *Alberts v. California* case decided the same year, changed the Supreme Court's interpretation of obscenity, one that earlier had been defined by the *Hicklin* case. Henceforth, it became much harder for prosecutors to convict people for obscenity. Samuel Roth was convicted for mailing *Wild Passion, Wanton by Night*, and *Sexual Content of Men and Women*. Well-known for distributing such material, he had earlier convictions for obscenity. His appeal came at the same time as that of David Alberts, convicted in California for selling obscene literature. While the U. S. Supreme Court upheld the convictions of Roth and Alberts, and stated that obscenity was not protected by the First Amendment, it nevertheless changed fundamentally the way in which it dealt with obscenity cases. What became known as the *Roth* test became the foundation of American obscenity law. Obscenity would be "whether to the average person, applying contemporary community standards, the dominant theme of the material taken as a whole appeals to the prurient interest." In delivering the opinion in *Roth*, Justice William J. Brennan, Jr. said that "all ideas having even the slightest redeeming social importance... have the full protection" of the First Amendment, unless "they encroach upon the limited area of more important interests." Justice Douglas, who joined by Hugo L. Black in dissenting in both *Roth* and *Alberts*, went farther. He argued that the First Amendment protected literary treatment of sex even if it offended "the common conscience of the community."

**721.** "Russians Reject Film On Ten Commandments." *New York Times* Oct. 24, 1958 1958: 38.

In 1958, Eric Johnston, president of the MPAA, negotiated a deal with Soviet Premier Nikita Khrushchev to exchange films. Cecil B. DeMille's movie *The Ten Commandments* was shown to a Russian audience but the Soviets rejected the movie as one of those to part of the exchange between the two countries.

**722.** "Sabbath Champions Rap New Sunday Law." *New York Times* Jan. 9, 1908 1908: 8.

The subtitle of this article reads: "Meeting Condemns Aldermen for Passing 'Contradictory' Ordinance and Criticises [sic] Judges; To Appeal to the Mayor."

**723.** "Saloon Pictures Must Be Pure, Too; Police Who Are Busy 'Suppressing' Immoral Postcards Say So." *Chicago Daily Tribune* Sept. 15, 1907 1907, sec. A: 3.

This article discusses the effort to eliminate "immoral" postcards. The article's subtitle reports: "'Activity' Is Kept Up. Sleuths' Report Shows One Shop Display Censored in the Last Month."

**724.** Hearings before the Subcommittee on National Security Policy and Scientific Developments of the Committee on Foreign Affairs, House of Representatives, Ninety-First Congress, First Session

Subcommittee on National Security Policy and Scientific Developments. *Satellite Broadcasting: Implications for Foreign Policy*, May 13, 14, 15, 22, 1969. United States House of Representatives, Committee on Foreign Affairs. 1969.

These hearings are interesting for the information they give about the state of satellite broadcasting during the 1960s and projections for how such broadcasts might be use worldwide during the early 1970s. For example, discussion focused on the possibility and desirability of direct television broadcasts into people's homes by means of satellites. A map is given (p. 152) of the projected telecommunications network for Central and South America during the early 1970s.

**725.** "Science in Germany." *Nature* 13 (1875): 112.

**726.** "Science Lays Bare the Mystery of Color." *Current Opinion* (1923): 219-20.

This piece reports on the theoretical work of Professor Christine Ladd-Franklin at Columbia University. Ernest Brennecke has written about her earlier in *World Magazine*. "The Ladd-Franklin theory, simply stated, is that there have been in the evolution of life on our planet three stages in the development of color-vision. The first is the black-and-white stage: Living things learned to distinguish between light and darkness and saw the world, but not in color. In the second stage, the longer light-rays gave the sensation of blue and the shorter rays yellow. In the third, the longer yellow rays began to look red and the shorter yellow rays green...." (219)

**727.** "Science Notes." *Los Angeles Times* July 16, 1907 1907, sec. II: 4.

This article touches on ways that moving pictures are used to advance science.

**728.** Committee on Foreign Affairs, U. S. House of Representatives

Subcommittee on National Security Policy and Scientific Developments. *Science, Technology, and American Diplomacy: A Selected, Annotated Bibliography of Articles, Books, Documents, Periodicals, and Reference Guildes*, Science Policy Research and Foreign Affairs Divisions, Legislative Reference Service, Library of Congress.

This 69-page annotated bibliography covers the period from 1965 to 1969, although basic works published prior to 1965 are also included. It is divided into four sections: 1) articles; 2) books and documents; 3) periodicals; and 4) bibliographic aids.

**729.** "Scores Movie Crime Films; Pinkerton Sounds Warning." *Los Angeles Times* June 18, 1914 1914, sec. II: 5.

William A. Pinkerton says that movie scenes have more powerful effect on children than written stories. "The moving picture has become a mode of instruction, as well as a form of entertainment," Pinkerson said in an address before the Association of Chiefs of Police. "Its appeal is universal and its achievements wonderful. Within its province lies a dangerous power for evil that cannot be too seriously considered. A written story of crime and human frailty may pass from memory, but a picture delineation is apt to remain. Like an anecdote in a speech, which a hearer remembers long after the subject and words of the speaker have flown, the pictured scenes of evil deeds adhere to the mind like shadows to the sun. But take a serial picture of sordid crime, what good purpose can any normal, unselfish person expect them to serve? To the rough and weak and ignorant it is like throwing more fuel upon a fire already hard to control.

"I am so deeply impressed with the educational value of the moving picture, and so partial to its realistic entertainment, I cannot refrain from calling attention to these corrupting influences."

In this story, "Pinkerton Declares Moving Pictures Should Be Strictly Censored to Prevent Displays Depicting Crime and Holding Authority of Low Up to Ridicule," according to a subtitle.

**730.** "Seals Up Wilson's Smile. Historical Record on Film Not to be Opened for 100 Years." *New York Times* Dec. 5, 1913 1913: 20.

This article says that the Modern Historical Records Association (William Howard Taft was the honorary president) presented a special film "which gave a complete record of the facial expression of President Wilson, concluding with his broadest smile." It was presented to the New York Public Library which planned to seal the film in an airtight, watertight, and fireproof container and put it into its vault, not to be opened for 100 years. Alexander Konta, founder of the Modern Historical Records Association, accepted the film. Also to be played in 100 years are phonographs of Thomas Edison talking and of leading opera singers of the day.

**731.** *The Seamy Side: A Story of the True Condition of Things Theatrical: By One Who Has Spent Twenty Years Among Them.* Boston: Percy Ives Publishing, Co., 1906.

In this book -- the author is unnamed and often writes in the third person -- offers a condemnation of the corrosive effects that commercialization was having on acting and on actors. The author found the typical professional actress "A cold, unsympathetic, bitter, calloused, calculating woman" who had become "this petted, envied servant of the public...." "She had started out upon her career with quite a degree of talent and an abnormal amount of ambition. She had attained heights which apparently satisfied ambition, and yet this is what it had done for her. Could she be happy even if she knew nothing of the discomforts luxury cannot alleviate? She had not one of the elements of happiness in her character, as it was dwarfed and twisted then, and she still suffered in a dull, dead, apathetic way that even the old vent to hysteria did not relieve.

"It was when I finally did secure another engagement (not so hard a task now, as my association with 'big people' made me seem of value to lesser ones) I found, as I have already stated, that Miram [this actress] stood only as a type of almost hundred I came daily to know. I might change companies, management, but seldom, if ever, conditions...." (272)

The author warns of dangers to both young women and men who enter the profession. "Just here I wish to say although I have dedicated this book to young women, it is only too true that they are not alone persecuted nor morally endangered by the conditions of this profession. Boyish young fellows entering such an environment are easy prey to women whose years, sometimes, almost double theirs, and who, through drink or morphine, present so pitiful a spectacle that they young man's sympathy is aroused, and through a beginning of kindly solicitude, he is soon the abject slave of the sensual, debauched creature he may have tried to help. I have in mind just such a case of a beautiful woman not yet in her fortieth year...." (273)

The author concludes. "How bitterly cruel that all this is true, I have said to myself again and again. No more beautiful art exists than that of characterization and story 'embracing' as Charlotte Cushman has ably said: 'In its exposition all other arts combined, music, dancing, color, and even sculpture in its poses and form.' Yet to-day it stands upon the very last foundation it should ever, by any stretch of the imagination occupy -- *Commercialism*. [emphasis in original text] (291)

"Will a play or an actor draw? That is the only consideration. Never, is the play a literary achievement, a beautiful story, or an ethical study? Nor is the act a man of experience, of natural talent who can be relied upon to bring out all that is best of the author's thoughts. Is it a money maker? Is he a good card? There are the things that count in the estimation of the men who rule things theatrical.

"'What kind of house did you have?' one actor asks another. Seldom indeed, 'What kind of performance did you give?'...." (291)

The author sees newspaper and magazines as willing participants in the effort to make "stars" out of actors and all too eager to accept, uncritically, material from press agents. "Let me not be misunderstood as blaming the newspaper and magazines for the very misleading statements which they print daily, weekly, monthly in their

stage items. These articles are usually supplied them by press agents in the employ of the various managers, and as we could scarcely expect an editor to take the time personally to investigate these stories he is truly at the mercy of the one who 299/300 gives him the news. If the press agent chooses to write a column prevaricating about a prominent person, so long as it has the celebrity's sanction, the editor is not called upon to interfere. Flattery and adulation were never known to have been the grounds for a libel suit, so that no risk is run, either, in printing such untruths. Yet this attitude of the press unconsciously constitutes the whole thing a great, enticing honey pot to poor ambitious little flies, although the intention may be only the advertising of a certain line of goods. Nevertheless, human nature is imitative, and we are all seeking the good things of life; so if we read constantly of lives of apparently one long Elysian feast we are apt to want some of the dainties. (299-300)

"That these magazine and paper stories do not always hand together is scarcely ever taken into account by the public. A certain manager of a very well-known and firmly established star, sends out annually a new and altogether different version of her wonderful rise to fame and the manner in which she first obtained a hearing...." (300)

The author speaks "out against a *system* that was robbing women of their purity." (312) He, or she, concludes: "If you saw the stream of young men and women daily, yearly rushing toward this luring siren, only to be swallowed up in the vortex as I have seen them, your very soul would cry out and demand a half; and I have hoped in every line I have written that the serious minded will believe me, who has been in the pit, and avoid the pitfall.

"If this book saves one aspiring soul from Miriam's fate or even mine, it will not have been written in vain." (312)

**732.** "The Secret of Personality as Theodore Dreiser Reveals It." *Current Opinion* 66.3 (1919): 175-76.

This article summarizes and reprints excerpts from an early article that Theodore Dreiser published in *Pearson's* (New York). In the final analysis, according to Dreiser, personality seems "to be a sense of power resting on a feeling of wisdom and usefulness or right to be." (article's words, not Dreiser's) Dreiser believed that people were born with personality. Quoting from him: "The truth is, all good things are gifts -- a voice, strength of body, vigor of mind, vision, the power to lead, as in war, any art, beauty, charm." (Dreiser quote, 175) This article maintains that "Mr. Dreiser welcomes the tendency in America to-day to emphasize personality rather than character." (175) Then quoting Dreiser again: "Men do better once they realize their genuine limitations and cease reaching after the moon." (175) Intellect or knowledge alone does not make some people's personality strong but also (quoting Dreiser) "the vital energy to apply them or the hypnotic power of attracting attention to them -- in other words, personality."

**733.** "See 'Canning' of Dramas." *Chicago Daily Tribune* Aug. 15, 1912 1912: 10.

This article reports on the Motion Picture Exhibitors' League of America visiting the Essanay Film Manufacturing company in Chicago. The subtitle of this article says: "Picture Men Visit Plants Where Films Are Made; Life Comedy Crops Out. Actors Talk of Colds and Quinine While 'Speaking'."

**734.** "See First Pictures Taken Under Water." *New York Times* Aug. 12, 1914 1914: 9.

The subtitle of this article reads: "'Movies' Made Beneath Surface of Bahama Harbor Shown at Natural History Museum; Men Lowered in Big Globe; One of the Inventors Fought and Killed Man-Eating Shark in Front of Camera."

**735.** "See Plays by Machine." *New York Times* Sept. 7, 1903 1903: 1.

This article reports that "While the Pictures Move a Phonograph Will Say the Lines."

**736.** *Hearing* before the Subcommittee on Postal Operations of the Committee on Post Office and Civil Service, U. S. House of Representatives, Eighty-Sixth Congress, Second Session. *Self-Policing of the Movie and Publishing Industry*,

The subcommittee was chaired by U. S. Representative Kathryn E. Granahan (PA) and investigated the self-regulation policies of the motion picture and publishing industries. MPAA president Eric Johnston, PCA director Geoffrey Shurlock, and movie industry Advertising Code Administration director Gordon S. White, testified. Among the topics covered were the lack of regulation in the U. S. of foreign films, sensational or controversial themes in such movies as *Suddenly*, *Last Summer* and *Advise and Consent* (e.g., homosexuality), and the possibility of setting up a classification system for American films (Eric Johnston opposed such a plan).

**737.** "Senate Unit Hits Violence in Films." *New York Times* March 27, 1956 1956: 37.

Democratic Senator Estes Kefauver (D-TN) and the members of his subcommittee who were investigating possible links between the movies and juvenile delinquency, and concluded that violent films provided possible "trigger mechanisms" for some youth. Later, in December, 1956, Kefauver praised the revision of the motion picture Production Code which relax restrictions on showing narcotic abuse and kidnapping, and tightened restriction on brutality in films.

**738.** "Send Greetings to Edison; Good Wishes Telephoned Across the Continent to Famous Inventor." *New York Times* Oct. 22, 1915 1915: 3.

This article discusses "Edison Day" at the Panama-Pacific Exposition in San Francisco and the trans-continental telephone call made to Thomas Edison and his wife as part of the celebration.

**739.** "Send Pictures by Telegraph." *Chicago Daily Tribune* Feb. 21, 1899 1899: 2.

This article quotes Thomas Edison saying that he is working with the artist Homer Davenport to develop an instrument whereby photographs can be sent by telegraph wire. He also predicts that automobiles will be much more commonly used in the future but says that at present electric storage batteries are too heavy and impractical.

**740.** "Sending Photographs by Telegraph." *New York Times* Feb. 24, 1907 1907, sec. SM: 7.

This article talks about the "seeing telegraph" and sending photographs over telegraph lines. "Not long ago a poplar writer on electricity made this startling prediction of coming wonders: 'Lovers conversing at a great distance will hold each other as in the flesh. Doctors will examine patients' tongues in another city, and the poor will enjoy visual trips whenever their fancy inclines. In hot weather, too, Alpine glaciers and arctic snows will be made visible in sweltering cities, and when piercing northeast winds do blow, we shall gloat over tropical vistas of orchids and palms.'

"This is no dream. The new 'telephotograph' invention of Dr. Arthur Korn, Professor of Physics in Munich University, is a distinct step nearer the realization of all this, and he assures us that 'television,' or seeing by telegraph, is merely a question of a year or two with certain improvements in apparatus."

This article predicts the arrival of television soon. The article's subtitle reads: "Professor Korn has Triumphantly Succeeded in Transmitting Portraits over Long Distances by Wire. Experiments in France and Germany Conclusive. Description of the Marvellous [sic] Instrument."

**741.** "Sending Pictures by Telegraph." *Frank Leslie's Popular Monthly* 51.6 (1901): 9-17.

This article begins by says that "there are few people who know that letters and pictures can be sent by telegraph." It then discusses the "curious invention by which a photograph or letter in facsimile can be transmitted from San Francisco to New York in half an hour." The invention was called the "telediagraph" and the

author notes that its inventor, E. A. Hummel, agreed two years earlier to "give the exclusive use of the apparatus to a syndicate of six American newspapers for a period of two years." In other words, a half dozen newspapers were using this system between 1899 and 1901. That agreement expired April 19, 1901, allowing the "picture-telegraphing machines" to "be installed in every telegraph office in the world," the article states. (9)

The article notes that not only newspapers will use this machine but also the police. One advantage of the telediagraph is that it "can send a picture to many widely distant cities simultaneously." (10)

The author reports that he watched the telediagraph in operation in the offices of the *New York Herald*. (11) It was also being used by the *Chicago Herald*. (13)

The article points out the similarities and differences between the telediagraph and the phonograph. "The mechanism which moves both the roller and arm in the phonograph is essentially the same as that which moves the corresponding portions of the telediagraph.

"But there all resemblance between the two machines ceases, for the telediagraph works like an ordinary dot-and-dash telegraphing instrument. Like the familiar telegraph 'transmitter' and 'receiver' in ordinary telegraphy, the telediagraph consists of both 'sending' and 'receiving' instruments. But in the telediagraph both sender and receiver are similar in appearance, and are operated upon practically identical principles." (12)

Hummel says that pictures can also be sent by transatlantic cable. The article explains that the "circuit system used in the telediagraph is what telegraphers call a closed-circuit system." (16)

**742.** "Sending Pictures by Wire." *Chicago Daily Tribune* June 25, 1899 1899: 12.

This article reports from Cleveland, Ohio, that "a series of long distance experiments in the transmission of pictures have recently been made over the wires of the Western Union Telegraph company, the last taking place between Cleveland and St. Louis.

"Among the pictures received during this test were those of Rear Admiral Schley, General Manager Melville E. Stone of the Associated Press, and J. C. Barclay, electrician of the Western division of the Western Union Telegraph Company.

"Telegraph electricians and others who were present at this test are a unit in expressing their belief that the machines will do all that is claimed for them. Printed or written matter can be transmitted and reproduced much more rapidly than pictures, though only a few moments are consumed in transmitting a cabinet size photograph." The rest of the article explains how this instrument works. The article's subtitle reads: "Latest Experiments in Long-Distance Transmission Said to Prove the Success of New System."

**743.** "Sex Reports on Priest Called Confirmed; Inquiry: Covenant House Says Probe Found Evidence of Misconduct by Father Ritter, Founder of Shelter for Runaways. He Has Denied Wrongdoing." *Los Angeles Times* Aug. 4, 1990 1990, sec. A: 21A.

An article dealing with the sex scandal that involved Father Bruce Ritter, a former member of the Meese Commission.

**744.** "The Shadow on the Stage." *Living Age* 230.2978 (1901): 276-83.

This article argues that the quality of the theater has declined because of two developments. One is the rising attention given to the actor who has come to overshadow the writer or poet who creates the drama or story. The other factor is the growing important of the "scenic artist" or carpenter who creates increasingly elaborate stage designs. These sets threatened to overwhelm not only the story (i.e., writer) but even the actor. The author argues that "the drama dies because it has confused its functions; it has wasted its true strength to enhance a

spurious beauty, and it resembles a man who should sacrifice both brain and muscle to increase by an inch or two the growth of his beard." (277)

With regard to the changing status of the actor and the role of scene makers, this article maintains that a "brief retrospect will show that when the theatre commanded an intelligent admiration, the poet was an omnipotent and unquestioned master. The simple decoration of the Greek stage was ordained by a holy tradition. The actors, whose heads were hidden in conventional masks, and whose feet were propped on clumsy patterns, could neither ogle nor strut. They were neither discussed nor advertised. Nobody knew their names nor cared about their visages.... Yet soon after Shakespeare's day the actor and scene-shifter begun to raise their heads.... Thus the servant already encroached upon the master's province. The poet, eclipsed by the actor, the carpenter and the musician, saw his supremacy threatened." (277)

As performers became more popular, their salaries increased and with that fact "the general excellence of a performance presently surrendered to the advancement of the popular actor...." (278) Although by the 18th century the author had by no means lost all his influence, "the history of the stage thus ... became the history of the player...." (278) The relationship between actor and writer had been altered. "At the outset, ... the actor was paid by the theatre to perform a certain task; now he hires the author to fit him with a part. It is a strange reversal of the *roles*, and it explains the dire malady which has long beset our playhouses. What man of letters would accept the new conditions and 278/279 see his work cut and slashed to suit the interpreter? What would the printer say if his frame-maker and colorman signed his canvas and assumed the glory of his work? Would the very *minimus* among the poets permit the printer and paper-maker to 'create' his poems, and set their names upon his title-page? Of course neither the painter nor the poet would submit to so monstrous an outrage, and as no playwright can hope for success who does not obey the actor, so the making of plays has fallen out of distinguished hands and is picked up by the odd cobblers and patcher, who are supposed to entertain us." (278-79)

The author has a low regard for the contemporary actor in 1901. "And what is the modern actor," this article asks, whom we have won in exchange for the vanished poet? He is distinguished from the ancient by a gentlemanly incompetence.... In fact, he has been told by the tongue of flattery that he has but to stride the stage as a drawing-room and his elegance will be paten to all...." (279) Actors, the author says, have "So long ... been pampered with wealth and flattery that they have quite forgotten the exigency of their art." (282)

Even worse for the theater is the rising influence of the carpenter, in the author's view. "But the pompous actor, who, with his vain desire to be pointed at with the finger, strides the Strand like a conqueror, is not the sole ruin of the stage.... For the carpenter and upholsterer destroy the very essence of the theatre, which is illusion. The city of make-believe should not be built of brick and stone.... There is but on possibility of dramatic illusion -- the consistent and harmonious suppression of reality...." (280)

The tradition balance between the playwright, actor, and scenic artist has been upturned and confused. Shakespeare may be performed but "Two boys, with their legs painted brown, wrestle on the stage; or lovers interrupt the action with their silent blandishments. Then a pause: the great man enters, the crowd is frozen to immobility, and the text of Shakespeare is not spoken, but interpreted (or created) with nods, winks and jerks of the elbow. Nothing is achieved simply. A perpetual commentary of crowd, speech or gesture converts the best play into a sort of pantomime. And the actor is no longer all-sufficient; as we have seen, he killed the dramatist long since, and it is only because he is his own manager that he has not already surrendered to the stage-carpenter. But when once he lets go his supremacy he will have a short shrift. For the upholsterer is to-day the essential artist of the stage, and he will esteem the actor no more highly than the actor esteemed the dramatist. Thus the balance is overturned, and the three elements which we have named pitifully confused. No longer are action and ornament the handmaidens of poetry. Poetry is a poor excuse for false splendor, and action -- in its own belief the foremost of the arts -- is made ridiculous by vanity." ( 281)

The high salaries paid actors and their unwillingness to tolerate rivals to their fame make it difficult to put together a company of players which is necessary for a truly national theater. And the carpenter's work limits the number of plays that can be performed because "the extravagance of the upholsterer has made long runs inevitable...." (281)

The author praised the Théâtre Français where the "method of Moliere is still revered, and no actor may pass the stately portals unless he has conquered his craft, can speak and walk, and is willing to subordinate his vanity to the common good." (281) But this article is pessimistic about whether or not the level of theater will be improved and this kind of national theater achieved in England. "We are not optimistic. Destiny and experience are against us, and the people long ago ceased to chafe at the domination of the actor." The theatre could "be the home of a beautiful and delicate art," but unfortunately it "is generally nothing more than a scene of vulgar 'pleasures taken in common.'" (283)

This article originally appeared in *Blackwood's Magazine*.

**745.** "She'd Have Women Police." *New York Times* Jan. 25, 1911 1911: 7.

This article says that more women in police work would help stop white slavery. The article's subtitle reads: "Dr. Anna Shaw Tells the Belmont Art League That the City Needs 1,000."

**746.** "The Shock of Freedom in Films." *Time* (1967): 66-68, 73-74, 76.

This article notes that with the demise of the Production Code, movie makers "enjoy a heady new freedom from formula, convention and censorship." (66) The article discusses several films including: *Blow-Up*, *Reflection in a Golden Eye*, *In the Heat of the Night*, *The Graduate*, and *Bonnie and Clyde*. Film makers and other artists put a premium on experiment in both life and art and in "the questioning of moral traditions, the demythologizing of ideals, the pulverizing of esthetic principles ...." (67)

**747.** "Show Life and Beauty." *Chicago Daily* Oct. 5, 1896 1896: 6.

This article comments on the showing of the first moving pictures in Chicago. "A Paris photographer, M. Promio, was in Chicago last week taking photographs for this tiny piece of mechanism that is now delighting thousands of Chicago people by throwing upon canvas lifelike, moving pictures of the streets, of battles, of pageants, of love making, of children at play, and almost everything else that goes to make up the life of the world."

"During the entire scene not a movement is lost. Every shade of action is faithfully portrayed and the picture is charming.

"The vitascope can reproduce photographs in colors and does so on occasion. One of the best pictures of this kind is that of two girls dancing. One of them holds a big, red parasol. They dance in perfect time and their movements are graceful and pleasing. The girl with the parasol suddenly drops it an instant later two heads are seen but only one body and one pair of legs. One has jumped upon the back of the other, who keeps up the dance and gives a very clever imitation of the two-headed girl.

"The cinematographe has been exhibited in every country in Europe, although it was first shown to the public on Christmas day, 1895. It was brought to this country last June. The vitascope has never been shown abroad, but it will be taken to Paris and London this year."

The subtitle of this article reads: "Marvelous Productions of Cinematographe and Vitascope. Two Thousand Photographs Necessary to Produce a Single Picture of Minute's Duration How the Photographs Are Made and Prepared for the Machines and Afterwards Reproduced on Canvas, Lifelike in Size and Action and Color."

**748.** "Show Stomach at Work." *New York Times* Mach 27, 1913 1913: 7.

The subtitle of this article says: "Moving Pictures a Feature of the Physiotherapy Congress in Berlin."

**749.** "Shows Moving Views in Natural Colors." *New York Times* Oct. 29, 1910 1910: 8.

This article reports on the first color moving pictures that were not hand-painted. "Moving pictures projected on the screen in natural colors by the agency of light only had their first public demonstration in America last night at a meeting of the New York Electrical Society, in its lecture room at 29 West Twenty-ninth Street. Into the coloring of these pictures no hand work, stencil work, or similar method enters...."

"The kinemacolor films are not yet on the market here, but that is said to be a matter of only a few weeks...."

"One of the most successful views was of a big orange being cut open in a man's hands. The fresh tints of the hands and the rich color of the orange were effective enough, and the applause came when the orange was squeezed and the juice trickled out...."

"Besides the greater accuracy of the kinemacolor process, it has the advantage over hand coloring in greater speed of production. Coloring the films means skilled craftsmen and much labor. The invention already has been exhibited in England and has been used in the London theatres for some months. It will reach American audiences in midwinter."

"It is understood that the perfection of this process is stealing Mr. Edison's fire...." Edison had talked of moving pictures combined with the phonograph in natural colors.

The subtitle to this article reads: "A New Process of Color Photography Exhibited at the Electrical Society. Invented in England. Pictures Taken Through Red and Green Glass and Double Usual Speed All Hues Perfectly Shown."

**750.** "The Significance of the Color Red." *Harper's Weekly* 52 (1908): 31.

This brief article comments on the importance of red throughout history and observes that there was a good deal of superstition associated with it and that it was often associated with the primitive or uncivilized. "History and archaeological research have disclosed the fact that the ancients were particularly fond of bright colors, especially of red. Relics of painted pottery antedate the classical period of the Homeric cycle."

"The savage receives the greater part of his education through his senses, and therefore brilliant colors make a great impression upon him, and red most of any. This color of blood is a great stimulant to deeds of valor, and warlike tribes have invariably worn a profusion of that color. Red is now generously used by all uncivilized peoples. The skin is painted red by the New Zealander; red turbans are worn in India; and African tribes willingly exchange their precious ivory for red calico."

...."In olden times the efficacy of red as a cure all for disease was strictly followed...."

....."In the west of Scotland and in the West Indies it is customary to wrap a bit of red cloth or flannel around children's throats to ward of the whooping-cough...." (31)

**751.** "Silent Police Watch 'French Line' Unreel." *Variety* 193 (1954): 1.

In the hands of a producer like Howard Hughes, the technology became a potent weapon to challenge censorship. Hughes, who earlier had defied the Production Code by sensationalizing Jane Russell in *The Outlaw*, saw another opportunity for the actress in the three-dimensional movie *The French Line* (RKO, 1954), which was filmed in Technicolor. It premiered in late 1953, in St. Louis's huge Fox Theater to a standing-room-only audience that included Jack Vizzard from the PCA who had been sent there by Breen, and police officers who had been sent there by the city's chief of police. Although this article does not say so, it was probably no accident that Hughes chose St. Louis. The city had no official censorship board but it was the home of the Code's author, Daniel Lord,

and many other Catholics. Advertising inundated newspapers, radio, television, and billboards proclaiming "J. R. in 3-D. That's all, brother," and "Jane Russell in 3 Dimension -- and What Dimensions!" The opening was uneventful in that the police took no action. The movie's appearance followed on the controversy created by Preminger's *The Moon Is Blue*, and it also appeared at a time when the influential National Theatre Owners of America was urging modernization of the Code.

**752.** "Skin Mags to Lose Newsstands Sales in 7-11 Decision." *Adweek* April 21, 1986 1986, sec. Midwest Edition.

Southland Corp.'s decision to stop it 7-Eleven stores from selling *Playboy*, *Penthouse*, and *Forum* will cost these magazine about 100,000 newsstands sales each per month.

**753.** "Some Effects of Modern Publicity." *Century Illustrated Magazine* 67.1 (1903): 155-56.

This article speculates on the influence that photography is having on political and religious power as photographers publish pictures of previous private moments of Queen Victoria, Pope Leo XIII, and "the daily doings of the Presidential family," (155) and other people of less renown. The article concludes: **"What effect is all this publicity to have upon the average man, woman, and girl? But, particularly, what effect is all this familiarity to have upon the world's sentiment with regard to royalty and high ecclesiastical authority? As to these latter matters, surely there will be palpable effects. Can the sense of awe continue as great when there is so little left of the unknown? One thing is sure: the sentiment toward kings and courts and Vaticans can never remain the same in these new and remarkable conditions. The relation between the former and their subjects and followers may be none the less affectionate, even reverent; it may become more human, more close. But the mystery having departed, there can hardly be the old stress. When the mind is no longer awed and clouded by the dim and the unknown the appeal to reason must be reinforced. So far as publicity has to do with authority, secular or sacred, we believe the change effected is very great and likely to increase; and we believe that this change is, on the whole, better for humanity."** (156) [emphasis added]

**754.** "Some Novel Uses of Electricity." *Scientific American* 94.17 (1906): 349-50.

This article begins by saying that "The increased use of electricity in every branch of industry is surprising even to the most ardent advocates of this mysterious form of energy. Not only has electricity invaded the territories occupied by all other forms of energy, but it has actually created new fields of its own. This is particularly marked by the present electrical invasion of our homes, where labor-saving devices were never thought of until electricity showed its wonderful adaptability to all classes of work." (349) It then discusses several items such as electric fans, sewing machine motors, curling irons, hair-drying machines, milk warmers, electric dish washers, broilers, knife polishing machines, and more.

**755.** "The Spectator." *Outlook* 96.14 (1910): 767-68.

This article begins by calling "the instantaneous photograph of moving objects in their nature colors" the "eighth wonder of the world." These pictures "were not the hand-colored cinematograph pictures which we have all seen, in which each of the thousands of separate films that make up a group of pictures is laboriously colored by the brush of a deft worker, a process taking a week or ten days at the least. Nor were they the Lumiere color photographs on glass, which astonished the world a year or two ago with the first real color photography, and were everywhere acclaimed as the greatest advance in photography since the days of Niepce and Daguerre. The Lumiere process required from sixty to a hundred times longer exposure than the ordinary photographic plate, and instantaneous work was out of the question. And here was a process that produced color motion pictures in one-half the time required for the taking of the ordinary instantaneous motion picture, with practically absolute fidelity to the real coloration of rapidly moving objects. The Lumiere process was wonderful; the Kinemacolor process, which is the name given to the new motion pictures, is marvelous." (767) Two Englishmen, Charles Urban and George Albert Smith, invented the Kinemacolor process.

The article says that "the first motion picture put on the screen in the exhibition of this process (just introduced into America) which was given for the Spectator's enlightenment was of an English harbor at sunset. A ship lay at anchor, her white paint glistening.... The scene was realistic to the last degree -- and the colors in all their natural hues were painted by Science, not by Art." (767)

The article discusses other films. "All seemed absolutely alive, the brightest colors and the neutral tints being shown with convincing fidelity; and one had the feeling that realism in art had at last come to its own." (767) Some people refused to believe that these pictures were not hand-colored. "But even more original and beautiful were the pictures of flowers" which showed not only "the brilliant beauty of fresh bloom, but actually the opening their blossoms before one's eyes, from the tightly closed bud to the full panoply of the most gorgeous dahlia or Chinese lily." (767)

The author argues that such images cannot help but have a positive impact on children. "Truly when one had thus, as it were, assisted 767/768 at the birth of a flower, a feeling of genuine awe came over one, and the thought, too, that a child who should see these wonderful things must not only have his soul awakened to beauty, but to the knowledge that science brings us close to the divine. Against the undoubted harm that has come to some children who have loved the moving-picture show not wisely but too well should be set the awakening of the imagination that must come from seeing pictures such as these, under proper auspices." (767-68)

The article offers other examples, many showing "scenes in foreign lands ... -- all presented with the same startling fidelity to the colors of the actual objects." (768) Like magic carpets, the article notes, movies could transport audiences "in a twinkling to distant places" but the work of "practical men" (768) in producing such things as color films exceeded fairy tales.

**756.** "A Splash of Photo History Comes to Light." *New York Times* May 21, 2007 2007, sec. B: 1, 5.

This article is accompanied by picture on a color photograph taken of a woman, probably Charlotte Spaulding in Buffalo, NY, in 1908. The photographer, Edward Steichen, used a process developed by the Lumiere brother in France. Steichen, the article says, brought this process to the United States. The article then discusses how this photograph came to light almost a century after it was taken. The article describes the pictures. "Autochromes are positive images, meaning they are unique and not negatives that can be used to create prints. They were made using a complex process in which tiny dyed grains of potato starch were spread across a piece of glass and light was passed through them to a photo-sensitive plate.

"The three colors of the starch grains -- bright blue-violet, bright orange-red and Kelly green -- worked together to produce a wide range of realistic-looking colors, in the same way that combinations of red, blue and green dots produce a color-television picture....

"Unlike most other antique prints, autochromes are usually displayed with a light source behind them, allowing their colors, which are dim in regular light, to shine through the semi-transparent glass or to reflect onto a mirror. But prolonged exposure to light can wash out the images. After Eastman House displays the pictures they will be returned to storage. (The pictures will be exhibited on a light table sometime in October, although a date has not been set.)"

**757.** "Spring New Scheme. Democrats to Show Moving Pictures of Bryan in Chicago on Labor Union Day." *Los Angeles Times* Sept. 13, 1908 1908, sec. I: 2.

This article talks about the Democrats used film to promote William Jennings Bryan.

**758.** "Stanley Kauffmann on Film". 1999. (July 12, 1999).  
<<http://www.tnr.com/archives/0799/071299/kauffmann071299.html>>.

Movie critic Stanley Kauffmann writing for the *New Republic* called Oliver Stone's *Natural Born Killers* (1994) a "paradigm ... of the ills and the imbalances in American life."

**759.** "Starr Going to Africa." *Chicago Daily Tribune* Sept. 15, 1905 1905: 3.

This article says that Professor Frederick Starr is going to Africa to take pictures and bring back phonographic records of natives' songs. This article's subtitle reads: "University of Chicago Professor to be Away a Year. Educator Will Spend Time in Heart of the Jungle.... Photographs Will Be Taken, Phonographic Records Secured of Voices, and Much Valuable Data Brought Back."

**760.** *Hearings*, Committee on Education, United States House of Representatives, House of Representatives, Sixty-Third Congress, Second Session on Bills to Establish a Federal Motion Picture Commission. *Statement*, (March 20, 1914). Chase, William Sheafe, Rev. 1920.

This statement came from a leading religious critics of motion pictures. Rev. Chase saw great moral damaged being caused by some types of films.

**761.** *Hearings*, U. S. House of Representatives Postal Operations Subcommittee. *Statement*, Johnston, Eric.

Eric Johnston told this congressional committee in 1960 that the movie industry's Production Code had been created to assure "breadth and diversity, not blind conformity." Nor was it intended to guarantee "all films are suitable for the entire family." No person qualified "to pass in advance on what the rest of us in America may read or not read, may hear or not hear, may see or not see." Johnston expressed his opposition to government classification of films. During Johnston's presidency of the Motion Picture Association of America (1945-1963), the Production Code was revised and its enforcement liberalized. A copy of this statement is in the Johnston Papers, Folder 87, Box 7, MS 118, Eric A. Johnston Papers, Eastern Washington State Historical Society, Spokane, WA.

**762.** *Hearings*, "Copyright Infringements (Audio and Video Recorders)," Committee on the Judiciary, United States Senate, Ninety-Seventh Congress. *Statement*, (April 21, 1982). Valenti, Jack. 1921.

Jack Valenti, president of the Motion Picture Association of America, was alarmed by the use of video recorders and thought they threatened Hollywood and the television industry. As the sale of VCRs burgeoned in America, he argued that the technology would irreparably damage the entertainment industry by undermining the intellectual property rights of writers and performers. It threatened Hollywood's normal distribution patterns: the industry did not serve all markets at the same time, but distributed motion pictures sequentially, that is, films went first to theaters, then to pay TV, network TV, home video, hotels, airlines, schools, and so on. The timeshifting that videotape made possible gave consumers the ability to choose when to view a film, and that feature, together with the fast forward function by remote control that allowed viewers to edit out commercials, would destroy the advertising revenue that undergirded commercial television and film making, Valenti argued. "Now like a great tidal wave just beyond the shore line, this video recording machine and its tape threaten, profoundly, the life-sustaining protection on which the U.S. film and television industry depends: *its copyright*." Video recorders were like "tapeworms" that would invade millions of homes "eating away at the very heart and essence of the most precious asset the copyright owner has, his copyright." (emphasis in original text)

**763.** *Hearings*, "Juvenile Delinquency (Television Programs)," Committee on the Judiciary, United States Senate, Eighty-Fourth Congress, First Session, S. Res. 62. *Statement*, (April 7, 1955). See also: violence See also: sexuality Lazarsfeld, Paul F. 1907.

Lazarsfeld gives three reasons why so little was known about television at the time and what Congress should do to help improve understanding of this medium.

**764. Hearings,** " Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People," Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Statement, (Oct. 24, 1985).* Wall, James M. 1924.

The United States Senate held hearings on drug abuse and the entertainment industry in 1985. It became apparent at these hearings that people wanted more information about why ratings were given. James Wall of the National Council of Churches and editor of *Christian Century* urged adding a short phrase to indicate sex, violence, language, or substance abuse.

**765. Hearings,** "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People," Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Statement, Oct. 24, 1985.* Valenti, Jack. 1985.

As critics charged that Hollywood movies encouraged drug use, or at least treated the problem in a light manner, Motion Picture Association of America president Jack Valenti argued that such films favorable to drug use were the exception and that the movie industry was doing a good deal to combat substance abuse.

**766. Hearings,** "Television Ratings System," Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session, pp. 159-63. *Statement, (Feb. 27, 1997).* Cantor, Joanne. 1927.

This testimony is by one of the leading scholars of media effects, especially the effects of motion picture and television violence and horror. Here Cantor supported calls for a rating system for television programs.

**767. Hearings,** "Television Ratings System," Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session, Feb. 27, 1997. *Statement, (Feb. 27, 1997).* Photocopy filed under "Television Ratings System."

Valenti, Jack. 1927.

As critics charged that television violence had harmful effects for children and called for a rating system for television programs, Jack Valenti argued that such a system would much too complicated and expensive to implement.

**768. Hearings,** *Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement,* Berger, Benjamin N.

In this Statement, Berger, who was Director of the Allied States Association of Motion Picture Exhibitors, commented on the importance of the movie theater in local communities. He said: "A motion-picture theater in every community is not a dispensable luxury but a necessity. Much of the community of life and activity center around it. Other merchants are dependant upon it for much of their trade. Theaters cause traffic and traffic makes trade. But more important than that, they constitute an educational and cultural center." 93)

**769. Hearings,** *Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement,* Kalmenson, Benjamin.

Kalmenson was Vice President and General Sales Manager for Warner Bros. and discusses several aspects of movie distribution and new technology, including Warner Bros.'s use of 3D and CinemaScope during the 1950s. He notes that by 1956, more than 15,000 theaters in the United States were equipped with CinemaScope (337).

**770.** *Hearings, Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement*, Freeman, Y. Frank.

In this Statement, Freeman, then Vice President of Paramount Pictures, commented on several matters including the need for studios to produce films that appealed to an international audience rather than merely an American audience. With the foreign market, he said, Hollywood would soon be out of business. It became necessary, therefore, to "search for material to fit the international market rather than the domestic market," and to produce films that appealed to "universal" tastes rather than to specific American preferences. (353) He also discussed cooperation with the Pentagon and on such topics as VistaVision (something Paramount spent more than \$3 million on during the mid-1950s).

**771.** *Hearings, Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement*, Montague, Abraham.

Montague noted that as Hollywood came to depend more and more on revenue from foreign markets to make profits during the 1950s, studios had "to produce pictures palatable to tastes in England, Italy and Japan as well as here at home." (395) Montague was Vice President and General Sales Manager for Columbia Pictures.

**772.** *Hearings, Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement*, Picker, Arnold.

At these hearings, Picker said that he know of "no industry so dependent on the overseas market for its welfare and health." (403) The technology of filmmaking lent itself to widespread distribution. Duplicating the print required relatively little additional investment, especially when compared to the return it could bring. And when compared with other large industries, distribution costs were easily manageable. As an executive from United Artists commented in 1956, it was "no more expensive" (405) to deliver a print in Europe than it was to deliver one in Fort Worth or Syracuse. And film had the added advantage of being "the greatest single instrument for spreading the American way of life throughout the world. (404)

**773.** *Hearings, Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement*, Phillips, Louis.

Phillips, a Paramount vice president, told a U. S. Senate subcommittee in 1956, that to compete successfully in the international arena for foreign markets, the studios must not be "hamstrung by being glued to old standards" (457) or to outmoded marketing techniques

**774.** *Hearings, Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors*, U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement*, Rembusch, Trueman T.

In Rembusch's statement (Exhibit no. 11), there is a list of the top 150 grossing Hollywood films of all time (as of early 1956) (75-76). These are films that made \$4 million or more. Rembusch also quotes from a 1954 industry analysis by Sindlinger & Co. on television: "Television made the living room a little theater-- with all the comforts of home, offering a new entertainment medium - free of admission price and free of admission tax.... It is not only the use of television, but also the economic factor of paying for the box that keeps people away from the theaters." (71)

**775.** *Hearings, "Television Ratings System,"* Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement [Re Television Ratings System], (Feb. 27, 1997).* Neuborne, Burt. 1927.

Neuborne, then a Professor of Law at New York University, drafted this Statement for the Association of National Advertisers. He said that "while the effort to ban violent programming is undoubtedly well-intentioned, and while many persons understandably deplore the preoccupation with violence that pervades our mass culture, I believe that such an approach is clearly unconstitutional."

**776.** *Hearings, Motion-Picture Distribution Trade Practices -- 1956: Problems of Independent Motion-Picture Exhibitors,* U. S. Congress. Senate. Subcommittee of the Select Committee on Small Business, Eighty-Fourth Congress, Second Session. *Statement and Testimony,* Myers, Abram F.

Myers notes that as Hollywood increasingly came to expand its foreign markets and to become dependent on the revenue they generated, that the nature and content of American movies changed. "The aim is to make pictures with universal appeal -- pictures that will appeal to audiences at home and abroad. This policy has virtually eliminated the American family-type pictures and those featuring familiar American sports and customs. Recently I heard an exhibitor bemoan the fact that for more than 4 years he has not been offered a football picture, although the American people are football conscious for about 4 months every year. That is quite obviously due to the fact that football, as we know it, is as unfamiliar to foreign audiences as soccer is to most Americans." (6) Myers at the time was Chairman of the Board and General Counsel for the Allied States Association of Motion-Picture Exhibitors.

**777.** *Hearings, Overseas Information Programs of the United States,* U. S. Congress, Senate. Subcommittee of the Committee on Foreign Relations, Eighty-Third Congress, First Session. *Statement and Testimony,* Johnston, Eric.

Johnston, who was then president of the Motion Picture Association of America, discusses the role of foreign markets in the American film industry. For Johnston and many of the studio executives, the Production Code seemed more of a hindrance than a help in attracting a global audience. When Johnston testified before members of the U. S. Senate Foreign Relations Committee in 1953, he told Senator J. William Fulbright that the Production Code was "very rigid" and "far more rigid than the code of any other country. In fact," he said, "most other countries don't even have a code." (280) Moreover, in dealing with perhaps 70 or 80 countries worldwide, it was "almost impossible to set up a standard formula," (290) he told Senator Karl Mundt. The MPAA therefore advised studios on a country-by-country basis. One picture might be "suitable for Norway" but "unsuitable for Turkey, suitable for France but unsuitable for Indonesia." (290) Johnston noted that the Code screened out "extreme brutality, sexiness" (280) and other elements that critics such as Norman Cousins objected to, but at the same time, he undoubtedly understood that that fact may have put American films at a competitive disadvantage abroad. In offering audiences sex and violence, the movies produced in other countries were "far worse." (280)

**778.** *Hearings, Self-Policing of the Movie and Publishing Industry,* before the Subcommittee on Postal Operations of the Committee on Post Office and Civil Service, U. S. House of Representatives, Eighty-Sixth Congress, Second Session. *Statement and Testimony,* Johnston, Eric.

In his statement and testimony, Eric Johnston, MPAA president, discusses the Production Code, foreign films in the United States, his opposition of a classification system for movies (although he agreed some movies were inappropriate for children), censorship in the U. S. and the USSR, and specific films that had caused controversy such as *Suddenly, Last Summer*, and themes as homosexuality. Johnston came out strongly against any form of government censorship. If the government began to censor movies, it might well lead to censorship in other areas such as scientific research, he said. Johnston also responds to suggestions about expanding the MPAA's Appeal Board to include people who reflect the public interest better than movie producers do. Johnston did not think that plan was practical.

**779.** *Hearings, Self-Policing of the Movie and Publishing Industry*, before the Subcommittee on Postal Operations of the Committee on Post Office and Civil Service, U. S. House of Representatives, Eighty-Sixth Congress, Second Session. *Statement and Testimony*, Shurlock, Geoffrey.

Shurlock, the director of the movie industry's Production Code Administration, discusses the state of the Code and the 1956 revision of that document. Shurlock discusses his philosophy in interpreting the Code and the depiction of sin in the movies. He discusses five censorship cases involving the films *Serenade*, *Gigi*, *From Here to Eternity*, *Cat on a Hot Tin Roof*, and *Peyton Place*. Other movies discussed include *Suddenly*, *Last Summer*, and *Advise and Consent*.

**780.** *Hearings, Self-Policing of the Movie and Publishing Industry*, before the Subcommittee on Postal Operations of the Committee on Post Office and Civil Service, U. S. House of Representatives, Eighty-Sixth Congress, Second Session. *Statement and Testimony*, Brandt, Richard.

Brandt was Governor of the Independent Film Importers and Distributors of America. He says that his association imports about 100 to 150 films a year (excluding films in the Chinese and German language without subtitles) and that only five or six get a PCA seal. (89)

**781.** *Hearings, Self-Policing of the Movie and Publishing Industry*, before the Subcommittee on Postal Operations of the Committee on Post Office and Civil Service, U. S. House of Representatives, Eighty-Sixth Congress, Second Session. *Statement and Testimony*, Twyman, Margaret G.

Twyman was Director of Community Relations for the Motion Picture Association of America. She discusses ways in which the movie industry tries to make the public aware of movies: 1) submitting films in advance to critics; 2) making movies available to independent national organizations for them to review; 3) special promotions for outstanding films; 4) informing educators.

**782.** Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement of Andrea Sheldon, Executive Director, Traditional Values Coalition, Feb. 27, 1997*. See also: violence See also: sexuality

Sheldon, Andrea. 1997.

This Statement from a leader of the Traditional Values Coalition support the adoption of a rating system for television programs.

**783.** *Hearings, "Television Ratings System,"* Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement of Brian Wilcox, Director, Center for Children, Families and the Law, University of Nebraska, on Behalf of the American Psychological Association, (Feb. 27, 1997)*. See also: violence See also: sexuality

Wilcox, Brian. 1997.

This Statement was delivered at U. S. Senate hearings in early 1997 that considered the need for a rating system for television programs. Wilcox was Director for Children, Families and the Law, and spoke on behalf of the American Psychological Association (APA). At these hearings, the APA was one of several associations concerned with health and public welfare that urged creating a new rating system, and who also argued that violence in mass media had harmful effects on children.

**784.** Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement of Joan Dykstra, President, National Parent-Teacher Association, Feb. 27, 1997*. See also: violence See also: sexuality

Dykstra, Joan.

This statement is from Joan Dykstra, the president of the National Parent-Teachers Association (PTA), before a Senate hearing on establishing a rating system for television programs. Dykstra said at the hearing that unless there were changes in industry policy, she was prepared to recommend that Congress "go far beyond the V-chip venturing into far more restrictive quagmires of safe harbor resolutions."

**785.** Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement of the American Academy of Child and Adolescent Psychiatry, Feb. 27, 1997.* See also: violence See also: sexuality

Stone, Lawrence. 1997.

Stone's Statement, which reflected the views of the American Academy of Child and Adolescent Psychiatry, argued that media violence is harmful to children and supported a rating system for television programs.

**786.** Attorney General's Commission on Pornography. *Statement to the Attorney General's Commission on Pornography, Oct. 16, 1985.* Peters, Robert. 1985.

Peters was an L.A. detective who talked to the Meese Commission about the technology and distribution of pornography.

**787.** Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement, ... on the Television Ratings System, Feb. 27, 1997.* See also: violence See also: sexuality

American Academy of Pediatrics. 1997.

Here the American Academy of Pediatrics endorses the adoption of a rating system for television and points to the damaging effects of television violence.

**788.** Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement, ... RE: Ratings System for Violence on Television, Feb. 27, 1997.* See also: violence See also: sexuality

American Medical Association. 1997.

Here the American Medical Association endorses the adoption of a rating system for television programs and points to the damaging effects of television violence.

**789.** Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Statement, Hearings, "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People", (Oct. 24, 1985).* Goldman, Marvin. 1985.

The United States Senate held hearings on drug abuse and the entertainment industry in 1985. At these hearings, Marvin Goldman, who had been president of the National Organization of Theater Owners during the late 1970s, strongly recommended giving parents more data about why movie ratings were given. He thought it would be helpful to parents if they knew that a restricted, or R, rating had been given for substance abuse.

**790.** Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Statement, Hearings, "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People", (Oct. 24, 1985).* Gaughan, Norbert F. 1985.

Bishop Norbert F. Gaughan testified before a U. S. Senate subcommittee investigation the portrayal of substance abuse in motion pictures. He pointed to movies that treated drug use in a light or favorable manner.

**791.** Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Statement, on the Television Parental Guidelines System, Feb. 27, 1997.* See also: violence See also: sexuality

American Psychiatric Association. 1997.

Here the American Psychiatric Association endorses the adoption of a rating system for television programs and points to the damaging effects of television violence. The Statement of Robert T. M. Phillips, Deputy Medical Director, American Psychiatric Association, appears in *ibid.*, 237-39.

**792.** Committee on the Judiciary

Subcommittee to Investigate Juvenile Delinquency. *Statement, to "Juvenile Delinquency (Motion Pictures)", June 17, 1955.* Shurlock, Geoffrey. 1955.

Geoffrey Shurlock, the newly appointed head of the movie industry's Production Code Administration, testifies about the relationship between movies and juvenile delinquency.

**793.** *Hearings, "Television Ratings System,"* Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session (Feb. 27, 1997). *Statement: TV Parental Guidelines: Helping Parents Monitor the TV Watching of Their Young Children, Simply, Easily, Efficiently, Feb. 27, 1997.* Valenti, Jack. 1997.

Jack Valenti, president of the Motion Picture Association of America, delivered this Statement to a Senate hearing investigating the need for a rating system for television programs.

**794.** *Hearings, "Movie Ratings and the Independent Producer,"* Committee on Small Business, House of Representatives, Ninety-Fifth Congress, First Session

Subcommittee on Special Small Business Problems. *Statement: The Movie Rating System -- How It Began -- Its Purpose -- How It Works -- The Public Reaction [March 24, 1977], March 24, 1977.* Valenti, Jack. 1977.

Jack Valenti, who often too credit for the creation of the movie industry's rating system, which was adopted in 1968, here explains the system's origins and how it works. This Statement was made at a congressional hearing investigating charges that Hollywood rated the films of independent producers more severely than it did the movies of large studios that were members of the Motion Picture Association of America.

**795.** "Strike Near Top of Cupid Trust." *Chicago Daily Tribune* March 5, 1908 1908: 7.

The subtitle of this article reads: "Inspectors Arrest Isadore Meyers, Head of Series of Agencies. Stage Photos His Stock. Fifty Thousand Copies of Six Pictures Ready to Be Mailed to Applicants."

**796.** "Studies in the Emotions of Man." *Chicago Daily Tribune* Nov. 29, 1903 1903, sec. A: 5.

This article, illustrated with woodcuts of men's faces, discussion how the face expresses emotion. In Ancient Greece, actors were more honest. They wore masks to symbolize emotion and made no effort to use facial expressions. Modern actors use their facial expressions but rely on conventional forms of expression rather reflecting true emotion. "The hardest task of an artist, sculptor, or even actor is the reproduction of delicate shades of human emotions. Certain ??, well defined emotions have certain conventional physical signs which frequently are used by the person trying to express the feeling.

....

"The actor can represent a whole series of emotions by a series of expressions and can change from one to another at will. He has the still further advantage of being able to illustrate the emotion by word as well as by expression.

"In spite of this freedom the actor, as well as the artist, is found using the old conventional forms, which, like a Greek mask, are supposed to be the types for certain emotions.

"The Greek actors were more honest than the modern actor who pretends to give a real and natural expression of emotion. They in the old days of the stage made no attempt at facial expression. They put on a mask which represented the conventional idea -- whether of anger, horror, reverence, or whatever might be required.

"These conventional and much used expressions are declared to be entirely opposed to the true and natural representations. The actor, when he portrays the emotions of anger, for instance, is more apt to be using an expression that some actor before him used than one which he knows would be natural expression.

"These facts are apparent to a stranger to the art of mimicry, as well as those who have made it a careful study. Scientists like Darwin, Meynert, Mantegazza, and especially Pederit, were the first to apply scientific methods in investigating the subject. They used physiology as a foundation for the study, but they did what others had not done and focused their entire attention on the features alone, to the exclusion of the body.

"Pederit gave the results of his study to the world in the shape of his book, "Mimicry and Physiognomy." He is said to have been unfortunate in his classification of the emotions.

"Dr. [H.] Heller, who has gone farther and has illustrated the emotion with plaster models for the study of artists and actors, was an admirer of Pederit...."

**797.** "'Suddenly, Last Summer'." *New York Times* Dec. 13, 1959 1959: SM72.

This brief account notes that this movie was written by Tennessee Williams with "collaboration with a friend, Gore Vidal." The movie was based on an off-Broadway play. Several pictures from the movies accompany this piece. *Suddenly, Last Summer* was one of the so-called American-interest or "runaway" films made during the 1950s and 1960s. This film had problems with the Production Code Administration because it dealt with homosexuality and cannibalism.

**798.** "Suit Against Meese's Commission on Pornography Reported Settled." *Los Angeles Times* Jan. 30, 1987 1987: 20.

The article concerns the settlement of a suit brought against the Meese Commission by the Magazine Publishers Association charging that the Commission had sent a letter to chain stores urging them to stop selling such magazines as *Playboy* and *Penthouse*, thus creating a blacklist. The article says that *Playboy* and *Penthouse* still have suits against the Commission still outstanding.

**799.** "Sunday 'Times' Greatest Yet." *Los Angeles Times* July 30, 1917 1917, sec. II: 5.

This article notes the huge volume of advertising in the July 29, 1917, Sunday edition of the *Los Angeles Times*. It included: "Classified Advertising, 145 columns, 3 inches. Individual liners, 7074 in number. Display advertising, 397 columns, 4 inches. Total advertising (linear and display), 542 columns 7 inches. Number of full-page advertisements, 28. Twice as much merchandise advertising as any competitor." The article's subtitle reads: "New Standard of Excellence Set by Huge Issue. Notable in News, Features and Heavy Advertising. Public Demand Exhausts the Whole Edition by Noon."

**800.** *Superior Films, Inc. v. Dept. of Education of Ohio*. 159 Ohio St. 315, 112 N.E. 2d 311 (1953), rev'd per curiam, 346 U.S. 587 (1954) 1953.

In this case, the Court voided the use of "harmful" as a justification to censor motion pictures.

**801.** "[Surgeon General's Report on TV Violence]." *Indianapolis Star* Sept. 4, 1971 1971: 1.

This is one of many newspaper accounts about the Surgeon General's Report on Television Violence.

**802.** Committee on the Judiciary, United States Senate, Ninety-Fourth Congress, Second Session

Subcommittee on Constitutional Rights. *Surveillance Technology: Policy and Implications: An Analysis and Compendium of Materials: A Staff Report of the Subcommittee on Constitutional Rights*, United States Senate, Committee on the Judiciary.

This Staff Report from the Subcommittee on Constitutional Rights of the U. S. Senate's Committee on the Judiciary notes that "as long as surveillance technology remains unregulated and continues to grow at an accelerating rate, the free and enriching exercise of the rights guaranteed by the Constitution and the Bill of Rights will inevitably be chilled to the point of immobility by the general awareness that Big Brother commands the tools of omniscience." (iii)

This report and related documents run almost 1,300 pages and includes about 90 pages of annotated bibliography relating to surveillance, computers, privacy, and government information. This work provides an excellent starting point for anyone wishing to study the state of electronic surveillance in 1976.

**803.** "Taft in Moving Pictures; Will be Snapped as He Signs Arizona Statehood Proclamation." *New York Times* Feb. 14, 1912 1912: 12.

This article reports that "For the first time in the history of the White House moving pictures of an event of national importance will be taken to-morrow when President Taft signs the proclamation admitting Arizona to the Union."

**804.** "Takes Photos in Colors." *Chicago Daily Tribune* Oct. 10, 1903 1903: 3.

The subtitle of this article says: "J. H. Powrie Claims He Has Solved Old Problem."

**805.** "Taking Movies Seriously." *New York Times* March 9, 1919 1919: 48.

The writer of this article is "convinced that the photoplay has the possibilities of a truly great art." The article goes on to say: "And, of course, there is the universality of the moving-picture language. It is more universal, even, than the language of music."

**806.** "Talking Pictures: The New Kinetophone." *The Times [London]* Jan. 20, 1914 1914: 8.

This article discusses Thomas Edison's kinetophone, which combined the phonograph and moving pictures.

**807.** "Tammany Aids Movie Fight; Democratic Committee Sees No Objection to Sunday Shows." *New York Times* Dec. 13, 1916 1916: 24.

This article reports that Tammany Hall wants to keep theaters open on Sunday.

**808.** "Taping Untapped Markets." *Time* 85.8 (1965): 90, 92.

This article notes that "few Americans have ever seen one, but the videotape recorder is playing a steadily bigger part in their lives." (90) There is a huge potential market for recorders but at this time, that potential is still largely unrealized.

**809.** "Teaching by Moving Pictures." *Los Angeles Times* Sept. 20, 1908 1908, sec. V: 15.

This article notes that moving pictures are "Already in Use in Medical Schools and May Be Extended for Other Work."

**810.** *Technology Assessment Advisory Council Meeting Files*. Office of Technology Assessment Records.

The files in the Records of the Office of Technology Assessment Records give insight into the way business leaders, researchers, and government leaders thought about technological change during the late 1970s. The OTA, a Congressional agency, produced dozens of reports from the 1970s until its demise in 1995, on communication technologies. These files are in RG 444, National Archives 2 (NARA 2), University of Maryland, College Park, MD.

**811.** "Telediagraph and Telediagram." *Zion's Herald* 77.18 (1899): 552.

This article says that newspaper offices in five major cities now have installed technology that can transmit pictures by telegraph wire. The inventor is Ernest A. Hummell.

"Two new words have been added to our vocabulary. These are made necessary by the invention of an apparatus for transmitting pictures by telegraph. It is called a telediagraph, which is the best word to express 'long distance drawing,' and is analogous to the word telegraph, which expresses the idea of long-distance writing. Following the analogy, the product is a telediagram. The inventor has succeeded in transmitting pictures from Chicago to Boston, and is looking for immediate returns from his invention. The machines are very complicated and require the utmost care in adjusting one to another and in synchronizing them. There are now five of them installed in newspaper offices in Boston, New York, Philadelphia, Chicago, and St. Louis, and furnish additional evidence of the powers of electricity when utilized by science. Pictures may be sent from Chicago to Boston, exactly as they are drawn, in less time than it takes to make the original drawing. The greatest difficulty experienced in former efforts to send pictures by electricity was found in making the transmitting instrument and the receiving instrument run together. This has been overcome by making them run by clockwork. The inventor is Ernest A. Hummell, born in Germany thirty-four years ago, and now living at St. Paul, Minnesota. He is an expert watchmaker, and has succeeded in perfecting his new invention without borrowing money or in any manner impairing his rights in it."

**812.** "The 'Telephot'." *Current Literature* 35.2 (1903): 149.

This article summarizes and uses excerpts from Dr. A. Gradewitz article "The 'Telephot,' a Novel Apparatus for Photographing at Great Distances," in the *Scientific American*, June 27, 1903. See under Gradewitz.

**813.** "Telephotography." *Living Age* 257.3336 (1908): 689-91.

This article begins by explaining the distinction between "telephotography, or the photography of objects at a distance," and "phototelegraphy, or the transmission of a photographic image between distant points by means of electricity." (689) The article then discusses the telephoto lens, how it works and its limitations. Among the disadvantages: "Except at low magnifications the definition given by a telephoto lens is not equal to that given by an ordinary high-class lens of the same focal length. Also, as the amount of light passed is greatly decreased by the introduction of the 'negative' element, the telephoto lens is relatively a slow lens. Indeed the ordinary rule for exposure is that the exposure which would be necessary if the front of 'positive' lens were used along must be multiplied by the square of the magnifications. If the magnification is ten or twelve diameters, instantaneous telephotography become hopelessly impossible. But, both as regards definition and shortness of exposure, the telephoto lens, if properly handled, will do a great deal more than even experts seemed to think possible a few years ago." (690) Still, the telephoto lens is somewhat unpopular. It generally needed a long hood to prevent reflections internally from the lenses' surfaces.

The article, though, points out that the telephoto lens gives "new power" to the photographer. (690) Naturalists and others who wish to photograph nature will be empowered, as will architects and engineers. The article also discusses the advantages this instrument can give to the military and especially the navy. It also says

that telephotography will "render Press photography much less of a glaring nuisance to public characters than it is under ordinary conditions." (691)

**814.** "Telephotography." *Scientific American* 80.13 (1899): 202-03.

This article discusses telephotography. It discusses its use in the Spanish American War and suggests that it has great potential for military applications. The article talks about how this kind of photography works, the exposure time required, and the fact that anyone can use it. It mentions photographic plates with pictures that have been magnified seven times.

Of the Spanish American War, the author says: "During the late war with Spain, the desirability of procuring photographic negatives with the aid of a telephotograph became very apparent. Mr. Dwight L. Elmendorf, of New York city, who has made a special study of this method of photography, followed the campaigns in Cuba, both on sea and land, and with the aid of the telephotographic camera obtained some remarkable photographs of troops in action. Many of these photographs were taken at a great distance from the scene of action, so that the photographer was in comparative safety while engaged in taking the views. The results obtained, however, do not justify this supposition, as, from all appearances, the men appear to be in close proximity to the camera, and one would judge that the intrepid photographer was having a hot time of it. There are immense possibilities of a very practical nature in the use to which this method of photography can be put, and it should prove of great value in warfare in determining the nature of the enemy's country, in making observations of special objects and fortifications, and in obtaining a record of the positions of troops while maneuvering or in action, while they are at a considerable distance."

With regard to exposure time, the article says that the "time of exposure is, of course, much longer with the telephotographic attachment than with the photographic lens alone: that is, it is approximately proportional to the square of the magnification. For example: If, with the photographic lens alone, the exposure would be 1/44 of a second, with the telephotograph adjusted to magnify eight times, it would require an exposure of one second; but there is considerable latitude in exposure in a telephotograph, and it is well enough to give a little more time than the rule calls for."

As for easy of use: "The principles underlying the use of the camera for this kind of photography are so simple that there is no reason why any one having any taste for photography should not quickly become accustomed to its manipulation, with results that will be found most novel and gratifying. The expense if trifling, as the ordinary camera and lens may be used, the extra length being obtained by means of the box extension at the back of the ordinary camera."

**815.** "Television Declared Ready to Broadcast, Starting Sectionally, With Relays Later." *New York Times* Aug. 11, 1933 1933: 18.

This article reports on progress in developing television.

**816.** "Television Is Evolving at Slow but Sure Pace." *New York Times* April 22, 1928 1928: 145.

This article reports on the progress of television research. The article's subtitle reads: "De Forest, Pupin and Others Are Pessimistic As to Early Use of Radio Vision Sets in the Home Much Research Remains to Be Done Present Apparatus Is Too Complex."

**817.** "Television Promised by French Inventor." *New York Times* March 15, 1924 1924: 17.

**818.** *Hearings, Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. Television Ratings System, (Feb. 27, 1997).* United States Senate. 1927.

These hearings considered the need for a rating system for television programs. The senators heard testimony from representatives of several professional and health-oriented associations who argued violence on television had harmful effects on society, and especially on children.

**819.** "Televisor Lets Radio Fans 'Look In' As Well As Listen." *New York Times* April 25, 1926 1926, sec. XX: 17.

This article reports on an early demonstration of television. The article's subtitle reads: "John L. Baird of Scotland Demonstrates Apparatus Which Sends and Detects Pictures of Moving Objects."

**820.** "Ten Million Persons See Los Angeles Every Night." *Los Angeles Times* Nov. 29, 1914 1914, sec. II: 1, 10.

This article talks about the growth of the motion picture industry and the increasing place that Los Angeles has in that business. "When the lights wink out in the motion picture houses of this and other lands and the projection machines begin their sputtering songs, 10,000,000 armchair travelers mount **a magic carpet** that whisks them away on their nightly visits to **modern Bagdad [sic] -- Los Angeles**, the photo-play capital of the world. [my emphasis]

"Springing into life with the rapt suddenness that a plant springs and blooms at the behest of an Indian magician, the motion-picture business has taken on mammoth proportions in much less than a generation and has secured a sure place in the affections of untold millions of \_'fans.' And it is but in its infancy, say not only those who make the pictures, but the candid even the scoffers at this baby in the family of Thepis." Articles says that L.A. makes 85 percent of the films made in the USA today and the that the movie "field has only been scratched..." L.A. has scenery compared to southern California. There is a growing demand for American movies abroad in Europe, South America, Australia.

The subtitle of this article says of Los Angeles: "It's the Photoplay Capital of the World, and Wonder Cities of Steel and Concrete Spring up to House this Vast Industry."

**821.** *Hearings*, "Movie Ratings and the Independent Producer," Committee on Small Business, House of Representatives, Ninety-Fifth Congress, First Session (July 21, 1977)

Subcommittee on Special Small Business Problems. *Testimony*, July 21, 1977. Valenti, Jack. 1977.

Valenti testified at these congressional hearings investigating charges that Hollywood rated the films of independent producers more severely than it did the movies of large studios that were members of the Motion Picture Association of America.

**822.** *Hearings*, "Television Ratings System," Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Testimony*, (Feb. 27, 1997). Photocopy filed under "Television Ratings System."

Valenti, Jack. 1927.

Valenti, president of the Motion Picture Association of America, testified at these hearings which considered the need for a rating system for television programs. The senators heard testimony from representatives of several professional and health-oriented associations who argued violence on television had harmful effects on society, and especially on children. Valenti was reluctant to create a new rating system for television, arguing that it would be too complicated and time-consuming.

**823.** *Hearings*, "Movie Ratings and the Independent Producer," Committee on Small Business, United States House of Representatives, Nineth Fifth Congress, First Session

Subcommittee on Special Small Business Problems. *Testimony*, Heffner, Richard D.

Here Richard D. Heffner, then head of the movie industry's Classification and Rating Administration, testifies that films made by independent producers are not rated more harshly than motion pictures made by large studios that were members of the Motion Picture Association of America. A copy of this testimony can be found in the Richard D. Heffner's Personal Papers, Private Collection, New York, NY.

**824.** *Hearings, "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People,"* Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session  
Permanent Subcommittee on Investigations. *Testimony, (Oct. 24, 1985).* Valenti, Jack. 1924.

As critics charged that Hollywood movies encouraged drug use, or at least treated the problem in a light manner, Motion Picture Association of America president Jack Valenti argued that such films favorable to drug use were the exception and that the movie industry was doing a good deal to combat substance abuse.

**825.** *Hearings, "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People,"* Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session  
Permanent Subcommittee on Investigations. *Testimony, (Oct. 24, 1985).* Shatner, William. 1924.

Actor William Shatner testified at this U. S. Senate hearing on motion pictures and drug abuse, and indicated that he favored a new rating ("SA") to indicate this topic in movies.

**826.** *Hearings, Overseas Information Programs of the United States.* U. S. Congress. Senate. Subcommittee on the Committee on Foreign Relations, Eighty-Second Congress, Second Session. *Testimony, Nov. 20, 21, 1952.* Edwards, Herbert T. 1952.

Edwards tells Senator J. William Fulbright that the State Department did make films abroad that that "the ones that are produced abroad are invariably produced by local private concerns, so that the finished product will be completely in the visual idiom of the country." (212) Edwards was Director, Motion Picture Service, IIA, U. S. Department of State.

**827.** *Hearings, Self-Policing of the Movie and Publishing Industry,* before the Subcommittee on Postal Operations of the Committee on Post Office and Civil Service, U. S. House of Representatives, Eighty-Sixth Congress, Second Session. *Testimony,* White, Gordon S.

Gordon White, the Director of the motion picture industry's Advertising Code Administration, discusses how the MPAA polices ads for films. A copy of the Advertising Code is attached to his testimony.

**828.** Attorney General's Commission on Pornography. *Testimony before Attorney General's Commission on Pornography, Oct. 16, 1985.* Peters, Robert. 1985.

Peters was an L.A. detective who talked to the Meese Commission about the technology and distribution of pornography. This material is in Folder: "Los Angeles -- 10/16/85 (Part I)," Box 3, Records of the Attorney General's Commission on Pornography, RG 60 (Justice Dept. Records), National Archives and Records Administration (NARA II), College Park, MD.

**829.** Attorney General's Commission on Pornography. *Testimony before the Attorney General's Commission on Pornography, Sept. 11, 1985.* Donnerstein, Edward. 1985.

Despite his earlier testimony in Minneapolis suggesting a strong connection between watching violent pornography and aggression toward women, in October, 1985, Donnerstein said that although he believed that sexually violent materials might change attitudes, there was no evidence to indicate that it changed people's behavior. It was "impossible," he said, to prove that pornography caused sexual crimes. "The evidence just isn't that clear-cut." Donnerstein felt that the opponents of pornography misused his research. A point often missed

was his finding that images showing women who did not enjoy being raped failed to arouse most men. Moreover, simply erotic images – explicit non-violent, non-degrading depictions – did not produce aggressive behavior. He told the Houston panel that “it was really the violent component in violent pornography which was the issue, not the sexual nature of the material.” But even in considering violent materials, one had to be careful about what conclusions could be drawn. This testimony can be found in Folder: "Houston -- 9/11/85 (Part I)," Box 2, RG 60 (Justice Dept. Records), National Archives and Records Administration (NARA 2), College Park, MD

**830.** Attorney General's Commission on Pornography. *Testimony before the Attorney General's Commission on Pornography, Sept. 12, 1985.* Court, John. 1985.

Court, an Australian researcher, was one of several witnesses before the Meese Commission in 1985 to argue that pornography as seen through mass media had harmful effects on individuals and society. Court was critical of the conclusions made by the 1970 President's Commission on Obscenity and Pornography. This testimony can be found in Folder: "Houston -- 9/11/85," Box 2, RG 60 (Justice Dept. Records), National Archives and Records Administration (NARA 2), College Park, MD.

**831.** Attorney General's Commission on Pornography. *Testimony before the Attorney General's Commission on Pornography, (Oct. 17, 1985).* Valenti, Jack. 1917.

By the time Jack Valenti testified in Los Angeles on October 17, 1985, the Meese Commission had heard plenty of testimony that condemned not only hard-core pornography but also violent mainstream motion pictures. Eager to disassociate Hollywood from the hearings, Valenti branded pornography an “outlaw industry,” contended that the rating system effectively shielded children from explicit materials, pronounced pornographic movies tedious, and predicted that interest in them would decline once the novelty had worn off. When Father Bruce Ritter of the Meese Commission asserted that the gap between PG-13 and R films had narrowed and that many R films amounted to soft-core pornography, Valenti acknowledged that the values behind the ratings changed with time. *Midnight Cowboy* had been given an X rating when it appeared in 1969, for example, but now, he said, it probably would receive no more than a PG-13. Asked if an X-rated movie in 1985 might not in the future become an R-rated picture, Valenti thought it doubtful, but admitted that because the system depended on consensus from many groups, “you have to lower sometimes the standards you might employ.”

A copy of this testimony is in Folder: "Los Angeles -- 10/17/85 (Part I)," Box 4, Records of the Attorney General's Commission on Pornography, RG 60 (Justice Dept. Records), National Archives and Records Administration (NARA II), College Park, MD.

**832.** *Hearings, "Television Ratings System,"* Committee on Commerce, Science, and Transportation, United States Senate, One Hundred Fifth Congress, First Session. *Testimony on Behalf of the National Conference of Catholic Bishops, Department of Communication, (Feb. 27, 1997).* See also: violence See also: sexuality

Costello, Thomas J. 1927.

Here a representative from the National Conference of Catholic Bishops testifies before the U. S. Senate on the need for a rating system for television programs.

**833.** Attorney General's Commission on Pornography. *Testimony to Attorney General's Commission on Pornography, Oct. 16, 1985.* Docherty, James. 1985.

James Docherty was a police captain who told the Meese Commission in 1985 about the extent of pornography in Los Angeles in mass media. He also said that he had never come across a snuff film.

**834.** *Testimony, before Attorney General's Commission on Pornography, Sept. 11, 1985.* Malamuth, Neil. 1985.

Most research appeared to show that viewing pornography, either on an occasional or long-term basis, heightened sexual arousal. Whether this effect had long-term consequences and whether those consequences harmed society was the subject of disagreement. Pornography did not change arousal patterns in viewers, Neil Malamuth noted in testimony before the Meese Commission, but a “surprising percentage of the population” was already prone to arousal by the combination of violence and sexuality and found violent pornography exciting. Malamuth argued that popular fiction portrayed aggression against men and women differently. Aggression against women generally included a sexual component not present in assaults against men. Men were seen as wanting to avoid being victimized, while women often seemed to invite victimization and hence, by implication, bore some responsibility for their treatment. These themes, so blatantly depicted in hard-core pornography, were subtly portrayed in mainstream fiction and advertising, and differed only in degree. They appeared in such PG-rated movies as Sam Peckinpah’s *The Getaway* (1972) and Lina Wertmüller’s R-rated *Swept Away* (1975) – movies shown widely on television. The violent images and themes appeared in such publications as *Penthouse*, which Malamuth charged had accented violence and sex in recent years, and in the advertising of other *Penthouse*-owned magazines such as *Newlook*. This type of material, including that found in mainstream outlets, could bring “relatively long lasting attitude changes” even when people are “not aware that they are being affected or they are being changed,” Malamuth’s research indicated.

Malamuth emphasized context and the complex nature of behavior. He concluded that mass media and pornography by themselves were hardly inconsequential, but they were also not the only factors, nor were they perhaps even major causes of aggression against women. They were part of a complicated interaction.

**835.** *Testimony, before Attorney General's Commission on Pornography, Sept. 11, 1985.* Green, Richard. 1985.

Although the Meese Commission (1985-86) skewed its witness list to those who emphasized pornography’s negative effects, it did receive some testimony from those who offered alternative views, even though their voices were in the minority. Richard Green, the founding editor of *Archives of Sexual Behavior* and a past president of the Society for the Scientific Study of Sex, argued that some types of sex-related crimes had decreased in Denmark and Germany as people bought more erotica. Pornography combined with masturbation, he said, provided “an outlet for anti-social sexual impulses.” He contended that erotica could be educational and therapeutic. He also criticized laboratory research that used student subjects – the kind of studies done by Edward Donnerstein and Neil Malamuth, for example – saying that it was an unreliable way to predict behavior.

**836.** *Testimony, before the Attorney General's Commission on Pornography, Sept. 11, 1985.* Mosher, Donald L. 1985.

Critics of the Meese Commission (1985-86) argued that there was inadequate data on the effects of pornography, and the lack of scientific consensus made it difficult to formulate a sound national policy. Donald L. Mosher, a professor of psychology at the University of Connecticut who had contributed three studies to the *Report of the Commission on Obscenity and Pornography* (1970), told the Meese Commission as much when he testified in 1985.

**837.** Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Testimony, Hearings, "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People", (Oct. 24, 1985).* Heffner, Richard. 1985.

Heffner, who was then head of the movie industry's Classification and Rating Administration (CARA), testified about how CARA rated movies that depicted substance abuse. Heffner did not believe that the subject matter of a film should guarantee a rating per se, but he favored giving the public more information explaining why ratings were given -- although on this latter point, he had to be careful because Jack Valenti resisted giving more information on the ratings.

**838.** Committee on Governmental Affairs, United States Senate, Ninety-Ninth Congress, First Session

Permanent Subcommittee on Investigations. *Testimony, Hearings, "Role of the Feature Film Industry in a National Effort to Diminish Drug Use Among Young People"*, (Oct. 24, 1985). Goldman, Marvin. 1924.

The United States Senate held hearings on drug abuse and the entertainment industry in 1985. At these hearings, Marvin Goldman, who had been president of the National Organization of Theater Owners during the late 1970s, strongly recommended giving parents more data about why movie ratings were given. He thought it would be helpful to parents if they knew that a restricted, or R, rating had been given for substance abuse.

**839.** *Hearings, "Movie Ratings and the Independent Producer,"* Committee on Small Business, House of Representatives, Ninety-Fifth Congress, First Session

Subcommittee on Special Small Business Problems. *Testimony: The Movie Rating System -- How It Began -- Its Purpose -- How It Works -- The Public Reaction [March 24, 1977]*, Valenti, Jack.

Jack Valenti, who often too credit for the creation of the movie industry's rating system, which was adopted in 1968, here explains the system's origins and how it works. Valenti's testimony was given at a congressional hearing investigating charges that Hollywood rated the films of independent producers more severely than it did the movies of large studios that were members of the Motion Picture Association of America.

**840.** Attorney General's Commission on Pornography. *[Testimony] Effects of Repeated Exposure to Nonviolent Pornography, Sept. 11, 1985.* See also: violence See also: sexuality

Zillmann, Dolf. 1985.

Most members of the Meese Commission agreed with researcher Dolf Zillmann who testified that prolonged exposure to non-violent pornography made both men and women more accepting of pre- and extramarital sex, generated discontent with one's sexual partner, created doubts about marriage being one of society's essential institutions, and destroyed trust between spouses or friends. Moreover, heavy use of pornography promoted a lack of sensitivity toward victims of sexual violence because it tended to trivialize rape and the sexual abuse of children, led people to believe that unusual sexual activities were normal, and decreased the belief that women should be equal to men in intimate relations.

**841.** *[Testimony] Public Hearings on Ordinances to Add Pornography as Discrimination against Women, Dec. 12, 1983.* Donnerstein, Edward. 1983.

In December, 1983, Edward Donnerstein, a professor in the Communication Arts Department at the University of Wisconsin, Madison, testified at the public hearing in Minneapolis in December, 1983, where the Catharine MacKinnon and Andrea Dworkin's anti-pornography ordinance was being considered. Donnerstein stated that many men were aroused by depictions of women enjoying rape and other forms of aggression. Even short exposures of five to ten minutes could affect the attitudes of "very normal types of males" and make them more inclined to accept myths about rape. If one assumed that children learned "from Sesame Street how to count one, two, three, four, five, believe me," he said, "they can learn how to pick up a gun and also learn ... about male/female relations." If you could "measure sexual arousal to sexual images" and measure what attitudes males had about rape, you could "predict aggressive behavior with women, weeks and even months later," Donnerstein suggested. Indeed, some researchers would argue, he said, that the connection between watching some kinds of violent images and callous and aggressive behavior toward women was "much stronger statistically than the relationship between smoking and cancer."

This testimony can be found in Folder 15, Box 69, Records of the Attorney General's Commission on Pornography, RG 60 (Justice Dept. Records), National Archives and Records Administration (NARA II), College Park, MD.

**842.** "Tests that Pornography Fails [editorial]." *Christian Science Monitor* July 10, 1986 1986: 15.

This article asks: "Is a crusade against pornography needed, as Attorney General Meese says? The issue is one of tone. Crusades can be indiscriminate, trampling the rights of many to honest, wholesome expression." It goes on to say that "It is not sexual content of itself that necessarily makes pornography deplorable. It is how it fails to pass some fundamental but easily understood tests: Does the material strengthen human affections, deepen trust, elevate purpose, safeguard the individual and society's interest in stable, lifetime bonds? A public effort to make such a review widespread would be welcome."

**843.** "That New Telectroscope." *New York Times* April 3, 1898 1898: 22.

This article discusses a new invention, the telectroscope, by Jan Szczepanik in Vienna, that can transmit pictures and printed material such as manuscript over long distances by telegraph wire. The pictures can all be sent in color. This instrument may make the current telegraph superfluous. The subtitle of the article reads: "Details of the Instrument That Is to Transmit Pictures Over a Telegraph Wire. Szczepanik's Weird Machine. Claims of the Polish Schoolmaster as to What His Telectroscope Will Do and How It Does It -- A Scheme for the Transmission of Colored Rays."

**844.** "Theatres Can Open on 'Idle Mondays'." *New York Times* Jan. 20, 1918 1918: 2.

This article reports on the effort to conserve electricity during World War I and when motion picture theaters could be open.

**845.** "Theatres to Open for Shows To-Day; ... Moving Pictures Barred." *New York Times* Dec. 22, 1907 1907: 2.

This article concerns Sunday blue laws.

**846.** "The Theatrical Muck-Raker Answered." *Current Literature* 46.6 (1909): 669-71.

This article responds to a previously published piece in this magazine by Walter P. Eaton which severely indicted the American theater and theatrical managers. This article notes that newspapers provide a dual picture of the theater. Quoting Mrs. Leslie Carter: "While in one column of the newspaper appears an interview with some celebrated 'star' of the church, in which the public is warned against the danger of certain plays in the theater, in another column, on the same page, the newspaper gives its readers a blood-curdling and hideous picture of some actual drama in real life that would be quite impossible of representation on any stage because of its moral ugliness." (670-71) The article quotes Miss Jeannette Gilder's in *Putnam's Monthly* saying that "A censorship is a futile officer." (670) It also begins by citing Jane Addams who extolled the American stage for attacking serious social problems on which the church and press were silent. Addams listed about a dozen plays that fell into this category. (669)

**847.** "Theodore Roosevelt: The Picture Man." *Moving Picture World* 7.17 (1910): 920.

This article says that "Colonel Roosevelt has certainly had, and certainly is having, a great and, it must be said, a historic career. He is one of those men of whom, as we have hinted, the future historian must take decided cognizance. His is such an overmastering personality that we go the length of expressing the hope that moving pictures of him may be preserved in safe custody for future reference. What would the public of this country give to-day to see Abraham Lincoln or George Washington in their habits as they lived, in moving picture form?..."

**848.** "Thirty-Eight Masterpieces of the Altman Collection." *New York Times* April 5, 1914 1914, sec. SM: 8.

This article describes the artwork that was reproduced in the *New York Times* using the paper's new rotogravure process. See also related stories on this topic in this issue of the paper. The article's subtitle reads: "These, with the Thirteen Pictures Reproduced in Last Sunday's New York Times, Make up the Great Collection That Will Shortly Be Housed in the Metropolitan Museum."

**849.** "Throng at Bunny Funeral." *New York Times* April 29, 1915 1915: 14.

The subtitle to the article reads: "Film and Legitimate Stage Actors Attend Services at Elks' Club."

**850.** "The Times Pictures Praised by Critics." *New York Times* April 6, 1914 1914: 9.

This article reports the reaction of several artists and others to the *New York Times* publication of art work using the rotogravure process. Among those quoted are Charles Dana Gibson and John G. Anar, President of the National Arts Club.

**851.** "The Times' Rotogravure Presses. From the Editor and Publisher." *New York Times* April 15, 1914 1914: 12.

Here the editor and publisher of the *New York Times* explains the paper's new rotogravure process and how it is "an improvement of the slow and expensive process of photogravure." It uses a rotary press and is thus much faster. The picture is etched on a copper cylinder rather than on a copper plate; it uses fewer rollers than an ordinary press. Other newspaper using this process in 1914 included the *Boston Sunday Herald*, *Philadelphia Public Ledger*, and the *Chicago Tribune*. The article notes that the rotogravure process cost equals about that of half-tone printing.

**852.** "The Times's Magazine Supplement." *New York Times* May 18, 1897 1897: 6.

This article is reprinted from the *St. Augustine (Fla.) Record* and it says that the *New York Times* Sunday supplement recently devoted "a couple of page to snap shots of the Grant parade." It says that the *Times's* Sunday supplement's use of halftone pictures is "worthy of the highest commendation."

**853.** "Times's Pictures Win British Praise." *New York Times* April 19, 1914 1914, sec. C: 4.

This article begins by saying that "It is not too much to say that the *New York Times* Easter colored supplement, illustrating the gems of the Altman collection, and, even more, the first rotogravure supplement, caused a general sensation in art circles here and elicited many commendations on the enterprise displayed, as well as what is termed the immernse service rendered to the cause of art." It quotes one the mural painter Frank Brangwyn as saying of the rotogravure pictures: "I have neer seen anything as good even in high-class magazines.... You can get a much better and truer idea of the original from these rotogravures than from small magazine pictures...."

**854.** "To Boom Germany in Motion Pictures. Big Publicity Plan Launched for the Capture of Foreign Markets." *New York Times* Nov. 8, 1913 1913: 1.

This articles discusses Germany's effort to expand the global market for its motion pictures.

**855.** "To Broadcast Baseball by Radio Movies." *Popular Science* 102 (1923): 67.

**856.** "To City Desk and Entertainment Editor." *PR Newswire* July 18, 1985 1985.

This news release says that according the *Parade* magazine, at least sixty major movies during the past five years have portrayed "the use of illegal drugs in a positive, upbeat way."

**857.** "'To Make Good Citizens the Theatre for Children'." *New York Times* Nov. 12, 1911 1911, sec. SM: 7.

The subtitle of this article reads: "Miss Alice Minnie Herts Outlines Interesting Plan for a Permanent Institution of National Scope." The article goes on to quote Herts. "'To commercialize the imagination of the child seems to me to be a terrible thing,' averred Miss Herts, in explaining the rules of the children's theatre. 'The object of this whole scheme is to entertain, educate and develop children poor children. It is not to declare dividends!'"

**858.** "To Photograph in Colors." *Chicago Daily Tribune* Jan. 19, 1896 1896: 33.

The subtitle to this article reads: "Two Chicago Men Near the Goal."

**859.** "To Prohibit Indecent Pictures." *New York Times* Feb. 28, 1900 1900: 9.

This article notes that "Anthony Comstock appeared before the Assembly Codes Committee to urge favorable action on Senator Wagner's bill making it a misdemeanor to exhibit any indecent moving pictures in slot machines. The committee decided to report the bill favorably. It has already passed the Senate."

**860.** "To Take Movies Up in Air." *New York Times* July 2, 1918 1918: 11.

The subtitle of this article reads: "Lieut. Webb of Mail Service Will Carry Operator and Camera."

**861.** "Today's Christmas Edition of the New York Times Is the Finest Ever Issued by a Newspaper." *New York Times* Dec. 6, 1914 1914, sec. XX: 1.

The subtitle of this article summarizes its content: "Color Section Containing Reproductions of Boutet de Monvel's Joan of Arc Paintings an Unparalleled Achievement -- Together with the Rotogravure and Halftone Sections, the Special Articles and Other Features. It Marks New Era in Journalism."

**862.** "A Top Aide's Close-Up of a President Who Never Says 'I'm Tired'." *U. S. News & World Report* 59.2 (1965): 22.

An article that reveals Jack Valenti's deep admiration of President Lyndon B. Johnson.

**863.** "Toughened Child Pornography Bill Signed by Reagan." *Los Angeles Times* Nov. 8, 1986 1986, sec. 2: 3.

This article gives an account of the Reagan administration's tough stance on child pornography. Reagan "signed legislation strengthening federal law against child pornography. The measure amends a section of a law that prohibits the interstate transportation of children to engage in sexual activity for commercial purposes."

**864.** Committee on Science and Technology, U. S. House of Representative. *Toward the Endless Frontier: History of the Committee on Science and Technology, 1959-79*, United States House of Representative, Committee on Science and Technology.

This 1,073-page history of the U.S. House of Representative's Committee on Science and Technology cover the period from 1959 to 1979. Although this work is not particularly well written or organized, it does have a reasonably good index and offers students a decent starting point to study Congress's efforts to formulate policy relating to science and technology in the first two decades after the launching of Sputnik by the USSR.

**865.** "Traces Crime to Nickel Theater." April 14, 1907 1907: 3.

The subtitle of this article reads: "Judge Cleland Says Juvenile Offenders Owe Downfall to This Cause. Has Law to Check It. Offers Ordinance Barring Children from Shows Unless Parents Take Them." This article has the following subheadings: "Cause of Every Juvenile Crime"; "Debauches the Imagination"; "Little Boy Attempts Robbery"; "Small Girls Find Ruin."

**866.** "Traffic Record. Are Booming Country." *Los Angeles Times* July 25, 1911 1911, sec. II: 5.

This article talks about efforts to spread "the name, fame and productiveness of California" and notes the work of public lecturers equipped with "moving-picture machines and many thousand feet of films descriptive of California" The subtitle to the article reads: "Many Homeseekers Expected from World Over; The Moving Picture Machines Show Resources ...."

**867.** "The Tragedy and the Compensations of the Actor's Career." *Current Literature* 42.2 (1907): 188-89.

This article comments on the nature of the actor's fame at a time when it was unlikely people could either hear or see the actor's performances after his death. It begins with a story about Michelangelo who was "said to have

once gratified a whim of his own or of some exacting patron by carving a statue of snow. It may have been his masterpiece, but, under the warm rays of the sun, it quickly melted into a shapeless lump, leaving no record of its beauty. 'And this is what the actor does ever night,' Lawrence Barrett used to say; 'he is forever carving a statue of snow.'" (188)

The article cites actor Joseph Jefferson's observation that the work of painters, sculptors, and writers live on after their deaths, unlike that of the actor. It then reprints an excerpt from an article in *Munsey's Magazine* by Prof. Brander Matthews on the nature of the actor's fame. Matthews saw two advantages coming to the actors, however. One was that he was often given great wealth and fame while he was alive. (188) Matthews pointed out that the actor, because of a statue made of him, is well known but the sculptor is likely to be unknown. Similarly, the actor may be famous for his performance in a play but the audience is unlikely to know who the author of the play was. (189) A second advantage of the actor was that once dead, his reputation was unlikely to change. By contrast, the reputation of the painter, sculptor, and writer is likely to rise or fall in the years following his death -- all because his work has survived after him. (189)

The article quotes from poem by Campbell:

"For ill can poetry express  
Full many a tone of thought sublime,  
And painting, mute and motionless,  
Steals but a glance of time. 188/189  
But by the mighty actor brought,  
Illusion's perfect triumphs come --  
Verse ceases to be airy thought  
And sculpture to be dumb." (188-89)

This article may be compared with the comedian Joseph Jefferson's assessment of the fleeting nature of the actor's fame in "Joseph Jefferson on the Actor's Fame," *Forest and Stream*, 66, No. 21 (May 26, 1906), 842.

**868.** "Transcript of Record, *Samuel Roth, Petitioner v. United States of America*, Supreme Court of the United States, October Term, 1956, No. 582". 1957. (Jan. 14, 1957). Feb. 8, 2006.  
<<http://www.yale.edu/lawweb/avalon/curiae/html/354-476/001.htm> (accessed May 20, 2010)>.

This transcript gives the 26 counts on which Samuel Roth was indicted for distributing obscenity and it also lists the publication and other materials he was charged with mailing. The Petition for Certiorara was filed November 16, 1956 and the Certiorari was granted January 14, 1957. Among the publication Roth mailed were a monthly magazine, *Good Times: A Review of the World of Pleasure*; *American Aphrodite: A Quarterly for the Fancy Free*, which Roth edited; and such other items as "Stereoptice Nude Show," "Wallet Nudes," and "2 Undrapped Stars."

This case, together with the *Alberts v. California* case decided the same year, changed the Supreme Court's interpretation of obscenity, one that earlier had been defined by the *Hicklin* case. Henceforth, it became much hard for prosecutors to convict people for obscenity. Samuel Roth earlier convictions for obscenity for mailing *Wild Passion*, *Wanton by Night*, and *Sexual Content of Men and Women*. On one occasion he had gone to jail in Philadelphia for selling copies of James Joyce's *Ulysses*. Well-known for distributing such material, he had earlier

convictions for obscenity. His appeal came at the same time as that of David Alberts, convicted in California for selling obscene literature. While the U. S. Supreme Court upheld the convictions of Roth and Alberts, and stated that obscenity was not protected by the First Amendment, it nevertheless changed fundamentally the way in which it dealt with obscenity cases. What became known as the *Roth* test became the foundation of American obscenity law. Obscenity would be “whether to the average person, applying contemporary community standards, the dominant theme of the material taken as a whole appeals to the prurient interest.” In delivering the opinion in *Roth*, Justice William J. Brennan, Jr. said that “all ideas having even the slightest redeeming social importance... have the full protection” of the First Amendment, unless “they encroach upon the limited area of more important interests.” Justice Douglas, who joined by Hugo L. Black in dissenting in both *Roth* and *Alberts*, went farther. He argued that the First Amendment protected literary treatment of sex even if it offended “the common conscience of the community.”

**869.** "Tribune to Print Toned Pictures by Rotogravure." *Chicago Daily Tribune* Feb. 7, 1915 1915, sec. A: 1.

This article talks about the *Tribune's* use of the rotogravure process. It notes that the paper has been installing the new presses and that the process comes from Germany. It also discusses how the process works, its use of color, and its expense. "Mechanical engineers and experts in the art of photographic reproduction have been engaged for several weeks in installing a number of intricate machines in the *Tribune* building. When these machines are set in motion within a few weeks, another *Tribune* achievement will have been attained -- an achievement unequaled in the history of newspaper picture work in the United States.

"On Feb. 28 the first rotogravure work ever 'run off' of a rotary newspaper press on roll paper will be in the hand of the *Tribune's* readers. This work, from an artistic standpoint, will surpass in faithful reproduction of the gradations of light and shadow and detail any picture printed in the country except ... the most expensive of book paper and will be superior in softness of tone to most of these."

The subtitle of the article reads: "Machinery Installed for Highest Achievement in American Newspaper Publishing. Superior Process Is Used."

**870.** "Tries Out Kinetophone." *Los Angeles Times* Jan. 4, 1913 1913, sec. I: 1.

This article discusses Thomas Edison's kinetophone which combined moving picture machines and a phonograph. "Seven films were shown," the article reports. Edison is quoted: "'This will put the finest operas and the best dramas within the reach of the poorest man.'" Indeed, the article's subtitle reads: "Edison Declares His Latest Device Will Be a Big Agency for the Uplift of the Poor."

**871.** "Troland's Body Sent Homeward." *Los Angeles Times* May 29, 1932 1932, sec. A: 1.

This article reports the death of Leonard Troland, a co-inventor of Technicolor, from a fall on Mount Wilson in California, noting that he had been in ill health and that witnesses said his death was clearly accidental.

**872.** "Troland's Death Accident." *New York Times* May 29, 1932 1932: 6.

This article says that the Los Angeles Sheriff's office has closed its investigation of Leonard Troland's death, declaring it an accident. The article says that "Dr. Troland, suffering from the affects of a recent nervous breakdown, had gone into the mountains on a hiking trip with an associate, R. D. Eaton. Dr. Troland had climbed out on a rock to pose for a photograph when he fell into the canyon."

**873.** "Try to Wipe Out Billboard Evil." *Chicago Daily Tribune* June 27, 1908 1908: 18.

In addition to billboards, this article talks about licenses required for theater film machine operators. The article's subtitle reads: "Aldermen Propose Ordinance That Will Do Away with Unsightly Signs."

**874.** "Turned to Arson by Moving Pictures." *New York Times* July 15, 1910 1910: 16.

The subtitle of this article reads: "Twelve-Year-Old Ethel Allen Confesses to Setting a Tenement Ablaze Twice; Wrote a Black Hand Note; Demanded \$50 from Her Father She Says She Saw These Things in a Bronx Moving-Picture Theatre."

**875.** "TV and an Age of Pictures." *America* 94.16 (1956): 427.

This short piece reflective of the Catholic Church's views on television and movies, warns about "the constant danger that culture will indeed be 'vulgarized' by the steady encroachment of the picture-technique." This piece also mention that on December 20, 1955, 250 alumni from the Graduate College at Princeton University met to dicuss "The Communication of Ideas."

**876.** "TV News Film - New Role for 8mm." *American Cinematographer* 44.4 (1963): 227, 230, 232, 234-35.

This article discusses the potential for 8mm film in producing newsreels for television. News cameramen found that the 8mm cameras have advantages because they are lighter and more compact. It notes that in 1963, there was increasing use of 8mm film in television news programs and that its quality compared favorably with 16mm film. It notes that KPHO-TV in Phoenix, AZ, has been experimenting with a Fairchild sound camera and projector.

**877.** "The TV Parental Guidelines: About TV Ratings and V-Chip". Nov. 7, 2005. <<http://www.tvguidelines.org/>>.

This site provides the television industry's explanation of its rating system and the V-chip.

**878.** "TV Ratings." *Tampa Tribune* July 11, 1997 1997, sec. News/World: 6.

This article deals with political pressure building to force the television industry to adopt a rating system.

**879.** "TV's First Nude." *Playboy* (1968).

This article is about the first nude to appear on television.

**880.** "Two-Sided Attack on Picture Shows." *New York Times* March 14, 1911 1911: 7.

This articles reports on two approaches to regulating motion pictures. The article's subtitle reads: "Children's Society Going Before the Legislature and Conference Appeals to the Mayor; Not Agreed in Their Views; Children's Society Regards It as a Moral Question and Conference as an Administrative Detail."

**881.** "U. S. Gets a Look at Brigitte." *Life* 43 (1957): 83-84, 87-88.

This one of several articles in mainstream magazines publicizing Brigitte Bardot and her movie *And God Created Woman*.

**882.** "An Unamerican Innovation." *The Independent* 86.3520 (1916): 265.

This article laments that movie censorship seems to have become an "institution" and says that while it may be a military necessity during World War I, "it always involves a dangerous infringement of personal liberty." American have "purer plays and purer periodicals than European countries," even though they censor their press and theater. The author asks what would have become of photography if had been censored 50 years ago? It would be dominated by "a few rich and powerful organizations" and not the democratic pastime it is in 1916.

The article says that movie camera technology will soon be affordable for almost everyone and that censorship cripples the potential democratization of this art. "Now the motion picture camera will soon be made cheap enough so that almost any one can afford one. If not interfered with by censorial laws it will in a few years be the common custom to take motion pictures of home and street scenes, to exhibit these in school, church and theater within a few hours after taking, and to mail them cheaply to any part of the country for exhibition in the family circle or in public. But this very desirable democratizing of the art will be impossible under a national or state

censorship where one has to pay a fee of some ten dollars for every new film or two dollars for every duplicate, and have them shown to the censors before being exhibited in public."

The article says that motion pictures are "more than a means of amusement and more than a method of education. It is one of the most powerful forms of propaganda yet discovered. Some day there will, we hope, be films attacking the entrenched wrongs of modern society, as 'Uncle Tom's Cabin' attacked slavery, for which it was not allowed to circulate in the South...." Censorship makes this seem unlikely. "Does anyone suppose that our political appointees would ... stand for the freedom of the film against the pressure of vested interests and popular prejudice? No, we should have again what Shakespeare calls 'art made tongue-tied by authority,' and the old battle which has been won by the press would have to be fought over again for the screen."

**883.** "Uncut Features Aired Freely Into Homes But Censored for Screens." *Variety* 193.5 (1954): 1.

Between 1948 and 1952, Ohio TV stations played more than 1,800 movies, and between 500 and 600 of them had never been submitted to censors. Another 484 had been cut before they had appeared in movie theaters only to have the cuts restored before they were aired on TV. Five films that had been rejected outright by the Ohio Board of Censors were televised.

**884.** "United Artists Quits Film Group: Studio Resigns After Denial of Code Seal to 'The Man with the Golden Arm'." *New York Times* Dec. 8, 1955 1955: 46.

In November, 1955, the *New York Times* reported that United Artist would release the movie, *The Man with the Golden Arm*, with or without the PCA's seal. It was the first time that a major studio had announced its intention to exhibit a controversial film before submitting it to the PCA. The studio did submit the film to the PCA but the PCA refused to approve it. Johnston and the MPAA's Appeals Board upheld this decision on December 6, 1955, but the studio heads were divided. Only five voted to uphold the appeal while four other abstained. The following day, Arthur Krim announced that United Artist would withdraw from the MPAA in protest. This episode contributed to Johnston's decision to revise the Production Code in 1956. The revised Code permitted treatments of narcotics use in movies.

**885.** *United States v. Paramount Pictures, Inc.* 334 U. S. 131 (1948) 1948.

In a decision written by Justice William O. Douglas, the U. S. Supreme Court in 1948 made the work of censoring movies much more difficult. The major studios owned hundreds of theaters, which guaranteed outlets for their films -- pictures the Production Code Administration approved. In *United States v. Paramount Pictures, Inc.*, the Court ruled that studios were in violation of antitrust laws and must divest themselves of their theater chains. Control over exhibitors had already weakened in 1942 when Hays in a little-known maneuver gave theater owners freedom to show movies that had not received the PCA's blessing.

**886.** "Universal to Release "Henry & June" as First Film with NC-17 Rating." *PR Newswire* Sept. 26, 1990 1990.

This article is about the first movie to be given an NC-17 rating by the motion picture industry. *Henry and June* was made by Lew Wasserman's studio, Universal.

**887.** "Unusual Snapshots Taken at Thrilling Moments." *New York Times* Aug. 14, 1910 1910, sec. SM: 7.

This article notes that the "cameras recorded images of critical moments far more graphic than a writer's pen could." Such pictures "were found in much greater variety than had been expected." It reports that the assassination of Prince Hirobumi Ito in Japan was captured by moving picture camera. Movie makers often use such film of actual events holding the showing of the film until a movie story could be invented to fit the pictures. The subtitle of the article reads: "Work of Camera Men with Presence of Mind to Press the Button at Critical Times."

**888.** "The Use of Cinematography in Physiology: Some Recent Applications." *The Times [London]* Oct. 4, 1913 1913: 3.

This article reports on the use of slow motion moving pictures in the study of physiology. (Erik Barnouw also discussed use of slow motion as earlier as 1899. See Erik Barnouw, *The Magician and the Cinema* [New York: Oxford University Press, 1981], 99.)

**889.** "Using the Camera to Illustrate Fiction." *New York Times* Jan. 6, 1918 1918: 75.

This article says that some of the best-known actors on a list of 3,000 names used as models for photographers. It notes that these photographs must be much more carefully done than facial pictures in the movies. The subtitle to the article reads: "Models Pose for Photographs Showing Scenes in the Story How Two Artists Originated the Plan."

**890.** "Valenti Exits White House for MPAA Post." *Broadcasting: The Business Weekly of Television and Radio* 70 (1966): 38-39.

An article about Jack Valenti leaving his position as assistant to President Lyndon B. Johnson to become president of the Motion Picture Association of America.

**891.** "Valenti in Ode to Code: Wisdom Behind Administration." *Variety* Sept. 28, 1966 1966: 5, 68.

This article discusses the 1966 revision of the motion picture Production Code. Valenti says that there are no rigid restrictions on any topics that can be treated in the movies and that there are "gauzily defined boundaries" relating to good taste in treating crime and sexuality.

**892.** "Valenti Seeks VCR Collaboration." *Los Angeles Times* Jan. 9, 1989 1989, sec. Business: 3A.

During the early 1980s, Jack Valenti of the Motion Picture Association of America had considered video cassette recorders to be a dire threat to the movie industry but by 1989, he was willing to seek an accommodation with video makers. "The trend is that the more a person watches a movie on a VCR, the more that person seems to be drawn to wanting to see a movie in a theater," Valenti concluded.

**893.** "Variety Houses Like 5 Cent Kind." *Chicago Daily Tribune* April 17, 1907 1907: 2.

This article comments on the type of people who attend the 5-cent theaters. "The body of the house was filled with men and women largely of the class to be found in the near north side region, in the middle of which the theater stands." The article also notes that near nudity in stage show "Mlle. Salome." "The scene was so baldly and openly an attempt to play on the lower tastes of the audience that when the curtain fell no one in the house had the temerity to applaud, and Salome disappeared amid silence, which finally was broken by a man's hoarse guffaw, followed by a hysterical giggle from one of the women in the gallery."

The article offers an unflattering description of the theaters. "In close proximity to the nickel theaters which infest the downtown district, many of them touched with vicious suggestiveness, there stand a number of more pretentious places of entertainment which outrival their less ostentatious neighbors in the vulgar spectacles they produce. These theaters in recent months have grown bold and unrestrained."

The subtitle of this article reads: "Some More Pretentious Theaters Have Just as Vicious Spectacles; Children Are Patrons; Theater on North Side Shows 'Girl in the Pie' and a 'Salome' Dance."

**894.** "The Verb 'To Film'." *New York Times* May 26, 1914 1914: 10.

This article reports that "The verb 'to film' having gained currency, it must be graciously admitted to the language."

**895.** "Very Educational." *Newsweek* 61 (1963): 86.

This article talks about Richard D. Heffner and public television.

**896.** "Vice President's Funeral. Mr. McKinley and Many Distinguished Persons Go to Paterson." *New York Times* Nov. 26, 1899 1899: 4.

This article on funeral of Vice President Garret Augustus Hobart in 1899 says that people with Kodak cameras and kinescope moving picture cameras captured the procession: "All along the line of march the kodak fiends were active, and even the ubiquitous kinetoscopoe man got a series of moving pictures of the cortège as it came through Broadway."

**897.** "A Victory for Decency." *Outlook* 89.4 (1908): 135-36.

This article discusses a woman who was awarded \$6,000 by the U.S. Court in New York because her photograph had been used by the Lydia E. Pinkham Medicine Company for advertising, even though the company had not told the woman for what purpose her picture would be used. The article says the "appearance of the advertisements gave Miss Wynne unpleasant notoriety among her fellow workers, and finally obliged her to give up her employment." (136) The article says the judgment in this case was "a stroke for decency and good order." (136)

**898.** "Videotape Recorders." *Popular Photography* 59.4 (1966): 145-46.

These pages give examples of videotape recorders that were available to purchase in 1966 from such companies as Ampex, Concord, Sony, Panasonic, and Wollensak.

**899.** "View in Privacy of Home; Women Form Big Market for Hard-Core Porn Tapes." *Los Angeles Times* Dec. 22, 1985 1985, sec. Metro (Part 2): 13.

This article discusses that fact that women make up a significant part of the market for pornographic video tapes.

**900.** "Villa at the Front; 'Movies' Sign Him Up." *New York Times* Jan. 7, 1914 1914: 1.

This two-article story reports on a camera designed to capture action on battlefield with Francisco Villa. Quoting H. A. Aitken: "Meanwhile there was the question of the cameras. We wanted a camera that would stand up and take pictures of a battlefield and yet operate in such a way that the man with it could keep under cover while the machine was exposed.

"Such a camera was designed, and ten of them were ordered. We next had to consider the question of men. We wanted daring men, of course, and also men who would know how to take care of themselves in military operations. We didn't want greenhorns in army matters, who would welch out at the first experience under fire.

"We have ten men in our squad at the front, two of them operating cameras to take pictures where the movies [sic] cameras will not be practicable. We are holding another man here ready to go at a moment's notice to any point where there may be a chance to catch some good manoeuvre." (Subhead for this article reads: "Villa to War for 'Movies'; Become Partner of H. A. Aitken Who Sends Camera Squad to Front.")

The subtitle of the article reads: "Brings 3,500 Recruits and Moving-Picture Contract to Ojinaga. Camera Record of Battle. The General Will Provide the Pictures and Care for Operators for a Percentage of Receipts."

**901.** "The Vulgar Snapshot Man." *New York Times* March 29, 1909 1909: 6.

This article says that "Photographs of persons and places are perfectly legitimate accompaniments of modern journalism. They often greatly increase the interest of the daily record of news." However, in the case of the photographer discussed in this story, he went too far taking pictures at a private funeral.

**902.** "War Declared on Crime in 'Movies'." *Chicago Daily Tribune* Sept. 19, 1913 1913: 1.

"Children need no instruction in murders..." says Judge Mary Bartelme. The subtitle to this article reads: "Gun Play Film Shows Attacked by Social Workers, Police, and Judiciary."

**903.** "War of Moving Pictures." *Chicago Daily Tribune* June 2, 1907 1907, sec. B: 3.

The subtitle to this article reads: "Berlin Police Act as Result of Medical Theory That They Are Harmful to Eyes."

**904.** "War Surgery Shown in Moving Pictures." *New York Times* Oct. 7, 1916 1916: 11.

The subtitle of this article reports: "Films Here Portray Removal of Shrapnel Ball from a Living Man's Heart; Human Wrecks Salvaged...."

**905.** "Well-Known Authors Act Their Own Plays in 'Movies'." *New York Times* Feb. 8, 1914 1914, sec. SM: 5.

The subtitle of this article reads: "Amelie Rives, Booth Tarkington, George Ade, Ida Tarbell, Rex Beach, George Barr McCutcheon, and Others as Film Actors."

Ida Tarbell talks about appearing before the camera. She had been working on a biography of Abraham Lincoln. Here the article quotes Tarbell: "'Here is a great human undertaking with limitless possibilities to bring amusement and instruction to the whole world. What was I that I should say 'I will have none of it'? So I did the best I could to follow the instructions of the serious and enthusiastic young man who had undertaken to pose me. I discovered afterward that the young man had been impersonating Lincoln in my little sketch, so I understood better his natural interest in having me smile up at the Lincoln portrait, catch my inspiration from the corner of the frame, where I had been told to look, and fall to writing furiously.

"I did feel a little foolish, but only because I realized what a stupid amateur I was as an actress. All the revolt had been taken out of me by the bigness of the things I had seen. The only "emotions" I have to record, then, are the haughtiness with which I went in and the meekness with which I came out."

**906.** "What Are Pathescopes?; Question Before the General Appraisers for Decision." *New York Times* Feb. 4, 1915 1915: 14.

This article says that "the Pathescopes are moving picture machines made especially for home entertainment...."

**907.** "What Helped Me to Success Will Help You, Says Jackie Saunder Movie Star." *Chicago Daily Tribune* Nov. 2, 1919 1919, sec. E: 5.

This advertisement has a picture of Jackie Saunders and considerable text about the virtue of using Senreco toothpaste and visiting the dentist regularly for good gums. It projects an image of beauty.

**908.** "What Makes a Woman's Beauty." *Chicago Daily Tribune* Feb. 28, 1904 1904, sec. A: 5.

This article talks about the relationship between photography and a woman's beauty. Photographers, it notes, are "trying to lift" their "profession to a place among the fine arts." Quoting Bliss Carmen, the article says that "no one 'has the power of reaching his own ideal, unless he inculcates that ideal of himself in the minds of others.'" The article goes on to say that the "new photography makes its own creation, not imitation. The sensible qualities of beauty, which Burke enumerates as 'smallness, smoothness, variety in the direction of parts, flowing lines, delicacy of form without remarkable appearance of strength, freshness and contrast of color,' are as important in this art as in every other. But the photographer concerns himself directly with the visible effort which nature is making in every individual, spiritually even more than physically, toward that beauty that philosophers recognize as the normal state of man."

The article emphasizes the importance of the face and eyes in revealing beauty. **"A recent issue of a photographic magazine gives this rule of interpretation of facial expression; 'The eyes reveal the soul, the nose will power, the mouth and chin stand for purpose and determination; and what we call expression, the combination of all, is the mirror through which the inmost character of each subject is reflected.' It is usually through emphasis of some one feature that the photographer is most successful."** [my emphasis]

"If a girl has beautiful eyes and an ugly mouth, he either poses the head or veils the face in such a way that the beautiful eyes catch and hold the attention. If she has a sweet and tender mouth and her eyes are so light in color that photographed they will seem to pop out from their background, he turns her face so that the beauty of the mouth will be its distinguishing feature...."

The article is accompanied with five photographs and one drawing of women's faces.

**909.** "What Schools to Use Movies." *Chicago Daily Tribune* July 28, 1916 1916: 10.

This article says that movies will probably be used to teach Americanism.

**910.** "What the Ancients Missed." *New York Times* March 26, 1918 1918: 10.

This article comments that "No longer does a hero have to depend on the uncertain pleasure of the bards of posterity to celebrate his aristeia; he comes home and lectures about it himself, usually to his credit be it said, for the benefit of some worthy cause. Or, it may be his achievements pass into the running record of the film, with Himself as Himself if possible; if he lacks the technique, another may impersonate him with greater or less fidelity; the public is pleased just the same.

"Rome would have howled with joy could it have seen upon the screen 'My Seven Years in Gaul,' by C. J. Ceasar...."

**911.** "What TV Does to Kids." *Newsweek* 89 (1977): 62-63.

This article discusses what research seemed to show about the impact of watching violence on television and in other forms of mass entertainment. By the time the average person had reached 18 years of age, they had seen literally thousands of murders enacted on TV and movies.

**912.** "What TV Is Doing to the Movie Industry." *U. S. News & World Report* 47 (1958): 88-90.

As the sales of television sets increased, more and more people watched movies at home. By 1956, almost 4,200 feature motion pictures (more than 5,200 hours of films) were being shown nationwide on television each week. Less than two years later, more than 200 million people were watching free films on television each week compared to 46 million people who bought tickets at movie theaters.

**913.** "What You Should Know About 16mm Workprint Editing." *American Cinematographer* 48.2 (1967): 112-14, 140.

This articles discusses working with 16mm film. It notes that "while it is true that non-theatrical productions are shot in both 35mm and 16mm, and on 16mm negative as well as 16mm reversal, most non-theatrical production such as industrial films, in-plant film-making, contract film reports, etc., are in 16mm and the bulk of this is shot on 16mm reversal film, both color and black-and-white." (112)

**914.** "Where Melodramas Are Produced Without an Audience." *Chicago Daily Tribune* May 3, 1908 1908, sec. F: 6.

This article comments on the filming of movies and how they are attended by live audiences. Violence is common in the storylines. "Have you a deadly enemy your wish 'removed'? Entice him out to Western avenue, where more murders are committed per second and more kidnappings to the square yard than in any other place

in the country." These and many other similar scenes are enacted, not before live audiences, but in silence before the "moving picture machine."

The subtitle of this article reads: "Every Day In the Week, Heroes and Villains, the Woman in the Case, and a Company of Supernumeraries act In Pantomime Before the Moving Picture Machine."

**915.** "The White Slave Films." *Outlook* (1914): 120-22.

This article begins by pointing out that the current generation is not the first to have discovered sex but that "while we have not discovered sex, it can be said perhaps that we are to-day approaching it in a somewhat different spirit than has obtained in the past." (120) The current films about white slavery are not nearly as immoral as the musical comedies which are built on marital infidelity. "No one in these post-Victorian days publicly objects, apparently through fear of being thought prudish and unsophisticated, to the musical comedies founded upon the glorification of marital infidelity. Yet between these white slave films, pointing a moral which he who runs may read, and the 'wit' and cynicism of the average musical farce, skillfully and successfully staged to appeal to the immature in age, mind, and morals, there is a gulf as wide as the seven seas." (121)

The white slave films do not so much promote immorality as hysteria this article says. "The most valid objection to the reproduction of the best of these films is not that they promote immorality, but that they promote hysteria." Quoting Mrs. Barclay Hazard, head of the New York branch of the National Florence Crittenton Association: "All this talk about the poisoned needle that has been filling the papers is nothing but the result of the hysteria which is brought about by the state of mind people are getting into through the constant discussion of these subjects." (121)

The article comments on the power of movies to discuss social topics compared to print media. It argues that "much can be said for the 'movies' as purveyors of social information which cannot be said for fiction and the drama. The 'movies' are intensely democratic -- emphatically more so than the legitimate stage or even the ubiquitous novel. They can be made accurate without offering to the adolescent mind opportunity or time for the intimate self-comparison and analysis which results from the reading of fiction. They can be made interesting without the alluring presentation of physical reality inseparable from the enactment of such themes upon the stage...." (121)

The article concludes: "These films will not teach morality to the immoral. They will not by themselves inculcate high ideals. That is the business of the church and the home. They certainly will aid, we believe, in destroying the glamour of baseness. There are more ways than one of circumventing the devil." (122)

**916.** "Who We Are". 2004. (2004). July 5, 2004. <<http://www.iop.harvard.edu/who/director.html>>.

This website for Harvard University's Institute of Politics gives a biographical sketch of Dan Glickman, who succeeded Jack Valenti as president of the Motion Picture Association of America on September 1, 2004.

**917.** "Who's Afraid ... of Jack Valenti?" *Newsweek* 68 (1966): 84-85.

This article asks if Jack Valenti "will be more than a front man, a resplendent chief usher to the world. The biggest guns in the West didn't saddle him up to be a Trojan horse." (85)

**918.** "Whose Picture Is the Best Seller?" *New York Times* Feb. 9, 1908 1908, sec. SM: 6.

The subtitle for this article reads: "Here Is the Answer, Also Data About Other Celebrities Who Attract Collectors."

This article is on the popularity of celebrity photos. **Actresses most popular but many sales abroad because of antipathy from non-acting women.** (my emphasis) "According to a leading dealer in photographs of celebrities in

this city, the business which he conducts may be considered a thermometer of the public's feeling toward its favorites of the stage and in other walks of life which bring them into prominence.

**"The dealer along keeps on hand a stock of about one million photographs.** (my emphasis) They include pictures of actors, actresses, singers, members of royal families and of the nobility of foreign countries, men prominent in politics, scientists, and every other kind of celebrity known to the human race.

**"Of all these the most popular are the picture of actresses.** (my emphasis) And first and foremost among the favorite actresses of the American stage is Maude Adams...." (she played Peter Pan) Ethel Barrymore second most popular.

"Fully 25,000 pictures of Maude Adams in her various roles are sold in this city by the leading dealer in photographs of celebrities alone. This represents somewhat less than one-half of the total number of pictures of actors and actresses purchased from him by collectors each year.

"The pictures of actors and actresses represent about one-third of the entire number of celebrities' pictures which that dealer sells...." (Maude Adams represents about one-sixth of all celebrity sales by this dealer.)

Next to stage celebrities, pictures of royalty are next in popularity. Opera singers and politicians (e.g., TR) are also popular as are scientists and writers. Pictures of TR a greater seller in US and abroad.

"The reason that the collections of 'types of American beauties' sent abroad to fill the order received from foreign dealers are drawn so largely from the acting profession is the fact that there exists an antipathy among American ladies not on the stage to allowing the sale of their photographs."

**919.** "Why the Movies and the Drama Must Take Different Roads." *Current Opinion* 58.5 (1915): 333.

In one area, early silent cinema usually drew unfavorable reviews when compared to the live stage. That was in the ability to depict the inner life of human beings, the psychological underpinnings of drama. Silent films, usually produced in black and white, relied heavily on pantomime which offered a poor substitute for the words spoken and emotions registered by live actors [on stage]. These films seemed incapable of entering "the subjective world of the soul." Pictures were "the province of melodrama; the legitimate stage is the province of motivated drama, high comedy and tragedy," said H. M. Hedges. "For drama, great drama, the only thing of importance is human personality in conflict.... How can the struggle of a soul be adequately portrayed by pantomime?" (333)

This article is a summary with excerpts from H. M. Hedges, "A Laocoon for the Movies," *The Play-Book*, 2, no. 8 (Jan. 1915), 20-23.

**920.** "[Widescreen Cinema]." *Velvet Light Trap*.21 (1985).

This entire issue was devoted to widescreen cinema. It also included bibliography on the subject.

**921.** "Will 'Cold Light' Soon Be a Scientific Fact?" *New York Times* July 23, 1916 1916, sec. SM: 7.

This article talks about "A cold light moving picture projector on which the film may be stopped without danger of ignition." The subtitle of this article reads: "M. Dussaud, French Engineer, Has Just Reported Definite Progress in Solving Problem That Will Be Revolutionary."

**922.** "Will Issue Films for Home Movies." *New York Times* May 27, 1927 1927: 29.

This article discusses plans to provide short films for those who own home movie equipment. The subtitle of this article reads: "Eastman Kodak Company to Start Monthly Service of Four-Minute Pictures. Chaplin to Figure Early; 'Releases' of Stars and News Reels Will be Available to Owners of Small Projectors."

**923.** "Will Scientists Succeed in Destroying Distance." *Chicago Daily Tribune* Oct. 25, 1908 1908: F3.

This article discusses a new invention by M. Armengaud, a French scientist/inventor, that promises the "annihilation of distance." He explained it, it was "merely an extension of the system under which photographs at present are being transmitted by telegraphy." The article goes to say that "it means that in everything but physical contact we will be in momentary presence of the people in the furthest part of the earth. That we will be as familiar with the daily lives of the inhabitant of China as we are with the dwellers in State street." The invention promises to give people scenes of "actual war" and such disasters as the San Francisco earthquake. There are implications for history, too: "The nickel moving picture show may be the nucleus of an institution which will beggar the gladiatorial shows of the Roman emperors and bring our ancestors back from their graves in astonishment." "Secrecy Would Be Impossible," the article says, and notes this new invention will "imply the absolute destruction of all privacy." In the future, "it will mean that men will have to live their lives in the full glare of publicity."

There will also be changes in the newspaper of the future. "The newspaper office of the future," Armengaud predicted, "will be really a theater where on an enormous screen the principal events of the world will be reproduced, with phonographs giving the words of the actors. Who would care to read a description of the installation of a president or of a battle in Morocco when he could go and see the whole event portrayed in actuality before his eyes?"

**924.** "Will Wireless Next Bring Us Radio Sight?" *New York Times* Dec. 7, 1924 1924, sec. 9: 1.

**925.** "Wilson Won't Resign at Once." *New York Times* July 4, 1912 1912: 1.

This article mentions the use of motion picture machines during the 1912 campaign.

**926.** Committee on Foreign Affairs, House of Representatives, Eighty-Eighth Congress, First Session

Subcommittee on International Organizations and Movements. *Winning the Cold War: The U. S. Ideological Offensive: Part V, Sept. 11, 12, 13, 1963.* United States House of Representatives, Committee on Foreign Affairs. 1963.

These hearings covered three topics: 1) "The Impact Abroad of U. S. Private Information Mass Media"; 2) "The Impact Abroad of Special Activities of Selected Private U. S. Organizations"; and 3) "The Problems and Techniques of International Communications." There are several interesting witnesses and statements regarding the role of American mass media in the Cold War. In his statement, Walter Joyce, then managing editor of *Printers' Ink*, says that the United States "possesses the resources for persuasive communications in such quantity and quality that we could turn the Communist siren song into an ineffectual moan. Our technology in transmitting sound, pictures, and printed word is unmatched." (531) He notes that the "official output of communications by our Government is minute compared with the dissemination of news and entertainment by our commercial news services, motion pictures companies, television producers, and magazines, newspaper, and book publishers. This mass of international communications is primarily the export of the same matter criticized here for its sex, sensationalism, and inanity. Outside the United States more than 150 million persons a week pay to see American movies. There are more than 1,100 television stations in other free world countries, and their fare is heavily loaded with old shows from U. S. television producers." (532) He also notes that "books, as a communications medium, command special attention because they may be the most important ideological weapon of all. The Communists rely on them heavily." (534)

In another statement, George England, and producer and director with MGM, notes the impact abroad of movie advertising. Indeed, the advertising campaigns, which often precede the arrival of movies by up to six months, must be taken into account in any effort to calculate the impact of American films abroad. (536)

**927.** "Wins World Tour for Two with Essay on Pictures." *New York Times* Oct. 17, 1926 1926, sec. X: 5.

This article reprints excerpts from top three winner in essay contest on the experience of going to the movies. The winner talks about movies and vicarious travel, movies and the news, and says of movies and history (quoting from the essay): "Great characters who have swayed the destinies of national reappear before me and I live in ages past, experiencing their glorious triumphs and ignominious defeats." The winner also says of movies that "They unlock the treasure house of Romance and keep its scared fire burning." The third place winner was a recent immigrant and talks about movies and Americanization.

**928.** *Wiring the World: The Explosion in Communications.* Washington, D. C.: Books by U.S. News & World Report, 1971.

This book argued in 1971 that there was "every reason to believe that we are now at the approaches of another great revolution -- one which may have even greater repercussions than the invention of the automobile, the airplane, and television. This extraordinary development -- new techniques of communication which will bring all forms of consumer services, education, and entertainment directly into the home from other points in the country and in the rest of the world -- is also likely to create new problems." This work discusses cable television, satellite technology, videocassettes, and picture telephones. Chapter 9, "As Seen From the White House," is an interview with Clay T. Whitehead, then director of the Office of Telecommunications Policy in the Nixon administration. This book contains good charts on the growth of cable and satellite broadcasting, as well as satellite telephone circuits.

**929.** "Woes of the Moving Picture Man." *New York Times* Dec. 19, 1909 1909, sec. SM: 11.

This article gives a description of open-air movie making in the area around Fort Lee, NJ. One scene involving clergy was interrupted by locals who protested. The subhead of this article reads: "Scenes That Never Come Before the Public An Open Air Performance."

**930.** "Women Censors See Twelve Reels." *Chicago Daily Tribune* Feb. 20, 1914 1914: 1.

This articles gives specific examples of films that would censored because of violence. It also notes that in censoring "Merchant of Venice," authoritieis substituted "Shylock" for "the Jew." The subtitle for the article reads: "Indorse Two Cuts; Hear Orders to Reduce Crime in One Film and Trim Immorality from Another. Shylock Receives O. K.; 'Citizens' Jury Makes Only Change in Subtitle in 'Merchant of Venice'."

**931.** "Women Object to Pictures of Bull Fight." *Chicago Daily Tribune* Nov. 13, 1904 1904: 2.

Women objected to moving pictures of a bull fight at lecture (given by Prof. Dwight L. Elmendorf) before the Brooklyn Institute of Arts and Sciences.

**932.** "The Wonderful Kinetograph." *Current Literature* 7.3 (1891): 451-54.

This article, the substance of which originally appeared in the *New York Herald*, discusses Thomas Edison's plans for the "kinetograph." "The popular preacher, the eminent public speaker, with it can all be brought to the home," it says. (451) The kinetograph, Edison says, is "merely a mechanical eye" that can record an "original scene" so that it to audiences "as true as life." (Edison quoted, 453) The article says that Edison has been experiment with a camera, run by electric motor, that takes 46 impressions each second. (452) At this speed, "2,760 photographs can be taken each minute and 82,800 every half-hour." (452) Edison notes that it can record prize fights and that he hoped to have a demonstration ready for the Chicago Exposition. (454)

**933.** "Wonderful New Picture Section." *New York Times* April 5, 1914 1914: 9.

This article discusses the rotogravure process the *New York Times* used to reproduce color pictures of art work from the Altman collection. It notes that the presses were imported from Germany and that the *Times* is the only paper in the New York City area to use this process. The article says this is the first time the *Times* rotogravure presses have been used to reproduce picture and it describes how the process works.

The article refers to the previous Sunday edition. "Admired as this color section was, it is the opinion of many artists, art dealers, and others who have had the opportunity to examine advance copies of today's art section that, although it is in one color, it surpasses the multi-color section issued a week ago.

"To-day's art supplement is the first work produced by the *Times* upon the new rotogravure presses which it has imported from Germany and installed in the *Times* Annex. In this process there is no stereotyping or or electrotyping to mar the delicacy of the work. Also there is no printing surface to be worn away by the printing of a large edition.

"The picture to be reproduced is transferred by photographic processes to a copper cylinder and etched thereon by the application of chemicals. The picture is therefore composed of a multitude of small depressions on the cylinder. In its revolution this cylinder is entirely covered with ink, but just before the printing it passes under a steel blade which removes all the ink except that in the depressions. The paper received the ink from this etching, with what wonderful softness and beauty of effect may be seen in the examples presented to-day.

"While to-day's rotogravure supplement was regarded by the *Times* as something of an experiment, the photographers, engravers, and pressmen employed being all new to their tasks, the results have been so satisfactory that it is hoped to supply rotogravure sections with the *Sunday Times* hereafter without interruption.

"The *Times* has, for a term of years, the exclusive right to the use of this process in connection with newspaper work in New York, which promises to its Sunday readers picture sections of a quality never before equaled and not elsewhere obtainable.

"The next rotogravure art section will be issued with next Sunday's *Times*. Appropriate to the day, Easter Sunday, it will contain seventeen pictures of Jerusalem and the Holy Land from photographs taken only a few weeks ago for the *New York Times* by Earle Harrison, the well-known travel photographer."

The subtitle for the article reads: "Reproductions of the Altman Pictures Are of a Quality Never Before Attained. The Times's New Process. Belongs to This Newspaper Exclusively in New York -- Presses Imported from Germany."

**934.** "Wonderful Things Done by the Camera." *New York Times* Sept. 28, 1895 1895: 3.

The subtitle to this articles reads "Vast Advances in the Science of Photography in Recent Years," and the article discusses the progress in photography over the past generation. It talks about "instantaneous photography" and cameras with exposure time of one millionth of a second, a photographic gun that than takes dozen picture a second, and sending pictures by telegraph. It says that "today the camera's sensitive eye ... shows every motion of a bullet from the instant it leaves the muzzle of the gun until it comes in contact with the target."

**935.** "Wonders of the Kinetoscope." *Current Literature* 15.5 (1894): 442-43.

This article discusses Thomas Edison's kinetoscope and a rather lengthy excerpt from an interview with Edison discussing how he built this device. A word about definitons: "The kinetograph is the machine which takes the photographs, and the kinetoscope the machine which displays them to the eye," this article explains. (442) Edison describes the difficulties in determining how many photographs needed to be taken each second to give the illusion of true motion. At first, 25 photographs were taken but this was not adequate and the number was increased to 45 or 46.

Edison assumed from the outset that moving pictures would have a special importance in preserving history. He was not satisfied with the kinetoscope, a box that required a single viewer to look moving pictures through a "peephole about two inches long and half an inch broad, covered with glass," and announced in May, 1894, that his goal was to project the moving images on a big screen so that a large number of people could watch them at the same time. He then hoped to combine the moving pictures with the phonograph so that the personalities projected on the screen "might be heard plainly." Once these two things had been accomplished, he predicted, it

would be possible to catch a speaker's "every gesture ... and every inflection of ... voice" and "exhibit both to admiring audiences a hundred years after he is dead." (443) A great person would "never die if his pictures and speeches are saved for posterity by the kinetograph and the phonograph," Edison said.

Of the kinetoscope, Edison claimed that it was mainly "a work of sentiment" on his part and he doubted if there was "much money in it." (443)

This article was published originally in the *New York Sun*.

**936.** "Wondrous Beauty. Wednesday Night's Pageant." *Los Angeles Times* May 7, 1903 1903, sec. A: 1.

This article describes that first electrical parade in Los Angeles history.

**937.** *World Communications: A 200-country survey of press, radio, television and film*. Paris; and Epping, Essex, Eng.: Unesco Press/Unipub/Gower Press, 1975.

The information in this work is based on questionnaires on mass media facilities returned to Unesco. Included are data on the number of newspapers, radio transmitters, television stations, and motion picture theaters in 200 countries. A concise paragraph is devoted to each of these media in the various nations.

**938.** "The World's Busy Workers. Celluloid." *Los Angeles Times* May 18, 1903 1903: 4.

This article talks about the multiple uses of celluloid but notes that in 1903 only three United States companies manufacture celluloid for sale. The discusses the fire hazards posed by celluloid and the process by which the material was made.

**939.** "Writing the Movies: A New and Well-Paid Business." *New York Times* Aug. 3, 1913 1913, sec. SM: 4.

This article says that a "novel form of entertainment" in the form of "countless moving-picture houses," have "cropped up, as if by magic all over the continent...." The article discusses the work of screen writing. The play, it says, is only about five percent of the successful film. The subtitle of this article is: "This Latest of Professions Assuming Great Proportions and Making Fortunes for Those Who Can Make a Success of It -- Some of the Men and Women Who Have Hit the Right Note -- Why Most of Those Who Attempt It Are Unsuccessful."

**940.** "Written on the Screen; Authors and the Screen." *New York Times* June 1, 1919 1919: 46.

This article quotes author Philip Curtiss saying that the movies should admit "they really are a primitive entertainment for simple minds."

**941.** "X-Rated Motion Pictures: From Restricted Theatres and Drive-ins to the Television Screen?" *Valparaiso University Law Review* 8.1 (1973): 107-24.

This article examines legal issues involving X-rated entertainment and cable television.

**942.** "Year's Fight with Vice. Anthony Comstock's Annual Report About What He Has Done. Tons of Bad Things Captured...." *New York Times* Jan. 23, 1896 1896: 9.

This articles lists some of the materials that vice-hunter Anthony Comstock had confiscated during the previous year.

**943.** *Young v. American Mini Theatres*. 427 U. S. 50 (1976) 1976.

Realizing that the *Miller v. California* (1973), *Paris Adult Theatre* (1973), and *Jenkins* (1974) cases by themselves were inadequate to eliminate adult movie houses, communities tried a different approach that involved controlling land use and concentrating such theaters into "combat zones." The goal was to prevent concentration in areas where residential neighborhoods and businesses might be destroyed. The United States Supreme Court

upheld this method of control in two cases, *Young v. American Mini Theatres* (1976) and *City of Renton v. Playtime Theatres, Inc.* (1986). Neither case involved criminal penalties or suppressing films completely.

**944.** *The Zenith Story*. Chicago: Zenith Radio Corp., 1955.

This work has information on early Zenith radios and the company's work in the development of television.

**945.** "Zing Go the Strings of Brigitte's Heart." *Life* 45 (1958): 45-46, 48, 51.

One of several articles in mainstream U. S. magazines publicizing Brigitte Bardot after her movie *And God Created Woman*.

**946.** [Aller, Herb, et al. "Echoes from the Hollywood Festival of World Television." *American Cinematographer* 48.6 (1967): 418-19, 424, 431.

This article has excerpts from a panel on "Runaway Technology" at the Fourth Annual Hollywood Festival of World Television, April 9-12, 1967. Aller was business manager for IATSE Cameraman's Union (Local 659) in Hollywood; DiGiullio was vice president of the Mitchel Camera Corporation; and Mohr was director of photography and vice president of IATS Local 659.

Aller noted that more film used for newsreels than in making theatrical and TV productions. DiGiullio argues that there is much obsolete capital equipment and that the industry needs to modernize.

**947.** [Berliner, Emile]. "An Interview with the Inventor of the Gramophone." *Roll Back the Years: History of Canadian Recorded Sound and Its Legacy: Genesis to 1930*. Ed. Moogk, Edward B. Ottawa: National Library of Canada, 1975. 380-82.

An interview with Emile Berliner, which originally appeared in the *Canadian Music Trades Journal* (Sept. 1918). In it, Berliner talks about the gramophone and the article also quotes from Berliner in 1888 in which he made predictions for how the gramophone might be used.

**948.** [Black, Alexander]. "A Novel Photographic Play." *Los Angeles Times* Aug. 28, 1895 1895: 10.

This article presents an excerpt from an article by Alexander Black in *Scribner's* (Sept. 1895) issue on the nature of the "picture play." Black said that "Primarily my purpose was to illustrate art with life. Five or six years ago, when my plan was first made, I discovered several instances in which photographs from life were used to illustrate fiction, and many other instances in which fiction evidently had been adjusted to photographs from life. Neither of these phases offered any practical hint toward the picture play. The suggestion definitely came through a group of photographic studies from living characters, which were tossed together in a 'picture talk' that I called 'Ourselves as Others See Us.' After outlining a combination of fiction and photography, each devised with a regard for the demands and limitations of the other, it began to be quite clear that the pictures must do more than illustrate. Thus there would be two points of radical difference from the illustrator's scheme. In the first place, the pictures would be primary, the text secondary. Again, the pictures would not be art at all in the illustrator's sense, but simply the art of tableau vivant plus the science of photography. If it is the function of art to translate nature, it is the privilege of photography to transmit nature. But in this case the tableaux vivants must be progressive, that the effect of reality may arise not from the suspended action of isolated pictures, but from the blending of many. Here the stereopticon came to my aid."

**949.** [Bradbury, Ray]. "Ray Bradbury on 'Film in the Space Age'." *American Cinematographer* 48.34-35, 65-70 (1967).

In this speech to the American Society of Cinematographers, Bradbury discusses his love of movies and comments on the difference between watching a film on a large screen in a theater and watching it on television. The "trouble is," he said, "when you see it in the theatre it's one thing -- when you see it on the TV screen it's

another, because when you see it on TV you hold King Kong in your lap. When you're in the theatre, King Kong hold you in his lap. A very important difference, isn't it." (67) He goes on to celebrate the exploration of space. "I want to sell people on the inevitability and the beauty and the distinction of the Space Age," he said, in part because it was "a religious movement whereby man relates himself to the Universe by which God -- the moving hand of God -- relates Himself to Himself." (69-70) "We're going to be on the Moon -- and then, right on off to Mars and from Mars to Alpha Centauri in 100 to 200 years." (69)

**950.** [Breen, Joseph I.], ed. *The Story of the Twenty-Eighth International Eucharistic Congress Held at Chicago, Illinois, United States of America from June 20-24, 1926*. Chicago: Committee in Charge at Chicago, 1927.

Joseph Breen prepared the first six chapters of this publication. They suggest that Breen knew a good deal about modern media and its public relations uses. This work is located in the Archdiocese of Chicago Archives and Records Center, Chicago, IL.

**951.** [Clay, W. R.], ed. *The Alternative: A Study in Psychology*. London: Macmillan and Co., 1882.

W. R. Clay was one of the first psychologists, if not the first, to talk about the "specious present." He called it a "fiction of experience" and separated it from the "obvious past" and the "real present." (168) In 1890, William James in discussing this term in *The Principles of Psychology* (Volume I, p. 609), quoted a passage from Clay's work.

**952.** [Cousins, Norman] N. C. "The Free Ride." *Saturday Review* 33 (1950): 24-25.

Cousins, who was editor of the *Saturday Review*, argued that American movies when shown abroad projected a terrible image of the United States and its citizens. It based this conclusion on having attended American movies abroad and having talked with "American officials abroad." Although he does not mention specific movies, he writes: "In a foreign setting American movies have a meaning and an effect which are difficult to imagine back home. Every word, every gesture becomes almost part of a score card for or against Americans.... You realize that what you are seeing is more than mere entertainment: it is a projection of America, and, as such, of vital importance to the American people at a time when they are spending millions of dollars to create good will abroad and a real understanding of themselves.... What is involved here is a major matter hitting squarely upon America's stake in world public opinion." (24) Hollywood movies often reinforce the Soviet Union's propaganda that tried "to split off world public opinion from America, to create a deep distrust of Americans as individuals and as a nation, to picture us as selfish, degenerative, depraved, ruthless, acquisitive, anti-humanitarian, and anti-cultural."

(25)

**953.** ---. "The Free Ride, Par II." *Saturday Review* 33 (1950): 20-21.

This is the second of three articles that Norman Cousins wrote in early 1950 attacking the impact of Hollywood movies abroad. Here he argues that "Soviet propaganda against the United States was not nearly as damaging as the grotesquely distorted view of the American people being created abroad by our own motion pictures.... The 'kiss-kiss, bang-bang' standard formula of the Grade-B movie is building up an image of the American people that our officials abroad are finding difficult to correct or offset -- at any price." According to Cousins, "the effect of our movies abroad is actually the direct opposite from the one we described." Moreover, "American movies set up false standards for the measurement of a democracy." (20)

**954.** ---. "The Free Ride, Part III." *Saturday Review* 33.4 (1950): 22-23.

This is the third of three articles that Cousins wrote in early 1950 arguing that Hollywood movies were creating an impression "of America as a nation consisting largely of quick killers and quick kissers, with a collective intelligence at ceiling zero and practically no contact with civilized values." The movies were doing as much, or more, damage to the U. S. abroad as was Soviet propaganda. Cousins says that movies seem to be made for audiences with "the average mentality ... of a twelve-year-old," but that since the end of World War II the

American public has become much more highly educated and needs more responsible and intelligence entertainment. Since the 1920s, he writes, "the mechanical and technical advances in motion pictures have been superb, but the overall policy and story material are just about where they were when sound was introduced." (22)

**955.** [Davis, Robert C., Jack M. McLeod, and James W. Swinehart ], ed. *Satellites, Science, and the Public: A Report of a National Survey on the Public Impact of Early Satellite Launchings ... for the National Association of Science Writers and New York University*. Ann Arbor, MI: Survey Research Center, Institute for Social Research, University of Michigan, 1959.

This 57-page study compares public attitudes about satellites shortly before the launching of Sputnik by the Soviet Union on October, 4, 1957, and then after that event. Before Sputnik, more than half (54 percent) of the American public had never heard of satellites. After October, 1957, about 91 percent of the public was aware of them. "Most of this awareness was gained during the few weeks following the launching of Sputnik I...." (p. 1) The study notes that "much of the post-Sputnik satellite news emphasis was shifted towards the political 'cold war' and the military arms race with Russia." The researchers also observe that a "new type of response began to appear in the post-Sputnik survey. Purposes which were not the immediate aims of the satellite scientists, but which do constitute possible outcomes of the space age, were classified under the category of 'future possibilities.' The scientific sophistication of response of this type varied considerably, however all ignored the current information-gathering function of the satellites. Almost one person in five was placed in this category." (p. 4) This study attempts to gauge the extent to which people depended on different media newspapers, magazines, radio, television for news about satellites and their purposes. The study shows some decline in the use of newspaper and magazines for science news after Sputnik and slight increases in dependence on radio and television. (Table 11, p. 16) It indicates that which there was a slight increase in science news readership, this category of readership did not grow significantly in comparison with readership for other parts of the news (e.g., sports, society, national politics, etc.). This work indicates that while in November, 1957, about 25 percent of the American public considered Russian science superior to American science, by May, 1958 (after the U.S. had launched its first satellite), only about 8 percent of the American public considered Russian science superior. (p. 38) A majority of people surveyed gave "no clear edge to either America or Russia in the science race." (p. 50)

**956.** [Fleischer, Richard , and Harpman], Fred. "Multiple-image Technique for 'The Boston Strangler'." *American Cinematographer* 50.2 (1969): 202-05, 228.

In this article, director Richard Fleischer, and Visuals Designer Fred Harpman, discuss the making of "The Boston Strangler" (1968), which starred Tony Curtis and Henry Fonda. The movies was about Albert DeSalvo who admitted to murdering 13 women between 1962 and 1964. 20th Century-Fox produced the film in Panavision and subdued color, and "an intricate technique in which multiple images appear simultaneously in varying configurations upon the wide-screen frame." (202) "The Boston Strangler" was the first feature film to use this technique in an extensive fashion. About 35 percent of the movie uses the multiple-image technique.

**957.** [Heffner, Richard D.] Richard Heffner Associates. *Network Television's Business-Related Content*.

This study, funded by the Ford Foundation, examined how television programs and advertising during the early 1970s portrayed business content. A copy of this study is in Richard D. Heffner Personal Papers, Private Collection, New York, NY; and at the University of California, Los Angeles.

**958.** ---. [Report and Proposal: Concerning the Identification of Entertainment Television's Aging-Related Content].

This study examined how entertainment programs on television depicted age-related issues during the early 1970s. A copy of this material is in Richard D. Heffner Personal Papers, New York, NY, and at the University of California, Los Angeles.

**959.** [Heffner, Richard] Richard Heffner Associates. *Network Television's Environmental Content*.

This study examined how network television programs depicted environmental issues during the early 1970s. A copy of this material is in Richard D. Heffner Personal Papers, Private Collection, New York, NY, and at the University of California, Los Angeles.

**960.** [Insull, Samuel] (Edited with additional information by Larry Plachno), ed. *The Memoirs of Samuel Insull: An Autobiography*. Polo, IL: Transportation Trails, 1992.

This book contains material pertaining to Samuel Insull and the Peabody Coal Company, the Century of Progress Exhibition in 1933, George Cardinal Mundelein, and Benito Mussolini. In these pages, published before World War II, Insull wrote that after a meeting with the Italian dictator that "I left the Venezie Palace with the feeling that it had been my privilege to meet one of the great statesmen of Europe."

**961.** [Kellor, Frances A.]. "The American Female Offender." *Chicago Daily Tribune* Jan. 21, 1900 1900: 42.

The subtitle of this article reads "Number 3: The Psychology and Sociology of Criminals and Students Compared," and says that the article reports the "results of observations made in penal and Reformatory Institutions of this Country by Miss F. A. Kellor of the University of Chicago." Kellor's studies examined choices of color, tested taste, hearing and memory of women criminals. Kellor said that female criminals tended to prefer "bright colors" because they "attract more attention" and because they are often "cheaper." Criminals much preferred blue, then pink, red, and yellow. Students, however, preferred red.

**962.** ---. "Psychological Studies of Southern Criminals." *Chicago Daily* Oct. 28, 1900 1900: 34.

This article, the third in a series, reports on the research of Frances A. Kellor at the University of Chicago. Among the things measured to see if traits of women criminals could be detected were the size of noses, hearings, the sense of smell, and so on. Color preferences between white women criminals and black women were compared. Black women much preferred purple; "strangely," red was preferred by only one person. White women criminals preferred blue, pink, red, and yellow in that order. "Thus among immoral women in the North, red, pink, and yellow are more showy, attract more attention, and are cheaper. In the South the colors chosen make the negro more attractive. Immoral persons use color quite as much to attract attention as to satisfy their taste. This variation in color preference has a racial as well as economic and social element. Negroes are particularly partial to these colors because they believe it enhances their beauty and attractiveness, and they do not need to dress as much to attract attention. Races vary in the colors which are adapted to them."

**963.** [Leeds, Josiah W.]. "The Relation of the Press and the Stage to Purity." *The Friend: A Religious and Literary Journal* 69.22 (1895): 174-75.

This article prints excerpts from a pamphlet by Josiah W. Leeds on the demoralizing effects of some theater exhibitions. Leeds deplored the fact that women acted on stage and noted that this development was but two centuries old. "'Yet it is only within the last two centuries ... that the public's sense of propriety has so far weakened as to tolerate this degrading innovation of woman's appearance as a stage dancer and actress,'" Leeds said. (174) In India and China, he asserted, "it is only those women who have lost their good name who will consent to appear as actresses or dancers upon a public stage." (174)

Leeds was against dancing. "'No man in India would allow his wife or daughter to dance, and as to dancing with another man, he would forsake her forever, as a woman lost to virtue and modesty, if she were to attempt it. In their observation of white women, there is nothing that so much perplexes them as the fact that fathers and husbands will permit their wives and daughters to indulge in promiscuous dancing. No argument will convince them that the act is such as a virtuous female should practise, or that its tendency is not licentious. The prevalence of the practice in 'Christian' nations makes our holy religion -- which they suppose must allow it -- to be abhorred by many of them, and often it is cast in the teeth of our missionaries when preaching to them. But what would these heathens say, could they enter our opera houses and theatres, and see the shocking exposure of their

persons which our public women there present before mixed assemblies! Yet they would be ten times more astonished, that ladies of virtue and reputation should be found there, accompanied by their daughters, to witness the sight, and that, too, in the presence of the other sex!" (174)

Leeds comments on the role of Sunday papers and advertising in promoting "theatre news ... stage gossip and scandal." (175) He had little regard for the private lives of actors. "'One of the most convincing statements that I ever read, in proof of the position that the theatre is not a safe school of morals, was furnished by an article upon "Divorces of the Stage," written by a theatre-goer, who had given a great deal of attention to the domestic life of actors and actresses.'" (175) As long as women are on stage and as long they continue to dance, "'the feeders of impure pictorial representations will thrive and their produce increase'," Leeds laments. (175)

**964.** [Lord, Daniel]. "Father Lord Reveals He Wrote Movie Code." *Catholic Action of the South* June 20, 1940 1940.

Daniel A. Lord discusses his role in writing the motion picture industry's Production Code of 1930. Lord was the primary architect of this document that was used to censor motion pictures until the mid-1960s. Lord was profoundly troubled by the new technology of motion pictures and the modern ideas it seemed to convey. This material is in Folder: "Lord, Daniel A., S.J. 1934," National Catholic Welfare Conference, Episcopal Committee on Motion Pictures, 1933-1944, Washington, D. C.

**965.** [Lord, Daniel A.], ed. *Played By Ear: The Autobiography of Daniel A. Lord, S. J.* Chicago: Loyola University Press, 1955.

This the autobiography of the primary author of the movie industry's Production Code of 1930, which tried to bind motion pictures to the Ten Commandments. In this work, Lord discusses his reactions to the new technology of motion pictures. Lord, a Jesuit priest who taught at St. Louis University, was a prolific writer and critic.

Lord comments on the powerful influence that movies had on interpreting history and religion. With regard to history, Lord wrote that in 1915: "Enthralled I sat with my mother, I the young Jesuit in transit from studies to the summer villa, and saw *Cabiria*. All the history of Rome and Carthage, which had slumbered through the pages of my textbooks, suddenly came to life. The battles were not dusty wrestling matches between men in tin armor, but violent conflicts to settle the future of civilization and the world. I marched with Hannibal and his elephants. I watched Fabius as he fought his magnificent delays. And out of the film emerged a great comedian, a vast giant of a man, Maciste, whose contribution to the story of the motion pictures is now only too vaguely recalled." (272) 272/273

On holiday in Wisconsin, he watched with his mother D. W. Griffith's *Birth of a Nation*. "The deep hatred that Dixon had written into *The Clansman* had been blown high and hot in the film. Griffith, whether he meant to or not, made many persons hate Negroes and dread an emancipation given them. And I knew that I was in the presence of a medium so powerful that it well might change our whole attitude toward life, civilization, and established custom." (273)

**966.** [Lucas, George] (interview by Benjamin Bergery, and Bosley), edited by Rachael K. "Digital Cinema, By George." *American Cinematographer* 82.9 (2001): 66-75.

**967.** [Lynn, Barry W.], ed. *Polluting the Censorship Debate: A Summary and Critique of the Final Report of the Attorney General's Commission on Pornography*. [Washington, D.C.]: American Civil Liberties Union, 1986.

The ACLU issued this 188-page critique of the Meese Commission, which had been established by the Reagan administration to study and make recommendations on pornography. *Polluting the Censorship Debate* argued that the Commission promoted government censorship and "moral mob rule" as it set forth a "panorama of

unconstitutional proposals" that violated not only the First Amendment but privacy, choice, and due process. Public Policy Report, July, 1986

**968.** [Mees, C. E. Kenneth], ed. *The Photography of Colored Objects*. Rochester, NY: Eastman Kodak Company, 1928.

This work, originally published in 1909 and in its tenth edition, "is a statement of the theory underlying the photography of colored objects." Mees, whose name does not appear on the title page, says the work makes "no pretense ... of being unbiased" and that "Eastman projects are freely discussed." (Preface)

**969.** [National Commission on Technology, Automation, and Economic Progress], ed. *Statements Relating to the Impact of Technological Change: Appendix Volume VI: Technology and the American Economy, The Report of the Commission*. Washington, D. C.: U. S. Government Printing Office, 1966.

This appendix was published in February, 1966, and it contains about four dozen statements from various corporations and labor organizations commenting on the impact of technology and its possible future consequences. Several of the statements reflect concerns about automation and unemployment. Among those statements relating to communications are those from Bell Telephone Laboratories, Edison Electric Company (which give an assessment of America's electrical network in the mid-1960s), General Electric Company, Honeywell, Inc., International Brotherhood of Pulp, Sulphite, and Paper Mill Workers, McGraw Hill, Inc., RCA, and the Xerox Corporation.

**970.** [Reagan, Ronald]. "Excerpts from President's Reagan's Commencement Address, Notre Dame University." *New York Times* May 18, 1981, sec. B: 7.

In this address, called for a patriotic and spiritual revival in the United States and would "transcend communism."

**971.** [Sunday, Billy]. "[Moving Picture Shows]." *Herald of Gospel Liberty* 106.31 (1914): 966.

Here the evangelist Billy Sunday says that "I believe that moving pictures shows (notwithstanding the so-called censorship) are ruining more women and children, and weaning them from the holy influences of Church and Sunday-school, than all the saloons of our rum-cursed cities. If you don't think so, study the shameful posters in front of these theaters. The low price of admittance brings them in reach of tens of thousands of children who never went to theaters before, and the average character is as bad or worse than the high-priced kind. There are a few harmless pictures shown, but these serve only as bait to the devil's hook.

"No wonder that our young girls and women, in their shameful styles of dress, are throwing away the modest ways of the charming girls of forty years ago!

"The National Board of Censorship for moving pictures endorse the nude and semi-nude. No red-blooded man, Christian or non-Christian, art or no art, can willingly look upon such pictures without defilement. Such censorship is satanic."

Sunday goes on to say that moving pictures should not be left to the devil but that pastors should "get a good stereopticon" and show some of the "splendid slides of the "Life of Christ," the tragedy of His death, and other Bible subject."

**972.** [Tesla, Nikola], ed. *My Inventions: The Autobiography of Nikola Tesla (Ben Johnston, ed. and intro.)*. Williston, VT: Hart Brothers, 1982.

This brief work runs 111 pages with illustrations but no index or bibliography. The work's six chapters are I) My Early Life; II) My First Efforts in Invention; III) My later Endeavors (The Discovery of the Rotating Magnetic Field);

IV) The Discovery of the Tesla Coil and Transformer; V) The Magnifying Transmitter; and VI) The Art of Telautomtics. An appendix is entitled "Hydraulic Analog of Tesla Two Phase Induction Motor."

**973.** [Valenti, Jack] Motion Picture Association of America. "Motion Picture Association of America: 1968 -- A Year of New Developments." *The 1969 Film Daily Year Book of Motion Pictures*. 51st ed. New York: Film and Television Daily, 1969. 616-25.

In this volume, Motion Picture Association of America president Jack Valenti explains the new rating system that went into effect in November, 1968. The essence of the new system was "voluntarism," according to Valenti, who defined this term as follows: "a voluntary willingness by film creators and managers to temper freedom with responsibility, a voluntary willingness by the public to be discerning movie-goers and by parents to know what's playing in the theatres in order to guide the attendance of their children." The organization created to rate films was initially called the Code and Rating Administration (CARA) and was established by NATO, the MPAA, and the International Film Importers and Distributors Association (IFIDA).

This work has much other information about the working of the motion picture and television industries.

**974.** [Young, Freddie]. "Filming Actual Location Interiors ... Now." *American Cinematographer* 48.9 (1967): 641, 665-67.

Freddie Young, the Director of Photography, discusses interior location filming for a new James Bond film (in Technicolor), "You Only Live Twice" (1967). The article are notes taken by the Editor of *American Cinematographer* at a symposium of the British Society of Cinematography

**975.** Abbate, Janet, ed. *Inventing the Internet*. Cambridge, MA: MIT Press, 1999.

Abbate focuses on the social and cultural factors that influenced the Internet's design and use. Early network breakthroughs formulated in the Cold War era saw the creation of the ARPANET by U.S. Defense Department think tanks. She examines how military and academic use influenced and shaped both the Internet and ARPANET; how usual lines between the producer of technology and the end user of it intersect, sometime with surprising results; and how later users of the technology invented their own very successful applications, such as e-mail and the World Wide Web..

Since the mid- to late- 1960s the Internet has grown from an experimental military network serving about a dozen sites across the United States to a burgeoning network of networks linking millions to computers worldwide. Abbate recounts a twisting story of conflict and collaboration among a remarkable cast of characters from the government and the military, to computer scientists in industry and academia, as well as graduate students, telecommunications companies, and the individual user.

Abbate concludes that the trend toward decentralized, user-driven development that has characterized the Internet's history is a symbol of postmodern times, and says the key to the Internet's success has been its commitment to flexibility, diversity, both in technical design and organizational culture.

The book is written for the computer-literate and technically minded. The dozens of references to an alphabet soup of military-influenced acronyms abound, and the amount of computer jargon can make the uninitiated head's swim!

**--Robert Pondillo**

This history of the Internet begins with the Cold War and the perfection of packet switching by the Department of Defense's Advanced Research Projects Agency (DARPA) and ends in the mid-1990s with the popularization of the Internet and the World Wide Web. The development of the Internet, as described by Abbate, resulted from the interplay of government and military agencies, academia, the computer industry, telecommunications

companies, and perhaps most importantly, net users. She finds that the Internet has progressed in an increasingly decentralized manner with success resulting from a commitment to flexibility and diversity. Abbate's sources include documents from the National Archive for the History of Computing, ARPANET newsletters, congressional reports, interviews with central figures and a variety of secondary sources.

**--Mark Tremayne**

**976.** Abbott, Arthur G., ed. *The Color of Life*. New York and London: McGraw-Hill Book Company, Inc., 1947.

Abbott begins this book by saying that "As its qualities are recognized, better understood, and more widely and intelligently applied, color may help to effect a change in the nature of humanity. If that is possible, it can be instrumental in diminishing man's most unnatural and unprofitable traits and increasing the better ones. At any rate, since it is at this moment a very important element in life and is contributing tremendously to the progress of humanity, to find out as much as can be known about it is desirable and profitable." (vii) The author maintains that "Color, a constant companion of nearly all forms of life on this earth, has, like other great forces, potential of good and of evil. It is our privilege, perhaps our duty, to learn to use it for good as much as possible. Woven into our modern civilization in such a way as to be an integral part of it, color can be taken for granted, but it cannot be ignored. The sudden removal of all color would produce chaos until vast readjustments were effected, not only in human affairs but in those of almost all other creatures associated with man." (xix)

Abbott continues: "Since its influence is manifested largely through the sense of sight, the power of color is most effective when this sense is keen." (xix) When one takes the time to actually see and understand color, then the "color of life ... takes on a new meaning. It ceases to be just another inescapable factor of existence and becomes one of the most pleasurable and constantly thrilling experiences of life." (xix)

This book is divided into seven parts and 20 chapters plus References. Part I considers "The Foundations of Color." Part II is "Colors by Nature and How Produced." Part III deals with "Colors by Man and How Produced" (e.g., dyes, paints, photography, printing, glass, etc.). Part IV is "Guides to Use of Color." Part V is "Colors for Everyone" and has a chapter on "Apparel" and another on "Buildings." Part VI covers the "Relation of Color to Man's Progress." Part VII, "References," has three sections: Organizations, Manufacturers, and Bibliography.

In Chapter 14, "Effects of Color on Life," Abbott writes that the "effects of color on the human organism are as yet only vaguely understood. It is known that under certain conditions, visual impressions (including color) affect the blood pressure and muscular, mental, and nervous activity and mood." (129) The author says that "Color helps to make things easy to see; it helps to convey moods; it emphasizes situations and increases audience interest. A deep red-orange is said to have the most exciting influence, and yellow-green the most tranquilizing, and violet the most subduing influence." (131) For a discussion of the symbolic uses of colors, see also pp. 214-17.

This work talks about the likely effects of specific colors such as green, blue, orange, yellow, violet, and red. Of red, the author says that it is a "mental stimulant, ... warm and irritating. It aggravates any inflammatory condition, and it increases the activity of the male sex glands. It is effective in adjusting cases of melancholia. Dr. [Edward] Podolsky reports the case of the employees in the Lumiere photographic factory in France. The red light under which they work had a bad effect on their temper. When the lights were changed to a particular green, the results were excellent." (132)

In Part VI, Chapter 19 ("General Uses Through the Years"), Abbott says that color was often used for camouflage and other forms of deception. (210) It discusses efforts to use electric lighting and color as a form of communication and how this combination can be "independent of languages, nationalities, education, and temperament, and ... the degree of civilization." (211) There is also a consideration of motion pictures that use color (211-12). The author notes that in 1925, "Maude Adams designed 'Color Dynamics,' which was produced by the Eastman Kodak Company." (12)

Chapter 20 covers "Special Uses of Colors Today." Abbott argues that black and white photography and motion pictures lack an element of life that color provides. "Color is making strides in photography of all kinds and may some day eliminate the black and white motion pictures. **Still compositions in black and white will always have a certain amount of appeal, but when life and action are portrayed, they lack a very vital element without color. If the goal of motion pictures is to dramatize and present a realistic illusion of life, the ultimate product will incorporate all the elements of sight, as well as of sound. Sight includes not only color but solidity or relief. Solidity can and may be effected by applying the principles of the stereoscope. The color of animated cartoons has contributed enormously to their popularity. Educational films are vastly more instructive with color than without. Historical dramas, musical comedies, operas, or any other spectacles are only half a forceful without color.**" (222) (emphasis added) This work comments on the use of makeup and color the faces of actors and notes the problems of using makeup when something is filmed in black and white. (223-24)

Abbott observes that by 1947 many news publications were using color. "Every magazine on the newsstand employs color on its cover to attract attention. Some newspapers run a line of color in a margin to indicate the final or some other edition. The old *Police Gazette*, a fixture in nearly every barber shop in the country for years, was recognized by its pink paper throughout. The current publication has added color printing to its make-up." (228)

This work explains that advertisers used color because it makes their products more attractive and saleable. "A most ingenious and effective use of color in bringing products and services to the attention of the buying public is found in the Diorama," the author writes. (261)

This book has an interesting Bibliography (281-89) that pulls together a good deal of research (up to 1947) on the effects of color.

**977.** Abbott, Arthur V. "Electricity Up to Date: From the Centennial to the White City." *Frank Leslie's Popular Monthly* 36.5 (1893): 2-16.

This article discusses the spread and impact of electricity on the United States in the seventeen years between the Centennial in 1876 and the Chicago World's Fair in 1893. "At the Centennial, with the exception of the telegraph and a little electro-plating, there was absolutely no commercial application of electricity. Now scarcely a single detail of daily life that is not permeated by and dependent upon it." (3) At the 1893 exhibit, the steam engine was "banished" and the electric motor reigned. (3) The spread of telephones was evident in 1893. There were 800 miles of underground telephone wires connecting the exhibits at the World's Fair alone.(3) In the United States, in early 1893 there were more than "400,000 miles of telephone lines ... in active service, exclusive of 100,000 miles of underground cable line." (8) These lines served "200,000 subscribers, from 1,351 exchanges, operating 552,000 instruments, requiring the attention of 10,000 employees, and involving the investment of over \$165,000,000 of capital. Upon these lines over 600,000,000 conversations annually take place." (8) The article discusses the switchboard and its use at the World Fair and more broadly in the economy. (9, 11)

The storage battery "was not only unknown, but was unimagined" in 1876, and only a few dreams of an electric railway. The article says that in the United States in 1893 there were "2,500 isolated plants ... devoted to the business of illumination. These figures take no account of the foreign plants, for which actual statistics are not obtainable. A conservative estimate, however, would place the total electrical illuminating power of the world at the present time at about one hundred and fifty million candle power." (5)

The article notes the progress of wireless communication and reports that "already intelligible messages have been transmitted across more than five miles of space with out the aid of any wire, or other conducting circuit, simply by means of electro-magnetic waves impelled through the luminous ether. Thus, compared to the possibilities so opened to the imagination, the present method of telephonic communication sinks into insignificance." (13)

The author comments on the progress of converting heat energy directly into electricity. (13-14)

Abbott believed that "The greatest scientific attainment of this century was the discovery of the correlation of energy, which informs us that all the forms of force with which we are acquainted, such as light, heat, sound, electricity, chemical action, the attraction of gravitation, and mechanical motion, are mutually interconvertible, so that any manifestation of force can be transformed into any other form; and could the inevitable friction wastes of mechanics be avoided the change would be accomplished absolutely without loss...." (15-16) The author asks if the next seventeen years (1893-1910) will see progress on such a great scale as the last seventeen. (12) This article is illustrated with several pictures from the Chicago World's Fair.

**978.** Abbott, Karen, ed. *Sin in the Second City: Madams, Ministers, Playboys, and the Battle for America's Soul*. New York: Random House, 2008.

At the turn of the century, Chicago was awash in vice, with its abundance of shady politicians, houses of ill fame, and organized crime. Two women were at the center of this depravity: the Everleigh sisters, proprietors of one of the most famous brothels in the world. *Sin in the Second City* chronicles their rise and fall, a story that would seem to occupy a narrow slice of history, but was tied in with larger issues like the white slave trade and evangelical religion. Abbott, a journalist who's written for *Philadelphia* magazine and Salon.com, has meticulously researched *Sin*, relying on numerous sources such as magazines that wrote about the scourge of prostitution (*The Philanthropist*), newspapers (*Chicago Tribune* and *Chicago Daily Socialist*), the three other books that have been written on the Everleigh sisters, letters the sisters wrote to Irving Wallace, interviews with the sisters' great niece, and governmental reports on the vice trade.

Her extensive use of a variety of sources, and the way she uses weaves them together, makes the book read like a novel. *Sin in the Second City* is a valuable work of sex-related history. Abbott says that *Sin* "is also about identity, both personal and collective, and the struggle inherent in deciding how much of the old should accompany us as we rush, headlong, into the new (p.xii)." Not all early twentieth-century madams were worth writing books about. What makes the Everleigh sisters worthy is the fact that their mission was to elevate the prostitution industry. The Everleigh club had doctors on staff to give regular check ups to the women, they provided free meals, paid over \$100 a week, and gave the workers an education in classical literature (Balzac and Longfellow were emphasized). In contrast, other brothels paid their workers \$35, didn't have doctors on staff and let syphilitic women (with visible symptoms) continue to work, and allowed drugs their workers to do drugs and steal from the clients.

Although prostitution was technically illegal in Chicago, it was tolerated by the city because it was so profitable: brothel owners paid the city officials, like Bathhouse John Coughlin graft payments. Everything in the prostitution world went along swimmingly until vice crusaders decided to target the industry. Standing outside of the Everleigh Club, Ernest Bell would preach sermons on the wages of sin and the debilitating effects of syphilis. Ironically, his preaching increased business for the club. When prosecutor Clifford Roe joined in the demonizing of the prostitution trade by accusing brothel owners of drugging girls, raping them, and forcing them into the industry -- a practice referred to as the white slave tradet -- the fight was on, and the end of the freewheeling Everleigh club was on the horizon.

The Everleigh Club became a symbol of the Levee district (vice district) because it was the most visible of the brothels, and the sisters dared to advice, producing a glossy book showing all of the ostentatious decorations of the club, but none of the girls. Prince Henry of Prussia visited the brothel, as well as boxer Jack Johnson, and Marshall Field Jr. (who was a regular and may or may not have died at the club). And when the White Slave Traffic Act, aka the Mann act, was passed in 1910, and the Bureau of Investigation was created to enforce it, the club was doomed. Even though the Everleigh sisters were far from white slavers (so many girls wanted to work there that they had a waiting list), they were shut down in 1911, never to re-open again. And, what makes this story interesting from a mass communication perspective is that the mayor claimed that the reason that they were

targeted "was the Everleigh club's 'infamy, the audacious advertising of (p.248) it'; 'it was as well known as Chicago itself and therefore a disgrace to the city ." (p.249).

**-Hallie Lieberman**

**979.** Abel, Richard, ed. *Americanizing the Movies and 'Movie-Mad' Audiences, 1910-1914*. Berkeley: University of California Press, 2006.

Among the topics Abel examines is the rise of the movie star in Chapter 6, "'The Power of Personality in Pictures': Movie Stars and 'Matinee Girls'" (231-56). At the end of this chapter, Abel reprints newspaper articles on this topic including "Personality a Force in Pictures," from *New York Dramatic Mirror*, Jan. 15, 1913, p. 44 (see Abel, pp. 252-54). It says in part: "The secret of intimate personal expression through the medium of the camera and the screen is elusive. A pleasing face is not in itself sufficient, nor can an individuality be made distinct by means of conventional gestures and facial expressions. The players selected to appear on this page have distinctive personalities that they have learned to express in distinctive ways." (quotation from newspaper article, in Abel, p. 252)

"...Fleeting facial expressions that might indicate little at first, gain in meaning as features become familiar, until we can guess at thoughts without the need of words to express them." (quotation from newspaper article, in Abel, p. 253)

"...It seems that many people are more concerned about the figures they see on the screen than the connected series of incidents they are engaged in relating. If some of these enthusiasts stopped to ask themselves whether they were more entertained by a good photoplay acted by strangers or a mediocre one in which some favorite appeared, there is a good chance that the verdict would be in favor of the popular player. That may not be an altogether healthy condition, but it is one that exists and must be recognized by the men who produce pictures." (quotation from newspaper article, in Abel, p. 254)

In "Entr'acte 5: Trash Twins: Newspapers and Moving Pictures" (215-27), Able attempt "to sketch the more prominent patterns in the cinema's developing institutional relationship with newspapers... in selected cities from the Northeast to the upper Midwest...." (216) This relationship began to develop as early as 1911. Able writes: "As late as October 1912, the *New York Dramatic Mirror* claimed that the "'movies" continue to flourish' without 'the benignant approval' of the daily newspapers, that the 'pictures are left very much to speak for themselves.' Yet, by the spring of 1913, trade journals as different as the *World* and *Motography* acknowledged that local newspapers were now promoting *photoplays* or *movies* (the distinction could be significant) by running special pages and/or columns on a regular basis. Yet, if a mutually profitable relationship was well established between moving pictures and newspaper by 1913-14, signs of its emergence -- however tentative, irregular, and uneven, like those for feature films -- are quite visible as early as 1911, despite the *World's* complaint, and even before." (215)

This book, Abel says, can be considered a companion to his earlier book, *The Red Rooster Scare: Making Cinema American, 1900-1910* (1999).

**980.** ---, ed. *The Ciné Goes to Town: French Cinema, 1896-1914*. Berkeley: University of California Press, 1994.

This substantial, well-researched book, should be read in conjunction with Abel's earlier work, *French Cinema: The First Wave, 1915-1929* (1984). In this study Abel examines whether a national cinema existed in France. He writes: "Despite a certain 'international' character to early cinema, such an assumption is not without justification. **First** of all, the French cinema can be situated economically within the historical context of imperialism -- in the sense used by Eric Hobsbawm that the world economy of capitalism had become an aggregate of rival national economies engaged in colonial conquest -- which defined Europe as well as the United States at the turn of the century. The space of colonial expansion, along with that constructed by the more direct trading

rivalry between national economies, provided a field of exploitation for Pathé - Frères when it became the first film company to move into mass production in 1904-1905. **Second**, the French cinema can be situated within the related historical context of nationalism, specifically in terms of the institutions and practices that defined the French Third Republic as a distinct nation-state. Although the new secular system of education served as the principal bonding agent of late nineteenth-century French society, a loose network of new mass culture practices proved increasingly crucial during the period. Within this network, the cinema quickly assumed a significant role, especially through the appropriation of a historically specific cultural tradition, so that certain film genres gained a privileged importance -- the trick film and the *féerie*, the comic series, the biblical film, the historical film, and the *grand guignol* version of melodrama. **Finally**, the French cinema can be situated historically according to its definition under French law, for the courts consistently classed the cinema as a *spetacle de curiosité*, subjecting it to the control and censorship of local officials. In 1906, a state decision to end all censorship restrictions against theater provoked efforts by the industry to upgrade the cinema's status. The consequences of this move to align the cinema with theater were profound -- theater analogy, at the level of both commercial enterprise and critical discourse, became more deeply ingrained in France than anywhere else. That these economic, cultural, and legal practices gave the French cinema a high degree of historical specificity makes all the more valid an interrogation of the early French cinema as a more or less distinct national cinema."

981. ---, ed. *The Red Rooster Scare: Making Cinema American, 1900-1910*. Berkeley: University of California Press, 1999.

This book argues, in Abel's words, "that the Americanization process -- specifically, the concerns about constructing a distinctive American national identity -- continued to frame early cinema's institutionalization as a popular mass entertainment, particularly if certain categories of spectators formed its core audience -- namely, recent working-class immigrants, women (especially young working women), and children. It also argues that early cinema, as a mass entertainment, has to be conceived in terms that reach beyond the production of film texts and their promotion in the trade press to focus on distribution and exhibition practices, as well as regional or even local discursive traces of their promotion and reception." (quoted from Introduction, Abel, *Americanizing the Movies and 'Movie-Mad' Audiences, 1910-1914* [2006], p. 3).

Abel devotes a section to "The Color of Nitrate (pp. 40-47) and discusses Pathé "Heavenly Billboards." Abel also later observes that "In the 1890s, chromolithography rapidly gave way to a new technology of halftone photoengraving, a process that allowed photographs to be reproduced on cheap paper (usually in black-and-white). Their use transformed newspaper and magazine journalism (a good example was *The World's Work*), where the photo now served to guarantee accuracy and authenticity." (p. 125) (Here Abel cites Neil Harris' *Cultural Excursions* and Richard Slotkin's *Gunfighter Nation*.)

As American film producers challenged the dominance of French-made films (around 1909-10), colored films became associated with "foreignness" (157). "That Pathé released *A Western Hero* in stencil color reveals its 'foreignness' in another way. 157/158 Here, the trade press was unanimous: stencil color was perfectly appropriate for certain *films d'art* and 'exotic' scenics, but not for American subjects, especially westerns. For the latter, the realist aesthetic promoted by the *Mirror* and the *World* dictated a concern for the 'orthochromatic,' the accuracy of tonal values in 'the black and white picture,' which by 1909-1910, so went the claim, the public preferred, from whatever school it came. The *World* singled out Biograph in particular as a model for other manufacturers to imitate, for its films' 'fine rich deposit in the shadows and clear, delicate lights.' The chiaroscuro of black and white could be enhanced by tinting and/or toning effects, but, as Woods argued, those had to serve the purpose of 'approximating reality and at the same time make the story clear.' If *color* were to be invoked in the American cinema, it would be yoked to an aesthetic of 'impressive realism' (to cite a Biograph ad), one imbued with a distinctive, historically specific American ideology."

**982.** Abelson, Philip H. and Allen L. Hammond. "The Electronics Revolution." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 16-28.

This piece, written by the editor and staff of *Science*, seeks to set the microelectronic revolution into historical perspective.

**983.** Abler, Ronald. "The Telephone and the Evolution of the American Metropolitan System." *The Social Impact of the Telephone*. Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 318-41.

The author examines the relation between telephones and modern cities. He notes that the dreams of utopians in the late 19th century have been realized in that the "telephone has conquered distance as no other technology has."

**984.** Abrahamson, David, ed. *Magazine-Made America: The Cultural Transformation of the Postwar Periodical*. Cresskill, NJ: Hampton Press, Inc., 1996.

In this 101-page book, the author draws on such authors as Russel Nye and John Pauly to note that "all communication media have an important societal dimension, both reflecting and shaping the social actualities of their time." Abrahamson argues that "the emergence of the special-interest magazines in the 1960s was both a product of and contributor to major sociocultural and economic changes in postwar America." (p. 3) This work examines magazine readership and it looks at publications that specialized in leisure activities such as boating, automobiles, flying, and photography. Eleven tables (73-80) give data on magazine circulation, readership, publishing, and other economic statistics.

**985.** Abrahamson, Eric John. "Hear Me Now: Competition, Regulation, and the Pace of Innovation in Mobile Telephony in the United States, 1945-1984." Johns Hopkins University, 2003.

Abstract from UMI ProQuest Digital Dissertations: "Policy analysts and economists have frequently criticized the Federal Communications Commission (FCC) for delaying the commercial launch of cellular communications in the United States. This study looks at the evolution of the wireless industry in the U.S. from the end of World War II to the commercial launch of cellular service in 1983. It focuses on three arenas -- technology, politics and the market. It argues that competitive forces unleashed by the federal government in 1946 shaped the path and pace of innovation and conditioned the coevolution of four core economic and political institutions: AT&T, Motorola, the association of Radio Common Carriers, and the FCC.

**986.** Abramson, Albert, ed. *The History of Television, 1880-1940*. Jefferson, NC: McFarland Press, 1987.

**987.** Abramson, Jeffrey B. , Arterton, F. Christopher, and Orren, and Gary R., eds. *The Electronic Commonwealth: The Impact of New Media Technologies on Democratic Politics*. New York: Basic Books, Inc., 1988.

The authors discuss the political implications of new media technologies on democratic government. Their work appeared before the widespread use of the Internet. The new media they consider include computers, satellites, cable television, videocassette recorders, direct broadcast satellites, multipoint distribution service, satellite mater antennae television, pay television, VHF drop-in TV, low-power television, videotex, teletex, lasers, and optical fibers. The authors note that such media vastly expand the amount of data that can be exchanged, and make it possible to exchange that information with little regard to real space or time. Consumers have increased control over the message they receive. Senders of messages have greater control over the audiences they will reach. These new media decentralize the control of mass communication. They also bring new two-way communication or interactive possibilities to television. The authors are noncommittal as to whether these new media constitute a "communication revolution." Their more modest purpose is to convince readers that such new

media warrant serious scholarly research. The authors reject both technological determinism and political determinism.

"The democratic theory that lies behind this book can be described as a cross between the pluralist and communitarian views -- pluralism with a communitarian face," the authors write. They hope to explain how "we can seize the opportunity presented by the current changes in the media environment to reorient mass communications toward more robust democratic service...."

The eight chapters in this work are entitled: "The New Media and Democratic Values"; "What's New About the New Media?"; "Elections and the Media: Past, Present, and Future"; "Communications Technology and Governance"; "The New Media and Democratic Participation"; "Policy in a Comparative Perspective"; "Freedom of the Press and the New Media"; and "Toward an Electronic Commonwealth."

**988.** Acland, Charles R. and William J. Buxton, eds., ed. *Harold Innis in the New Century: Reflections and Refractions*. Montreal and Kingston: McGill-Queen's University Press, 1999.

This collection of essays grew out of various centennial celebrations in 1994 of Harold Innis's birth. The volume has twenty chapters (with twenty-three authors) arranged around three broad themes: "Reflections on Innis" (Part One), "Gaps and Silences" (Part Two); and "Innis and Cultural Theory" (Part Three). The work has an excellent Introduction by William J. Buxton and Charles R. Acland entitled "Harold Innis: A Genealogy of Contesting Portraits." Buxton and Acland give an information of the scholarly literature on Innis's life and work, and they also cogent summaries of each chapter.

Chapters in Part One examine Innis's thinking and its context. Richard Noble writes on "Innis's Conception of Freedom" within the Whig political tradition. Judith Stamp places Innis in the context of Canadian education and the Scottish Enlightenment. Michael Dorland looks at how Innis viewed the connection between religion and Canadian politics. James Carey explores the influence of the Chicago School on Innis. Irene M. Spry, a former Innis colleague, discusses his way of working and doing research. Cheryl Dahl and Liora Salter consider how Innis defined public intellectuals and the university's role in the world. Donald Fisher deals with Innis's relationship to academic communities and his part in the founding of the Canadian Social Science Research Council in 1941. In Chapter 8, Michèle Martin and Buxton contrast Innis's ideas about relation between academics and moral and social life, and his worries that modern media were too "space-biased," with the approach taken by his contemporary Victor Barbeau. Barbeau critical journalism could be a catalyst for progressive reform.

Chapter 9-12 consider "gaps and silences" in Innis's work such as gender relations.

Most of the discussion of Innis and technology occurs in Part Three, "Innis and Cultural Theory." Here there are eight chapters including Acland's "Histories of Place and Power: Innis in Canadian Cultural Studies"; Andrew Wernick's "No Future: Innis, Time Sense, and Postmodernity"; Jody Berland's "Space at the Margins: Critical Theory and Colonial Space after Innis," Kevin Dowler's "Early Innis and the Post-Massey Era in Canadian Culture"; and Kim Sawchuk's "An Index of Power: Innis, Aesthetics, and Technology."

This book has a thorough bibliography on work relating to Innis.

**989.** Adams, Henry, ed. *The Education of Henry Adams: An Autobiography*. Boston: Houghton Mifflin Company, 1918.

Henry Adams wrote this autobiography in the third person. Adams believed that the coming of electrical energy, the dynamo, represented a radical break in human history, and that one had to go back to the year 310, "when Constantine set up the Cross," (383) to find a similar historical rupture. There was a continuity in Christianity's power, which survived other challenges including those from Galileo and Bacon, until 1900. Then, Adams said, "continuity snapped." (457) The child born in 1900 was "born into a new world...." (457) The dynamos promised "infinite costless energy" and "they gave to history a new phase." (342)

From Chapter XXII-- "CHICAGO (1893)" starting on page 341: Jostled by these hopes and doubts, one turned to the exhibits for help, and found it. The industrial schools tried to teach so much and so quickly that the instruction ran to waste. Some millions of other people felt the same helplessness, but few of them were seeking education, and to them helplessness seemed natural and normal, for they had grown up in the habit of thinking a steam engine or a dynamo as natural as the sun, and expected to understand one as little as the other. For the historian alone the Exposition made a serious effort. Historical exhibits were common, but they never went far enough; none were thoroughly worked out. One of the best was that of the Cunard steamers, but still a student hungry for results found himself obliged to waste a pencil and several sheets of paper trying to calculate exactly when, according to the given increase of power, tonnage, and speed, the growth of the ocean steamer would reach its limits. His figures brought him, he thought, to the year 1927; another generation to spare before force, space, and time should meet. The ocean steamer ran the surest line of triangulation into the future, because it was the 341/342 nearest of man's products to a unity; railroads taught less because they seemed already finished except for mere increase in number; explosives taught most, but needed a tribe of chemists, physicists, and mathematicians to explain; the dynamo taught least because it had barely reached infancy, and, if its progress was to be constant at the rate of the last ten years, it would result in infinite costless energy within a generation. One lingered long among the dynamos, for they were new, and they gave to history a new phase. Men of science could never understand the ignorance and naiveté of the historian, who, when he came suddenly on a new power, asked naturally what it was; did it pull or did it push? Was it a screw or thrust? Did it flow or vibrate? Was it a wire or a mathematical line? And a score of such questions to which he expected answers and was astonished to get none.

From CHAPTER XXV-- "THE DYNAMO AND THE VIRGIN (1900)": Starting on page 380: "Then he showed his scholar the great hall of dynamos, and explained how little he knew about electricity or force of any kind, even of his own special sun, which spouted heat in inconceivable volume, but which, as far as he knew, might spout less or more, at any time, for all the certainty he felt in it. To him, the dynamo itself was but an ingenious channel for conveying somewhere the heat latent in a few tons of poor coal hidden in a dirty engine-house carefully kept out of sight; but to Adams the dynamo became a symbol of infinity. As he grew accustomed to the great gallery of machines, he began to feel the forty-foot dynamos as a moral force, much as the early Christians felt the Cross. The planet itself seemed less impressive, in its old-fashioned, deliberate, annual or daily revolution, than this huge wheel, revolving within arm's length at some vertiginous speed, and barely murmuring -- scarcely humming an audible warning to stand a hair's-breadth further for respect of power -- while it would not wake the baby lying close against its frame. Before the end, one began to pray to it; inherited instinct taught the natural expression of man before silent and infinite force. Among the thousand symbols of ultimate energy the dynamo was not so human as some, but it was the most expressive.

"Yet the dynamo, next to the steam-engine, was the most familiar of exhibits. For Adams's objects its value lay chiefly in its 380/381 occult mechanism. Between the dynamo in the gallery of machines and the engine-house outside, the break of continuity amounted to abysmal fracture for a historian's objects. No more relation could he discover between the steam and the electric current than between the Cross and the cathedral. The forces were interchangeable if not reversible, but he could see only an absolute *fiat* in electricity as in faith. Langley could not help him. Indeed, Langley seemed to be worried by the same trouble, for he constantly repeated that the new forces were anarchical, and especially that he was not responsible for the new rays, that were little short of parricidal in their wicked spirit towards science. His own rays, with which he had doubled the solar spectrum, were altogether harmless and beneficent; but Radium denied its God -- or, what was to Langley the same thing, denied the truths of his Science. The force was wholly new.

"A historian who asked only to learn enough to be as futile as Langley or Kelvin, made rapid progress under this teaching, and mixed himself up in the tangle of ideas until he achieved a sort of Paradise of ignorance vastly consoling to his fatigued senses. He wrapped himself in vibrations and rays which were new, and he would have hugged Marconi and Branly had he met them, as he hugged the dynamo; while he lost his arithmetic in trying to figure out the equation between the discoveries and the economies of force. The economies, like the discoveries,

were absolute, supersensual, occult; incapable of expression in horse-power. What mathematical equivalent could he suggest as the value of a Branly coherer? Frozen air, or the electric furnace, had some scale of measurement, no doubt, if somebody could invent a thermometer adequate to the purpose; but X-rays had played no part whatever in man's consciousness, and the atom itself had figured only as a fiction of thought. In these seven years man had translated himself into a new universe which had no common scale of measurement with the old. He had entered a supersensual world, in which he could measure nothing except by chance collisions of movements 381/382 imperceptible to his senses, perhaps even imperceptible to his instruments, but perceptible to each other, and so to some known ray at the end of the scale. Langley seemed prepared for anything, even for an indeterminable number of universes interfused -- physics stark mad in metaphysics.

"Historians undertake to arrange sequences, -- called stories, or histories -- assuming in silence a relation of cause and effect. These assumptions, hidden in the depths of dusty libraries, have been astounding, but commonly unconscious and childlike; so much so, that if any captious critic were to drag them to light, historians would probably reply, with one voice, that they had never supposed themselves required to know what they were talking about. Adams, for one, had toiled in vain to find out what he meant. He had even published a dozen volumes of American history for no other purpose than to satisfy himself whether, by severest process of stating, with the least possible comment, such facts as seemed sure, in such order as seemed rigorously consequent, it could fix for a familiar moment a necessary sequence of human movement. The result had satisfied him as little as at Harvard College. Where he saw sequence, other men saw something quite different, and no one saw the same unit of measure. He cared little about his experiments and less about his statesmen, who seemed to him quite as ignorant as himself and, as a rule, no more honest; but he insisted on a relation of sequence. and if he could not reach it by one method, he would try as many methods as science knew. Satisfied that the sequence of men led to nothing and that the sequence of their society could lead no further, while the mere sequence of time was artificial, and the sequence of thought was chaos, he turned at last to the sequence of force; and thus it happened that, after ten years' pursuit, he found himself lying in the Gallery of Machines at the Great Exposition of 1900, his historical neck broken by the sudden irruption of forces totally new.

"Since no one else showed much concern, an elderly person without other cares had no need to betray alarm. The year 1900 was 382/383 not the first to upset schoolmasters. Copernicus and Galileo had broken many professorial necks about 1600; Columbus had stood the world on its head towards 1500; but the nearest approach to the revolution of 1900 was that of 310, when Constantine set up the Cross. The rays that Langley disowned, as well as those which he fathered, were occult, supersensual, irrational; they were a revelation of mysterious energy like that of the Cross; they were what, in terms of medieval science, were called immediate modes of the divine substance. 383/457

From Chapter XXXI -- "THE GRAMMAR OF SCIENCE (1903)" -- from page 457: "... The motion of thought had the same value as the motion of a cannonball seen approaching the observer on a direct line through the air. One could watch its curve for five thousand years. Its first violent acceleration in historical times had ended in the catastrophe of 310. The next swerve of direction occurred towards 1500. Galileo and Bacon gave a still newer curve to it, which altered its values; but all these changes had never altered the continuity. Only in 1900, the continuity snapped.

"Vaguely conscious of the cataclysm, the world sometimes dated it from 1893, by the Roentgen rays, or from 1898, by the Curie's radium; but in 1904, Arthur Balfour announced on the part of British science that the human race without exception had lived and died in a world of illusion until the last year of the century. The date was convenient, and convenience was truth.

"The child born in 1900 would, then, be born into a new world which would not be a unity but a multiple. Adams tried to imagine it, and an education that would fit it. He found himself in a land where no one had ever penetrated before; where order was an accidental relation obnoxious; artificial compulsion imposed on motion; against which every free energy of the uni- 457/458 verse revolted...."

**990.** Adams, I. Howe. "Photography, or the Manchausen of the Arts." *Outing, an Illustrated Magazine of Recreation* 16.6 (1890): 476-80.

This article offers a sour appraisal of photography. "One conscienceless epigrammatist somewhere has said that 'photography is the George Washington of the arts.' Washington was never so slandered before, for if there be anything that shuns things as they are and clings to things as they are not, anything which distorts the real and lives in a world of its own, it is the art of photography. It drags down what we call beautiful; it often elevates the ugly; the weather-beaten hovel is as likely to grow romantic under its deceptive touch as the stately mansion is to depreciate in value; while the faces of those we love or admire are, in the hands of the unskillful, set down to posterity with more disfigurement than ingenious Indian artists could devise.

"A human being, in fact, is never more unreal than when being photographed...." (471) Later, the author says that "the camera makes friends; true, but it imposes on good nature to comply with the numerous requests a village community will make, sometimes with provoking interation, especially at a time -- which every amateur photographer stumbles over occsionally -- when he has a run of bad pictures in succession, an event which is sure to come at some inopportune time...." (478)

**991.** Adams, W. I. Lincoln. "Flash Light Photography: Concluded." *Outing, an Illustrated Monthly Magazine of Recreation* 17.4 (1891): 259-64.

This article, illustrated with a number of pictures, discusses the progress in photographing out-of-doors and at night using magnesium powder. "In 'flash' light photography the most remarkable achievements are, undoubtedly, those which have been accomplished out of doors and at night.

"Here a larger amount of magnesium is required, and, of course, since so much of the light is lost in the surrounding darkness, powerful reflectors must be used." (259) Among the images is the Statue of Liberty at night. (259)

**992.** ---. "Photography and Athletics: First Paper." *Outing, an Illustrated Monthly Magazine of Recreation* 19.5 (1892): 404-08.

This article, published in early 1892, says that there has been rapid improvements in photography over the past two years, so "that it is now possible for the instantaneous photographer to accomplish results which were unattainable even two years ago." (404) The article is devoted to describing the work of John C. Hemment, a former athlete (skater) who uses instantaneous photography to show athletic events. Races, for example, that were once considered dead heats to the naked eye are shown to have clear winners and losers when instantaneous photography is used at the finish line. Hemment used an "ingenious hand box" camera to replace reliance on the tripod. (406) The article is illustrated with six photographs by Hemment of athletes in action.

**993.** ---. "Photography and Athletics: Second Paper." *Outing, an Illustrated Magazine of Recreation* 19.6 (1892): 445-49.

This article is a follow-up on an earlier article that appeared in this magazine in Feb. 1892. In this piece, Adams describes the process photographer John C. Hemment used to take instantaneous pictures of athletes in action. Hemment discusses how he develops his pictures. Hemment used a hand camera which produced photographs that technically "were not only as perfect as could be if a prolonged exposure were given in every case," by the pictures were "also caught with such a precision that just the particular attitude of the subject or subjects which were desired is depicted, and that particular phase of the sport or feat is brought out which is most characteristic or pictorial." (447) The article notes that even pictures taken in weak light turn out well. Hemment "uses the quickest working exposing shutter, the most rapid lens and the most sensitive dry plate," Adams reports. (449) To those who said that Hemment could not develop his photos fast enough, he says that he "devoted three hours in bringing up only four plates of rapid exposure." (449) He predicts that in the future all important racing events will

have their own official photographer. The article says that in March, 1892, most large newspapers already have their own "regular staff photographer" and that "many papers have several photographers connected with them, and some have extensive photographic establishments where the work of the photographer can be finished and prepared for the press. A very large number have their regular 'photographic' editor, in addition to the 'sporting' editor, 'exchange' editor, etc." (449)

Adams concludes by saying: "The instantaneous photographer is also a familiar figure now on the occasion of any athletic performance of importance. His value as an impartial judge is being more widely recognized every day." (449)

The article is illustrated with eight photographs of athletic events.

**994.** Addams, Jane, ed. *Spirit of Youth and the City Streets*. New York: Macmillan Company, 1912.

Addams comments on the negative impact that movies and movie theaters have on urban youth. She talks about the moral hazards of commercialized leisure, and likens the movie theater to dance halls and pool rooms.

**995.** Adler, Mortimer. ["*Freedom of the Films*"].

This is a draft of a manuscript that Mortimer Adler prepared for Will H. Hays justifying protecting of movies as a form of free speech. Hays was to deliver it to the Senate committee investigating Hollywood and warmongering in September, 1941, but Hays apparently did not get the chance to give it. A copy of this draft is located at [1942?], Box 60, Will H. Hays Papers, Indiana State Library, Indianapolis, IN; and in Boxes 69-70, Mortimer J. Adler Papers, Regenstein Library, University of Chicago, Chicago, IL.

**996.** Adler, Mortimer J. Mortimer J. Adler Papers.

This is a rich collection pertaining to Adler's life and career. There is a good deal in these papers revealing Adler's association with Will H. Hays and the motion picture industry. Hays liked Adler and thought his work gave a strong intellectual justification for motion pictures, one that could be used against the industry's critics. Adler was on Hays' payroll for a time, drafting the MPPDA president's annual reports.

**997.** ---, ed. *Art and Prudence: A Study in Practical Philosophy*. New York: Longmans, Green and Co., 1937.

Part of this work provides a scathing critique of the Payne Fund Studies and social science research. Part of it offers a justification of motion pictures as an art form. Will Hays considered this work a strong intellectual defense of motion pictures, one that could be used against the industry's critics. Adler was on Hays' payroll for a time, writing his annual reports. It is unclear if Adler was being paid by Hays at the time this book was written.

**998.** ---, ed. *Philosopher At Large: An Intellectual Autobiography*. New York: Macmillan Publishing Co., Inc., 1977.

Adler acknowledges here that during the late 1930s and early 1940, he was on the payroll of the Hays Office (MPPDA). At the time, he wrote some of Will Hays' speeches and reports. Adler provided a defense of movies as an art form in *Art and Prudence*.

**999.** Administration, Classification and Rating.

These annual reports provide information about the motion picture industry's Classification and Rating Administration, including how many movies received G's, PG's, PG-13's, R's, X's, and NC-17's. These reports can be found in the Papers of Richard D. Heffner, Private Collection, New York, N. Y.

**1000.** Affairs, Bureau of National. "Adopting Media Techniques." *Unions Today: New Tactics to Tackle Tough Times*. Washington, DC: Bureau of National Affairs, 1985. 80-87.

This report briefly details how unions were using mass media in the early 1980s, arguing that the “use of media by labor unions is undergoing a revolution.” One union official estimated that labor organizations were spending between \$10 million and \$15 million annually on media, and that advertising and public affairs offerings by labor organizations may have been more extensive at that time than ever before. Unions such as the Teamsters, the SEIU and UFCW, for example, were using film and videos for organizing. A 40-minute UFCW organizing film, *The Road to Dignity*, was also being marketed through direct mail to 25,000 high school teachers for use in vocational education and social studies classes. AFSCME, according to the authors, built a network-quality radio and television studio to produce public affairs programs and to conduct teleconferences that can be sent via satellite to television and radio stations around the country. In 1983 and 1984, the AFL-CIO’s Labor Institute of Public Affairs produced *America Works*, an 18-part series of half-hour programs shown on commercial and public television stations. In late 1984, LIPA launched the “Campaign for America’s Future,” a radio and television advertising effort kicked off with a nationwide teleconference with labor leaders and news reporters. The AFL-CIO, according to the authors, purchased ad time in 24 markets on 70 television stations and local labor bodies purchased 4,200 radio spots as part of the coordinated campaign. The UAW used broadcast advertising during 1984 to communicate for public support during labor negotiations with Ford. These communications were designed to meet key goals: improving union leaders’ communications with other union officials and members; providing better news media access to labor leaders; expanding communications with lawmakers, interest groups and opinion leaders; gaining public support for bargaining positions; and improving the public perception of labor.

**1001.** Agar, Jon, ed. "History of Computing: Approaches, New Directions." *History and Technology: An International Journal* 15.1-2 (1998).

These issues are devoted to new approaches to writing the history of computing. Agar contributes an "Introduction: History of Computing: Approaches, New Directions and the Possibility of Informatic History," and an article, "Digital Patina: Texts, Spirit and the First Computer." **Paul N. Edwards** article is "Y2K: Millennial Reflections on Computers as Infrastructure." Other articles include **Robert W. Seidel**, "'Crunching Numbers': Computers and Physical Research in the AEC [Atomic Energy Commission] Laboratories"; Geoffrey C. Bowker, "Archival Technology in the Historical Sciences: 1800-1997"; and Paul Atkinson, "Computer Memories: The History of Computer Form."

**1002.** Agee, James and Walker Evans, ed. *Let Us Now Praise Famous Men*. Boston: Houghton Mifflin Company, 1939.

This work attempts to record the life of sharecroppers. “The immediate instruments are two,” the authors write, “the motionless camera, and the printed word. The governing instrument—which is also one of the centers of the subject—is individual, anti-authoritative human consciousness....”

“For in the immediate world, everything is to be discerned, for him who can discern it, and centrally and simply, without either dissection into science, or digestion into art, but with the whole of consciousness, seeking to perceive it as it stands: so that the aspect of a street in sunlight can roar in the heart of itself as a symphony, perhaps as no symphony can: and all of consciousness is shifted from the imagined, the revisive, to the effort to perceive simply the cruel radiance of what is.... That is why the camera seems to me, next to unassisted and weaponless consciousness, the central instrument of our time; and is why in turn I feel such rage at its misuse: which has spread so nearly universal a corruption of sight that I know of less than a dozen alive whose eyes I trust even as much as my own.”

**1003.** Agency, Defense Advanced Research Projects, ed. *Strategic Computing: New-Generation Computing Technology: A Strategic Plan for its Development and Application to Critical Problems in Defense*. [Washington, D.C.?]: Defense Advanced Research Projects Agency, 1983.

This 69-page document (plus appendices) sets out the Defense Advance Research Project Agency's plan for a new strategic computing initiative. It begins: "As a result of a series of advances in artificial intelligence, computer science, and microelectronics, we stand at the threshold of a new generation of computing technology having unprecedented capabilities. The United States stands to profit greatly both in national security and economic strength by its determination and ability to exploit this new technology." (1) The generation of computers "will exhibit human-like, 'intelligent' capabilities for planning and reasoning," it says. (1) The plan calls for close cooperation between industry, universities, and the military. This documents predicts that the next generation of computing will change warfare in a fundamental way and also have enormous spin-off implications for the civilian sector. The changes under way are analogous "to those resulting from the replacement of the vacuum tube by the transistor, the displacement of discrete transistors by integrated circuits, and the fourth generation displacement of simple integrated circuit technology by VLSI now occurring in the computer and electronics industry." (9)

**1004.** ---, ed. *Strategic Computing: Second Annual Report: New General Computing Technology: A National Strategy for Meeting the National Security Challenge of Advanced Computer Technology*. Feb. 1986. Arlington, VA.

As Director Robert C. Duncan notes in his opening remarks on this Report, the "fundamental goal of the Strategic Computing Program is to advance machine intelligence technologies by emphasizing research in several scientific disciplines. First, the program supports research in advanced computing architectures including concepts that promise to allow thousand fold increases in processing capability using multiprocessors that can process data in parallel streams, thereby improving both speed and flexibility in accomplishing massive computations, both symbolic and numeric. Second, the program emphasizes research in several areas of machine intelligence: advanced expert systems, speech recognition, natural language processing, and computer vision. Third, Strategic Computing includes research in microelectronic devices such as optical interconnects that can reduce the physical interfaces between internal computer hardware, thus avoiding bottlenecks while improving speed. Finally, Strategic Computing builds the elements of infrastructure needed to support research on advanced computing technologies, such as rapid prototyping methods for system development, large-scale emulation facilities, and access to new generation computers as they become available." (1-2) Duncan goes on to say that "An underlying objective of Strategic Computing, as with all DARPA programs, is the advancement of the scientific and technical capability of our universities, national laboratories, and industry." (2)

The Report goes on to say that the "main components of the Strategic Computing Program are Military Applications and a Technology Base consisting of: New Machine Architectures (symbolic and numeric), Generic Software Systems, and Microelectronics. The current Military Applications projects include an Autonomous Land Vehicle (ALV), systems for Naval Fleet Command Center Battle Management (FCCBMP) and for Army AirLand Battle Management (ALBM), a Pilot's Associate system, and a system for Radar/Optical Imagery Analysis. The role of the applications projects is to provide a realistic task environment for technology research. Also, these projects are designed to service as the principal means of demonstrating the emerging technology and of transferring it to military systems and to the industrial base." (3)

**1005.** Agre, Philip E. "Growing a Democratic Culture: John Commons on the Wiring of Civil Society." *Democracy and New Media*. Ed. Henry Jenkins and David Thorburn, eds. Cambridge, MA: MIT Press, 2003. 61-67.

Agre begins by asking if the Internet is a "friend of democracy?" (61) He goes on to write that "by providing a general mechanism for moving digital information and a general platform for constructing digital information utilities, the Internet provides new opportunities for the design of institutional mechanisms; it opens a vast new design space both for technology in the narrow sense and for the institutionalized social relationships within which the Internet is embedded. The Internet also necessitates a renegotiation of institutional rules in a more urgent way by destabilizing the balance of forces to which any successful negotiation gives form; by lending itself to the amplification of some forces and not others, the Internet undermines many of the institutionalized accommodations through which stakeholder groups with distinct interests and powers have gotten along." (63) Barber uses the work of John R. Commons as a context. Barber believes the "central question of democracy in its newly wired

manifestation" is "what is the proper relationship between collective cognition among communities of shared interest and the actual formal mechanisms of the state?" (65)

The volume in which Agre's essay appears is part of a larger series on new media technologies entitled *Media In Transition*. The volume tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. As the editors explain, the "essays in this volume capture something of the complexity and disagreement in current discourse about the politics of cyberspace. Some contributors offer us front-line perspectives on the impact of emerging technologies on politics, journalism, and civic experience. What happens when we reduce the transaction cost for civic participation, or increase access to information, or expand the arena of free speech? Other contributors place our shifting understanding of citizenship in historical context, suggesting that notions of cyberdemocracy and online community must grow out of older models of civic life. Still others expand this conversation to consider the global flow of information and to test our American conceptions of cyberdemocracy against developments in other parts of the world. How, for example, do new media operate in Castro's Cuba, or in post-apartheid South Africa, or in the context of multicultural debates on the Pacific Rim? Some contributors examine specific sites and practices, describing new forms of journalism or community organizing. Some voices here are deeply skeptical; other are optimistic. For some writers the new technologies endanger our political culture; for others, they promise civic renewal.

"Most of the papers on which these chapters are based originated in series of public forums and conferences hosted by MIT from 1998 to 2000 under the title 'Media in Transition.' Funded by the John and Mary R. Markle Foundation and organized by the MIT Communications Forum, these events aimed to nourish a broad civic conversation about the political impact of new media technologies. The essays have been revised for this book." (ix-x)

**1006.** Aitken, Hugh G. "*Allocating the Spectrum: The Origins of Radio Regulation.*" *Technology and Culture* 35 (1994): 686-716.

**1007.** Aitken, Hugh G. J., ed. *The Continuous Wave: Technology and American Radio, 1900-1932*. Princeton: Princeton University Press, 1985.

**1008.** ---, ed. *Syntony and Spark: The Origins of Radio*. New York: Wiley, 1976.

Aitken argues, among other things, that Marconi did not invent wireless telegraphy but rather that William Crookes had conceived Hertzian wave telegraphy in 1892 and that Oliver Lodge had demonstrated it in 1894 before the British Association in its annual meeting at Oxford. See Sungook Hong's article in *Technology and Culture* (Oct. 1994), which argues that Aitken's claim for Lodge is incorrect.

**1009.** Akersten, S. Ingvar. "The Strategic Computing Program." *Arms and Artificial Intelligence: Weapon and Arms Control Applications of Advanced Computing*. Ed. Allan M. Din, ed. New York: Oxford University Press, 1987. 87-99.

This paper grew out of a 1986 workshop sponsored by the Stockholm International Peace Research Institute. This paper gives an overview of the DARPA's strategic computing initiative, based on the original 1983 document outlining the program as well as a subsequent planning document. The original "Strategic Computing" document of October 28, 1983, notes that changes in artificial intelligence, computer science, and microelectronics present "possibilities" that are "quite startling, and suggest that new generation computing could fundamentally change the nature of future conflicts.

"In contrast with previous computers, the new generation will exhibit human-like, 'intelligent' capabilities for planning and reasoning. The computers will also have capabilities that enable direct, natural interactions with their users and their environment as, for example, vision and speech.

"... Our citizens will have machines that are 'capable associates', which can greatly augment each person's ability to perform tasks that require specialized expertise." (90)

**1010.** Albers, Josef, ed. *Interaction of Color*. New Haven and London: Yale University Press, 1963.

The author writes that "in order to use color effectively it is necessary to recognize that color deceives continually. To this end, the beginning is not a study of color systems." (1) Later he says that "both film color and volume color might be considered tricks of nature." (46) And then, "with the discovery that color is the most relative medium in art, and that its greatest excitement lies beyond rules and canons, a more sensitive discrimination was needed. The more a creative use of color developed, the less desirable became a merely trustful and obedient application." (66)

**1011.** Alder, Renada. "The Screen: Zane Grey Meets the Marquis de Sade." *New York Times* Jan. 25, 1968 1968: 33.

This review denounces the violence in Sergio Leone's *The Good, the Bad, and the Ugly* (1966), filmed in Spain and starring Clint Eastwood.

**1012.** Aldgate, Anthony, ed. *Cinema and History: British Newsreels and the Spanish Civil War*. London: Solar Press, 1979.

This study of British newsreels during the Spanish Civil War has information about the technology that cameramen used during the 1930s. By the mid-1930s, for example, the Mitchell and Newman Sinclair cameras from the United States were available on the British market. The camera and sound equipment together had been reduced in size to weigh about 150 pounds, although there were still obstacles to filming. The cameras held only about three minutes of film before they needed to be reloaded. The work also considered technical challenges to recording sound during this period.

**1013.** Alexander, Charles C., ed. *Here the Country Lies: Nationalism and the Arts in Twentieth-Century America*. Bloomington: Indiana University Press, 1980.

A clash of cultures occurred during the late - nineteenth century involving affluent traditionalists who believed great art must be European-inspired and dissident intellectuals who believed that America must produce a distinctive art. This cultural clash produced a rift within the dissidents themselves, who split into factions favoring modernism and romantic nationalism. This rift determined the course of acceptable art for most of the first half of the twentieth century. While the influence of architecture, most forms of music, and nearly all writing was limited to the domestic marketplace, the effect internationally of painters, sculptors, and moviemakers was profound. Images of America and Americans were popular in Europe during the late 1920s through the 1930s. This early popularity became the foundation for American dominance of international art during the immediate years following World War II.

--James Landers

**1014.** Alexander, Jerome. "Professor Troland and Dr. Kunz." *Science* 76 (New Series).1968 (1932): 255.

This brief piece has a paragraph listing "several important papers on the nature of life and life processes" that Leonard Troland wrote.

**1015.** Allali, Jacques Stourdze. "The Birth of the Telephone and Economic Crisis." *The Social Impact of the Telephone*. Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 97-111.

France was leery to embrace the modern technology of the telephone as it threatened the government's control of communication. Allali writes "A world of sequestered communication was fashioned where the fundamental orientation was to seek isolation, to escape as much as possible the dangerous pulsations of the social body. In the ten- year confrontation between the visual and electric telegraphs, conflicts emerged which would reappear at the birth of the telephone. Technical innovation in communication runs counter to already recognized and accepted technologies. To break through with its own new form and constraints, it must enlist the support of social forces which it, in turn, confirms and strengthens." (100-01)

**1016.** Allen, Mike , and Nakashima, Ellen. "Clinton, Gore Hit Hollywood Marketing; Ads Aimed at Kids Could Spur Rules, Industry Is Told." *Washington Post* Sept. 12, 2000 2000, sec. A: 1.

This article is about the Clinton administration's attack on the entertainment industry's calculated effort to market violent movies and video games to young children, some as young as 10 years of age.

**1017.** Allen, Viola. "What It Means to be an Actress." *Ladies' Home Journal* 16.6 (1899): 2.

Viola Allen says that the chief qualities an actress must have "are born with her: she must have health, strength, a good physique, brains, aptitude, imagination, memory and judgment. These aside from a generous share of instinctive talent and a goodly quantity which we call magnetism. Therefore is the true actress born and not made. I have not placed personal beauty in the category of essentials, because it is not an essential, but an undisputed aid. I say this because one need only to go over the list of the greatest actresses to see at once that they were not and are not all beautiful women. Genius always rises above personal beauty, but it must be true genius. And as there is so little of absolute genius in the world, an attractive face becomes an assistance to the actress." The article points out that the "actress has not time for social life."

**1018.** Allport, Gordon W. "[Book Review]." *Journal of Abnormal and Social Psychology* 23 (1928): 510-13.

In this book review of Leonard Troland's *Fundamentals of Human Motivation* (New York: Van Nostrand, 1928), Gordon Allport wrote that Troland's book suggests that "the time is ripe for a recrudescence of hedonism, purified and enriched by a century of discovery, and founded at last on a standard neural physiology." (510)

Allport commented on Troland's theories about sexual motivation. "There is probably no treatment of the psychophysiology of sex motives more complete than Troland's. It is a pity that the argument is widely scattered through the book, instead of gathered into consecutive chapters. It is well worth reprinting as a separate contribution. Characteristic of the author's method, this theory takes its point of departure in Sherringtonian psychology, postulates both the nerve centers and the functions necessary to account for the phenomena observed, and rigorously follows through the consequences of these postulates, until a highly original and quite plausible schema of sexual motivation is complete." (512)

Although Allport challenged some of Troland's ideas, he concluded that the work has a "remarkable richness and strength. Disagreement in this case itself a tribute." (513)

**1019.** Alpert, Hollis. "SR Goes to the Movies: The Film of Social Reality." *Saturday Review* 52 (1969): 43?

During the 1960s, movie makers found technology that gave them greater flexibility and freedom. Zoom lens, hand-held cameras, hidden cameras and microphones all made film makers more mobile and better able to record motion smoothly and capture spontaneity, action, sexuality, and violence in ways that gave movie and TV audiences a greater sense of realism. And the new technology also gave cameramen the "ability to use reality as adjunct," observed critic Hollis Alpert, "as highly convincing background to a film's fictional or imaginative purpose."

**1020.** Alvarado, Manuel, ed., ed. *Video World-Wide: An International Study*. Paris: UNESCO, 1988.

This UNESCO (United Nations Educational, Scientific and Cultural Organization) study, which employed 29 researchers and 39 countries, has valuable information on the spread and use of video technology at the end of the 1980s. It notes that there were then four "video rich" areas: North America, Western Europe, the Arab countries, and Japan and Southeast Asia. Lagging behind in video use were Latin America, Africa, and Eastern Europe.

The study found that the most important use of video technology was time shifting, recording television programs for later viewing. The next two most important uses were to watch non-broadcast material, primarily motion pictures, and to view non-broadcast amateur material such as home movies.

Among the variables in explaining the diffusion of video technology were 1) price; 2) restrictions and taxes imposed by government; 3) the distribution of income (e.g., south of the Sahara, a VCR cost 29 times the minimum annual salary); and the content of broadcast TV.

The study also notes that video had become "an alternative means of mass communication" in many countries. In some instances it was subversive to the prevailing power structure.

Each of this work's twenty-two chapters is devoted to a specific country or region, and has a separate author. (Paul E. Cahill wrote the chapter on the United States and Canada).

The work concludes by suggesting future research on video technology should be directed to several areas: research should focus 1) less on video recorders on more on cameras, editing, and dubbing suites; 2) more on the world-wide flow of pre-recorded videos; 3) more on government policy making relating to video technology; and 4) more on audiences, especially the part played by videos in multi-language societies.

**1021.** America, Film Council of, ed. *Sixty Years of 16mm Film, 1923-1983: A Symposium*. Des Plaines, IL: Film Council of America (Evanston, IL), 1954.

Twenty-three authors contributed to this symposium which was held on the 30<sup>th</sup> anniversary of 16-mm film. The essays discuss the medium's history since its inception in 1923 and speculate about its future in the coming three decades. Paul A. Wagner's (then president of the Film Council of America) Introduction, "What's Past Is Prologue..." gives an overview of 16-mm film and especially how World War II served as a catalyst in the medium's development and acceptance. Wagner provides good information about the increased use of 16-mm film during the war, and especially in the first seven years after the war.

This work is essentially optimistic about 16-mm film and its authors saw a bright possibilities for use in education, public libraries, museums, churches, government agencies, in labor, and theatrical productions. One author likened the functions of 16-mm prints of feature films to paperback books or the recording of classical music on long-playing records.

Although this work appeared in 1954, two years before the first commercially successful video recorder had been demonstrated (and 17 years before the invention of videocassettes), and at the dawn of the transistor's impact on communication, it clearly anticipates the impact of these developments. It predicts that quarter-inch magnetic tape will supplant 16-mm film and that "radical" changes will result. Every television set owner will have "electronic playback," and "since the tape will be lightweight and book-size, and since its cost will be comparable to that of many good books, thousands of retail outlets will handle a large stock." (Wagner)

This work was published by the Film Council of America, a nonprofit educational organization that promoted the use of audio-visual materials in adult education.

**1022.** America, Federal Council of the Churches of Christ in, ed. *The Public Relations of the Motion Picture Industry: A Report by the Department of Research and Education, Federal Council of the Churches of Christ in America*. New York: n.p.

This work discusses public relations tactics used by the MPPDA and Will H. Hays to divide groups critical of the movie industry such as the PTA.

**1023.** America, Motion Picture Association of. [New York?]: Motion Picture Association of America, 1968.

By the late 1960s, American studios made only about five percent of the 3,500 films produced each year worldwide. Television, this report notes, had reached saturation levels in several countries.

**1024.** ---.

This MPPDA/MPAA publication went to schools, libraries, churches, exhibitors, and newspapers. It issued age-appropriate ratings for motion pictures between the 1930s and 1960s.

This is a previously unpublished list of guidelines for the new rating system adopted in November, 1968. It reveals that in the beginning the rating system was to be guided by an abbreviated form of the Production Code on sex, crime, violence, language, and treatment of animals.

**1028.** America, Motion Picture Producers and Distributors of. Production Code Administration Files (1930-1966).

This collection is a major source for any scholar interested in motion picture censorship between 1930 and the late 1960s. The collection contains files on some 20,000 films. Often the files are detailed with letters and memoranda revealing how the Production Code Administration censored movie scripts, line-by-line, scene-by-scene, usually before production began.

**1029.** ---, ed. *Annual Report, Public Relations Department*. ??: Motion Picture Producers and Distributors of America, 1934.

Will H. Hays, president of the Motion Picture Producers and Distributors of America, created a Committee on Public Relations that he later turned into a department. He put Colonel Jason Joy in charge, and in 1927 replaced Joy with the former Maine governor Carl E. Milliken. The department responded to attacks on the industry, tried to engage citizens in making movies more acceptable, and attempted to make "customers out of critics." Public relations could convince skeptics that movie makers were good citizens, well-intentioned, and capable of self regulation, which Hays believed offered the best and perhaps the only realistic way to prevent government intervention. The Public Relations Department gained impressive momentum during its first decade. In the course of a year it routinely gave 15,000 interviews and turned out several times that many letters.

**1030.** American Academy of Child and Adolescent Psychiatry, et al. "Joint Statement on the Impact of Entertainment Violence on Children -- Congressional Public Health Summit (July 26, 2000)". 2000. (July 26, 2000). Feb. 2, 2003. <[http://www.aacap.org/press\\_releases/2000/0726.htm](http://www.aacap.org/press_releases/2000/0726.htm)>.

This joint statement by the American Academy of Child and Adolescent Psychiatry and others points to the potentially damaging social and psychological effects of violence on television and other mass media.

**1031.** American Federation of State, County and Municipal Employees, ed. *Gaining Access to Radio and TV Time: A Union Member's Guide to the Broadcast Media*. Washington, DC: American Federation of State, County and Municipal Employees, 1980.

This guide attempts to show union members how they can use the broadcasting industry to communicate labor messages without having to buy advertising. The authors argue that the Fairness Doctrine and other FCC rules and regulations, such as the "personal attack" rule and the "equal opportunities" rule, give unions an opportunity for access to commercial and public broadcast airwaves. "... For too long, labor has allowed its message to be manipulated by broadcasters who ignore their public responsibilities." This guide contains a brief explanation of public service programming, broadcast news operations, and public broadcasting. It includes sample letters that union members can use to ask or demand to be heard, sample public service announcements for radio and television, and a sample Fairness Doctrine complaint letter to the FCC.

**1033.** Analyzer, EDP. "The Experience of Word Processing." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 232-43.

This article looks at the experiences of those who have used word processors. It uses two case studies to explain how to handle this new technology, and it also is a guide to installing and operating word processors. It appeared originally in the British publication *Data Processing* (May 1978).

**1034.** Anderson, Benedict, ed. *Imagined Communities: Reflections on the Origin and Spread of Nationalism*. London: Verso, 1983.

Parts of this work are interesting in its consideration of nationalism and communication. The author notes (in 1983) that nationalism is far more powerful than ideology (e.g., Marxism or liberalism) and that its origins in the West grow out of the Enlightenment and the eras of the American and French Revolutions in the late eighteenth century. He has interesting things to say about the spread of printing (esp. books, and the newspapers) and the effect on nationalism as well as on conceptions of time. (Here the author draws heavily on a relatively few secondary works such as Febvre and Martin's *The Coming of the Book*). "The nation is imagined as limited because even the largest of them, encompassing perhaps a billion living human beings, has finite, if elastic boundaries....It is imagined as sovereign because the concept was born in an age in which Enlightenment and Revolution were destroying the legitimacy of the divinely-ordained, hierarchical dynastic realm....Finally, it is imagined as a community, because, regardless of the actual inequality and exploitation that may prevail in each, the nation is always conceived as a deep, horizontal comradeship." The latter chapters discuss the rise of nationalism in "Third world" areas as well as patriotism and racism. This often-cited book has been influential among researchers in communications studies.

**1035.** Anderson, Christopher, ed. *HollywoodTV: The Studio System in the Fifties*. Austin: University of Texas Press, 1994.

This book examines the developing relationship between Hollywood studios and television during the 1950s. The work has a good deal to say about the changing technology of both the movie and television industries. It also discusses the status of actors in American society and the role of advertising. Particularly interesting is the author's account of "Lights Jubilee," celebrating the 75th anniversary of the electric light.

**1036.** ---. "Television and Hollywood in the 1940s." *Boom and Bust: The American Cinema in the 1940s*. Ed. Schatz, Thomas. New York: Charles Scribner's Sons, 1997. 422-44.

This chapter dealing with Hollywood and television during the 1940s, appears in Volume 6 of Scribner's *History of American Cinema*, Charles Harpole, ed.

**1037.** Anderson, Craig A. , and Bushman, Brad J. "The Effects of Media Violence on Society." *Science* 30 (2002): 1-2.

This work survey's research showing a causal link between violence in mass media and aggressive behavior on the part of some children.

**1038.** ---. "Effects of Violent Video Games on Aggressive Behavior, Aggressive Cognition, Aggressive Affect, Psychological Arousal, and Prosocial Behavior: A Meta-Analytic Review of the Scientific Literature." *Psychological Science* 12.5 (2001): 353-59.

This article is a meta-analysis of research done on the effects of violent video games. Although video games were relatively new and empirical research on them is not as developed as on television, for example, video games had become a business surpassing motion pictures by 2001.

**1039.** Anderson, Howard A. , Dunn, Linwood G., and Westheimer, John. "Out-of-this-world Special Effects for 'Star Trek'." *American Cinematographer* 48.10 (1967): 714-17.

This article on special effects for the television series "Star Trek," consists of brief pieces by Howard A. Anderson, President of Howard A. Anderson Co.; Linwood G. Dunn, ASC, President of Film Effects of Hollywood, Inc.; and John Westheimer, ASC, President of Westheimer Company.

This article is about Jack Valenti (before he moved to the motion picture industry), and about his admiration for President Lyndon B. Johnson.

**1041.** ---, ed. *The President's Men: White House Assistants of Franklin D. Roosevelt, Harry S Truman, Dwight D. Eisenhower, John F. Kennedy and Lyndon B. Johnson*. Garden City, N. Y.: Doubleday & Company, 1968.

This book has information on Jack Valenti, one-time assistant to President Lyndon B. Johnson. Valenti in 1968 was president of the Motion Picture Association of America.

**1042.** Andrew, Dudley. "The Post-War Struggle for Colour." *The Cinema Apparatus*. Ed. Teresa De Lauretis and Stephen Heath, eds. New York: St. Martin's Press, 1980. 61-75.

Andrew discusses the French effort to develop color films during the post-World War II era. The French resented the American attempt to dominate the French market through Technicolor. Alternatives included Agfacolor, but "at the close of the war Technicolor was able to dominate the market largely because Agfa fell with the Third Reich.... While France did indeed avoid an American takeover in color, adopting the Belgian Geva system after the failure of its two most promising indigenous methods, this should not be seen as the victory of vision and intelligence over crass American money.... The French situation did not fully deteriorate until 1956 when cinema admissions began dropping enormously due to the impact of television and other leisure time alternatives."

This paper, delivered at a conference at UW-Milwaukee in February, 1978, has good information about Germany and the development of color film (e.g., on Agfa scientists), and changes in Technicolor: "... a momentous change had occurred in the color world. Technicolor abandoned its cumbersome camera, and entered into a pact with the Eastman Kodak Company. From 1953 on, Technicolor would process only Eastman Color negative stock using its peerless imbibition process."

**1043.** Andreyev, Leonid. "Andreyev on Motion Pictures." *New York Times* Oct. 19, 1919 1919, sec. XX: 5.

This article by Leonid Andreyev, the Russian novelist and dramatist, was originally published in the *Almanac Shipobnik* of Petrograd in 1912. The excerpts from that piece which appear in the *New York Times* were translated by the Russian actor Manart Kippen.

Andreyev begins by discussing the skepticism many intellectuals had about cinema, or as he says, "living photography." They tended to view it as akin to such entertainments as the skating rink. Andreyev says that many writers and artists considered early cinema to be "An artistic Apache, and aesthetic Hooligan, a free and grabbing arrival on the wheel of true art...."

Andreyev believed that cinema would "free the theatre from ... unnecessary and useless things," and that future cinema would become increasingly powerful and influential. He writes: "The cinema will be a mirror the size of the screen, but not a mirror which will reflect you. What is the nature of this? Technique? No, for the mirror is not technique: the mirror is life reflected a second time. Will this be lifeless? No, because what is reflected in the mirror is neither lifeless nor living: it is a secondary life, an existence of a vision or hallucination. Here the curtain is raised, the fourth wall seems to [fail? fall?], and a thirty-five foot opening as if in a colossal window, appear living pictures of the world. Clouds pass across the sky, grain fields wave and the sultry distance swoons." Cinema is much more effective than the theater in showing action, spectacle, and settings. "In addition to the decoration it can also give realistic effects which are not in the power of the theatre. The cinema has the advantage, commanding the entire extent of the world capable of many instantaneous reincarnations, a master about when it pleases to bring into action thousands of people, automobiles, aeroplanes, mountains and seas incontestable and clear." Andreyev says that "No matter where the action takes place, whatever extraordinary forms it assumes, the cinema will reach out and get it for the magic screen." The movie camera captures "everything except the spoken word." "Only one thing it cannot give -- speech. Here is the end of its power, the boundary of its might."

Movies also could revive the dead. "Do you wish to see those who have died? They humbly appear, look, smile, and, you having passed through the same door, they now sit at table with you."

Clearly Andreyev believed cinema would change thinking, although he writes that "I am not going to speak here of what revolution in psychology at the very beginning of thought the motion picture of the future will bring about." Andreyev thought cinema was an international language and comparable to the airplane, telegraph, and telephone. "Wonderful Moving Picture! If the highest and holy purpose of art is to create intercourse among peoples and their similar souls, then what a tremendous unimaginable, socio-psychological task is this modern Apache destined to perform. And alongside it, of the same staff, is navigation of the air, the telegraph, the telephone. Portable, placed in a box, films are sent by post all over the world like an ordinary newspaper. Having no language, understood equally by savages of Petrograd or Calcutta, they become indeed the genius of international intercourse, make nearer the ends of the earth and the borders of souls. They sweep within one fast current all pulsating humanity."

**1044.** Angelo, Emedio. "'Dante's Inferno' As(?) Experimental Film Project in 16mm Color." *American Cinematographer* 45.1 (1964): 24-25, 51-52.

The author discusses his efforts to bring Dante's classic to the screen "with a surrealistic underscoring in the art work" using 16mm color film. Describing his efforts as a "labor of love" (25) He saw the motion picture as a way of extending the work of traditional artists, to communicate their "emotions and ideas..... Motion pictures are

equivalent to a series of canvases. When projected they represent the artist as truly as though his work hung on a gallery wall." (52)

**1045.** Angus, Ian. "Orality in the Twilight of Humanism: A Critique of the Communication Theory of Harold Innis." *Continuum: The Australian Journal of Media & Culture* 7.1 (1993): 16-42.

The author writes that Innis's work, "in perpetual tension between ... two locations -- Canada and 'the West' -- begins to clear a space for a post-colonial reformation of thought through a theory of communication."

**1046.** Angus, Ian and Brian Shoesmith, eds. "Dependency/Space/Policy: A Dialogue With Harold A. Innis." *Continuum: The Australian Journal of Media & Culture* 7.1 (1993).

This issue is devoted to the work of Canadian historian and political economist, Harold A. Innis. There are several articles that deal with Innis' work as well as an excerpt from Innis's unpublished "History of Communication" that deals with printing in China during the nineteenth and twentieth centuries.

Essays include the editors Introduction; Ian Angus, "Orality in the Twilight of Humanism: A Critique of the Communication Theory of Harold Innis"; Roman Onufrijchuk, "Introducing Innis: McLuhan Concluding: The Innis in McLuhan's 'System'"; Alison Beale, "Harold Innis and Canadian Cultural Policy in the 1940s"; Paul Heyer, "Empire, History, and Communications Viewed from the Margins: The Legacies of Gordon Childe and Harold Innis"; Hart Cohen, "Margins at the Centre: The Application of Innis' Concept of Bias to the Development of Aboriginal Media"; Brian Shoesmith, "An Introduction to Innis' 'History of Communication'"; Harold A. Innis, "Printing in China in the 19th and 20th Century"; Sut Jhally, "Communications and the Materialist Conception of History: Marx, Innis and Technology."

**1047.** Ansen, David. "Raw Carnage or Revelation? The Overkilling Fields." *Newsweek* (1994): 54.

This article discusses violence in such movies as Oliver Stone's *Natural Born Killers* (1994), the NC-17 rating, and the adequacy of the motion picture rating system.

**1048.** APEX. "A Trade Union Strategy for the New Technology." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 374-90.

This statement comes from a pamphlet entitled *Office Technology: The Trade Union Response*, issued in March, 1979 by the Association of Professional, Executive, Clerical and Computer Staff, a British office workers union. The pamphlet gives a good account of how word processing has influenced jobs -- their content, design, skills needed, and threats to health. It outlines union strategy in the event of likely unemployment.

**1049.** Appelbaum, Stanley, and Richard Kelley, eds., ed. *Great Drawings and Illustrations from Punch, 1841-1901*. New York: Dover Publications, 1981.

One of the interesting illustrations is a picture from *Punch* in 1879 of "Edison's Telephonoscope" which was to have transmitted "light as well as sound." It is an early vision of home entertainment.

**1050.** Arar, Yardena. "Movie-Ratings Boss Says System Works." *Plain Dealer [Cleveland]* Nov. 25, 1993 1993: 3L.

This article relates Jack Valenti's defense of the movie rating system, then under heavy criticism from critics. Valenti notes that about a third of the 225 most recent appeals of movie rating have been changed. He also admitted that they rating might be harsher on sex than on violence. "We've been unable to define what is too much violence, any more than the Supreme Court has been able to define, to this hour, what is pornography," he said. "The definition of violence is gauzy and very shadowy. It's almost like trying to pick up mercury with a fork."

**1051.** Arata, Luis O. "Reflections on Interactivity." *Rethinking Media Change: The Aesthetics of Transition*. Ed. David Thorburn and Henry Jenkins, eds. Cambridge, MA: MIT Press, 2003. 217-25.

The author says that "the sense of interactivity that dominates the digital media stretches as far back as we care to look into the roots of human creation." (217)

Arata's essay is one of twenty-two chapters by different authors that attempt to improve our "understanding of emerging communication technologies." This volume, which part of a larger series on new media technologies entitled *Media In Transition*, tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. The editors of this volume describe the chapters in this work as follows: "Challenging the assumption that new technologies displace older systems with decisive suddenness and have a revolutionary impact on society, the essays in this book see media change as an accretive, graduate process, always a mix of tradition and innovation, in which emerging and established systems interact, shift, and collude with one another.

**1052.** Archer, William. "The New Drama and the New Theater." *McClure's Magazine* 34.1 (1909): 3-16.

This article seeks to refute critics who argue that the modern theater is decadent. The author explains his intent: "This is the endeavor I am about to make with regard to the dramatic movement of our time. That there has been a marked movement during the past twenty-five years in the Anglo-American drama it is impossible to doubt. In the following pages I shall briefly trace its history: for the moment, it may be sufficient to point to the most recent phase of the movement -- the number of more or less idealistic enterprises which are maturing or have lately matured on both side of the Atlantic...." (3)

The author argues that drama is "not decadent." (4) Archer asks "Is this idealistic impulse an attempt to rescue the drama from a state of abject and intolerable decline? or is it merely the latest manifestation of a general and decisive advance? I myself, without any shadow of hesitation, hold the latter opinion; but the former is, if not the more common view, at least the view of a not insignificant minority. We constantly hear talk of the decadence of the drama, and lamentations over its by-gone glories. Let us see if we can find any reasonable grounds for this frame of mind. Let us try to discover what it really means." (4) Archer discusses "The Reign of Scribe, and the Ibsen Revolution," (7-9), "The Free Theaters" (9), "Ibsen and Nationalism" (9-10), "Two Wave of Progress" (10-11), "The Stage Society" (11-12), "London, Dublin, and Manchester" (12-13), "The Nineteenth Century in America" (13-14), "1899 and 1907 -- A Contrast" (14-15), "From James Herne to Donald Robertson" (15), and "The New Theater" (15-16).

**1053.** Argüelles, José A., ed. *The Transformative Vision: Reflections on the Nature and History of Human Expression*. Berkeley & London: Shambhala, 1975.

Chapter 11, "Drawing with Light: Photography, Reality, and Dream," and chapter 13, "Revolution of the Eye, Revolution of the Mind," make perceptive observations about the influence and nature of photography. The author writes: "Photography is one of those technical devices which has so drastically altered our senses and upon which we have developed such a profound dependence that it is difficult, indeed impossible, for us to think about it with any degree of detachment. Nothing yet invented, save perhaps the tape recording, offers such a convincing 'proof' of what we consider to be real; and conversely, nothing is likely to be considered real unless it can be photographed. Photography makes the philosophy of materialism a closed case...."

"The true culmination of the mechanistic mode of visual perception and mental ordering was the perfection of *drawing with light*, the literal meaning of photography. In a vital respect, the tradition of Western painting after the Renaissance is the prehistory of photography...."

Before photography, the length of time needed to complete a painting ensured that "the narrative mode predominated in the visual arts as well as in other cultural areas; history painting was flanked by grand opera and

the novel," Argüelles writes. "With the rise of photography, however, history painting lost its significance, for photography's instantaneous technique plunged the European consciousness of reality into the immediate present. With the displacement of history painting, the entire edifice of academic culture came crashing down. The history painting produced by the residual academicism of the late nineteenth century appears bombastically contrived, a stage set that could be salvaged and redeemed only by the aesthetics of Hollywood cinema."

**1054.** Armstrong, David, ed. *A Trumpet to Arms: Alternative Media in America*. Los Angeles: J. P. Tarcher, Inc., 1981.

This book offers one of the best accounts of the underground or alternative media during the 1960s and 1970s. In chapter 2, "Rise of the Underground Press," Armstrong discusses the impact of offset printing that made it possible to publish newspaper at a greatly reduced cost. For those interested in other developments related to new technologies, chapter 3, "The New Media Environment," is particularly good. There Armstrong discusses the impact of 16mm films and videotape. "Video activists believed strongly in the power of the new technology to create a video democracy," he writes. (72) He also covers the use of color in the underground press (e.g., by such underground papers as the *San Francisco Oracle*) and the use of radio.

**1055.** Armstrong, Richard, ed. *The Next Hurrah: The Communications Revolution in American Politics*. New York: Beech Tree Books, William Morrow, 1988.

Armstrong attempts to assess the impact of new media technologies on American politics during the 1980s. "What is really 'new' about political television in the 1980s," he writes, "was that it was cheaper, more plentiful, and much more immediate than it had ever been before. These effects were the direct result of new video production technologies [especially videotape], new distribution technologies, new technologies in the generation of 'free media,' new technologies in media buying, and new technologies in polling -- all of which combined to make campaigns seem more 'negative' but that actually made them more 'reactive.'" Armstrong believes that during the 1980s, "the press was not just being manipulated, it was actually being *supplanted*."

Armstrong deals with several means of communication -- direct mailings, computers, cable television, satellites, telemarketing, and other so-called "new electronic media" -- and how they intersect with American politics. The book is divided into two sections. The first has four chapters on Direct Mail. The second, entitled "The New Technologies," has five chapters dealing with telemarketing, cable TV, satellites, computers, and telecommunications and its new electronic media.

**1056.** Arnold, Erik and Ken Guy, ed. *Parallel Convergence: National Strategies in Information Technology*. Westport, CT: Quorum Books, 1986.

This book surveys how nine countries and one supra-national grouping have attempted to build national strategies for using information technology (IT) -- defined as "the *convergence* of computing and communications technologies." Chapter 3 deals with the United States. Subsequent chapters treat Japan, the European Economic Community, the United Kingdom, France and Germany, and four smaller countries -- Belgium, Canada, The Netherlands, and Switzerland. The work discusses artificial intelligence, supercomputing, the strategic computing initiative, research and development, and other topics relating to national defense.

**1057.** Aronson, Sidney H. "Bell's Electric Toy: What's the Use? The Sociology of Early Telephone Usage." *The Social Impact of the Telephone*. Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 15-39.

This essay is based largely on published sources. The author writes that "Alexander Graham Bell gave up his idea of the telephone as a commercial medium of entertainment and enlightenment when he solved the problem of reciprocal communication over distances, but the concept developed just the same and in a number of ways. In many communities the first to transmit news were not professional reporters or broadcasters but the telephone operators themselves. It is likely that in the role of informal broadcasters, operators illustrated the possibilities of

the telephone. By the time increased telephone traffic made it impossible for them to continue that service, it was relatively easy for the enterprising to see the direction that a new medium might take."

**1058.** Ashworth, William B., Jr. "Iconography of a New Physics." *History and Technology* 4.2 (1987): 267-97.

The author asks if there was "a pictorial accompaniment to the scientific revolution" of the seventeenth century. He observes that "the visual side of seventeenth-century was not confined to text illustrations. There was also widespread use of visual symbolism -- allegories, emblems, personifications -- found primarily on elaborate engraved title pages." Ashworth focuses on physics and develops several themes. First, it was "apparent that seventeenth-century physics -- at least the physics of moving or standing bodies -- was without a doubt the science with the least and poorest illustrations, and it is in strong contrast ... with cosmology, optics, pneumatics, magnetism, and even mathematics." Second, he notes that "some images that seem significant to us today were almost totally ignored in the seventeenth century." Subjects that were illustrated included "the discovery of parabolic trajectories, and the problem of free fall from a tower."

**1059.** Asman, Edwin, ed. *The Telegraph and the Telephone: Their Development and Role in the Economic History of the United States: The First Century, 1844-1944*. n. p.: n. p., 1980.

**1060.** Aspray, William. "The History of Computing Within the History of Information Technology." *History and Technology* 11.1 (1994): 7-19.

This article gives "an historiographic overview ... of the field of history of computing" framed around such categories as "components, hardware units, systems, and software," recognizing that such organization "naturally leads to a greater concentration on the technical rather than the social history of information technology." Aspray suggests additional topics that he believes deserve more study: e.g., "theory of computing, algorithm design, data structures, artificial intelligence, robotics, computer graphics, and information and control theory, together with a number of other topics taught in our graduate and increasingly in our undergraduate computer science curricula." He argues that "the most general trend in the historiography of computing is the preponderance of attention to the 'producer' (supply side) as opposed to the 'consumer' (demand side). I cannot think of a single major historical study on consumers," he writes.

This article appears in a special issue of *History and Technology* devoted to "Information Technologies and Socio-Technical Systems." Other authors include **Daniel R. Headrick, Alan Q. Morton, Hans Dieter Hellige, and James S. Small.**

**1061.** Assessment, Office of Technology, ed. *Advanced Network Technology: Background Paper*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

This 79-page background paper, published in June, 1993, "analyzes technologies for tomorrow's information superhighways. Advanced networks will first be used to support scientists in their work, linking researchers to supercomputers, databases, and scientific instruments. As the new networks are deployed more widely, they will be used by a broader range of users for business, entertainment, health care, and education applications.

"The background paper also describes six test networks that are being funded as part of the High Performance Computing and Communications Program. These test networks are a collaboration of government, industry, and academia, and allow researchers to try new approaches to network design and to attack a variety of research questions. Significant progress has been made in the development of technologies that will help achieve the goals of the High-Performance Computing Act of 1991."

This is the third background paper on this topic. Earlier papers included *High Performance Computing & Networking for Science* (1989), and *Seeking Solutions: High-Performance Computing for Science* (1991).

Chapter 2 deals with "The Internet." Chapter 3 is on "Broadband Network Technology." Chapter 4 deals with "Gigabit Research." Chapter 5 is "Application of Testbed Research."

**1062.** ---, ed. *Annual Report to Congress: Fiscal Year 1990*. Washington, D. C.: [U. S. Congress, Office of Technology Assessment], 1991.

This 41-page report contains the names of advisory panels and OTA members. It lists the previous year's publications but does not summarize them as had been the case with some earlier Annual Reports.

**1063.** ---, ed. *Annual Report to the Congress by the Office of Technology Assessment (March 15, 1975)*. Washington, D. C.: U. S. Government Printing Office, 1975.

This Report has a brief opening statement by OTA Director Emilio Q. Daddario about the history and goals of the OTA. The Report then discusses the "Organization and Operations" of the OTA. It is interesting as a source for the names of members of OTA's advisory panels (e.g., Ithiel DeSola Pool).

**1064.** ---, ed. *Annual Report to the Congress: Fiscal Year 1985*. Washington, D. C.: U. S. Congress, Office of Technology Assessment, 1986.

This Report summarizes recent studies including "New Electric Power Technologies," "Strategic Materials: Technologies to Reduce U. S. Import Vulnerability," "Information Technology R & D: Critical Trends and Issues," and "Civilian Space Stations and the U. S. Future in Space." It also contains the names of OTA committees and their members.

**1065.** ---, ed. *Annual Report to the Congress: Fiscal Year 1987*. Washington, D. C.: U. S. Congress, Office of Technology Assessment, 1988.

This Report contains an organizational roster of OTA staff members through September, 1987. It summarizes recent reports on biotechnology, "Commercial Newsgathering from Space," and "The Electronic Supervisor: New Technology, New Tensions."

**1066.** ---, ed. *Annual Report to the Congress: Fiscal Year 1988*. Washington, D. C.: U. S. Congress, Office of Technology Assessment, 1988.

This report summarizes studies the OTA conducted during the year including ones on book preservation technologies, "Advanced Materials by Design: New Structural Materials Technologies," "Power On! New Tools for Teaching and Learning" (e.g., computers), "Copper: Technology and Competitiveness," "Science, Technology, and the First Amendment," genetic research and biotechnology, and more. This Annual Report also gives organizational charts and the names of various committees and their members who specialized in different areas of technology.

**1067.** ---, ed. *The Big Picture: HDTV & High-Resolution Systems: Background Paper*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1990.

This publication, which appeared in June, 1990, is good not only as an introduction to high definition television (HDTV), but also to the United States' electronic communication infrastructure in 1990. As John H. Gibbons (OTA director) writes in his "Foreword":

"Television technology is now on the threshold of a new evolution. We are on the verge of combining digital-based computer technology with television. This technological marriage promises to produce offspring that can deliver movie-quality, wide-screen programs to our homes with stereo sound equivalent to the best compact

disks. Its importance goes well beyond home entertainment, however. High-definition television -- HDTV as it is called -- is linked with many other basic technologies important to the United States. The impacts of the development of HDTV will ripple through the U.S. economy: It will make us confront such issues as public policy dealing with manufacturing, educational and training standardization, communications, civil and military command and control, structural economic problems, and relationships between government and business."

Chapter 3 deals with "Communication Technologies" and notes that following: "The U.S. electronic communication infrastructure is a mixture of five media: 1) terrestrial radio frequency transmissions; 2) satellite radio frequency transmissions; 3) paired copper wires; 4) coaxial cables; and 5) optical fibers." This chapters devotes a section to each of these media.

**1068.** ---, ed. *Biotechnology in a Global Economy*. Washington, D.C.: Congress of the United States, Office of Technology Assessment, 1991.

This 283- page report seeks to identify how biotechnology was being applied and its potential uses in sixteen nations (Australia, Brazil, Canada, Denmark, Federal Republic of Germany, France, Ireland, Japan, The Netherlands, Singapore, South Korea, Sweden, Switzerland, Taiwan, United Kingdom, and the United States). It notes that since the early 1970s when recombinant DNA technology was discovered, many researchers and new industrial firms have found biotechnology to be a powerful tool. The report examines how these nations supported and regulated biotechnology's commercial uses, and also how they encouraged innovation. The report discusses biotechnology's impact in a number of industries including agriculture, chemicals, hazardous waste clean up, and pharmaceuticals.

**1069.** ---, ed. *Civilian Satellite Remote Sensing: A Strategic Approach*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1994.

With index, this report runs 166 pages. It predicts that during the next two decades, observing the earth from space will play an ever great role in predicting the weather, understanding global changes, and managing the earth's resources. How the United States government responds to increasing interest in satellite remote sensing could have a great influence on how global resources are used and managed. This report "analyzes the case for developing a long-term, comprehensive strategic plan for civilian satellite remote sensing, and explores the elements of such a plan, if it were adopted." The report also suggests what Congress needs to do in this area.

**1070.** ---, ed. *Commercial Newsgathering from Space: A Technical Memorandum*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1987.

News organizations, this 51-page report notes, are increasingly using satellite imagery in their reports on world events, leading some to conclude that the news media will soon what to own and operate their own remote sensing systems. News media "have generally supported the idea of a dedicated 'mediasat' because it could supply a stream of timely and critical information, peering where repressive governments or dangerous natural environments have heretofore kept the press at bay." But the mediasat also has raised concerns that this technology could pose national security problems, make the conduct of U. S. foreign policy more complicated, and "erode the average citizen's expectation of personal privacy."

This report concludes that the current high cost and low demand will limit efforts of news organizations to own their own remote sensing satellite systems dedicated solely to newsgathering. Yet the use of remote sensing will continue and is likely to pose conflicts between First Amendment rights and national security concerns. Such conflicts are manageable but some remote sensing systems are only indirectly affected by American law and will require international negotiations.

**1071.** ---, ed. *Commercializing High-Temperature Superconductivity*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1988.

This 171-page report notes that "less than two years ago, superconductivity -- total loss of resistance to electricity -- could be achieved only at temperatures near absolute zero. Since the discovery of high-temperature superconductivity (HTS), research laboratories around the world have pushed the temperature limits steadily upward, opening the way to commercial applications with potentially revolutionary impacts. The scientific race is becoming a commercial race, one featuring U. S. and Japanese companies, and one that the United States could lose. Indeed, American firms may already be falling behind in commercializing the technology of superconductivity."

The report says that Japan has been more aggressive in exploring the commercial possibilities of HTS than has the United States. Although Federal money would help the private sector compete, there is little tradition of such support in the U. S. In the U. S., post-World War II technology policy combined Federal funding for research and development with indirect measures such as tax policy. Such measures may not keep the U. S. competitive in the future.

**1072.** ---, ed. *Communications and Rural America: Recommendations to the U.S. Congress and the Executive: Report of OTA Conference, Washington, D.C., November 15-17, 1976.* [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1977.

**1073.** ---, ed. *Computer Software & Intellectual Property: Background Paper.* [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1990.

This report notes that computer software has grown to become a \$60 billion per year domestic industry (as of 1990), and that the United States dominates the world market in this area, far surpassing Japan, Western Europe, and the USSR. This paper analyzes the intellectual property protections then in existence (1990) for computer software, including such things as trade secret, patents, and copyrights. It also examines the concerns that have been raised about protecting such intellectual property.

**1074.** ---, ed. *Computer-Based National Information Systems: Technology and Public Policy Issues.* [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1981.

This report has several goals: 1) To give the nonexpert an introduction to America's computer-based national information systems. 2) To give a framework for better understanding of computer and information policy issues. 3) To give readers an idea of the state-of-the-art in computers and information technologies. 4) To build a foundation for understanding subsequent OTA studies on e-mail, electronic transfer of funds, and the computerization of criminal history records. The report indicated that "evolving computer-based systems are crossing over and blurring traditional regulatory boundaries."

**1075.** ---, ed. *Copyright & Home Copying: Technology Challenges the Law.* [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1989.

This 293-page report notes that modern consumer electronics give the average person the ability "to make very good copies of recorded music, television shows, movies, and other copyrighted works for private use at home. Soon, as digital recording equipment comes into widespread use, homemade copies will not just be very good -- they can be perfect reproductions of the originals. Home copying is becoming much more common; for instance, the proportion of people who make home audiotapes has doubled in the last 10 years. Copyright owners are concerned, and claim that home copying displaces sales and undermines the economic viability of their industries. They fear that the ability to make perfect copies will increase home copying even more."

This report begins by examining home recording technologies. Then it focuses primarily on audiotaping and home copying's ambiguous legal status. It tries to measure the economic impact of home recording on the recording industries and weigh that against the undesirable effects of restrictions on home copying. It presents a

range of recommendation to Congress for action. The report includes a 1988 survey conducted by the OTA of 1,500 people who engaged in home copying.

**1076.** ---, ed. *Critical Connections: Communication for the Future*. [Washington, D.C.]: U.S. Congress, Office of Technology Assessment, 1990.

The opening chapter, which summarizes this 395-page report, offers a good account of the many problems and issues involved in America's changing communication infrastructure. "As information is treated more and more as a commodity to be bought and sold in the marketplace, the traditional political gatekeepers -- including political parties, the traditional press, and government agencies -- are being replaced by new kinds of political gatekeepers, such as political consultants, media consultants, private sector vendors, and international newscasters. Whereas the traditional gatekeepers are governed by political rules and norms, the new gatekeepers are guided to a greater extent by market criteria. **Where markets dominate the allocation of communication resources -- such as information, a speaking platform, or access to an audience -- political access may become increasingly dependent on the ability to pay. Thus, the economic divisions among individuals and groups may be superimposed on the political arena.**" (emphasis in original).

"OTA found that **changes in the U.S. communication infrastructure are likely to broaden the gap between those who can access communication services and use information strategically and those who cannot....**" (emphasis in original)

Chapters are devoted to communication and: business, the democratic process, production of culture, and the individual.

**1077.** ---, ed. *Critical Connections: Communication for the Future: Volume II: Contractor Documents*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1990.

See Volume I for a summary of this study.

**1078.** ---, ed. *Data Format Standards for Civilian Remote Sensing Satellites: Background Paper*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1992.

This report grew from a request by the U. S. Senate Armed Services Committee to investigate the many formats used for collecting remotely sensed Earth data. The pros and cons of standardizing formats for remote-sensed data were discussed at a workshop held Oct. 2, 1992.

This report outlines the problem as follows: "Earth data -- positional, topographic, climatological, meteorological, man-made features, and changes over time in all of these -- are increasingly important to the military. They form the heart of navigation, intelligence, combat formation, situational awareness, weapon guidance, damage assessment, and training systems. Analysis indicates that great advantages may accrue from being able to integrate these functions. However, being able to do that integration in a routine and efficient way will require either generating databases in one format (or a very few compatible formats) or developing equipment to convert quickly and routinely among various formats. Today, neither of these conditions exists. Data exist (and are gathered) in a variety of diverse formats. This is the natural consequence of a situation in which -- in the absence of a central plan for integrating collectors, processors, and users -- format commonality has not been a major design factor. The format for any one system is usually chosen to meet the specific needs of that system and is driven by the technology available at the time it is created. Often the factors that dictate format are compelling (e.g., continuity of data provided to long-standing clients, or optimization of satellite power budget). In many cases, altering format would necessitate costly, extensive changes in hardware and software systems. Finally, setting standards is difficult when technology moves quickly, and is particularly hampered by the notoriously cumbersome MILSPEC process."

**1079.** ---, ed. *The Defense Technology Base: Introduction & Overview: A Special Report of OTA's Assessment on Maintaining the Defense Technology Base.* [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1988.

This 113-page report grew out of Reagan administration and congressional concerns that the United States' technological lead over the USSR has been slipping and that it was "increasingly difficult to maintain a meaningful lead." The report focuses on the health of the Department of Defense's defense technology base programs and facilities. It notes that the DoD is being reorganized under the Goldwater-Nichols Reorganization Act (Public Law 99-433). The report reflects matters up to Feb. 1, 1988. The report sets out several complex factors on which American defense technology depends -- all this with little inkling that the USSR was on the verge of collapse.

**1080.** ---, ed. *Effects of Information Technology on Financial Services Systems.* [Washington, D. C.]: United States Congress, Office of Technology Assessment.

This 282-page report says that the "effects of technology on the internal operations, the structure and the types of services offered by the financial service industry has been profound. Technology has been and continues to be both a motivator and a facilitator of change in the financial service industry. The structure of the industry has changed significantly in recent years as firms not traditionally viewed as financial service providers have taken advantage of opportunities created by technology to enter the market. New technology -based services have emerged. These changes are the result of the interaction of technology with other forces such as overall economic conditions, societal pressures, and the legal/regulatory environment in which the financial service industry operates."

The report divides the financial service industry into three segments: retail, securities, and wholesale. It describes technologies now available and what is likely to be available in the near future. The report attempts to analyze the structure of the financial service industry.

**1081.** ---, ed. *Electric Power Wheeling and Dealing: Technological Considerations for Increasing Competition.* [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1989.

This 265-page report, written in response to the U.S. House Committee on Energy and Commerce, evaluates "the technical feasibility of increased competition in the electric utility industry." Here the OTA analyzes "the impact of increased wheeling on the reliability and operation of the transmission systems. Wheeling is the use of a utility's transmission facilities to transmit power for other buyers and sellers." Competition, it was hoped, would lower costs, encourage innovations, and bring about new business opportunities. The OTA notes that the electric power system in the United States is very complex and that the introduction of increased competition needs to be done carefully. The report tries to identify technical requirements needed to keep the system working efficiently.

**1082.** ---, ed. *Electronic Enterprises: Looking to the Future.* [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1994.

This report examines electronic commerce and attempts to explain the kind of infrastructure needed to support it. It concluded that "in an electronically networked economy, the design and underlying architecture of the global information infrastructure will have a major impact on national economic growth and development." To maximize American business performance, "the information infrastructure will need to be flexible and open, seamless and interoperable, and evenly and ubiquitously employed." The report discusses strategy that will promote this network architecture. Electronic commerce will not operate in a vacuum as social factors must be taken into consideration. Congress must develop a national infrastructure policy.

**1083.** ---, ed. *Electronic Record Systems and Individual Privacy: Federal Government Information Technology.* [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1986.

This report suggests several possible policy actions for congressional consideration. These include establishing control over Federal agency use of computers in collection personal information; tighter controls over medical and insurance data pertaining to citizens; stronger controls over privacy, confidentiality, and security of personal information within the micro-computer environment of the Federal government; a review of issues concerning use of the social security number as a "*de facto* national identifier"; and review of access to Internal Revenue Service's data bases by Federal and state agencies.

**1084.** ---, ed. *The Electronic Supervisor: New Technology, New Tensions*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1987.

The 141-page report examines how computer-based technologies are being used to measure the productivity of workers. These new technologies give employers new ways of supervising their employees and controlling their use of telephones. But they also enable employers to gather detailed information about those in their employ. This report looks at this technology's impact on the workplace, civil liberties, and privacy. After an introductory chapter, subsequent chapters are entitled "Using Computers to Monitor Office Work"; and "Telephone Call Accounting"; "Electronic Work Monitoring Law and Policy Consideration." Appendix A deals with "Notes on Computer Work Monitoring in Other Countries." Appendix B is "Privacy and Civil Liberties Implications of Testing Employees in the Workplace."

**1085.** ---, ed. *Electronic Surveillance and Civil Liberties: Federal Government Information Technology*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1985.

This 72-page publication, which appeared in October, 1985, gives a good overview of the problems posed to civil liberties by electronic surveillance during the mid-1980s. The first two chapters offer a summary, introduction, and overview of the issues. Chapter 3 is on "Telephone Surveillance." Chapter 4 covers "Electronic Mail Surveillance." The last chapter is "Other Surveillance Issues," and examines "Electronic Physical Surveillance," "Electronic Visual Surveillance," and "Data Base Surveillance." --SV

This report, prepared by the U.S. Office of Technology Assessment in 1985, was written to inform Congress of the state of electronic communications technology and the laws regarding surveillance and civil liberties. In the mid-1980s, electronic communications technologies were developing quickly, as were the means of intercepting and monitoring them. In addition, new developments in cameras, fiber optics, computer database linkage and remote sensing were being introduced to law enforcement agencies at a rapid pace. One part of this report detailed the various new methods of surveillance, both at the time the report was prepared and, speculatively, in the future. The report also detailed the federal laws that were on the books in the mid-1980s and were related to electronic surveillance and civil liberties concerns. The report concluded that new technology had out paced the law, and that no clear principles or practical guidelines were available to address the issues that would be raised by continued use of these technologies. The report also suggested various courses of action that Congress might take to address these gaps in the law.

The report is divided into sections on several kinds of new technology. These include telephone surveillance, electronic mail surveillance, new methods of secret audio and video recording, and computer database-related methods of tracking activity and behavior. The report described the technical possibilities and outlined the extent to which federal and state officials were already using them. Of particular interest is the discussion of the framework of privacy and search and seizure laws. At the time, the most current laws on these issues dated from 1968 and related only to older technologies such as hidden microphones, telephone and telegraph line interception and visual surveillance by police or government agents.

The report is interesting for several reasons. First, it is a useful guide for understanding how electronic communications can, and are, monitored. Most of the technologies discussed in this report, such as cellular

phones, pagers, e-mail and computer database tracking, are in wide use today. We can assume that as the technologies have advanced, so have the methods of monitoring them. In fact, the current debates about Internet privacy and personal profiling by web databases shows that these issues are still a concern. The report is also interesting in that it shows a great sense of concern for privacy and civil liberties. Clearly, the authors were afraid that new technology might lead to abuse, and that there would be no clearly defined legal framework to limit surveillance. It would be interesting to study the course of subsequent action taken by Congress in response to the report. One of the policy choices that the report outlined was to do nothing, and instead wait and see how the technology developed before creating legislation.

--Rob Rabe

**1086.** ---, ed. *Electronic Surveillance in a Digital Age*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1995.

This report notes that electronic surveillance will be a valuable tool in fighting terrorism and crime in the 21st century. "Digital communications technology has recently out paced the ability of the law enforcement agencies to implement court authorized wiretaps easily and effectively. To address this problem, the 103d Congress enacted [Oct. 1994] the Communications Assistance for Law Enforcement Act (P.L. 103-414). This Act invokes the assistance of the telecommunications industry to provide technological solutions for accessing call information and call content for law enforcement agencies when legally authorized to do so." This report assesses the technical aspects of implementing this legislation.

**1087.** ---, ed. *The Feasibility And Value Of Broadband Communications In Rural Areas*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1976.

One of the Office of Technology Assessment's earliest assessments of communication technology, this regarding the use of broadband communication in rural areas.

**1088.** ---, ed. *Federal Funding for Artificial Intelligence Research and Development: Staff Paper*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1987.

This report was the fourth in a series of OTA studies on research and development. Earlier reports included *Information Technology R & D* (1985), *Microelectronics* (1986), and *Supercomputers* (1986).

This report is divided into two parts. Part I reviews and analyzes patterns of Federal funding for research and development (R&D). Part II presents the results of a conference where researchers in computers and artificial intelligence discussed long-range issues. The OTA in this study found artificial intelligence at a critical juncture. In 1987, it was not on the verge of thinking or reasoning machines, and the OTA estimated that it would probably take decades before such developments took form. Yet artificial intelligence was already giving computers important new ways of solving complex problems. These areas include medical diagnosis, factory automation, natural language processing, and computer-assisted instruction.

**1089.** ---, ed. *Federal Scientific and Technical Information in an Electronic Age: Opportunities and Challenges*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1989.

This OTA Staff Paper runs fewer than 40 pages and notes that the American federal government is the world's single largest source of scientific and technical information (STI). "Federal STI ranges from stream flow data collected by the U. S. Geological Survey, to imagery and technical reports on the Voyager II interplanetary mission produced" by NASA, "and to the energy research database prepared by the Department of Energy." Scientific advancement depends on free flow of STI, but this OTA report notes that the federal government does not have an overall strategy to facilitate such dissemination. Such a strategy is needed to maximize federal investments in research and development, and to take full advantage of the possibilities inherent in new electronic technologies.

The report estimates that the federal government maintains an archive in earth and space sciences that total about 100,000 gigabytes, or 45 billion pages of text.

**1090.** ---, ed. *Finding a Balance: Computer Software, Intellectual Property and the Challenge of Technological Change*. [Washington, D. C.]: Congress of the United States, Office of Technology Assessment, 1992.

See also an earlier OTA report entitled *Computer Software & Intellectual Property: Background Paper* (March 1990).

**1091.** ---, ed. *The Future of Remote Sensing from Space: Civilian Satellite Systems and Applications*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

During the past decade, the report begins, satellite remote sensing has been used to study the earth, and the information gathered, when combined with other data, should help predict the effects of long-term global changes. This report is the first of three that deal with Earth observation systems. It looks at issues related to publicly funded remote sensing systems in the U. S. and other nations. It examines military and intelligence use of data gathered by civilian remote sensing satellites. It also assesses the outlook for privately funded and operated systems of remote sensing. The report says that the current budget deficit will require NASA, the Department of Defense, and other agency to find ways to cut costs. The federal government should develop a flexible interagency strategy, one that would assigned increased responsibility to the private sector to collection and archive remotely sensed data.

**1092.** ---, ed. *Global Change Research and NASA's Earth Observing System: Background Paper*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

The report assesses the United States' multi-billion dollar Global Change Research Program (the USGCRP) which is a multiyear project "to monitor, understand, and ultimately predict the nature of global changes and the mechanisms that cause them. This background report examines the direction and scope of USGCRP and its most expensive component, NASA's Earth Observing System (EOS) of satellites. In particular, it looks at whether some program elements are missing or need to be strengthened, and whether the program is meeting the needs of policymakers." The report makes suggestions for improvement. It believes that USGCRP's focus is too narrowly on climate changes, thus making it difficult to assess other dimensions of global change.

**1093.** ---, ed. *Government Involvement in the Innovation Process*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1978.

This 69-page report was prepared by the Center for Policy Alternatives at MIT, under a contract given by the OTA. Its purpose was the acquaint OTA members with how governmental policies are related to technological innovation -- "the process that leads to the commercial introduction of a new technology." Several government actions influence this process: "incentives and funding for basic research; tax, patent, procurement, and antitrust policies; regulations; size, sector, and locale of the business; subsidies; inflation rate; available technical, marketing, and management skills; credit; and the formation of capital." The report also summarizes similar policies in Japan, Great Britain, France, and West Germany, and question whether policies in those nations are transferable to the United States.

**1094.** ---, ed. *Helping America Compete: The Role of Federal Scientific and Technical Information*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1990.

This 68-page report shows how federal scientific and technical information (STI) can help make the United States more competitive. The report assumes that American global leadership is being challenged. The federal government is the world's single largest source of STI, and making more efficient use of this information can maximize federal resources that have been poured into research and development. See also the OTA's earlier

report on this topic entitled *Federal Scientific and Technical Information in an Electronic Age: Opportunities and Challenges* (Oct. 1989).

**1095.** ---, ed. *High Performance Computing & Networking for Science: Background Paper*. [Washington, D.C.]: U. S. Congress, Office of Technology Assessment, 1989.

This report discusses the urgency of establishing a supercomputing network. Among the networks discussed including the National Research and Education Network (NREN).

**1096.** ---, ed. *High-Temperature Superconductivity in Perspective*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1990.

This report follows an earlier OTA analysis of high-temperature superconductivity (HTS), entitled *Commercializing High-Temperature Superconductivity* (June 1988). Whereas the earlier report "considered HTS as a specific case study in the context of broader issues in U. S. industrial competitiveness and technology policy, the present work focuses more on the technology itself and the spectrum of potential applications. A centerpiece of this work is an extensive OTA survey comparing industry investment in superconductivity R & D [research and development] in the United States and Japan (see Chapter 6)." Japan's International Superconductivity Technology Center assisted this study by administering an OTA survey in that country. The National Science Foundation assisted the analysis of the United States. The OTA predicts that the full potential of HTS lies 10 to 20 years in the future.

**1097.** ---, ed. *Information Security and Privacy in Network Environments*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1994.

This 244-page report argues that "information networks are changing the way we do business, educate our children, deliver government services, and dispense health care." They intrude on our lives in both positive and negative ways. They provide rich information but they compromise privacy because personal information can be widely and instantaneously shared through these networks. This report focuses on issues of policy in three areas: "1) national cryptography policy, including federal information processing standards and export controls; 2) guidance on safeguarding unclassified information in federal agencies; and 3) legal issues and information security, including electronic commerce, privacy, and intellectual property."

**1098.** ---, ed. *Information Systems Related to Technology Transfer: A Report on Federal Technology Transfer in the United States*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

This report, completed Aug. 3, 1993, by Ball & Associates for the OTA, examines technology transfer. A section of the report is devoted to explaining the technology transfer process, and to "the philosophical gap between government and industry." Another section deals with factors that influence the effectiveness of technology transfer. The report also gives an overview of federal support for research and development.

**1099.** ---, ed. *Information Technology R&D: Critical Trends and Issues*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1985.

This work has several conclusions. 1) The United States has traditionally been strong in information technology, both in basic science and in practical applications. It has benefited the nation in several ways. 2) Most areas explored in this study -- microelectronics, fiber optics, artificial intelligence, computer designed -- were then (1985) in early stages of development. 3) American research and development is strong and viable, although past achievements in this area may no longer provide guidelines for the future. 4) New relationships are being forged between universities, industry, and the government. 5) The Department of Defense provides nearly 80 percent of the funding and is the predominant source for federal support of research and development in information technology. 6) Concerns are raised that the predominant flow of technical and scientific research is outward to other countries. 7) Instruments of scientific research are growing obsolete at an increasingly rapid rate. 8)

Policies designed to stimulate research and development in information technology need to be reexamined for possible tradeoffs in other areas.

**1100.** ---, ed. *Informational Technology and Its Impact on American Education*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1982.

This 269-page report grew out of a request from the U. S. Committees on Education and Labor, and Science and Technology in 1980 to examine how new information technologies could relate to education. The report draws two conclusions:

First, the "so-called *information revolution*, driven by rapid advances in communication and computer technology, is profoundly affecting American education. It is changing the nature of what needs to be learned, who needs to learn it, who will provide it, and how it will be provided and paid for."

Second, "information technology can potentially improve and enrich the educational services that traditional educational institutions provide, distribute education and training into new environments such as the home and office, reach new clients such as handicapped or homebound persons, and teach job-related skills in the use of technology."

**1101.** ---, ed. *Informing the Nation: Federal Information in an Electronic Age*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1988.

This work, which appeared in October, 1988, gives a good overview of the size, scope, and infrastructure of the federal government's information dissemination enterprise. Chapter 2 give an "Overview of Federal Information Dissemination." Chapter 3 discusses "Key Technology Trends Relevant to Federal Information Dissemination." Here the "microcomputer revolution" and the "continuing role of paper and microform" are discussed. Chapter 4 considers "Alternative Futures for the Government Printing Office," while chapter 6 is on "Information Technologies, Libraries, and the Federal Depository Library Program." Chapter 7 deals with "Alternative Futures for the Depository Library Program."

"The Freedom of Information Act in an Electronic Age" is the topic of chapter 9. Chapter 10 is "The Electronic Press Release and Government-Press Relationships," while chapter 11 is "Federal Information Dissemination Policy in an Electronic Age."

**1102.** ---, ed. *Intellectual Property Rights in an Age of Electronics and Information*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1986.

This report analyzes recent and expected advances in information and communication technologies that are related to intellectual property. "It focuses primarily on the Federal copyright system, and on the continuing effectiveness of copyright law as a policy tool in the light of technologies such as audio- and video recorders, computer programs, electronic databases, and telecommunications networks." In an effort to be comprehensive, this reports looks at intellectual property from several perspectives: the constitutional foundation of this system, its goals and economics, the creative environment it helps foster, problems in enforcing copyright, the international situation, and the Federal government's role in administering the system. The OTA concluded that new technologies were affecting all aspects of intellectual property rights and that because we were only at the beginning of a new era in electronic information, the full impact of these technologies has not been felt or has even become apparent. New problems relating to intellectual property are likely to arise in the near future and Congress must be prepared to respond.

**1103.** ---, ed. *International Competitiveness In Electronics*. [Washington, D. C.]: Congress of the United States, Office of Technology Assessment, 1983.

This report, prepared by a congressional agency early in the Reagan administration, reflects the concern then current about competition from Japan. It urges the government to take steps to make the electronics industry more competitive.

"American firms making radios, TVs, and audio products such as stereo receivers and tape recorders have been under severe competitive pressures for years; many have failed or left the market. Few radios or black-and-white TVs are made in the United States. No video cassette recorders are manufactured here. Color television production has become largely an assembly operation, heavily dependent on imported components -- whether the parent firm in American-owned (RCA, Zenith, GE) or foreign-owned (Sony, Quasar, Magnavox). *In television manufacture especially, the policies of the Federal Government have contributed to the plight of the industry.* Dumping complaints against importers going back to 1968 have never been fully resolved. An industry legally entitled to trade protection has not received it."

**1104.** ---, ed. *Issue Update on Information Security and Privacy in Network Environments*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1995.

**1105.** ---, ed. *Making Government Work: Electronic Delivery of Federal Services*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1993.

The first page of this report gives an idea of the broad range of people who receive federal services in the United States:

"46 million recipients of social security benefits.

"27 million recipients of food stamps.

"31 million Medicaid recipients.

"14 million recipient of aid to families with dependent children.

"15,000 scientists who receive National Science Foundation research grants each year.

"20,000 small businesses that receive business loans.

"600,000 persons participating in job-training programs.

"people and organizations that annually place about 1.6 million orders for a total of 110 million publications from the U.S. Government Printing Office.

"citizens who annually receive a total of 10 million pamphlets from the Consumer Information Center.

"30,000 or so academic and business researchers who receive research results and technical information each week from the National Technical Information Service, and

"170,000 citizens who use Federal depository libraries each week."

**1106.** ---, ed. *Medlars and Health Information Policy: A Technical Memorandum*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1982.

This report attempts to assess "the performance of MEDLARS, particularly the performance of its major biomedical data base MEDLINE, in disseminating health-related bibliographic information. It also explores "the Government's role in the creation and the distribution of health-related information by means of computerized bibliographic retrieval systems."

**1107.** ---, ed. *Microelectronics: Research & Development: Background Paper*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1986.

This 58-page report assumes that microelectronics is the "fundamental building block" of America's information technologies, and that it has assumed a "vital" place in the nation's commerce and defense. The report explains the role of microelectronics in these areas of national interest and recommends continued intelligent and aggressive investment in research and development in this area. It notes that the Federal government funds a significant part of activities in this area and that Federal agencies also have important influence on private support of research and development. The report tries to explain the current state (1986) of research and development in microelectronics.

**1108.** ---, ed. *Miniaturization Technologies*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1991.

With index, this report runs 48 pages, and it analyzes technologies that could be important to future developments in miniaturization. Research underway in America and in other countries "is pushing the limits of miniaturization to the point that structures only hundreds of atoms thick will be commonly manufactured. Researchers studying atomic and molecular interactions are continuing to push the frontiers, creating knowledge needed to continue progress in miniaturization. Scientists and engineers are creating microscopic mechanical structures and biological sensors that will have novel and diverse applications." The OTA says that American research and development in this area is the best in the world. The challenge is how to translate what takes place in the laboratory to the global marketplace.

**1109.** ---, ed. *Multinationals and the National Interest: Playing by Different Rules*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

This report analyzes the changed structure of world economy with the globalization of business, communications, and transportation during the past quarter century. These changes have transformed the post-World War II system of investment and international trade. Multinational enterprises (MNEs) are essential to promote future economic growth and ensuring fair and sustained distribution of advanced technologies among competing nations. "MNEs are central to this process because they are international conduits of technology and goods and services; they also provide the quality jobs and capital that support economic growth and high standards of living."

But the interests of MNEs do not always correspond to the interest of the United States. These multinational firms are more interested in their own well-being than in advancing national goals. Some ways need to be found to ensure that the MNEs work in harmony with their host nations. "Although companies and governments may pursue different objectives, there is no irreconcilable incompatibility between the interests of MNEs and those of nations," according to this report.

**1110.** ---, ed. *Multinationals and the U.S. Technology Base: Final report on the Multinationals Project*. [Washington, D.C.]: Congress of the United States, Office Technology Assessment, 1994.

This 211-page report asserts that "multinational firms are critical to ensuring the health of the U. S. technology base. The most technologically sophisticated and economically significant sectors of the U. S. economy are now characterized by high levels of international production, foreign direct investment, trade among affiliated companies, and complex forms of international financial and technological collaboration." At the same time, "extensive data suggest that technology is deeply rooted in national (or in the case of Europe, regional) concentrations or bases, with partial and company-specific interconnections." Thus, America's "technology base must be well-maintained on a continuous basis. Moreover, in order for the United States to retain its technology leadership in a broad range of industries, it must address the increasingly important role of multinational enterprises in innovation and in the development of the nation's science and technology base."

Spending on research and development is important, but also strategic investment by multinational corporation is important. "Between 1980 and 1992, global foreign direct investment grew by over a factor of four to reach \$2.0 trillion (in nominal dollars)," thus transforming the global economy. Most multinational corporations, though, "remain firmly rooted in the national technical, financial, and corporate cultures of their home countries." This produces uneven integration of the world economy and is likely to cause friction in the future between the United States and its most important trading and investing partners.

This report complements an earlier OTA report entitled *Multinationals and the National Interest: Playing by Different Rules* (1993).

**1111.** ---, ed. *NASA's Office of Space Science Applications: Process, Priorities, and Goals: An OTA Background Paper*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1992.

This report summarizes a one-day workshop devoted to assessing NASA's Office of Space Science and Applications (OSSA) planning and priority-setting mechanisms. Among its findings are: 1) That while OSSA involves a broad cross-section of the scientific community in setting its scientific priorities, it needs to be more realistic about future budgets and to find better ways of controlling costs. 2) The OSSA needs to develop means to gain better feedback on previous policies. 3) High quality space science has been seriously hindered by the lack of flight opportunities. 4) Multidisciplinary projects combining engineering and scientific goals find it particularly difficult to gain funding in the OSSA. 5) Congressional "earmarking" of funding for particular space programs undercuts the efforts by scientists to propose space science projects, and creates skepticism among scientists of congressional funding procedures.

**1112.** ---, ed. *New Developments in Biotechnology: Background Paper: Public Perceptions of Biotechnology*. Vol. 2. Washington, D. C.: Congress of the United States, Office of Technology Assessment, 1987.

This 125-page background paper surveys American public opinion about the benefits, risks, legal, and ethical issues surrounding genetic engineering and biotechnology. Louis Harris & Associates conducted this survey for the Office of Technology Assessment. Questions were asked about how the public felt about genetic testing in their own community, human gene therapy, and the future of biotechnology. A related OTA report discusses ownership and commercialization of human tissues and cells.

This report argues that the "United States stands at the brink of a new scientific revolution that could change the lives and futures of its citizens as dramatically as did the Industrial Revolution two centuries ago and the computer revolution today. This new revolution is based on advances in molecular biology that permit the identification, alteration, and transfer of genetic materials that control fundamental characteristics of organisms (and in some cases their offspring) promises major changes in many aspects of modern life."

**1113.** ---, ed. *New Developments in Biotechnology: Ownership of Human Tissues and Cells*. Vol. 1. Washington, D.C.: Congress of the United States, Office of Technology Assessment, 1987.

This 167-page study is the first in a series of OTA reports on biotechnology. Of the report, OTA Director John H. Gibbons wrote: "In the 1960s, the term 'biotechnology' did not exist. In the 1970s, development of techniques for: 1) splicing genetic information of one organism into that of another, and 2) fusing cells to produce large quantities of valuable proteins led to recognition that a revolution in biological technology – that is, *biotechnology*– was at hand. In the 1980s, biotechnology is best viewed as a growing cohort of technologies, each with its own scientific benefits and risks, and allied social, economic, legal, and ethical issues."

This report "analyzes the economic, legal, and ethical rights of the human sources of tissues and cells and also those of the physicians or researchers who obtain and develop these biological materials. The study describes the potential of three rapidly moving technologies (tissue and cell culture, cell fusion to produce monoclonal antibodies, and recombinant DNA) for manipulating human tissues and cells to yield commercially valuable

products. The report includes a range of options for congressional action related to commercialization of human biological materials, regulation of research with human subjects, and disclosure of physicians' commercial interest in patient treatment."

**1114.** ---, ed. *New Developments in Biotechnology: Patenting Life*. Vol. 5. Washington, D. C.: Congress of the United States, Office of Technology Assessment, 1989.

This was the fifth report in a series that the OTA produced on issues involving biotechnology. It runs 195 pages. The United States Supreme Court ruled in 1980 that living micro-organism could be patented, and thereafter the U. S. Patent and Trademark Office also decided that some kinds of animal and plant life could be patented. This reports reviews patent law as it relates to biotechnology, "including deposit requirements and international considerations." The report also provides Congress with a range of options about protecting intellectual property related to biotechnology.

**1115.** ---, ed. *New Developments in Biotechnology: U. S. Investment in Biotechnology*. Vol. 4. Washington, D. C.: Congress of the United States, Office of Technology Assessment, 1988.

This 296-page report is the fourth in a series that the OTA did on biotechnology. It examines investments then being made by the federal, state, and private sectors. The report considers ten issues influencing investment: 1) research priorities; 2) research and development funding; 3) coordination between agencies; 4) requirement for information; 5) what is needed in training and education; 6) efforts by states to promote biotechnology; 7) monitoring industry-university research; 8) how tax law affects commercial biotechnology; 9) how adequate is federal help for companies starting out in biotechnology; and 10) how export controls influences commerce in biotechnology.

The report offers conclusion about United States investment in biotechnology. First, investment were inadequate to fulfill the potential of the work then being done. Second, some manufacturers of biotechnology related products see the government's regulatory process as a major obstacle to commercial development. Third, rate of commercialization varies from one industry to another.

**1116.** ---, ed. *New Electric Power Technologies*. [Washington, D.C.]: United States Congress, 1985.

This 329-page report examines several new electric power storage, generating, and management technologies. The OTA studied "these technologies in terms of their current and expected cost and performance, potential contribution to new generating capacity, and interconnection with the electric utility grid. The study analyzes increased use of these technologies as one of a number of strategies by electric utilities to enhance flexibility in accommodating future uncertainties. The study also addresses the circumstances under which these technologies could play a significant role in U. S. electric power supply in the 1990s. Finally, alternative Federal policy initiatives for accelerating the commercialization of these technologies is examined."

The report starts with the Arab oil embargo in 1973-74, and notes that by 1984, utilities had to pay on average 240 percent more for oil and 385 percent more for natural gas than in 1972 (in real dollars). "The most critical legacy of the 1970s," the report says, "is the uncertainty in electricity demand growth."

**1117.** ---, ed. *New Structural Materials Technologies: Opportunities for the Use of Advanced Ceramics and Composites: A Technical Memorandum*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1986.

This 71-page report "assesses the opportunities for the use of structural ceramics and polymer matrix composites in the next 25 years, outlines the research and development priorities implied by those opportunities, and concludes with a discussion of ... prerequisites for their realization."

**1118.** ---, ed. *A New Technological Era for American Agriculture*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, August, 1992.

This 452-page report argues that American agriculture is entering a new era with promising advances in biotechnology and more sophisticated computing systems. These developments should help increase productivity, enhance food safety and quality, and help the environment. The introduction of these technologies are likely to face unique problems and (especially with regard to food production) be met with resistance during the 1990s. The report contends that the new technologies can solve many agricultural problems but will require striking the right balance between government, industry, and the public.

This is the fourth and final OTA report on a series started in 1990. Other titles include: 1) *Agricultural Research and Technology Transfer Policies for the 1990s*; 2) *U. S. Dairy Industry at a Crossroad: Biotechnology and Policy Choices*; and 3) *Agricultural Commodities as Industrial Raw Materials*.

**1119.** ---, ed. *OTA Priorities 1979: With Brief Descriptions of Priorities and of Assessments in Progress*. Washington, D. C.: United States Congress, Office of Technology Assessment, 1979.

This report notes that between February and May, 1978, more than 5,000 people were queried about what they believed were the most "critical technological issues" facing the United States and the world. About 1,000 of the people asked had been advisors to the OTA. "From these efforts to reach as broad and informed a public as possible, OTA received 1,530 suggested topics for study. Another 2,875 items were extracted from the published literature." From this list, the OTA prepared a list of 30 topics in rank order of importance. Several topics relating to communication appeared on this list. They included: Impact of Microprocessing on Society (no. 9); Applications of Technology in Space (no. 10); Designing for Conservation of Materials (no. 11); Future of Military Equipment (no. 12); Allocating the Electromagnetic Spectrum Globally (no. 15); Technology in Education (no. 19); Electric Vehicles: Applications and Impacts (no. 23); and Alternative Materials Technologies (no. 25).

**1120.** ---, ed. *The Potential Biological and Electronic Effects of EMPRESS II: Staff Paper*. [Washington D.C.]: Congress of the United States, 1988.

This report was prepared by the OTA Assessment International Security and Commerce Program. EMPRESS II was the U. S. Navy's electromagnetic pulser, a device that operated from a barge about 15 nautical miles off Corolla, NC in the Atlantic Ocean. "The EMPRESS II facility provides a pulse whose form and amplitude constitute an appropriate simulation of a nuclear electromagnetic pulse (EMP) that could arise from a nuclear explosion in or above the upper atmosphere. Exposure to test pulses of this sort are necessary for the Navy to verify the hardness of vital electronics on its ships. Computer simulations or sub-scale modeling would not provide adequate assurance of hardening, although they could be used to help reduce the amount of testing with EMPRESS II." The reports notes that EMP's effects on human health are not understood fully.

**1121.** ---, ed. *Power On! New Tools for Teaching and Learning*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1988.

This 246-page study deals with new interactive technologies, such as personal computers, and their potential for improving education. The study was initiated by the U. S. House Committee on Education and Labor, and its Subcommittee on Select Education. The report "examines developments in the use of computer-based technologies, analyzes key trends in hardware and software development, evaluates the capability of technology to improve learning in many areas, and explores ways to substantially increase student access to technology. The role of the teacher, teachers' needs for training, and the impact of Federal support for educational technology research and development are reviewed as well."

**1122.** ---, ed. *A Preliminary Assessment of the National Crime Information Center and the Computerized Criminal History System*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1978.

This 84-page report is a background planning document for assessing the Department of Justice's National Crime Information Center and the Computerized Criminal History System. It tries to identify and analyze the significant future issues in the development of a federal-state system. "These are: the information needs for administering criminal justice programs and assuring constitutional rights; federalism, including division of authority, and cost apportionment; organization, management, and oversight; the planning process, and social impacts such as the effects on the administration of justice and the creation of a dossier society." The reports notes that many of the issues raised here are also related to problems involving electronic mail and the electronic of funds.

**1123.** ---, ed. *Proliferation and the Former Soviet Union*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1994.

This is the fifth OTA report on the proliferation of weapons of mass destruction. This report examines the consequences of the breakup of the Soviet Union. One threat is the breakdown of international nonproliferation arrangements. The new republics of the former USSR face many pressures. Economic hardship and low morale among people who access to nuclear weapons poses problems. While the ability of the United States to control events in this area of the world is limited, this report does suggest strategies for limiting proliferation of nuclear weapons.

**1124.** ---, ed. *Proliferation of Weapons of Mass Destruction: Assessing the Risks*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

"This report describes what nuclear, chemical, and biological weapons can do, analyzes the consequences of their spread for the United States and the world, and summarizes technical aspects of monitoring and controlling their production. (A separate background paper analyzes the technologies underlying nuclear, chemical, and biological weapons and delivery systems in greater depth.) This report also explains the array of policy tools that can be used to combat proliferation, identifying tradeoffs and choices that confront policymakers."

**1125.** ---, ed. *Protecting Privacy in Computerized Medical Information*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

This reports notes that the Clinton health care plan introduced Sept. 22, 1993, relied heavily on information technology and telecommunications to reduce costs. "By linking computerized health information through a national network, the proposal envisions a system that would allow an efficient exchange of information to improve patient care and expand resources for medical research and education, while lowering health care costs. While automation may or may not achieve these goals, it will raise serious questions about individual privacy and proper use of the health care information system. This report analyzes the implications of computerized medical information and the challenges it brings to individual privacy."

This report analyzes three issues: 1) privacy as it relates to health care information and the current state of laws protecting such information; 2) the nature of proposals calling for computerizing health care information and the technologies available to computerize such information as well as to protect privacy; and 3) appropriate models for protecting health care information.

**1126.** ---, ed. *Radiofrequency Use and Management: Impacts From the World Administrative Radio Conference of 1979*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1982.

This 163-page report came in response to a request from the U. S. Senate Committee on Commerce, Science, and Transportation to evaluate the impact on the United States of the World Administrative Radio Conference in 1979 (WARC-79). "WARC-79 and related international conferences and meetings demonstrate that contention for access to the radio spectrum and its important collateral element, the geostationary orbit for communication satellites, presents new and urgent challenges to vital U. S. national interests," the OTA concludes. "Given the

complexities of spectrum management in a changing world environment and the increased importance of telecommunications to both developed and developing nations, it is unlikely that traditional U. S. approaches to these issues will be sufficient to protect vital U. S. interests in the future. Problems require strategies not yet developed or tested."

**1127.** ---, ed. *Remote Sensing and the Private Sector: Issues for Discussion: A Technical Memorandum.*

[Washington, D.C.]: United States Congress, Office of Technology Assessment, 1984.

This 141-page report was finished in March, 1984. In March, 1983, the Reagan administration had proposed to turn over the meteorological and land remote-sensing (Landsat) satellite system to private ownership. "This proposal has raised a variety of issues, including concern over the small size of the market for remote-sensing data, the public good aspects of remote sensing, and the use of the data to further foreign policy objectives." Chapters are devoted to "International Relations and Foreign Policy"; "Public Interest in Remote Sensing"; "U. S. Government Needs for Remote-Sensing Data"; and "National Security Needs and Issues." Nine appendices are devoted to such topics as: "Remote Sensing in the Developing Countries"; "The Use of Landsat Data in State Information Systems"; "Survey of University Programs in Remote Sensing Funded Under Grants From the NASA University-Space Application Program"; "Remote Sensing in Agriculture"; "Hydrology"; "Forestry"; and more.

**1128.** ---, ed. *Remotely Sensed Data from Space: Distribution, Pricing, and Applications.* [Washington, D.C.]:

Congress of the United States, Office of Technology Assessment, 1992.

This report summarizes an OTA workshop held on May 20, 1992. It dealt with data pricing and distribution of Landsat data. It does not consider larger issues related to commercialization of land remote sensing, nor does it deal with the decision to give responsibility for operating Landsat 7 to the Department of Defense and NASA.

**1129.** ---, ed. *Remotely Sensed Data: Technology, Management, and Markets.* [Washington, D.C.]: Congress of the

United States, Office of Technology Assessment, 1994.

The volume of information collected about the earth from satellites challenges American data archiving and distributing facilities. To make this data that has been collected useful for scientific research, it will require an adequate storage system, and also a computer system to process, organize, and distribute this information. This report examines strategies the United States has adopted to handle this massive data. It focuses on the Earth Observing System Data and Information System being developed by NASA. The entry of private firms into the realm of remote sensing gives the United States an opportunity to develop a new space industry that could supply worldwide markets with high quality data. The report addresses the controversial question of what role the federal government should play in this emerging industry.

**1130.** ---, ed. *Review of the Defense Department's Polygraph Test and Research Programs: Staff Paper.*

[Washington, D. C.]: United States Congress, Office of Technology Assessment, 1987.

This report reviews the Department of Defense's Polygraph Counterintelligence Screening Test Program. The review grew out of concerns that the Office of Technology Assessment found in 1983 "that there had been virtually no scientific research -- in or outside of the Federal Government -- on the validity of the polygraph technique for personnel security purposes." The OTA concluded that the DoD's polygraph test program was "not being conducted in such a way that the validity, utility, and general applicability of polygraphs for personnel security screening can be evaluated."

**1131.** ---, ed. *Rural America at the Crossroads: Networking for the Future.* [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1991.

This 190-page report contends that many American rural communities have declined in income, economic vitality, employment, and in their ability to retain talented people. New communication land information technologies, however, hold promise for reversing these trends by reversing problems associated with distance

and space. These new technologies allow rural Americans to link to urban markets in the United States, and indeed, worldwide. This reports sets out possible strategies and options aimed at promoting rural development.

**1132.** ---, ed. *Selected Electronic Funds Transfer Issues: Privacy, Security, and Equity*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1982.

This background paper complements an earlier OTA report entitled *Computer-Based National Information Systems: Technology and Public Policy Issues* (Sept. 1981). This report deals with selected electronic funds transfer issues and grew out of a request from several congressional committees including the U. S. Senate Committee on the Judiciary. Special attention is given to electronic funds transfer and security, privacy, and equity issues.

**1133.** ---, ed. *Space Science Research in the United States: A Technical Memorandum*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1982.

This 50-page report, finished in September, 1982, examines the purpose and direction of the American space science program. Reallocations and budget cuts within NASA left "planetary science, solar and heliospheric physics, gamma ray astronomy, and X-ray astronomy with uncertain futures." The report outlines then current situation in space science, sets out issues, including the present and future of manned space flight, and discusses the importance of doing space science. Among the important matters that space science considers are the ozone layer, weather and climate, the effects of solar variations on communication, the reliability of satellites, and the commercial value of near-space.

**1134.** ---, ed. *Studies in the Environmental Costs of Electricity: Background Paper*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1994.

This report analyzes "studies that assign monetary value to the environmental effects of energy technologies. Quantitative analysis of environmental effects has been an important feature of energy policy for several decades, and growing numbers of studies attempt to integrate these analyses into an overall framework that allows comparison of the environmental effects of different technologies for generating electricity." This report notes that the assumptions underlying these studies are often debated, and that changing the assumptions of a study "can profoundly affect its results." Currently there is no agreement on assumptions. This reports compares several studies and makes suggestions about how policymakers might make sense of them. "In contrast to other studies in this area, OTA's report explores the close ties between values, assumptions, and quantitative results and the implications of these ties for policymaking."

**1135.** ---, ed. *Supercomputers: Government Plans & Policies: Background Paper*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1986.

A 28-page report that reviews then current federal programs in supercomputing at the National Science Foundation,;NASA; Department of Energy; the Supercomputing Research Center, National Security Agency; and the Defense Advanced Research Projects Agency.

**1136.** ---, ed. *Teachers & Technology: Making the Connection*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1995.

This report notes that in the race to provide students with the most up-to-date technology, perhaps the most valuable part of education process -- the teacher -- has been overlooked. The report notes that relative few of the nation's 2.8 million teachers use technology in their work. The report tries to answer why so many teachers do not use new technology in their teaching. Making the connection between technology and teachers is important to the effort to improve education for children. With appendices and index, this report runs 292 pages.

**1137.** ---, ed. *Technology and Governance in the 1990s: Proceedings*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

This report grew out of one-day conference on Jan. 27, 1993, celebrating the twentieth anniversary of OTA's creation. Attended by members of Congress, the conference attempted to improve legislators' understanding of problems relating to technology and governing. It dealt with five issues: 1) international security; 2) American economic competitiveness; 3) sustaining a global environment; 4) health care; and 5) public education. This work contains five papers that were presented at this conference.

**1138.** ---, ed. *Technology Issues of the 80's (Other Than Energy or Military)*. [Washington, D.C.]: United State Congress, Office of Technology Assessment, 1980.

This 45-page report predicts several critical issues will confront those who live through the 1980s. Resources will become scarcer and more expensive, not only fossil energy but minerals, land, and water resources as well. There will be rapid advances in the sciences: e.g. research in biology (particularly at the molecular level) and in solid state electronics (particularly semiconductors) will lead to extraordinary advances in new technology. Gene splicing will have great impact on agriculture and chemical production; innovations in telecommunications and microcomputers will greatly influence national defense, education, information processing, and labor and industrial productivity. There will important demographic changes as the American workforce matures and demands for jobs in developing countries increases. Problems with large-scale technologies may lead to more emphasis on small-scale technologies. Changes in lifestyles will be needed as the earth reaches its capacity to supply the needs of humankind.

**1139.** ---, ed. *Telecommunication Technology and Public Policy: Draft*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1981.

This 306-page report, finished on June 24, 1981, outlines the structure of the American telecommunications industry. It then analyzes policy alternatives facing this industry, and the impact that various policies have on research and development. It also sets out future issues needing further consideration: national security implications, biological effects of non-ionizing radiation, transborder data flow, and more.

**1140.** ---, ed. *Trends and Status of Computers in Schools: Use in Chapter 1 Programs and Use with Limited English Proficient Students*. [Washington, D.C.]: United States Congress, Office of Technology Assessment, 1987.

This report, which runs a little over 100 pages, first surveys trends in the use computers in American education, then has a chapter on the use of educational technology. A final chapter deals with "The Use of Technology for Students with Limited English Proficiency." An appendix is entitled "Educational Technology: A Technical Survey."

**1141.** ---, ed. *U. S. Telecommunications Services in European Markets*. [Washington, D.C.]: Congress of the United States, Office of Technology Assessment, 1993.

This report predicts that the European market for telecommunications will grow rapidly during the next decade as the needs for rapid data transmission increases in the European business community. In most European nations, telecommunication services are still reserved mainly for a state-owned Public Telephone Operator, but this situation is likely to change soon. American telecommunications companies, especially in cable television and cellular communication, are already competing successfully in Europe. American firms appear to have an edge in Europe because of their experience in competing in a market economy. The American economy can benefit by the increased export of telecommunications to markets overseas, and by U. S. support to other companies that operate in global markets. Such international trade can (and already has) offset the national deficit. The success of trading in European markets, though, does raise domestic policy concerns.

**1142.** ---, ed. *Wireless Technologies and the National Information Structure*. [Washington, D. C.]: United States Congress, Office of Technology Assessment, 1995.

This 290-page study relates to a larger effort by the executive and legislative branches, plus the state governments, to combine the nation's many different networks -- cable television, telephone, computer, satellite, cellular telephone, broadcasting -- into a broader National Information Infrastructure (NII).

The "Executive Summary" discusses the advantages of wireless technology and its policy implications. Chapter 1 begins:

"Wireless communications technologies are poised to bring dramatic changes to the nation's telecommunications and information infrastructure, reshaping how people communicate, access information, and are entertained. These technologies, which use radio waves instead of wires to transmit information, already play an important part in the daily lives of almost all Americans. For more than 70 years, radio and television broadcasters have entertained and informed millions of people each day. Satellites connect the countries of the world, allowing people to converse, share information, and transact business. Most recently, cellular telephones have extended the reach of the public telephone system to peoples who are on the move or beyond the reach of traditional telephones.

"Over the next several years, use of wireless technologies is expected to grow dramatically as a wide range of new radio-based communication, information, and entertainment services and applications is introduced, and the prices of both equipment and services fall. Some of the wireless systems now being developed include: 1) terrestrial and satellite-based telephone systems that will allow people to make and receive calls from almost any point on Earth, 2) digital television that promises clearer images and better sound, 3) digital radio broadcasting that will offer crystal clear sound as well as a range of information services, and 4) a wide range of data communications systems that expand the reach of computer and online services. These emerging wireless technologies, along with existing wireless services, will become an integral part of the nation's evolving telecommunications and information infrastructure -- more formally known as the National Information Infrastructure (NII).

"Finally, the deeper implications of the widespread use of wireless technologies and services are not well understood. With the exception of television and radio broadcasting (and perhaps cellular telephony), radio-based systems have not yet penetrated deeply into the social and organizational fabric of American society and business...."

**1143.** Assessment], [Office of Technology, ed. *Communications and Rural America: Prepared at the Request of Hon. Warren G. Magnuson, Chairman, Committee on Commerce, Science, and Transportation, ... January 1978.* Washington, D.C.: Government Printing Office, 1978.

**1144.** Atherton, W. A., ed. *From Compass to Computer: A History of Electrical and Electronics Engineering.* San Francisco: San Francisco Press, Inc., 1984.

This history of electrical and electronics engineering is written by a non-historian, primarily for engineers and technicians, but also for a broader audience. Atherton believes that major inventors have drawn on history in their work and that it is important for contemporary practitioners to have a knowledge and appreciation of the past.

The work has twelve chapters. After the Introduction, early chapters cover "electricity and magnetism to 1820," the work of Oersted, Ampere, and other during the 1820s, and electromagnetism. Chapter 5 examines European, American, and submarine telegraphy. Chapter 6 deals with electricity and its consequences, and Chapter 7 looks at motors, generators, and other forms of electrical power. Chapter 8 treats radio, radar, and television. Chapter 9 covers theories and discoveries relating to such topics as electrons, magnetism, noise, information theory, and electrical units. Chapter 10 is about the miniaturization of electronics and discusses

transistors and integrated circuits. Chapter 11 deals with computers in Germany, Britain, and the U.S. A concluding chapter is entitled "A Technological Society."

The work has brief references after each chapter and both a name and subject index.

**1145.** Atkinson, Ross. "The Academic Library Collection in an On-Line Environment." *New Directions for Higher Education*.90 (1995): 43-62.

The author notes that librarians and administrators are being forced to "reinvent the library" in the wake of new technologies. "The old question of what constitutes a research collection remains but is transferred to a new medium." Atkinson was then associate university librarian at Cornell University, Ithaca.

**1146.** Atkinson, Terry. "Home Tech: Quiet Release of Controversial "Last Temptation of Christ"." *Los Angeles Times* June 30, 1989 1989, sec. 6 (Calendar): 25.

This discusses the release to home video of the controversial movie, *The Last Temptation of Christ* (1988). Many Christian groups boycotted this film and tried also to limit video rentals by pressuring rental chains. The article notes that the video was sent to rental stores "minus any promotion or advertising."

**1147.** Atkinson, W. Reay. "The Employment Consequences of Computers: A User View." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 345-52.

The author suggests ways in which microcomputers will be employed in office work. He is guardedly optimistic about this technology's impact on employment. Atkinson, at the time of this paper, was head of the Computers, Systems and Electronics Division of the Department of Industry, London, and had twenty years of experience using computers in government administration. This paper was delivered at a seminar near Nice, France in September, 1978.

**1148.** Attali, Jacques, ed. *Noise: The Political Economy of Music*. 1977. Minneapolis: University of Minnesota Press, 1985.

Attali was Special Counselor to French President François Mitterrand and also a professor of economic theory at the University of Paris and at the Ecole Polytechnique. He argues in this work that music does not merely reflect society but also portends new social patterns. Music, which is the organization of noise, offers theoretical possibilities for prophesy in two interrelated ways: 1) in the manner in which noise's violence is controlled and channeled; and 2) in the ways in which music is produced, distributed, and consumed.

Attali's book is organized around five themes, each the subject of a chapter: Listening, Sacrificing, Representing, Repeating, and Composing. For example, the chapter on sacrifice deals with rituals in sacred societies. The chapter that follows on representation considers a stage in which the creation of music is a professional activity connected to markets. The next chapter, "Repeating," deals with the period from the late nineteenth century when sound recording became possible, an era of unending reproduction in which live performances become secondary and it becomes essential to create demand for the material that has been recorded.

"The power to record sound was one of three essential powers of the gods in ancient societies," Attali writes, "along with that of making war and causing famine. According to a Gaelic myth, it was precisely by opposing these three powers that King Leevallyn won legitimacy.

"Recording has always been a means of social control, a stake in politics, regardless of the available technologies. Power is no longer content to enact its legitimacy; it records and reproduces the societies it rules. Stockpiling memory, retaining history or time, distributing speech, and manipulating information has always been

an attribute of civil and priestly power.... But... the reality of power belonged to he who was able to reproduce the divine word, not to he who gave it voice on a daily basis. Possessing the means of recording allows one to monitor noises, to maintain them, and to control their repetition within a determined code. In the final analysis, it allows one to impose one's own noise and to silence others: 'Without the loudspeaker, we would never have conquered Germany,' wrote Hitler in 1938 in the *Manual of German Radio*."

**1149.** Attali, Jacques and Yves Stourdze. "The Birth of the Telephone and Economic Crisis: The Slow Death of Monologue in French Society." *The Social Impact of the Telephone*. Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 97-111.

The authors argue that in France, where society was based on social hierarchy, the French did not embrace the telephone's person-to-person technology, and local authorities who were most interested in protecting their own power did little to promote the spread of telephony. "Can it be that the French State is only now discovering the sorry state of the telephone situation that it created by sacrificing telephone development for many decades on the altar of communication networks run by and for the local power holders? It probably means that the French State was willing to begin promoting the telephone only when industrial interests became prominent in economic and social relationships."

**1150.** Auerbach, Jonathan. "McKinley at Home: How Early American Cinema Made News." *American Quarterly* 51.4 (1999): 797-832.

This article examines early newsreel footage of President William McKinley between 1896 and 1901. He discusses the 1896 campaign film *McKinley at Home*, the coverage of the State funeral after the president's assassination in Buffalo in 1901, and *The Execution of Czolgosz* which dealt with McKinley's assassin. The author argues that such "early cinema significantly altered Americans' understanding of the relation between public and private." (798) The article also discusses the role of moving pictures as "visual newspapers" (815) during the Spanish-American War. (814-16) "Seeing the news," Auerbach maintains that thinking of a film as a "visual newspaper" (a term borrowed from Charles Musser) needs to be set into a historical context to understand how "seeing the news on screen" differed from "reading it in print." (799) Cinema had the capacity to make national news, and also to break down barriers between privacy and publicity. Conceptually, Auerbach draws on theorists from the Frankfurt School, and such writers as Tom Gunning, Harold Innis, Juergen Habermas, Charles Musser.

**1151.** Augustus. "The Paris Exposition -- V." *New York Observer and Chronicle* 78.45 (1900): 577-78.

This article reports on the Paris Exposition in 1900, and notes the use of electricity. For many people, electricity appeared to be something exotic and often akin to magic. [At the Palace of Illusion at Paris Exposition, this article says, a combination of "electricity and mirrors" revived the Arabian nights for a thousand people at a time." There was "a Mareorama by means of which passengers travel throughout the Mediterranean with the sights and sounds of the sea, as well as the illusion of entering the harbors of Constantinople, Naples, Venice, and other cities...." (578)

**1152.** Austen, Ian. "A Galaxy Far, Far Away Is Becoming Fully Digital." *New York Times* May 25, 2000 2000, sec. D: D8.

This article reports that "when *Star Wars: Episode II* starts production next month in Australia it will be the first major motion picture created mostly using high-resolution digital videotape rather than film."

**1153.** Austin, Charles. "Bishops in Plea Against Smut." *New York Times* May 25, 1983 1983, sec. A: 19A.

This article notes that almost "100 Roman Catholic bishops have written to President Reagan in the last month to ask that a Federal coordinator be named to monitor enforcement of obscenity laws, according to Morality in Media, an interfaith organization concerned with pornography."/

**1154.** Axelrod, Alan, ed. *Selling the Great War: The Making of American Propaganda*. New York: Palgrave Macmillan, 2009.

The author has discovered that the propaganda work of George Creel and the Committee on Public Information during World War I has renewed relevance in context of the Iraq War during the George W. Bush administration (2001-09). Axelrod contends that "Creel is little remembered outside of academic circles of historians and students of culture and media." (xi) He draws on Creel's writings and relies heavily on James Mock and Cedric Larson's 70-year-old book, *Words That War the War*. Little additional, more recent, scholarship on this topic was apparently consulted.

**1155.** Ayres, Robert and Steve Miller. "Industrial Robots on the Line." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 273-83.

As the use of robots increases, the authors (then at Carnegie-Mellon University) discuss the current uses of them and their future potential. The authors urge cooperation between unions, employers, and the government to lessen transition problems. This article first appeared in *Technology Review* (May-June 1982).

**1156.** Ayrton, William E., and John J. Perry. "Seeing by Electricity." *Nature* 7 (1880): 589.

**1157.** Ayscough, John. "Picture Teaching." *American Catholic Quarterly Review* 39.153 (1914): 99-109.

The author laments the relatively recent spread of newspapers and novels with un-Catholic or anti-Catholic themes but warns of an even more recent development, the movies. The movies, he says, should be easier to censor than novels (which are bought in private) because they are public.

"The great importance of novels in the modern world is, I believe, a thing that must be now recognized: the great importance of the press has been fully recognized by the highest ecclesiastical authorities, more than recognized -- strenuously insisted upon. But the importance to which newspapers and novels have attained is comparatively recent, and, unfortunately is principally due to the fact that they are immeasurably more read than any other printed matter. That fact I, for one, deplore; nevertheless it cannot be ignored. Hence the enormous importance of trying to provide a Catholic press that shall really rival in attraction that which is not only non-Catholic, but un-Catholic, and to provide the huge body of fiction readers with novels, tales, romances, etc., which shall be at least harmless to Catholic readers, and shall not be obnoxious to the many great objections that the mass of non-Catholic current fiction may be accused of. But there is another sphere of influence, of absolutely recent growth and of daily increasing extension.

"Quite young people must remember the time when picture shows were of no importance; people who are scarcely middle-aged can remember a time when such shows did not exist at all. Already any considerable town in the 'civilized' world is full of them, and even in the smaller towns and in villages they are seen and will soon be more and more seen. Villagers crowd into the towns near to them to see these shows: and we are told that as much money is spent in seeing them as used to be spent on drink. Probably that statement is short of the truth, for thousands of decent and quiet folk, who never did spend much of their wages in drink, see no objection to buying this easy form of recreation." (99)

The author expresses alarm over the great hold that movies have on millions of people and not that many youth who do not "read even the most morbidly sensational newspapers" attend the movies regularly. (100) After explaining his objections to modern literature and film, the author asks "Can anything be done?" (105) "We cannot, of course, hope to monopolize the picture teaching of the world, but we can try to get our share of it, to enlarge our share industriously everywhere to get hold of this weapon also, and make it more and more operative in our hands. Nor would it appear that such an enterprise would be either so difficult or so costly as the other enterprise -- of opposing a Catholic press to a non-Catholic or anti-Catholic press...." (106)

The author calls for mobilizing public opinion on the side of "what is wholesome and of good repute as any official censorship is ever likely to exercise" to opposed "the ideas of crime, violence and low standards as to marriage." (109)

"It would be cowardly and indolent to do nothing because it might seem hopeless to succeed everywhere and altogether. No vigilance committees have secured the total suppression of vice anywhere; they can but do their best, and their best is better than nothing. No censorship has ever put down all immoral books, but many immoral books are suppressed, and to suppress objectionable picture shows is less difficult than to destroy an evil book, because they work in public and the worst books can only be sold in secret; indeed, it may almost be said that the worst books are only sold to them who are at pains to seek them out. Nor is local effort very powerful against a book that is objectionable, but local effort could be made almost omnipotent against an objectionable picture show." (109)

**1158.** Bach, Steven, ed. *Final Cut: Dreams and Disaster in the Making of Heaven's Gate*. New York: William Morrow and Company, Inc., 1985.

Bach was vice president for East Coast and European production during the making of *Heaven's Gate*. The story details the disastrous story of this film. No United Artist executive had seen the final print of this movie before it opened. The movie sank United Artists which virtually ceased to exist afterward. There is material in this book that discusses the motion picture rating system, particularly as it applied to Woody Allen's movie *Manhattan*. There is also some information on Arthur Krim, who headed United Artists from 1951 to 1978, and who later became chair of Orion Productions.

**1159.** Bachman, W. S., B.B. Bauer, and P. C. Goldmark. "Disk Recording and Reproduction." *Disc Recording and Reproduction*. Ed. H. E. Roys, ed. Stroudsburg, PA: Dowden, Hutchinson [sic] & Ross, Inc., 1978. 9-15.

This article is a historical survey of sound recording, and discusses such men as Edison, Berliner, Bell, and Tainter. It covers major developments in disc recording up to 1962. The work also has a useful list of references on this topic. The articles originally appeared in *IRE Proceedings*, 50 (May, 1962), 738-44 (copyrighted by the Institute of Electrical and Electronics Engineers, Inc.).

**1160.** Baehr, Harry W., Jr., ed. *The New York Tribune since the Civil War*. New York: Dodd, Mead & Company, 1936.

In this history of the *New York Tribune*, the author recounts how this publication became the first to reproduce halftone photographs in its daily paper. Baehr writes: "Line cuts were used frequently after 1883; a daily political cartoon by Leon Barrett began on July 10, 1899, and on January 21, 1897, a portrait of Thomas Collier Platt marked the first use of the half-tone process for photographic reproduction in a daily newspaper. This innovation resulted from the experiments of Stephen H. Horgan, a former art direct on the [NY] *Herald*. Horgan had submitted his idea to the younger [James Gordon] Bennett, [Jr.] who, after seeking expert advice, was convinced that the notion of applying half-tone screens to the curved stereotypeplates was impractical. This shook his confidence in his art director and Horgan was presently out of a job. He applied to [Whitelaw] Reid with better success, and a fine facsimile of Platt's foxy features eventuated." (235)

The author also discusses Sunday supplements. "'Sunday Supplements,' in the modern sense, first appeared in the *Tribune* of November 8, 1896, in the form a of a 'serio-comic Weekly' called *Twinkles*. This was a curious melange of 16 pages of glazed stock, headed by a colored political cartoon. An 'editorial' explained the cartoon, in rather English fashion, and the rest of the supplement was composed of comic cartoons and articles, photographs of social lights, and political comment in the lighter vein. *Twinkles* had a short life, being succeeded on May 30, 1897, by a regular Illustrated Supplement of more conven- 235/236 tional form -- feature articles, illustrated by line cuts and photographs, with a few jokes, usually scissored from humorous publications. In this form the Supplement ran on until it was replaced by the Sunday Magazine." (235-36)

The author also notes that "The Only Woman's Page" appeared in the *Tribune* around 1896.

**1161.** Baer, Walter S. "Information Technologies in the Home." *Information Technologies and Social Transformation*. Ed. Bruce Guile, ed. Washington, D.C.: National Academy Press, 1985. 123-53.

This volume is in the National Academy of Engineering's Series on Technology and Social Priorities. Bruce R. Guile is editor of this volume. Photocopy filed under "Guile, Bruce."

**1162.** Bagdikian, Ben H., ed. *The Information Machines: Their Impact on Men and the Media*. New York: Harper & Row, 1971.

In 1971 Bagdikian wrote: "Today we are on the threshold of a change in human communications more powerful than our innocent introduction to electronic pictures in 1927, perhaps more significant than all past changes in the technology of information. The way men deal with each other and with the distant world is about to be transformed by a combination of the computer, innovations in the transmission of signals, and new ways to feed images into this system and to take them out."

Bagdikian focuses "on what the content of daily information will be, what form it will be delivered in, and how it will be distributed throughout the population."

He believed in 1971 that a major change had already occurred. Everyone now had virtually instant access to the news. "In this generation, for the first time in the history of any large nation, the potential audience for news had become almost the total population," he wrote. "Television and the ubiquitous car and transistor radios, plus the telephone to provide quick secondhand reporting, means that for the first time in history something approaching the total population of a society is in instantaneous contact with urgent global – and extra-global – developments."

**1163.** ---, ed. *The Media Monopoly*. Boston: Beacon Press, 1983.

Bagdikian argues that monopoly control of the media has allowed corporations to dictate what U.S. citizens receive as news and information. This concentration of corporate control has suppressed news and information that would reflect poorly on those corporations, big business in general and government policy written to favor big business. He asserts that media owners are pushing a pro-business news agenda.

--Phil Glende

Ben Bagdikian's book has become a standard reference for any scholar interested in studying the economics of media ownership and the implications for a democratic society. Now in the fifth edition, this book documents the increasing concentration of ownership by a handful of multinational corporations. Its particular focus is the chain newspaper and the way in which news is prepared and disseminated by them. He uses the introduction to note that the largest newspaper chain at the time was fifty-six times larger than the largest chain at the time of the first edition. This new edition is updated to include material on the Internet and other elements of the Information Age.

To Bagdikian, the importance of monitoring the increasing concentration of ownership goes beyond financial or statistical interest. He believes that the American democratic system is at stake. These media corporations have the power to alter the political agenda of the country and exert influence over both voters and political leaders. Because of their capitalist nature, Bagdikian argues that these businesses shape economic and political debates to their own financial advantage. News is not presented to inform, but to sell an image and increase profits.

Bagdikian believes that the democratic process works best when a wide range of voices and opinions are available. In his view, the media monopoly artificially constricts the range of debate, presents the public with

inaccurate information, and ultimately erodes democratic freedoms. Serious concerns are played down while advertising and trivial entertainment fills the newspaper each day. He also argues that corporate absentee ownership, rapidly taking the place of local ownership, disrupts the relationship between communities and their government. The book contains a wealth of examples of biased or incomplete coverage of news stories, along with an examination of the way in which advertising concerns shape this coverage. Bagdikian sees little chance for the Internet to break down this system. As it becomes more commercial, the most popular and widely used web sites are owned and maintained by the same corporate powers that own the other media outlets.

The final chapter of the book lists a series of actions that would address many of these problems. Bagdikian does not argue against commercial control of the media. Instead, he proposes stronger governmental regulation of media ownership and a tax on national mass advertising. He urges journalists and media managers alike to strengthen the wall between objective news content and corporate business interests. Finally, he asks for greater public awareness and interest in the problem. Political leaders are still willing to listen to the voice of the people.

--Rob Rabe

**1164.** Bagley, J. A. "Aeronautics." *An Encyclopedia of the History of Technology*. Ed. Ian McNeil, ed. London and New York: Routledge, 1990. 609-47.

An introduction to major developments.

**1165.** Bagrit, (Sir) Leon, ed. *The Age of Automation: The BBC Reith Lectures, 1964*. London: Weidenfeld and Nicolson, 1965.

Born in the Ukraine, Bagrit came to London at age 12 at the outbreak of World War I. He became an authority on automation and maintained that the mechanization of the industrial revolution should not be confused with the automation of the mid-20th century. "Automation is not a devil, a Frankenstein," he said. "It is no more than a tool, but a tool of such immense possibilities that no one can yet see the full extent of what it might achieve for mankind." In these lectures, he argued that whereas mechanization had "sometimes given millions of people sub-human work to do," automation would do "the exact opposite." He predicted that some day, people would carry computers that were the size of transistor radios.

These lectures might be read in conjunction with an interview Bagrit gave to Clyde H. Farnsworth of the *New York Times* (March 17, 1965, p. 66). There he said that automation represented "the greatest change in the whole history of humankind." It was a process that would change life so dramatically that within a few decades the pre-1960 world would "seem as rural as England before the Industrial Revolution." (Farnsworth paraphrasing Bagrit)

**1166.** Bailey, James, ed. *After Thought: The Computer Challenge to Human Intelligence*. New York: Basic Books, 1997.

This book deals with the way in which computers change the way we assimilate knowledge and conduct research. Massive changes are in store, Bailey suggests. Bailey argues that computers are poised to supplant human beings in the evolutionary process. What he calls "bit evolution" is a third evolutionary phase, following upon the original genetic evolution, which was followed by the much more rapid cultural evolution sped along by the printing press and other modes of mass communication. Something Bailey terms "intermaths" will correlate to newly relevant data as the now outdated geometry and calculus did in their own time. Computers are already vital organisms, Bailey maintains, and the better part of human wisdom is simply to stand back and give them ample room to evolve as they will. The book, which uses primarily secondary sources, is something of a history of human knowledge as it has been manifested through numbers.

**1167.** Bailey, John. "Film or Digital? Don't Fight. Coexist." *New York Times* Feb. 18, 2001 2001, sec. 2 (Arts and Leisure): 9, 20.

This article explains how digital movies work and considers their relationship to traditional, non-digital film making.

**1168.** Bailyn, Bernard , and John B. Hench, eds., eds. *The Press and the American Revolution*. Worcester, MA: American Antiquarian Society, 1980.

This collection of eight essays on various aspects of the colonial and revolutionary press remains the most useful source of information for historians studying the development of newspapers during this crucial period. American newspapers changed dramatically in their content and purpose in the years before the war and played a key role in informing early Americans about news and events, mobilizing and maintaining public opinion, and helping give shape to a budding American nationalism. The newspaper that emerged in the 1780s would no longer be an a-political commercial sheet run by an artisan printer, but would instead become an actor on the political stage. One strength of the collection is the inclusion of essays on less common topics, like the loyalist press, newspapers of the southern colonies and the German-language press of the day. These selections help broaden the normal scholarly focus on the New England area patriot printers. The book also contains a collection of statistical tables and charts, explained clearly in an essay by G. Thomas Tanselle, that gives a numerical sense of early publishing.

Two of the essays stand out as most insightful. First is Stephen Botein's "Printers and the American Revolution," which details the growing political orientation of the press. Events like the Stamp Act in 1765 and the rising factionalism of public opinion forced printers to take a stand on the question of independence, however reluctantly. As printers became politicized, newspapers began to play a greater role in the movement for independence (or the loyalist cause in some instances). Printers saw themselves as public servants, deserving of strong safeguards of press liberty. The essay "Freedom of the Press in Revolutionary America," by Richard Buell, Jr., is a valuable contribution to the study of the emergence of press freedom in the United States. Americans, Buell argues, understood press freedom in a way that seems contradictory only in retrospect. The Sedition Act, for example, was not seen as necessarily at odds with the first amendment as it clearly does to us today. The revolutionary experience left Americans deeply committed to preserving press freedom for legitimate political dialog and information, but also deeply worried about its potential for misuse.

**1169.** Baird, John Logie. "Television, or Seeing by Wireless." *Discovery* 6 (1925): 142-43.

**1170.** Baker, David, ed. *The Shape of Wars to Come*. New York: Stein and Day, 1981.

Chapter two ("Orbital Eyes: Reconnaissance from space"), and some pages from the next chapter ("Soviet Ploy") have good, basic information about the various stages of satellite reconnaissance during the 1960s, and how this technology dramatically changed what was known of the USSR and more generally of our planet.

**1171.** Baker, Nicholson, ed. *Double Fold: Libraries and the Assault on Paper*. New York: Random House, 2001.

Baker warns about the destruction of paper records, newspapers, "book wastage and mutilation." One wave came with microfilming. Another, just starting, he maintains, is digital recording keeping. Baker laments the wholesale destruction of old newspapers. The book's title comes from a test employed by librarians on paper "in

which they folded the corner of a page back and forth until it broke." Brittle records were scheduled for destruction. This book has an excellent bibliography.

**1172.** Baker, Robert K. , and Ball, Sandra J., eds. *Mass Media and Violence. Volume IX. A Report to the National Commission on the Causes and Prevention of Violence.* Vol. 9. Washington, D. C.: Government Printing Office, 1969.

This Report to the National Commission on the Causes and Prevention of Violence in 1969 provides information about research on the effects of television violence. At that time, there were relatively few empirical studies on this topic -- something that would change dramatically during the 1970s as numerous researchers began to study this problem.

**1173.** Baker, Ray Stannard. "Peter Cooper Hewitt -- Inventor: Three Great Achievements in Electrical Science." *McClure's Magazine* 21.2 (1903): 172-78.

Ray Stannard Baker discusses three inventions by Peter Cooper Hewitt: 1) a new electric lamp or vacuum lamp; 2) a new, inexpensive way of converting alternating currents into direct electrical current; and 3) "an electric interrupter or valve" which is significant for wireless telegraphy.

As for the vacuum lamp, Baker says that the "light was different from anything ever seen before, grateful to the eyes, much like daylight, only giving the face a curious, pale-green, unearthly appearance. The cause of this phenomenon was soon evident; the 172/173 tubes were seen to give forth all the rays except red, -- orange, yellow, green, blue, violet -- so that under its illumination the room and the street without, the faces of the spectators, the clothing of the women lost all their shades of red; indeed, changing the very face of the world to a pale green-blue.... Here was an entirely new sort of electric light. The familiar incandescent lamp, the invention of Thomas A. Edison, though the best of all methods of illumination, is also the most expensive. Mr. Hewitt's lamp, though not yet adapted to all the purposes of its peculiar color, produces eight times as much light with the same amount of power. It is also practically indestructible, there being no filament to burn out; and it requires no special wiring. By means of this invention electricity, instead of being the most costly means of illumination, becomes the cheapest -- cheaper even than kerosene. No further explanation than this is necessary to show the enormous importance of this invention." (172-73) An advantage of this lamp over Edison's light is that it is much cooler. "The waste of power in the incandescent lamp is known to be due largely to the conversion of a considerable part of the electricity used into useless heat. An electric lamp bulb feels hot to the hand. It was therefore necessary to produce a cool light; that is, a light in which the energy was converted wholly or largely into light rays and not into heat rays." (175) Hewitt discovered the uses of mercury vapor and that "*when once the high resistance of the cold mercury was overcome, a very much less powerful current found ready passage and produced a very brilliant light: the glow of the mercury vapor.*" ((176)(emphasis in original text)

Baker discusses the problems associated with the absence of red light rays which gave "a very strange impression of a redless world." (176) He notes that Hewitt was hoping to use red rays "thereby producing a pure white light." (176) The new lamp, though, appeared to "have a peculiar and stimulating effect on plant growth." (176)

Regarding the conversion of ac to dc, Baker says that the "chief pursuit of science and invention in this day of wonders is the electrical conquest of the world, the introduction of the electrical age. The electric motor is driving out the steam locomotive, the electric light is superseding gas and kerosene, the waterfall must soon take the place of coal." (173)

Baker considered the electric interrupter or valve the "most wonderful" of these three inventions. (173) It can "be called the enacting clause of wireless telegraphy," he writes. (174) This invention promises to improved on the method of sending messages across the Atlantic used by Marconi. (177) "'What I have done,' said Mr. Hewitt, 'is to perfect a device by means of which messages can be sent rapidly and without the loss of current occasioned by the

spark gap. In wireless telegraphy the trouble has been that it was difficult to keep the sending and the receiving instruments attuned. By the use of my interrupter this can be accomplished." (178)

Baker concludes by saying that "the possibilities of the mercury tube, indeed of incandescent gas tubes in general, have by no means been exhausted. A new door has been opened to investigators, and no one knows what science will find in the treasure-house-- perhaps new and more wonderful inventions, perhaps the very secret of electricity itself...." (178)

**1174.** Baker, Thomas Thorne, ed. *Wireless Pictures and Television: A Practical Description of the Telegraphy of Pictures, Photographs and Visual Images*. New York: Van Nostrand, 1927.

**1175.** Bakshy, Alexander. "Color in Modern Life." *Current History* 40 (1934): 444-48.

Bakshy, a drama and film critic, here comments on the "enormously important place in modern life" (444) that color had come to hold in 1934. He begins by quoting Ruskin in *The Stone of Venice* in which he says that "the purest and most thoughtful minds are those which love color most." (Ruskin quoted, 444) He ends this piece by noting that color is often associated with the emotional Oriental mind as opposed to the more logical Western mind which put form above color. Was there some kind of "radical change ... to be expected in our general attitude toward life? ... Are we then heading for a civilization ruled by emotion rather than intellect?" he asks. (448)

The author says that "our life has been invaded by prismatic color in all the endless variety of its shades and combinations," (444) and these colors have come into both homes and the workplace. Two factors help to explain this explosion of chromatic color. One is that "chemists and electricians discovered the means of producing color in large quantities and cheaply," (444) he says. The second, and perhaps more important factor in color's spread, is "because manufacturers of many articles found in color a new allurements for buyers." (444) This "ever-increasing use of color" (446) in advertising resulted from "overproduction" by American manufacturers. (446) It was a way of making goods more alluring, and a way of disguising products of poor quality or of giving a misleading impression of a product's quality. (444)

Color, Bakshy says, is also especially apparent in textiles. He notes that since the end of World War I it was more difficult to get dyes from Europe. This fact forced finding a solution of "fixing uniform shades of color with the seasonal changes of fashions." (445) The Textile Color Card Association of the United States was established in 1915 and its "Standard Color Card of America" listed 128 colors. (445) It helped to keep American textiles from being dominated by British and other foreign textiles.

The dyestuffs industry has been essentially a post-World War I development in the United States. Prior to the war, about 90 percent of the dyes Americans consumed came from foreign countries. By 1930, the U. S. imported only 18 percent of its domestic consumption of and 6.2 percent of the quantity of dyes used. (448) In 1934, the U. S. was an important exporter of dyes.

Color in advertising in 1934 was readily noticeable in newspapers and magazines, but "because of the technical difficulties of printing newspapers in colors, magazines have run ahead of newspapers, though the latter have gradually been catching up," Bakshy reported. (446) One needed only to look at the Sunday rotogravure sections of the *New York Times*. (446)

Bakshy said that "next to magazines and newspapers, color in advertising is particularly prominent in posters and billboards." (446) While there were objections to the "indiscriminate use" of colored posters and billboards, (446) less offensive were "the colored lights which have been transforming the principal streets of our cities into a fairyland of scintillating glamour particularly the electric gas-filled tubes of various colors, with their soft glow and easy adaptability to any desired pattern. Entire buildings, moreover, are sometimes illuminated by flood-lighting for advertising purposes and lend enchantment to the urban scene at night." (446)

Colored electric lighting has made the theater more visually beautiful. As an art form, "color music" is still in its "rudimentary stage." (447) Advances have come in using color in printing, photography, and movies. The goal has been to use color as one means toward the "approximation of visual reality." (447) Why there have been technical advances in accomplishing this approximation in color photography and motion pictures, "the goal is still far from attained." (447) Much greater technical advances have come in color printing. Bakshy says that "color printing has had a tremendous influence on modern culture, for it has become the principal means by which the knowledge of art reaches the masses of the people." (447) Magazine illustrations and poster art have been especially important in this regard. It has led to "a new and important, if unduly commercialized, medium" giving artists new means of expression and the "ability to disseminate appreciation of art among the people." (447)

**1176.** Baldasty, Gerald J., ed. *The Commercialization of News in the Nineteenth Century*. Madison: University of Wisconsin Press, 1992.

This short, readable book examines the commercialization of news during the nineteenth century. Baldasty looks at the role of advertising, hidden ownership, and other pressures that changed newspapers during the Industrial Revolution. This work offers a good treatment of this subject, one appropriate for undergraduate readers.

-- SV

What this book lacks in length it more than makes up for in insight and clarity. Baldasty's 140 odd pages of text are probably the most important examination of the enormous changes in the newspaper industry in the late nineteenth century. More accurately, it is the story of the emergence of something that can be called a newspaper industry in the United States and the decline of the partisan newspapers so dominant in the early and middle century. Baldasty also upsets the traditional narrative of the rise of urban commercial journalism as progress, making instead the provocative argument that the partisan press may have actually served Americans better because of their emphasis on politics and promotion of the obligations of citizenship. As he says, the low cost of the cheap urban newspaper hid important real social costs and were no bargain.

Baldasty's background as a scholar of the Jacksonian era party press informs this book as well, and the first chapter of *The Commercialization of the News in the Nineteenth Century* is one of the most succinct and informative discussions of the operation of what he calls the Party Press Model. He briefly outlines the role of the editor in the party structure and the necessity of patronage as a source of funds for the newspaper, while offering an evenhanded assessment of the limitations of one-sided "news" presentation and the potential for corruption. This chapter, and the book as a whole, serves the needs of an instructor teaching a journalism history course very well.

The remainder of the book shows how commercially-driven changes in the later nineteenth century affected newspapers. Most notably, advertising replaced patronage and subsidy and the journalist in effect was forced to serve a new master. Baldasty highlights the tension between "good journalism" as editors might have wished to practice it and the needs and desires of the advertisers who paid the bills. As the cost of operation a newspaper skyrocketed, largely due to increases in the cost of presses and newsgathering, newspapers began to run like a business, with the ultimate goal of profit for the investors. With this in mind, predictability and lowering operation costs became paramount concerns. The newspaper at the turn of the century was a totally different creature than it had been in the 1830s and, as Baldasty points out, was no longer serving the needs of a democratic society, despite the fact that the press still enjoys special legal status.

The book is readable, but not eloquent. It is broken into many small sections and suffers from excessive quotations and examples considering its length. While not ideal leisure reading, Baldasty's book is an excellent supplemental text for undergraduates in a journalism history class. The book is based on dozens of manuscript collections, trade publications, and newspapers. Of interest is the author's use of the proceedings of press association meetings, which are often a neglected source of "inside information" about the newspaper business.

-- Rob Rabe

**1177.** Baldwin, Neil, ed. *Edison: Inventing the Century*. New York: Hyperion, 1995.

Neil Baldwin, English professor, specializing in modern American poetry, has written a captivating biography of one of the most pivotal figures in American history. Relying on the letters of Edison and his associates, Edison's own autobiography (which he admits is not to be completely trusted), other Edison biographies, scientific articles written by Edison, his reception in the media, and the literary fiction of the period (such as Edward Bellamy's *Looking Backwards*), Baldwin tells the story of Edison the man, the inventor, and the bad husband.

Edison's many inventions are dissected in detail: his race to perfect the telephone before Bell did, his aspirations for the phonograph (education through recordings of *Decline and Fall of the Roman Empire*), his motion pictures (he was unable to conceptualize film as entertainment and lost out on the film industry), and most importantly: electric lighting (which he promoted by publicly decrying gas as dirty and producing ugly light).

Baldwin presents Edison as a complicated man who was so focused on work that he slept only 4-6 hours night, frequently skipped meals, and rarely saw his wife and children. He was deaf, but did not want to work on inventing a hearing aid because he saw his deafness as an asset. Although many worked on his inventions, he usually expected to get full credit. Although he was a brilliant man, he was unable to let go of his cylinders even when records became popular.

For Baldwin's discussion such innovations as the phonograph, electricity, and motion pictures, see especially chapters 8-12, 19, and 21.

**-Hallie Lieberman**

**1178.** Baldwin, Thomas F., D. Stevens McVoy, and Charles Steinfeld, ed. *Convergence : Integrating Media, Information & Communication*. Thousand Oaks, CA: Sage Publications, 1996.

Although this book does not specifically focus on the Internet, it explores the process of media convergence—the coming together of print, broadcasting, cable and telecommunications media enabled by computers and digitization. The authors consider the conditions that led to this convergence, the hurdles which must still be overcome, and the implications for the businesses involved, their management, public policy, and the economy. Included in this analysis is a detailed description of the key technological breakthroughs (fiber optics, satellite, ISDN, and increasing bandwidth) and what each means for the future of interactive media. The work relies primarily on secondary sources.

**--Mark Tremayne**

**1179.** Balides, Constance. "Immersion in the Virtual Ornament: Contemporary 'Movie Ride' Films." *Rethinking Media Change: The Aesthetics of Transition*. Ed. David Thorburn and Henry Jenkins, eds. Cambridge, MA: MIT Press, 2003. 315-36.

Balides' "point is that an incorporative mode of worker subjectivity in post-Fordism finds a homologous logic in immersion in the virtual ornament. This mode of immersion characterizes both the representation of

spectatorship in contemporary media and formal strategies drawing spectators into the diegetic worlds of 'movie ride' films. When these worlds are virtual are virtual, they suggest an investment not only in a synthetic reality but in an ephemeral spectacle." (328) Go figure.

Balides' essay is one of twenty-two chapters by different authors that attempt to improve our "understanding of emerging communication technologies." This volume, which part of a larger series on new media technologies entitled *Media In Transition*, tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. The editors of this volume describe the chapters in this work as follows: "Challenging the assumption that new technologies displace older systems with decisive suddenness and have a revolutionary impact on society, the essays in this book see media change as an accretive, graduate process, always a mix of tradition and innovation, in which emerging and established systems interact, shift, and collude with one another.

**1180.** Balio, Tino, ed., ed. *The American Film Industry*. Madison: University of Wisconsin Press, 1976.

This collection contains several essays that touch on the technology of cinema, censorship, and the economics of Hollywood. The essays are divided into four parts: "A Novelty Spawns Small Businesses, 1894-1908" (including Gordon Hendricks' piece on "The History of the Kinetoscope"); "Struggles for Control, 1908-1930" (including Balio on the founding of United Artists, and Douglas Gomery on "U.S. Film Exhibition," and "The Coming of Sound: Technological Change in the American Film Industry"); "A Mature Oligopoly, 1930-1948"; and "Retrenchment, Reappraisal, and Reorganization, 1948- " (including Richard S. Randall on "Censorship: From *The Miracle* to *Deep Throat*," and John Cogley on "HUAC: The Mass Hearings").

**1181.** Balio, Tino. "The art film market in the new Hollywood." *Hollywood and Europe: Economics, Culture, National Identity: 1945-95*. Eds. Nowell-Smith, Geoffrey and Ricci, Steven. London: BFI Publishing [British Film Institute], 1998. 63-73.

Balio notes that between 1950 and the 1960s, the number of movie houses that played "art films (defined as foreign-language films and English-language films produced abroad without American financing)" increased from about 100 to almost 700. After 1970, "the art film market functioned as a niche business.... During the consolidation of the American film industry in the 1990s, the art film market was taken over by the Hollywood majors who either created classics divisions or acquired the leading independent art film distributors. Although such moves were reminiscent of the companies' behaviour during the 1960s, the renewed interest in speciality film in the 1990s did not spur the new Hollywood to invest in indigenous foreign film production. Like the 1960s, however, Hollywood absorbed promising foreign film-makers, thereby depriving 'other national cinemas of their major talents and thus reducing competition for its own products.'" The book in which this essays appear is part of the series *UCLA Film and Television Archive Studies in History, Criticism and Theory*.

**1182.** ---, ed. *Grand Design: Hollywood as a Modern Business Enterprise, 1930-1939*. New York: Charles Scribner's Sons, 1993.

This volume, the fifth in Scribner's *History of American Cinema* (Charles Harpole, ed.), has chapters by several authors. Balio's contribution is the Introduction, Chapter 2 ("Surviving the Great Depression"), Chapter 4 ("Feeding the Maw of Exhibition"), Chapter 6 ("Selling Stars"), and Chapter 7 ("Production Trends"). The chapter that speaks most directly to film technology is Chapter 5 by **David Bordwell and Kristin Thompson** entitled "Technological Change and the Classical Film Style." Other chapters include "The Production Code and the Hays Office," by Richard Maltby; "The B Film: Hollywood's Other Half," by Brian Taves; "The Poetics and Politics of Nonfiction: Documentary Film," by Charles Wolfe; and "Avant-Garde Film," by Jan-Christopher Horak.

--SV

Part of the Scribner's series on American cinema, this work deals with the development of Hollywood into a major industry in the 1930s. It draws on secondary sources, as well as magazine articles and the movies of the time. It deals briefly with the influence of technology, in particular the development of special effects. A stunning ten-minute earthquake scene in the highly popular movie *San Francisco* represented a groundbreaking use of special effects. That the audience was able to stay riveted for ten minutes to such footage in an era of more conversational films was duly noted by the industry, and a trend was begun that has resulted in the Star Wars series and its numerous imitators in our own time.

--Gordon Jackson

**1183.** Ball, Leslie D. "Computer Crime." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 533-45.

The use of such new information technology as personal computers and distributed processing have made computer crime much easier for all levels of workers. The exact extent of such crime (in 1982) is hard to estimate precisely, but quick action is needed to prevent further losses. At the time of this piece, the author was an assistant professor at Babson College in Wellesley, MA. This article first appeared in *Technology Review* (April 1982).

**1184.** Ball, Philip, ed. *Bright Earth: Art and the Invention of Color*. New York: Farrar, Straus and Giroux, 2001.

This book offers a lucid account of how the materials available for making colors, and the technology of color, have influenced the nature of painting. "Color, like music, takes a shortcut to our senses and our emotions," Ball writes. (vii) He notes that during the latter half of the twentieth century, "color itself [was] being reinvented."

Philip Ball is a science writer trained in chemistry with a doctorate in physics. His earlier books include *Made to Measure: New Material for the 21st Century* (1997), a study in materials science about how scientists are inventing thousands of new materials.

**1185.** ---, ed. *Made to Measure: New Materials for the 21st Century*. Princeton: Princeton University Press, 1997.

Philip Ball begins this work by quoting Norbert Wiener who said that "invention, as contrasted with the more general process of discovery, is not complete until it reaches the craftsman," by which time, Ball says, "it no longer seems heroic, and the rest of the world has generally lost interest." By taking this attitude, Ball argues, is to lose sight of some of the most important consequences of innovation. "This book is about invention," he writes, "and I think also about a craft: the craft of making new materials, of designing new fabrics for our world. I find these fabrics astonishing. We can make synthetic skin, blood, and bone. We can make an information superhighway from glass. We can make materials that repair themselves, that swell and flex like muscles, that repel any ink or paint, that capture the energy of the Sun." (3-4)

Ball writes intelligently about complex scientific developments and in a manner that is understandable for non-scientists and other non-specialists. He offers a series of self-contained chapters designed to be "a collection of snapshots of materials science." (13) The opening chapter, "Light Talk: Photonic Materials," maintains that the next information technology revolution will abandon the transistor and use light to convey information. Chapter 2, "Total Recall: Materials for Information Storage," looks at light-based information storage. In this chapter, Ball explains magnetic recording ("writing with magnetism"). He suggests that photonics will supersede this means of information storage. "Convention magnetic information storage is a technology designed to be compatible with electronic information processing," he writes. "But when photonics replaces this means of handling data (as it surely will), information storage will have to adapt to suit the new regime.... If photonics is to be the information technology of the future, there will be ever more of a pressing need to develop ways of storing data optically." (79) He discusses the advantages of compact discs and suggests that despite its advantages, its "fatal flaw ... is that it is not (yet) possible to erase and write over the information on a disk." (80)

Chapter 3, "Clever Stuff: Smart Materials," argues that by coupling smart materials "to sensors and microprocessors" it will be possible to create "intelligent systems that adapt their properties to their environment." (103) Chapter 4 is "Only Natural: Biomaterials." Chapter 5, "Spare Parts: Biomedical Materials," points out that "most of the human body can now be replaced with artificial parts," and that increasingly, the trend is "toward bioactive or bioadaptive materials that cooperate with living tissues rather than ignoring them. The ultimate goal is the growth of new organs, which will come from a marriage of molecular biology and materials science." (209) Chapter 6 is entitled "Full Power: Materials for Clean Energy." Chapter 7, "Tunnel Vision: Porous Materials," explains how "materials with finely sculpted interiors are now being built by molecular architects." (282) In "Hard Work: Diamond and Hard Materials," chapter 8, Ball talks about synthetic diamonds and "diamond films" that "can now be grown at low pressures from carbon-containing vapors," and which "promise to usher in ultra-hard protective coatings and new kinds of electrical and optical devices." (313) Chapter 9, deals with "Chain Reactions: The New Polymers," and chapter 10, "Face Value," covers "Surfaces and Interfaces" that are engineered with "molecular-scale precision." (384)

Ball is a science writer trained in chemistry with a doctorate in physics. He has also written *Bright Earth: Art and the Invention of Color* (2001), about how the materials available for making colors, and the technology of color, have influenced the nature of painting.

**1186.** Balle, Francis. "The Communication Revolution and Freedom of Expression Redefined." *The Media Revolution in America and in Western Europe: Volume II in the Paris-Stanford Series*. Ed. Everett M. Rogers and Francis Balle, eds. *Paris-Stanford Series*. Norwood, NJ: Ablex Publishing Corp., 1985. 80-91.

According to Balle, the "central issue of mass communication policy throughout the world has been the freedom of expression. On one hand, communicators should have complete independence to write and say what they wish, without having to consider what the State wishes. In reality, the State often constrains such complete freedom of expression, so as to ensure that the mass media act in a way that is socially responsible. In this chapter, the historical background of the freedom of expression is traced, both in America and Europe, leading up to the current concern with the new media (that represent the Communication Revolution)." New communication technologies "represent a basic change in who can communicate with whom (and what content is transmitted)," and therefore "force a basic reexamination of the conditions for the freedom of expression."

This work is Volume 2 in the *Paris-Stanford Series*, edited by Everett M. Rogers and Francis Balle.

**1187.** Barak, A., W. A. Fisher, S. Belfry, and D. R. Lashambe. "Sex, guys, and Cyberspace: Effects of Internet pornography and individual differences on men's attitudes toward women." *Journal of Psychology & Human Sexuality* 11.1 (1999): 63-91.

This study examined the relationship that self-selection of pornographic materials via the Internet had with attitudes toward women, acceptance of rape myths, and likelihood of harassing a female. Participants were allowed to use a computer with preset site options based on the percentage of bookmarks being pornographic ranging from 0 percent pornographic to 80 percent pornographic. Contrary to expectations they did not find any differences in attitudes toward women, likelihood of sexual harassment, and rape myth acceptance between the four conditions. Although this study does not demonstrate a relationship between exposure to pornographic materials on the Internet and negative effects the authors indicate that there still exists a great deal of concern regarding the issue of Internet pornography.

--Michael Boyle

**1188.** Baran, Barbara. "Office Automation and Women's Work: The Technological Transformation of the Insurance Industry." *High Technology, Space, and Society*. Ed. Manuel Castells, ed. Beverly Hills, CA: Sage Publications, 1985. 143-71.

**1189.** Barber, Benjamin R. "Which Technology and Which Democracy?" *Democracy and New Media*. Ed. Henry Jenkins and David Thorburn, eds. Cambridge, MA: MIT Press, 2003. 33-47.

Barber offers four caveats in this essay: 1) He is not a technological determinist. 2) People often overestimate how much of "new technology" is actually new. 3) "We need to remind ourselves that spectrum abundance (the multiplication of conduits and outlets) is not the same thing as pluralism of content, programming, and software. When we distinguish content from the conduits that convey it, the consequences of monopolistic ownership patterns become much more obvious. For as the ownership of content programming, production, and software grows more centralized, the multiplication of outlets and conduits becomes less meaningful." (34) 4) Barber discusses the "generational fallacy, which is at play in the history of technology generally. Those who create and first use new technologies take for granted the values and frameworks of previous eras and previous technologies and assume that new generations will have those same values and frameworks. Wrapped in the cocoon of presentness, they forget that for a new generation introduced to the world only via the new technologies, the values and frameworks that conditioned and tempered those who invented the technologies will be absent. For the second generation of users, this can be corrupting in ways invisible to the pioneers and inventors." (35)

The volume in which Barber's chapter appears is part of a larger series on new media technologies entitled *Media In Transition*. The volume tries to offer a historical and comparative perspective on its subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. As the editors explain, the "essays in this volume capture something of the complexity and disagreement in current discourse about the politics of cyberspace. Some contributors offer us front-line perspectives on the impact of emerging technologies on politics, journalism, and civic experience. What happens when we reduce the transaction cost for civic participation, or increase access to information, or expand the arena of free speech? Other contributors place our shifting understanding of citizenship in historical context, suggesting that notions of cyberdemocracy and online community must grow out of older models of civic life. Still others expand this conversation to consider the global flow of information and to test our American conceptions of cyberdemocracy against developments in other parts of the world. How, for example, do new media operate in Castro's Cuba, or in post-apartheid South Africa, or in the context of multicultural debates on the Pacific Rim? Some contributors examine specific sites and practices, describing new forms of journalism or community organizing. Some voices here are deeply skeptical; others are optimistic. For some writers the new technologies endanger our political culture; for others, they promise civic renewal.

"Most of the papers on which these chapters are based originated in series of public forums and conferences hosted by MIT from 1998 to 2000 under the title 'Media in Transition.' Funded by the John and Mary R. Markle Foundation and organized by the MIT Communications Forum, these events aimed to nourish a broad civic conversation about the political impact of new media technologies. The essays have been revised for this book." (ix-x)

**1190.** Barger, Susan M., ed. *The Daguerreotype: Nineteenth Century Technology and Modern Science*. Washington, D. C.: Smithsonian Institution Press, 1991.

**1191.** Barish, Jonas, ed. *The Antitheatrical Prejudice*. Berkeley: University of California Press, 1981.

This book is an excellent study of how actors have been regarded through history in most, if not all, cultures of the world. The author notes that throughout history, at least prior to the twentieth century, actors have been held in low regard.

**1192.** Barnaby, Frank. "Microelectronics in War." *Microelectronics and Society: For Better or for Worse: A Report to the Club of Rome*. Ed. Günter Friedrichs and Adam Schaff, eds. Oxford, Eng.: Pergamon Press, 1982. 243-72.

The author, who was a former Director of Stockholm International Peace Research Institute, Hampshire England, looks at possible applications of microelectronics to warfare. He discusses strategic submarine-launched ballistic missiles, anti-submarine warfare, cruise missiles, the automated battlefield including sensors, electronic warfare, global military communication, deterrence, and more.

**1193.** Barnard, Charles. "The New Photography." *The Chautauquan* 23.1 (1896): 75-79.

This article discusses the work of Wilhelm Conrad Roentgen, the progress photography made possible by the vacuum tube, and the x-ray. "In less than thirty days absolutely new scientific terms were apparently adopted into the daily language of the newspapers" Barnard writes. It notes that "general newspaper public" and its acceptances of these seemingly miraculous discoveries. "The vacuum tube has opened up a new country and yet the X rays may be only new manifestations of the law of motions that extends from sun to sun and, however strange these new things appear, they are yet a part of the Creator's universe." (79)

**1194.** Barnhart, Aaron. "'V' is for virtually ignored: In a software age, the hard-wired V-chip hasn't caught on." *Wisconsin State Journal (Madison)* April 28, 2000 2000: 1D, 3D.

This article is about the V-chip, which Congress required to be placed in all new television sets, and notes that relatively few people are aware of this technology and even fewer choose to use it.

**1195.** Barnhurst, Kevin G., ed. *Seeing the Newspaper*. New York: St. Martin's Press, 1994.

This book focuses on the visual makeup of the modern newspaper. "In these pages," Barnhurst writes, "I have tried to describe and map out what has been published, so that journalists and readers need not make or see the newspaper without some sense of its visual history and meaning. I have also attempted to introduce the ideas from philosophy, science, and art that contribute to a visual understanding of newspapers." The book acknowledges that television is perhaps more important to mass culture. He believes, though, that studying the newspaper and its advertising has implications for better understanding television. Chapter 2, "Understanding Photography," has a discussion of histories of photography. "General histories of photography often recite a story of technology pushed forward by 'great men' who responded to their social milieu. However, pictures also wield ideological power, convey myths, and affect their subjects. Photojournalists have tended to ignore ideology as they invented new ways of thinking about pictures."

**1196.** Barnhurst, Kevin G., and Nerone, John. "Civic Picturing vs. Realist Photojournalism: The Regime of Illustrated News, 1856-1901." *Design Issues* 16.1 (2000): 59-79.

Readers who are willing to wade through the ponderous opening of this article will be rewarded with an interesting discussion of how two periodicals, *Frank Leslie's Illustrated Weekly* and *Harper's*, used illustrations and how those pictures changed from the mid-1850s through the assassination of President William McKinley in 1901. "Illustrated journalism," the authors write, intervened "between readers and the world," and provided readers "with an artificial archive of memory images -- a primitive form of total recall of the sort that contemporary scholars ascribe to later visual media." (64) Throughout much of this period, artists played a central role in creating illustrations that appeared in the press. During the 1890s, though, photography, and with it a greater sense of realism, assumed much greater importance. This development led to a shift from "personage" which depicted "a relatively fixed set of traits that spring from social class, race, position of power, physiognomy, style of dress, and personality," to "person," (72) in which both leaders and ordinary people in natural poses assumed increased prominence. "The fixity and materiality of the personage, even the character of great men, is quite alien to the photographic age," the authors maintain. (73) The decline of this earlier "regime of illustrated journalism" implied, the authors write, "the loss of the republican ethos of citizenship." (79)

This article discusses the processes and difficulties of reproducing pictures during the late 19th century. Early on, "woodcuts and wood-engravings were the favorite media for printers of news illustrations." (62) The process of making these illustrations "was a collective and routinized one" and each picture "required the skilled intervention of several artists." (62) Pictures rarely lacked text next to them. Usually, although not always, the illustrations used were chosen on the "basis of what pictures were available." (63)

The authors discuss four genres of illustration (64-70) often found in these two magazines: 1) "prominent people"; 2) "the wonders of nature"; 3) "the built environment"; and 4) "noteworthy events." (64) They identify seven modes of illustration used by *Leslie's* and *Harper's*: 1) sketches; 2) drawings or "fine drawings"; 3) photographs, "all in a clean, mechanical rendering at first reproduced as engravings, and later as halftones" (65); 4) cartoons; 5) editorial icons; 6) maps; and 7) technical drawings. (65)

Barnhurst and Nerone discuss the "civic gaze," or "images ... created to represent incidents as they would be viewed 70/71 by a citizen not directly involved, but paying close attention at a distance." (70-71) They consider how *Leslie's* depicted the assassination of James A. Garfield. The drawing of Garfield's face as he is hit by the bullet "was based on the sketch artists' interviews with people on the scene; the journalists themselves had not been present by arrived two hours after the shooting." (72) Engraving even provided "rather gruesome depictions of his corpse being autopsied and embalmed." (73) Such "illustration of Garfield's autopsy and embalming ... reinforced the President's body as a symbol of state," the author contend. (79) By the time of William McKinley's assassination in 1901, photography was used extensively and "the position of subjectivity changed quite dramatically. By the turn of the century, subjectivity floats in the air around great events -- a fly on the wall, not connected to any identifiable social or political subject. The emphasis has moved from a public (being those with the franchise) to a more generic 'public view' available at closer quarters, revealing emotion in the moment and emphasizing the human face and body frozen in action or reaction." (72) *Leslie's* published dozens of photos of McKinley when he was alive and also of his assassin, Leon Czolgosz.

The authors argued that "the year 1890 may be taken as a watershed, a moment of change in the practice of illustrated journalism.... Photography was ... the picturing tool most congenial to the realism of the news periodical literature. The landmark moment in the marriage of social realism, journalism, and photography was the publication of Jacob Riis's *How the Other Half Lives* in 1890." (74)

This article is vague on when the daily newspaper press began to use photographs merely saying that "In the 1890s, papers such as Pulitzer's *World*, Hearst's[sic] and the *Chicago Daily News*, carried illustration like those in *Leslie's* but on a daily basis and more cheaply." (77) Actually, the daily press probably did not begin using photograph until early 1897, when Stephen Horgan at the *New York Tribune* devised a method that make such picture possible on the high-power rotary presses of daily newspapers.

By 1901, a "new regime of realism embodied in photography" had "fundamentally recast" the role of illustration in the press. "The condition for the rise of photojournalism, then, was the rejection of the regime of illustrated journalism, with its obsolescent (and perhaps too republican) collusion in the explicit artistry of storytelling." (77) "What consequences flow from the loss of the regime of illustrated news?" Barnhurst and Nerone ask. "As a result of its marriage with realism, press photography embraced a notion of reportage that required the effacement of authorship. If photographers simply operate the machinery revealing reality, they cannot be held accountable for what the camera exposes. Unlike artists and authors, who hold responsibility for their vision of the world, photojournalists are witnesses and bystanders to events ostensibly beyond their control. Thus, the realist regime effectively removed any clear lines of responsibility, hiding news work in what has been called the fog of documentary force." (78)

One result of this realism were increased images of ordinary people and ordinary life. "Realism in art welcomed into the canon of imagery the depiction of ordinary life, as opposed to great scenes from history, mythology, and literature -- a move that preceded the shift we observed in the illustrated papers.... Certainly a kind of visual

intelligence disappears when readers forget about the authored artistry of pictures, and succumb to what philosophers call naive realism." (78)

Finally, the authors believe that "a more important loss was the disappearance of an implied model of citizenship. The new regime divides the reader or viewer from the world in way normatively distinct from those of the old regime. Journalism driven by narrative carried along in its wake the reader, who anticipated sequence, emplotment, and resolution. Realist press photography trades away temporal narrative in exchange for other things, such as immediacy and emotional impact. Photojournalism is exciting and startling but, by doing more, it may, in fact, do less to bring readers into the storytelling of 78/79 news...." (78-79)

**1197.** Barnouw, Erik, ed. *Documentary: A History of the Non-Fiction Film*. New York: Oxford University Press, 1974.

Barnouw based this work on interviews with documentarists and research in film archives in twenty countries. He (and his wife) also viewed some 700 documentary films and looked at many of their scripts. He notes that the documentary can both enlighten and deceive. "The documentarist has a passion for what he *finds* in images and sounds -- which always seem to him more meaningful than anything he can *invent*. Unlike the fiction artist, he is dedicated to *not* inventing. It is in selecting and arranging his findings that he expresses himself; these choices are, in effect, comments. And whether he adopts the stance of observer, or chronicler, or whatever, he cannot escape his subjectivity. He presents his vision of the world.

"In denying himself invented action, the documentarist adopts a difficult limitation. Some artists turn from documentary to fiction because they feel it lets them get closer to the truth. Some, if would appear, turn to documentary because it can make deception more plausible.

"Its plausibility, its authority, is the special quality of the documentary -- its attraction to those who use it, regardless of motive -- the source of its power to enlighten or deceive."

**1198.** ---, ed. *The Image Empire: A History of Broadcasting in the United States: Volume III -- from 1953*. Vol. 3. New York: Oxford University Press, 1970.

This work follows volume I (*A Tower of Babel*) and Volume II (*The Golden Web*) by Barnouw. This volume covers television in the age of Joseph McCarthy, the Cold War, John F. Kennedy, Vietnam, and the first man landing on the moon. There is much interesting information in this work. For example, Barnouw discusses the use of videotape during the so-called "Kitchen Debate" between then Vice President Richard Nixon and then Soviet leader Nikita Khrushchev. The work has an Appendix that covers major events chronologically from 1953-70. Another appendix deals with "Laws" with relevant sections from the Central Intelligence Agency Act of 1949, and the Communications Act of 1934.

**1199.** ---, ed. *The Magician and the Cinema*. New York: Oxford University Press, 1981.

Erik Barnouw tried to capture a period when the history of magic and history of cinema intersected. In his chapter on "Nitrate Magic," he talks about how magicians used movies and also how films were used to create new forms of magic film tricks, ghosts, metamorphoses, mayhem (e.g., decapitations), and "new tricks." He asks in 1981 "Does not our magic industry via drama, documentary, docu-drama still summon up ghosts of yesterday and use them for present purposes, whether of statecraft, religion commerce.?" (105) He talks about slow motion being used as early as 1899. (p. 99) See especially pages 85-105.

**1200.** ---, ed. *A Tower of Babel: A History of Broadcasting in the United States, Volume I -- to 1933*. New York: Oxford University Press, 1966.

**1201.** ---, ed. *Tube of Plenty: The Evolution of American Television*. 1975. New York: Oxford University Press, 1982.

*Tube of Plenty* is a condensation of Barnouw's multi-volume *History of Broadcasting in the United States*. Barnouw presents a detailed history of television, from its earliest days, through the late 1980s, focusing on the evolution of the technology and the content. He follows the development of television from its roots in radio technology and business, and relates its history to the economic and political history of the United States. He describes in great detail the history of television programming, and provides rich insight into why Americans saw what they did when they did.

--Phil Glende

*Tube of Plenty* is a history of American television (and some radio) that is widely considered to be a classic. Erik Barnouw (now deceased), a former professor at Columbia University, writes the history as a series of stories. The birth of television cannot be understood without a look at the history of radio, according to Barnouw, so that's where he begins, with fascinating stories of radio broadcasts in World War I (amateur operators got in the way of official army and navy transmissions) as the first radio stations (KDKA began broadcasting in Pittsburgh, PA before radios were commercially available). He details the history of television by beginning with the story of Philo Farnsworth, an Idahoan farm boy who invented TV and continues through to the 1980s and the rise of reality television.

Barnouw argues that television has become a defining influence on American life, affecting everything from the level of political discourse (news broadcasts have become more superficial and politicians to rely more on advertising and media) to social change (cigarette advertising led to anti-cigarette broadcasts that informed the public about the dangers of nicotine). He deftly synthesizes his (mostly secondary) sources that include biographies of television personalities, advertisements; television programs themselves, and court documents.

--Hallie Lieberman

**1202.** Barrett, Wilton A. "The Work of The National Board of Review." *Annals of the American Academy of Political and Social Sciences* 128 (1926): 175-86.

This article provides an account of the National Board of Review which censored motion pictures prior to the creation of the Motion Picture Producers and Distributors Association (MPPDA) or as it was better known, the Hays Office which was run from 1922 to 1945 by Will H. Hays.

**1203.** Barricklow, Denis. "Almodovar Appeals X Rating on Latest Film." *UPI release* April 24, 1990 1990.

This article concerns the legal challenge against the X rating given to *Tie Me Up! Tie Me Down!* This challenge was one of several made against the movie rating system in 1990 in the month preceding the adoption of a new rating category, NC-17. Civil rights attorney William Kunstler represented the movie and its makers.

**1204.** Barry, David S. "Screen Violence and America's Children." *Spectrum* 66.3 (1993): 37-43.

This article examines the large volume of research that shows that watching media violence can have harmful effects and notes that it is largely dismissed by the entertainment industry and much of the public.

**1205.** Barry, Kathleen, ed. *Female Sexual Slavery*. Englewood Cliffs, N.J.: Prentice-Hall, 1979.

This anti-pornography tract appeared as feminists and other groups were making a concerted efforts to boycott films and other entertainment deemed to be pornographic. Pornographic was seen as a form of sexual slavery.

**1206.** Bart, Peter. "More Than a Lobbyist." *New York Times* June 26, 1966 1966: 87.

This article says that although Jack Valenti's selection as the new MPAA president may have been a surprise, it appears to have been a "pleasant" one. Valenti hoped to make the movie Production Code "treat the world as it is

and at the same time remain within rational standards of community conduct." It notes that Valenti in his news conferences exhibited "persuasiveness, energy, contagious enthusiasm."

**1207.** Barthes, Roland, ed. *Camera Lucida: Reflections on Photography*. New York: Hill and Wang, 1981.

French cultural critic and historian Roland Barthes here offers a study of photography that focuses on the mystical and almost spiritual properties of the photographic image that are often hard to account for in traditional interpretive or historical studies of the medium. His study grows out of a wider theoretical project which examined the extent to which we can view photographs as messages. He concluded that we can indeed look at photographs this way, but only after taking into account the fact that it is a message that appears without a 'code' (or a series of representational forms that stand for concrete meanings -- the way that words stand for objects they represent). The writing in *Camera Lucida* draws on the work of Swiss linguist Ferdinand de Saussure, who proposed that we might view language as a series of signifiers (words) that refer to distinct signifieds (meanings). Barthes problematizes this distinction through his claim that the signifiers and signifieds in a photograph do not always line up the way they do in language. Here he explores other ways images might convey meaning. This work was translated from French by Richard Howard.

--Matt Lavine

**1208.** Bartlett, Lanier. "How the Motion Picture Industry Thrives Here: Birth and Soul." *Los Angeles Times* Jan. 1, 1916 1916, sec. III: 67, 73.

This article discusses Los Angeles as a center of movie making in early 1916.

**1209.** ---. "Los Angeles the Film Capital of the World. Miles of Story." *Los Angeles Times* Jan. 1, 1916 1916, sec. III: 70.

This article discusses Los Angeles as a center for movie making in early 1916. The article notes that 40,000 miles of film is used each day in southern California. It maintains that 10-15 million people attend movies each day in the United States. It says that American movies are superior to European films in "story, direction and acting." It notes that "the fundamental rules of morality, public decency and patriotism must be the guides of the motion picture business."

**1210.** Bassett, Ross Knox, ed. *To the Digital Age: Research Labs, Start-Up Companies, and the Rise of MOS Technology*. Baltimore: Johns Hopkins University Press, 2002.

"The MOS (metal-oxide-semiconductor) transistor," writes the author, "the fundamental element in digital electronics, is the base technology of late-twentieth-century and early-twenty-first-century America. Though it digital electronics have entered almost every area of American life, first through the calculator, then through the digital watch, and finally through the microprocessor. The rise of the MOS transistor has made what was once ludicrous commonplace." (1)

The MOS transistor was "revolutionary" in the way it replaced the bipolar transistor which had been invented by John Bardeen, William Shockley, and Walter Brittain, and which previously had dominated the market. While the MOS transistor was slower than the bipolar transistor, it had an advantage in that more MOS transistors could be put on an integrated circuit. Intel was the company that exploited this technology perhaps most effectively.

This work covers the years from 1945, when research began that led to the transistor at Bell Labs, until 1975, by which time MOS technology had produced such successful products as semiconductor memories and microprocessors. It attempts to trace MOS technology from a point when it seemed to be a bad idea until it was clear that this technology had become "the technological foundation of American society." (11)

This work is a volume in the *Johns Hopkins Studies in the History of Technology* series, edited by Merritt Roe Smith. It is well researched, and is based on primary and secondary sources. It also has an informative "Essay on Sources."

This book appears in the *Johns Hopkins Studies in the History of Technology* (Merritt Roe Smith, editor).

**1211.** Basten, Fred E., ed. *Glorious Technicolor: The Movies' Magic Rainbow*. South Brunswick and New York: A. S. Barnes and Company, 1980.

This well-illustrated book provides an uncritical history of Technicolor's efforts to bring color to motion pictures. One finds, for example, little information here on the government's antitrust suit against Technicolor in 1947 or about competition from Eastman Kodak. Anyone wishing to verify quotations or examine the original sources used will be frustrated by the lack of endnotes.

Herbert Kalmus is a central figure in the development of Technicolor. In addition to Kalmus, there is some information here about Leonard Troland, the Harvard psychologist who also helped to develop Technicolor. Basten provides an excerpt from Troland in which he discusses what types of films would be most appealing in Technicolor. His view contrasted with Kalmus who favored, according to Basten, "a series of historical dramas." (38) Troland favored films that appeared to "primitive instincts, such as sex, fear, and laughter. etc." (quoted, 38) Troland says in this passage:

**"It is obvious that we are making subjects to sell to the public for the purpose of amusing them and that our main purpose is not uplift or education. It, therefore, seems to me that we must not be high-brow in our selections and that our pictures should appeal in a fairly simply way to primitive instincts, such as sex, fear, laughter, etc. Becoming acquainted with American history is certainly not a fundamental motive of this sort, although the appeal to patriotic emotion may work under certain circumstances.**

**"I am afraid that we are an academic or high-brow organization... Anything which we feel is beautiful is apt to be a flop with the public. Isn't it the best business judgement [sic] to do the old stuff that we know the public will buy, rather than try to set new standards in any domain except photography?**

**"I should like to see us make a series of two-reel comedies of a very ordinary type so far as action goes, but Ziegfeldized to the absolute limit that the censorship will stand. Then you will be playing color's highest card so far as box office value is concerned. I am as sure of this as any psychological proposition I would dare to lay down, because I know that the high-brows will buy as well as the low-brows when it come to sex appeal, and color has a great deal to add here. People want to laugh or a kick and not tears or historical instruction. The latter is what they desire for their children, not themselves.**

**"I should strongly recommend that we experiment with at least one subject which is distinctly of the type which we as a high-brow group would shun and would blush to sign our names to. Such an experiment will, in my opinion, be the best box office success of all." (quoted, p. 38) (my emphasis)**

Basten notes that in movies there was a decided shift to color in the mid-1960s, but as for television, color videotape was difficult to transfer to other countries because of the different technology there. Basten writes: "The swing, however, was to color. Monochromatic filming, once the overwhelming choice of the industry, was now being pushed aside. The ratio of color to black-and-white took a pronounced leap in 1965 when practically all film exposed for television was multi-hued. And, beginning in 1967, with so few black-and-white films being made, the Academy of Motion Picture Arts and Sciences no longer felt it was necessary to continue the two separate classification in their awards structure. (157)

**"Technicolor's decision to enter the television field was influenced by its major customers and independent producers, as well as by the move of the three major networks to increase broadcasting of programs filmed in color. The company's reputation was enhanced almost immediately by the disclosure, in late 1966, of a revolutionary technical breakthrough developed by its subsidiary division, Vidtronics. The new technique made possible production of full color television prints from television color tapes of both feature shows and commercials. Previously, shows and commercials on color video tape could not be used overseas because of incompatibility with foreign telecasting equipment. Transferring such color taped shows to color film by the Technicolor Vidtronics systems made taped color shows economically available for telecasting anywhere in the world." (157) (my emphasis)**

Like sound, color changed filmmaking bringing about new techniques of lighting, makeup, and set design as well as creating new stars. Basten emphasizes the high quality and durability of the Technicolor process. "Films made less than a decade ago," he wrote in 1980, "processed by other methods than dye transfer Technicolor, are beginning to fade, slowly turning red in the studio vaults.

"Despite modern technology, scientists have yet to discover how to create dyes for color positive prints that will remain stable when exposed to sunlight and air. Purists, in their concern, say that the most fool-proof way to preserve color films is to isolate the three basic colors – as in the old Technicolor process – and make dye transfer prints. The dyes in these prints are so stable that the life of the prints is not yet known. The oldest available samples, prior to 1930, show no visible signs of fading." (166)

This work includes a filmography of Technicolor productions or which contained scenes by Technicolor from 1917 to 1979. There is also a timeline of milestones in Technicolor history. Two other appendices explain the "Technicolor Technique" and list Technicolor films given Academy Awards.

**1212.** Batchelor, David, ed. *Chromophobia*. London: Reaktion Books, 2000.

This brief book (125 pages counting references and bibliography) provides a stimulating account of how color in art has throughout history been viewed with suspicion. That prejudice can be traced back as far as Plato and Aristotle and may have helped to form the foundation for "a whole tradition ... of 'moral Puritanism and aesthetic austerity,'" in which only a black-and-white world stripped of odor and color "may be said to be true, beautiful, and good." (Batchelor quoting Jacqueline Lichtenstein). Color has been viewed as "the corruption of culture," something with the "power to overwhelm and annihilate," or at the very least "undo all the hard-won achievements" of civilization, and hence in need of strong social and moral controls. Long "the object of extreme prejudice" in literature, philosophy, and art, often "regarded as alien and therefore dangerous," color has been sometimes linked with "the feminine, the oriental, the primitive, the infantile, the vulgar, the queer or the pathological." It has been commonly associated with "sexual and racial phobias" (e.g., male homosexuality).

**1213.** Bates, James. "Encore Launches 'Nonviolent' TV Network." *Los Angeles Times* Feb. 2, 1994 1994, sec. D: 3D.

This article is about television cable operator Encore starting a network devoted to nonviolent programming.

**1214.** Bates, Roy Eugene. "Private Censorship of Movies." *Stanford Law Review* 22 (1970): 618-56.

This article is informative about court cases from the *Paramount* decision in 1948 through the 1960s that weakened the power of motion picture censors.

**1215.** Bächtmann, Oskar, ed. *The Artist in the Modern World: The Conflict Between Market and Self-Expression*. Cologne: DuMont Buchverlag, 1997.

The author writes: "The development in exhibitions from an annual event on a public holiday to the exclusive medium for the presentation of art, the emergence of the public and public criticism, and the orientation of artists to exhibition work, was the most decisive and consequential change in the art world since the

Renaissance. Artists had to define, legitimate and finance their work in public competition with each other. Generally, the court artists were appointed to a position by contract, and the studio artists had contracts for commissions, stating the price. The patron could prove to be difficult, moody or a bad payer, and the court artist could also find himself at the mercy of advisers and intriguers. The studio artist had to adjust to the changing demands of patrons and the requirements of the market.

By contrast, the exhibition artist had to work "at his own risk, to be judged by an unknown recipient, who could not always be accused of ignorance and a one-sided view. To calculate or steer public reaction, which could vary between aggressive disdain and enthusiasm or even acclamation, new strategies had to be developed. The exhibition as a forum for rivalry and an arena where artists fought for recognition intensified competition between artists. To be successful the exhibition artist had to be the subject of public discussion, had to find access to the media and project an interesting image to accompany his works. He was and is forced to win from the exhibition-going public followers of like mind, media support, buyers and patrons; and if necessary he must go to court to defend his interests.

"The exhibitions immediately gave rise to the suspicion that artists could be corrupted by money, mass taste, cheap applause and the pressure to succeed in the competitive art world."

**1216.** Battema, Douglas L. "Going for the Gold: A History of the Olympic Games and U. S. Television, 1956-1988." University of Wisconsin, Madison, 2003.

Battema writes that his doctoral thesis "explores the political, cultural, economic, and industrial uses to which U. S. broadcast television networks put the Olympic Games from 1960 through 1988. From 1956, when the Melbourne Games bypassed network distribution through syndication, the major broadcast networks have used ownership of exclusive Olympic rights to build and to shape viewing audiences, to attract advertising dollars, and to fulfill or to satisfy governmental initiatives, policies, and doctrines. During the period examined, the networks used the Olympics to experiment with and refine narrative techniques and technological innovations, to establish and maintain corporate identities, and to assert their legitimacy and responsibility as stewards of the public airwaves by contradicting critics who alleged that the television industry was unwilling to provide 'quality' programming. As the networks' dominance began to wane with the expansion of cable and satellite television, the Olympics became an even more highly-valued television property that helped the broadcast networks retain their prominence within the industry.

"Drawing on television industry sources and Olympics archives as well as popular sports journalism, this dissertation addresses critical gaps within the fields of television studies, media history, and sports studies." This doctoral thesis was completed in the Department of Communication Arts at the University of Wisconsin.

**1217.** Baudrillard, Jean, ed. *Jean Baudrillard: Selected Writings*. Stanford, CA: Stanford University Press, 1988.

This work assembles many of Baudrillard's writings between 1968 and 1985, published originally in French. Mark Poster's "Introduction" provides an informative overview of Baudrillard's work. Poster writes: "Baudrillard has developed a theory to make intelligible one of the fascinating and perplexing aspects of advanced industrial society: the proliferation of communications through the media. This new language practice differs from both face-to-face symbolic exchange and print. The new media employ the montage principle of film (unlike print) and time-space distancing (unlike face-to-face conversation) to structure a unique linguistic reality. Baudrillard theorizes from the vantage point of the new media to argue that a new culture has emerged, one that is impervious to the old forms of resistance and impenetrable by theories rooted in traditional metaphysical assumptions. Culture is now dominated by simulations, Baudrillard contends, objects and discourses that have no firm origin, no referent, no ground or foundation. In this sense, what Walter Benjamin wrote about 'the age of mechanical reproduction,' Baudrillard applies to all reaches of everyday life."

The last selection in this work is Baudrillard's 1985 article in *New Literary History* entitled "The Masses: The Implosion of the Social in the Media." In this essay, he takes a different tone than that of his earlier pessimistic "Requiem for the Media," a response to Hans Enzensberger's optimism about new media. In "The Masses....," Baudrillard writes: "...I would no longer interpret in the same way the forced silence of the masses in the mass media. I would no longer see in it a sign of passivity and of alienation, but to the contrary an original strategy, an original response in the form of a challenge; and on the basis of this reversal I suggest ... a vision of things which is no longer optimistic or pessimistic, but ironic and antagonistic."

**1218.** Baudrillard, Jean (translated by Chris Turner), ed. *America*. London and New York: Verso, 1986.

French postmodernist Jean Baudrillard writes that "America is the original version of modernity. We are the dubbed or subtitled version. America ducks the question of origins; it cultivates no origin or mythical authenticity; it has no past and no found truth. Having known no primitive accumulation of time, it lives in a perpetual present. Having seen no slow, centuries-long accumulation of a principle of truth, it lives in perpetual simulation, in perpetual present of signs. The Indians' territory is today marked off in reservations, the equivalent of the galleries in which America stocks its Rembrandts and Renoirs. But this is of no importance -- America has no identity problem. In the future, power will belong to those peoples with no origins and no authenticity who know how to exploit that situation to the full.... America was already in its day a satellite of the planet Europe. Whether we like it or not, the future has shifted towards artificial satellites. (76)

"The US is utopia achieved." (77)

Later Baudrillard says that the "advertisements which cut into the films on TV are admittedly an outrage, but they aptly emphasize that most television productions never even reach the 'aesthetic' level and are, basically, of the same order as advertisements. Most films -- including many of the better ones -- are made up from the same everyday romance: cars, telephones, psychology, make-up. They are purely and simply illustrations of the way of life. Advertising does just the same: it canonizes the way of life through images, making the whole a genuinely integrated circuit." (101-02) He goes on to say that "it is Disneyland that is authentic here! The cinema and TV are America's reality! The freeways, the Safeways, the skylines, speed, and deserts -- these are America, not the galleries, churches, and culture." (104)

**1219.** Baudrillard, Jean (translated by Sheila Faria Glaser), ed. *Simulacra and Simulation*. Ann Arbor, MI: University of Michigan Press, 1994.

Baudrillard sets out a theory of modern culture, one that focuses more on cultural expenditures and on cultural production. He uses the terms "simulacrum -- the copy without an original" and "simulation" to consider mass reproduction and reproducibility in contemporary electronic media culture. "Today abstraction is no longer that of the map, the double, the mirror, or the concept. Simulation is no longer that of a territory, a referential being, or a substance," Baudrillard writes. "It is the generation by models of a real without origin or reality: a hyperreal. The territory no longer precedes the map, nor does it survive it. It is nevertheless the map that precedes the territory -- *precession of simulacra* -- that engenders the territory...."

A few of the chapters in this work include "The Precession of Simulacra"; "The Implosion of Meaning in the Media"; "Absolute Advertising, Ground-Zero Advertising"; "Holograms"; "Simulacra and Science Fiction"; and "On Nihilism."

**1220.** Baudry, Jean-Louis. "Ideological Effects of the Basic Cinematic Apparatus." *Narrative, Apparatus, Ideology: A Film Theory Reader*. Ed. Philip Rosen, ed. New York: Columbia University Press, 1986. 286-98.

Part of the 1980s French invasion of deconstructionists and post-structuralists, this short essay is, typical of the genre, all but incomprehensible. It addresses squarely the impact of technology upon the ideological content of movies, but in a less than enlightening manner. It seems to be a strange hybrid of Marxism, and its

notion that the dominant bourgeois ideology inevitably determines the content of so major a form of mass communication as the movies, with postmodernism and its sense that meaning is determined entirely by the individual observer. The mobility of the camera and the ability of the film maker to position it so many different ways makes film an unusually good medium in which to explore the postmodern sensibilities, Baudry seems to be saying. A short reflective exercise in theory, this essay makes reference only to secondary sources.

**--Gordon Jackson**

French film theorist Jean-Louis Baudry here concerns himself with how one might account for ideology in the cinema. Drawing on a model of ideology developed by French philosopher Louis Althusser, in which the term 'ideology' refers to a compelling force that places individuals (or 'subjects') into a predefined set of relationships with one another to give one social group power over another, Baudry tries to account for how film technology has developed historically to place the film viewer into a specific relationship with the image that supports the dominant order. This essay also draws freely from the psychoanalytic studies of Jacques Lacan, especially his research of the 'mirror stage,' in which infants begin to see themselves as distinct entities within a larger world (Baudry will claim in this essay that film viewing reproduces certain conditions of the mirror stage). Overall, this work attempts to give a historical account of film technology that explains how film might be said to advance ideology.

**--Matt Lavine**

**1221.** Bauer, Martin. "Resistance to new technology and its effects on nuclear power, information technology and biotechnology." *Resistance to new technology: nuclear power, information technology and biotechnology*. Ed. Martin Bauer, ed. New York: Cambridge University Press, 1995. 1-41.

This introductory essay sets out the issues to be considered in this work. The focus, as the title suggests, is on three base technologies in the post-1945 era: nuclear power, information technology, and biotechnology. Here Bauer points to similarities in the development of these three technologies, and the forms that resistance to each has taken.

**1222.** Bauer, Martin, ed., ed. *Resistance to new technology: nuclear power, information technology and biotechnology (conference proceedings)*. New York: Cambridge University Press, 1995.

This book is a collection of papers given at a conference in London in April, 1993, on "Resistance to New Technology -- Past and Present." About 150 people from twenty countries attended the meeting.

The conference had three objectives: 1) to assess the nature of resistance in the recent past; 2) to make comparison between different technologies within this context; 3) "to think about, and work towards, a functional analysis of resistance in the process of technological development. The meeting provided material to overcome the technocratic bias according to which resistance is nothing but a nuisance in the technological process."

The book focuses on three major post-1945 developments: nuclear power, innovations in computers and information technology, and biotechnology. The work's attention is mainly, although not exclusively, on Europe. "In making comparisons the contributions reach out historically to the origins of the idea of 'progress' and the Luddite revolt of the early nineteenth century, and geographically to Australia, North America and Japan. The scope of the book prohibits the inclusion of several dimensions of the problem of resistance worth mentioning. First, the book excludes the problems of resistance or non-resistance to new technology in authoritarian and totalitarian systems such as Eastern Europe between 1945 and the collapse of communism, the USSR, or China. Secondly, it excludes the problem of resistance to new technology in developing regions such as South America, India and South East Asia...."

The publisher summarizes this book as follows:

"This book compares resistance to technology across time, nations and technologies. ... The focus is on post-1945 Europe, with comparisons made with the USA, Japan and Australia. Instead of assuming that resistance contributes to the failure of a technology, the main thesis of this book is that resistance is a constructive force in technological development, giving technology its particular shape in a particular context. Whilst many people still believe in science and technology, many have become more skeptical of the allied 'progress'. By exploring the idea that modernity creates effects that undermine its own foundations, forms and effects of resistance are explored in various contexts.

This interdisciplinary work includes essays by sociologists, political scientists, historians, and psychologists.

The volume includes the following essays: Martin Bauer's Preface, "Resistance to new technology and its effects on nuclear power, information technology and biotechnology." In Part I ("Conceptual Issues"), papers include:

Alain Touraine, "The crisis of 'Progress'";

Adrian Randall, "Reinterpreting 'Luddism': resistance to new technology in the British Industrial Revolution";

Dancker D L. Daamen and Ivo a Van Der Lans, "The changeability of public opinions about new technology: assimilation effects in attitude surveys";

Martin Bauer, "'Technophobia': a misleading conception of resistance to new technology."

Part II deals with "Case studies" in Scandinavia, Australia, Great Britain, and the United States (see John Staudenmaier, "Henry Ford's relationship to 'Fordism': ambiguity as a modality of technological resistance."

Part III is entitled "International comparisons." Essays in this section include:

Antonio J. J. Botelho, "The politics of resistance to new technology: semiconductor diffusion in France and Japan until 1965";

Ian Miles and Graham Thomas, "User resistance to new interactive media: participants, processes and paradigms";

Dieter Rucht, "The impact of anti-nuclear power movements in international comparison";

Robert Bud, "In the engine of industry: regulators of biotechnology, 1970-86";

Sheila Jasanoff, "Product, process, or programme: three cultures and the regulation of biotechnology."

Part IV is "Comparison of different technologies":

Joachim Radkau, "Learning from Chernobyl for the fight against genetics? Stages and stimuli of German protest movements -- a comparative synopsis";

Hans Mathias Kepplinger, "Individual and institutional impacts upon press coverage of sciences: the case of nuclear power and genetic engineering in Germany";

Dorothy Nelkin, "Forms of intrusion: comparing resistance to information technology and biotechnology in the USA."

Bauer's Afterword is entitled "Towards a functional analysis of resistance."

**1223.** Baughan, E. A. "The Art of Moving Pictures." *Fortnightly Review* 112 (1919): 448-56.

Baughan starts by saying that movies, which are shown in semi-darkness, have "a curious hypnotic effect" and that they engage "the mind agreeably." (448) But there is more that explains their appeal because "that hypnotic calm, produced by music and the bewildering rapidity of the pictures, is not the chief reason for the popularity of the cinematograph. It has opened a new world to those who do not read or who cannot afford to go to a theatre except in discomfort, and it has opened a different world." (448)

Baughan believed that some movies had were educational and that the educational potential of film had scarcely been touched. Motion pictures were also a powerful form of propaganda. "As a medium for propaganda its powers give one pause. The newspaper is ineffectual compared with it..." (449) Despite efforts to uses the talents of artists, writers, and dramatists, the artists side of cinema was "in a state of chaos." (449)

The author explains the difference between a novel or play and a motion picture which he believes is a "very different medium of expression." (450) It is difficult for the filmmaker to enter into psychoanalysis on screen. "Psychological suggestion is not impossible on screen," (451) provided the actor has the talent to pull it off. Baughan says that "the cinematograph has nothing to do with words." (451) "The real aim of the cinematograph is not to *tell* a tale, but to *show* one. Pictures in action are its medium of expression. They may and do suggest words, but the spectator must make them for himself. A novel, on the other hand, may suggest pictures by means of words -- just the opposite of the cinematograph -- but that depends on the imagination of the reading. Drama gives you both pictures and words, but then it lacks the power of explanation of the novel and the cinematograph, and is fenced round by all kinds of difficulties of time and space...." (451) The "novel describes; the camera depicts," Baughan said. (452) Moving pictures have "unlimited possibilities" (451) in turning out travel pictures.

Baughan commented on film acting and its magnification of personality. "Film-acting is a very subtle art, differing in many respects from stage-acting. A player in a theatre has to condition his art by the distance the audience is from him. The film-player, on the other hand, is quite close to the camera in thos pictures which are not merely landscapes and interiors with figures. The photograph when projected on the screen is vastly magnified. The faintest twitching of the lips can be seen quite plainly. Also it is possible to touch up negatives so that the expression is intensified. The stage-player has an audience which, to a great extent, reacts on him; the film-player acts without spectators. The absence of the voice as a medium of expression is a great loss to the film-player; but, on the other hand, he is free from the paralysing sensation that his acting is not 'getting over' the footlights. Although a film-actor has to learn how to carry himself, and, above all, how to keep these movements in a *tempo* considerably slower than normal (for the cinematograph exaggerates the quickness of movement), yet his principal aim should be naturalness. Given an expression face and, of course, imagination, and the necessary training of gesture, and the camera will do the rest. (454)

"The two arts of film acting and stage actors are very different, "but of screen-acting one can at least say that it has unlimited powers of expression. The difficulty is to give full scope to these powers. Being divorced from words, a dramatic crisis must necessarily be more brief than on the stage. Also it must be such a crisis that words are not necessary. The film-producer has not quite understood that, or perhaps his art is conditioned by the poor standard of intelligence in the average lover of the moving pictures...." (454) Further commenting on movie audiences, the author says that "the trouble at present is that the cinematogrph does not attract the most intelligent type of people." (455) Too many movies "continue to be made that are inspired by nothing but stupidity and brutality." (455) Such movies are not so much immoral as they "pander to the love of brutality that lurks beneath what we are pleased to call civilisation." (456)

Movie making needs to attraction more intelligent people. "The technical side of the cinematograph is in its infancy, comparatively speaking. The best brains of the world must in the end be attracted to an art which makes such a powerful appeal to democracy. The intellectual rulers of mankind cannot afford to ignore an art which appeals to millions and speaks a universal language to all the peoples of the world." (456)

Baughan starts by saying that movies, which are shown in semi-darkness, have "a curious hypnotic effect" and that they engage "the mind agreeably." (448) But there is more that explains their appeal because "that hypnotic calm, produced by music and the bewildering rapidity of the pictures, is not the chief reason for the popularity of the cinematograph. It has opened a new world to those who do not read or who cannot afford to go to a theatre except in discomfort, and it has opened a different world." (448)

**1224.** Baughman, James L., ed. *The Republic of Mass Culture: Journalism, Filmmaking, and Broadcasting in America since 1941*. Baltimore: The Johns Hopkins University Press, 1992.

Although this book discusses several media, television is at the core of this study. Baughman writes: "During the second half of the twentieth century, the American mass media underwent an extraordinary transformation. A new mass medium, television, quickly proved the most popular of the public arts. Americans who had once spent their evenings using a variety of mass media -- films, newspapers, periodicals, and radio -- were likely by the mid- and late-1950s to watch television. People still went to the movie house, read a daily paper or a magazine, and listened to a radio program, but the amount of time they devoted to each activity declined, in some cases dramatically."

**1225.** ---, ed. *Same Time, Same Station: Creating American Television*. Baltimore: Johns Hopkins University Press, 2007.

The early days of television were fraught with experimentation by networks, regulators and other mass media industries. Competing philosophies among the network front-runners led to a variety of show types and a race for audience cultivation. Meanwhile, regulators were forced to choose between enforcing network commitment to public service programming and ensuring ubiquitous public access to the new medium. Film and, to a lesser extent, radio and newspapers adapted themselves to complement, rather than compete with, the new broadcast network. While evolving technology and viewer preferences significantly impacted the direction of the American system of broadcasting, advertisers played perhaps the most influential role. Through their direct involvement in programming, their dependency upon the most far-reaching medium of the time but mostly through their choice of which programs to support, advertiser influence on networks have made American TV what it is.

As television spread to major cities and then to all corners of the country, preferences of the television audience were sounded through network programming experiments. A variety of shows were produced, and not all of those that were to remain standing tropes of television appeared as successes early on. Both networks and advertisers spent the early years of television trying to figure out not only what the audience liked, but who the audience was and how to expand the latter.

The competing schedules of the Big Two early TV networks (CBS and NBC) were partially accounted for by practical reasons of investment opportunities and counter-programming strategies. But they were also a product of distinctly different philosophies of the network executives. Ultimately, mass entertainment prevailed over high culture or news programming due to viewer and advertiser preference as well as the pressures of competition and profit-making.

As the regulations and structures of radio were transferred to television, problems of public access and network competition were almost inevitable. While broadcasters were overwhelmingly conscious of a civic duty demanding high standards and public service programming, the commercial pressures of competition were something neither morals nor governmental regulation were able to completely overcome.

The cultural values expressed in early television programming were a direct import of the norms of radio broadcasting. Dominated by a house-guest mentality, broadcasters were careful not to offend neither the (active) listener audience nor the political elites of Congress and the FCC.

Even before television, advertisers had played a major role in sponsoring America's mass media. With television, advertisers actually lost some of the control over programming that they'd had with radio, as expensive programs demanded multiple sponsors and less oversight. However, advertisers still had a strong say in what went on air and, through their patronage, encouraged less competition between networks in order to reach the largest possible audience. Only after the commercial sponsorship system was firmly entrenched did advertisers begin to consider targeted demographic in conjunction with broadest possible appeals.

Television news began at a time of changing standards for broadcast reporting, facilitated by the demands created by World War II and the Korean War. However, public demand for television news was slight at best, and that usually only when the news contained some inherent drama. Networks produced news mostly to cultivate goodwill among political leaders; but while quality did increase in the 1950s, television never established itself as the dominant medium of news.

The film industry was a late entrant to the television age, initially anticipating as many did that the TV fad could not compete with theaters. Eventually, though, the two industries began to work together, sharing technology and performers. Executives slowly discovered the profitability of reruns and TV movies, and partnerships with Hollywood studios proved a boon whenever networks struggled.

--Dale Erlandson

**1226.** ---, ed. *Television's Guardians: The FCC and the Politics of Programming, 1958-1967*. Knoxville: University of Tennessee Press, 1985.

Why has the United States had "the least regulated broadcasting system of any modern democracy," Baughman asks? This work argues that the Federal Communications Commission was often ineffective because of political opposition in Washington, not because it was controlled by broadcasters. Such liberal FCC chairs as Newton Minow and E. William Henry, who succeeded Minow, had their initiatives to regulate television frustrated "by jealous members of Congress and cautious Presidents." During the late 1960s, widespread dissatisfaction with the commercial networks led to the establishment by Congress of the Public Broadcasting System. By the late 1970s and early 1980s, conservatives and liberals alike called for abolishing the FCC.

**1227.** Baxter, James Phinney, 3rd, ed. *Scientists Against Time*. Boston: Little, Brown and Company, 1946.

Vannevar Bush assigned Baxter to write this official history of the Office of Scientific Research and Development during World War II. The book attempts to survey the range of scientific advances during the war: chemistry, military medicine, the development of the atomic bomb. Some material here relates to communication. For example, Part II ("New Weapons and Devices") has chapters on radar, sonar, and rocketry, as well as the proximity fuse. There are also pages on high altitude communication, VHF, and "speech secrecy systems."

**1228.** Bazin, André. "Three Essays on Widescreen." *Velvet Light Trap*. 21 (1985): 8-16.

In these three essays, Bazin considers widescreen motion pictures in the context of the threat posed to cinema by television. The essays reprinted are "Will CinemaScope Save the Cinema" (1953), "The End of Montage" (1954), and "A Little too Late" (1955).

**1229.** Beale, Alison. "Harold Innis and Canadian Cultural Policy in the 1940s." *Continuum: The Australian Journal of Media & Culture* 7.1 (1993): 75-90.

This article examines Innis's comments and work on behalf of Canadian arts and sciences.

**1230.** Beam, Alex, ed. *A Great Idea at the Time: The Rise, Fall, and Curious Afterlife of the Great Books*. New York: Public Affairs, 2008.

*A Great Idea at the Time* is a narrative that discusses the long and tortuous history of the "Great Books" idea in America. Beam focuses on Robert Hutchins and Mortimer Alder, the two prime advocates of a Great Books curriculum in American higher education. Beam spends the early part of his book discussing the Great Books idea in both higher education and adult/extension education during the 1930s and 1940s.

The second part of *A Great Idea at the Time* is devoted largely to the publishing history of the Great Books collection, and all the trials and tribulations that resulted. Beam also examines why the Great Books were as popular as they were during the 1930s, 1940s and 1950s.

The last section of the book examines the Great Books idea today, particularly their downfall in academia and their role in the "Culture Wars." Beam also places himself squarely in the narrative by visiting a Great Books discussion session as well as a college (St. John's) devoted entirely to the Great Books.

**1231.** Beck, Bob. "Creating 'Psychedelic' Visual Effects for *The Trip*." *American Cinematographer* 49.3 (1968): 176-79, 196-97.

This article discusses the special effects for the movie "The Trip" (1967), and the efforts to recreate what an acid trip might look like to a LSD user. Peter Fonda and Susan Strasberg starred. The article notes that "Jack Nicholson's script called for considerable use of strobe lights in the nightclub sequence." (1976) Beck was an electronic and optical engineer who had been involved with "light shows" as a hobby and who pioneered techniques for the so-called "happenings" and discotheques of the mid-1960s. He discusses working with a 16mm camera in this movies. The movie attempted to capture the "visual illusions and the hallucinations which Peter Fonda experiences"(177) on an acid trip. Beck says that the movies tried "to use the classic dream images and symbols which had been researched by Dr. Karl Jung, the noted psychologist." (178)

The makers of this film make interesting psychological assumptions what their film techniques can accomplish. "The reason for the rapid flicker rate was psychological," Beck wrote. "Research on subliminal stimulation has shown that as little as one frame of a film, 1/24th of a second, of data can be registered by the unconscious mind and can cause an impression to be made on the consciousness of the beholder." (178) As for the movie's sex scenes: "A great deal of the sensuality which came through in the controversial love sequence was due to the art work of Dr. Henry Hill, the psychedelic artist, who granted us permission to photograph some of his paintings, which we then projected onto the bodies of the actors. It is undoubtedly this combination of art and life that caused film reviewer Richard Whitehall to say that these were the most sensual love scenes that he had ever seen on film." (178)

As for the techniques used in this movies, "such as the adjustment of light flickerings to the natural psychological constants of the epileptic flicker rate and the alpha rhythm of the brain, the emotional impact of a production can be greatly heightened -- especially in psychological terms. For these rapid images rush past the natural mental 'censors' (in the Freudian sense) and go directly into the unconscious, much in the manner of hypnosis. We are all well acquainted with the great amount of research done by psychologists in the area of subliminal psychopenetration. Yet this area of human capability has hardly been touched," Beck argued. (196-97)

Part of Beck's "fun and games" in this film, he said, was in "exploring ... techniques that might tap these basic unconscious wells of imagery." He was "convinced that the future of creative film production lies in this direction, and that many such techniques will be extensively explored in the future." (197) He lamented that his "light-show" techniques had been mislabeled "psychedelic." Of the so-called "happenings" of the mid-1960s, he referred to them as the "Theatre of the Now."

The treatment of drug use in this 1967 movies (which appeared after the demise of the motion picture Production Code) stands in contrast to Otto Preminger's 1955 black-and-white movie starring Frank Sinatra, *The Man With the Golden Arm*. For its time, Preminger's movie was a breakthrough in the way Hollywood treated drug addiction.

**1232.** Beck, Robert C., ed. *Color Games: Light Show Manual*. 1966. Los Angeles: Pericles Press, 1967.

Robert C. Beck was an electronic and optical engineer who had pioneered techniques used in kaleidoscopic light shows that were in vogue among underground film makers and in West Coast discotheques during the mid- and late-1960s. Beck worked with producer-director Roger Corman in creating the special effects for the movie *The Trip* (1967), that starred Peter Fonda, and was about the psychedelic experience taking LSD. Beck had been involved with experimental cinema and was interested in what was then emerging as the "Theatre of the Now," and had also been a technical adviser for film about Timothy Leary and LSD called *Turn On, Tune In, Drop Out* (United Productions of America, UPA, 1967). This manual talks about how to set up light shows and where to get the appropriate equipment. It also has an essay by Dr. Henry Hill entitled "Color Games Traps," in which, a psychedelic artist who designed the cover of Beck's manual, talks about the psychological effects of light and color shows.

**1233.** Becker, Bill. "Hollywood Specter: European Competition Worries Industry." *New York Times* June 26, 1960 1960: X7.

By 1960, the impact of runaway pictures and foreign films on American movie making was substantial. "Never has Europe affected Hollywood so much," the *New York Times* reported in 1960. This article also quotes producer-director Mark Robson saying that in general, Europeans regard U. S. movies as "too slick" and "sterile." The author of this article then goes on to say that "Hollywood products often lack a point of view, and the films that attract the most interest abroad, he [Robson] said, are those that have been opposed by various pressure groups in the United States."

**1234.** Becker, Jörg, ed., ed. *Small Pulp and Paper Mills in Developing Countries*. New Delhi, India: Concept Publishing Company, 1991.

Becker describes this work by saying that it "presents the results of two research projects which were undertaken separately, but which were related in content to each other." Becker and English paper engineer Arthur W. Western supervised the projects which were undertaken for the German Agency for Technical Cooperation (GTZ). "The first project was an attempt to develop a model for the relationship between cultural paper and the Third World.... The second ... had a more concrete, practical orientation; together with colleagues from Third World countries, we aimed at the evaluation of paper mills which complied at least with the following two criteria: 1. annual production of approximately 10,000 tonnes, 2. using non-wood pulp as raw material."

This volume assembles papers that emerged from the second GTZ project. They were first delivered at a workshop in New Delhi in April, 1988, entitled "Small Paper and Paper Mills in Developing Countries." The work contains twenty-two essays divided under five headings: "General Situation," "The GTZ Project," "Different Country Reports," "Pollution Control and Process Technology," and "Outlook."

**1235.** Becker, Judith , and Levine, Ellen. "Statement of Dr. Judith Becker and Ellen Levine." *Final Report of the Attorney General's Commission on Pornography*. Nashville, TN: Rutledge Hill Press, 1986. 540-46.

This statement by two members of the Meese Commission disagreed with the conclusions of the majority. Becker, a behavior scientists, and Levine, a journalist, while noting the arrival of new media that easily delivered pornography to a wide public, nevertheless questioned whether researchers had established a causal link between watching pornography and violent acts. They also questioned the way in which the Commission defined pornography and categorized different types of pornography.

**1236.** Becker, Judith , Levine, Ellen, and Tilton-Durfee, Deanne. "Statement of Judith Becker, Ellen Levine and Deanne Tilton-Durfee." *Final Report of the Attorney General's Commission on Pornography*. Nashville, TN: Rutledge Hill Press, 1986. 540.

Here three women members of the Meese Commission conclude on the basis of the evidence they have seen "that those who exploit women's vulnerability in the production or consumption of pornography are inflicting

harm that profoundly violates the rights of women, damages the integrity of the American family and threatens the quality of life for all men and women."

**1237.** Beckwith, Carroll. "Color." *Art World* 3 (1917): 176-79.

James Carroll Beckwith (September 23, 1852 – October 24, 1917) was a well-known American portrait painter. This article was written shortly before his death. In the article, Beckwith advances of general rules for using color. He divides colors between *warm* and *cold*. (176)

Beckwith said that mastery of color came from the heart, not intellect. "Recently I was asked if there were 'intellect in color.' **I am rather of the opinion that color is pure Emotion, as form and line are Mind.** [my emphasis] One could be *taught* that certain combinations were harmonious and other were reverse; but the mastery of color must come from the heart, as the mastery 177/179 of drawing, form, finds its source in the brain. To attain completeness in our painter-art requires the amalgamation of these two forces which are in our nature." (177, 179)

This article was part of a symposium on color that appeared in this issue of *Art World*.

**1238.** Bedini, Silvio A., ed. *Thomas Jefferson and His Copying Machines*. Charlottesville: University Press of Virginia, 1984.

Jefferson lived before the typewriter, carbon paper, and photocopying machines. How did he manage to preserve so much of his writing, Bedini asks. "Reviewing his writing tools and habits, it is surprising to learn that although he owned the most advanced writing tools of his time, including a 'reservoir' or fountain pen, he customarily used the common quill for most of his life. Writing was such an important activity in his life that he even designed furniture for the purpose. He as well as Benjamin Franklin and George Washington owned and used Watt copying presses, then considered the most innovative writing aid. Always alert to the new and experimental, however, Jefferson promptly abandoned his press for a new invention called the 'polygraph,' a writing machine which he continued to use for more than twenty years and which, of all his writing tools, he loved best and most intrigued him. Nonetheless, he never overlooked an opportunity to experiment with new writing and duplicating processes and devices as they became available." This book uses correspondence between Jefferson, the manufacturer Charles Willson Peale, engineer Benjamin Henry Latrobe, and the inventor John Isaac Hawkins. The papers of Peale, Labrobe, and Jefferson are among the primary collections used to document Jefferson preoccupation copying and duplicating.

**1239.** Bedwell, Bettina. "'Glamorous' Styles of Films Don't Flatter Average Girl." *Chicago Daily Tribune* Feb. 3, 1935 1935, sec. D: 1-2.

Bedwell notes that movie stars have a powerful influence on clothing styles. "...There are always ideals of clothes beauty -- ideals that vary with different strata of society. The stars of the cinema have become one of the most potent sources of clothes idealism for great masses of women." (1)

Bedwell quotes Robert Edmond Jones on the power of beautiful film stars. "As Robert Edmond Jones wrote: 'Unreal, intangible as they are, they have in some curious way the power to enthrall our imaginations.' And, 'Watching them we slip insensibly over the border into a day dream where they work their spells upon us.' True indeed. And the wish to snatch some of this magic of the stars, and add it to our own lives, is what supplies the potency to styles worn by the stars. Another reason, almost as powerful, is the frequency with which these glamorous beings, in their glamorous clothes, are to be seen by women everywhere." (1)

Bedwell concludes by saying that "By bring to the movies your mind and eyes, clear of unwise glamor, you can learn to dress yourself with infinitely more effect in the world where you are a star." (2)

**1240.** Beebe-Center, J. G. "Leonard Thompson Troland: 1889-1932." *American Journal of Psychology* 44.4 (1932): 817-20.

This obituary of Leonard T. Troland provides an excellent account of his scholarly career. Troland achieved distinction in two distinct areas. One was psychology where he was a professor at the time of his death. As a graduate student between 1912 and 1915, he worked with Hugo Munsterberg and E. B. Holt. He also took classes with Bertrand Russell and Josiah Royce. The other area of distinction for Troland was in theoretical and applied physics. As an undergraduate he took courses on optics with D. F. Comstock, and later co-authored a book with Comstock entitled *The Nature of Matter and Electricity*. Troland worked with Comstock, Herbert Kalmus, and others to become a co-inventor of Technicolor. At the time of his untimely death in 1932, Troland was working for Technicolor, Inc.

**1241.** Beerbohm, Max. "Actors." *More*. Ed. Beerbohm, Max. New York: John Lane Company, 1899. 29-35.

In this chapter, Max Beerbohm discusses actors. The actor, "having to devote all his time to the development of his emotions, is the least logical creature in the world, and the least likely to be comforted by nice distinction. He cannot detach himself, as you detach him, from his work. ... So far as he is concerned -- and I am here concerned for him and his feelings -- 'in criticising his work, you criticise, also, him.' Wonder not at his sensitiveness!" (30)

Beerbohm comments on the actor and fame. "As a matter of fact, actors are no more desirous of irrelevant fame than are any other artists. It is the public which wishes quite naturally, to know all about them. The journalists, quite naturally, seek to gratify the public." (31)

The author notes that the way actors perform has much to do with the how they are received by the public. "At first, the actor was but an inanimate medium, a masked convention.... But, as time went on, the Athenians began to listen not merely to the words, but also to the manner of their recital. One actor was preferred to another by reason of his ampler gesture or his more significant appeal. We know that, in the decadence, he overshadowed the dramatist, and had plays 'written round' him, quite in the modern way...." (32)

In a time before actors had become immortalized on film, Beerbohm comments on the nature of the actor's fame. "The actor's art is evanescent, and he must needs, therefore, be rather hectic in his desire for fame. Good books and good pictures are monuments, which, once made, are always there and may take fresh garlands; but the actor's finest impersonation, repeated night after night, is a thing of no substance, exists not but from his lips, perishes with him. Other artists can afford to wait. It is not only that they, as men who work not in the actual presence of the public, value praise less highly; it is also that their art will endure. For them the immediate verdict is not irrevocable. Time turns their rude public into a polite posterity. But it is 'now or never' with the actor. One knows how the gayest assemblage of youth may be chilled by a reference to Macready or Edmund Kean. Theatrical reminiscences is the most awful weapon in the armoury of old age.... it is curiously exasperating to hear about a great actor whom we have 33/34 not seen. So far from honouring, we abominate, his memory. Actors are like pet-birds. When a pet-bird dies, there may be, for those who knew it in the day of its song and its ruffling plumage, some poor comfort in the sight of its stuffed body. For others, there is only a sense of depression. The most unsuccessful 'super' on the stage may always console himself with the thought that he is, at least, a cut above David Garrick." (33-34) Beerbohm says that "Their art dies with them, but I think that in the immediateness, the directness of their fame, they are supremely recompensed." (34) "Even the writings of William Shakespeare will perish in the next ice-age. The whole history of this world is but as a moment in eternity, and happy is that man whose fame is the accompaniment of his own life. Such a man is the actor. Do not grudge him his honours. Do not blame him for his love of them. Ponder my formula, 'and, look you! mock him not!'" (35)

**1242.** ---. "Playgoing." *Mainly on the Air*. Ed. Beerbohm, Max. London: Heinemann, 1946. 52-60.

This essay, or better broadcast, was originally delivered on Sunday, October 8, 1945. Beerbohm says that "Actors and actresses were certainly regarded with far greater interest than they are nowadays. The outstanding

ones inspired something deeper than interest. It was with excitement, with wonder and with reverence, with something akin even to hysteria, that they were gazed upon. Some of the younger of you listeners would, no doubt, interrupt me if they could at this point by asking, "But surely you don't mean, do you, that our parents and grandparents were affected by them as we are by cinema stars?" I would assure you that 52/53 those idols were even more ardently worshipped than are yours. Yours after all, are but images of idols, mere shadows of glory. Those others were their own selves, creatures of flesh and blood, there before your eyes. They were performing in our presence. And of our presence they were aware. Even we, in all our humility, acted as stimulants to them. The magnetism diffused by them across the footlights was in some degree our own doing. You, on the other hand, having nothing to do with the performances of which you witness the result. These performances or rather these innumerable rehearsals took place in some faraway gaunt studio in Hollywood or elsewhere, months ago. Those moving shadows will be making identically the same movements at the next performance or rather at the next record; and in the inflexions of those voice enlarged and preserved for you there by machinery not one cadence will be altered. Thus the theatre has certain advantages over the cinema, and in virtue of them will continue to survive. But the thrill of it is not quite what it was in my young days." (52-53)

Beerbohm noted that anti-theatrical bias existed. "In those piping days of yore, there was in playgoing a spice of adventure, of audacity. The theatre was frowned on by quite a large part of the community. The Nonconformist Churches were, without exception, dead against it. Ministers of even the Church of England were very dubious about it and never attended it. Players were no longer regarded in the eighteen-eighties and 'nineties as rouges and vagabonds, but the old Puritan prejudice against them still flourished." (53) He notes that his brother Herbert Beerbohm Tree had been a well-known actor and only when he became a manager in 1887 did his status rise. "An actor-*manager* could be mentioned quite frankly, and even with awe." (54)

Beerbohm made a perceptive observation about the difference in reading a book and watching a play. "Indeed, I have a sort of feeling that one can appreciate ideas, is more susceptible to them and better able to grapple with them, when they are set forth in a book that one is reading by one's own fireside than when they are mooted to an auditorium. One can pause, can linger.... I have a notion that the drama is, after all, essentially a vehicle for action (for drama, as the Greeks quite frankly called it), is essentially, or at least mainly, a think to cause the excitement of pity and awe, or of terror, or of laughter, rather than to stimulate one's ratiocinative faculties. The theatre, I would say, is a place for thrills. You may, of course, be thrilled at your fireside by a book of philosophy or of history. You are still more likely to be so by a fine work of fiction. But the characters in a novel are not there before your very eyes, saying and doing things in your very presence. The novelist's power to startle you, or to hold you in breathless suspense, is a slight one in comparison with the dramatist's. All ... my memories of the theatre are memories of stark 'situations' -- the 59/60 appearance of the Ghost on the battlements at Elsinore; or the knocking at the gate while Duncan is murdered, and the repetition of that knocking...." (59-60)

**1243.** Beers, Henry Putney, ed. *Bibliographies in American History, 1942-1978*. Vol. 2 volumes. Woodbridge, CT: Research Publications, Inc., 1982.

This unannotated two-volume bibliography has 11,784 entries, a detailed index, and attempts to cover the entire scope of American history. It is a continuation of a work first published in 1942 and reprinted in 1959 and 1973. This edition contains the titles in the earlier editions plus new entries. The compilation took place mainly in the Library of Congress, the National Agricultural Library, the National Archives Library, the Department of Justice Library, and at Georgetown University Library. Numerous entries relate to history of new communication technologies. Themes covered include aeronautics, aviation, satellites, photography, radio, sound recording, photocopying, phonograph records, television, paper, books, newspapers, microfilm, electricity, information storage and libraries, magazines, motion pictures, and more.

**1244.** Behavior, Surgeon General's Scientific Advisory Committee on Television and Social, ed. *Television and Growing Up: The Impact of Televised Violence*. Washington, D.C.: U. S. Government Printing Office.

This carefully worded report is the result of two year of work by a committee of distinguished behavioral scientists. The committee is frank about questions it was unable to answer. An opening chapter provides the report's "Findings and Conclusions." Nine chapters and five appendices follow. The chapters deal with "Violence in Society and in the Television Medium"; "Some Problems of Research on the Impact of Television"; "Television Content"; "Changing Patterns of Television Use"; "Television and Violence in the World of Children"; "Television and Adolescent Aggressiveness"; "Current Knowledge and Questions for Future Research"; "The Unfinished Agenda."

With regard to the question "how much contribution to the violence of our society is made by extensive violent television by our youth?" the Report answers: "The evidence (or more accurately, the difficulty of finding evidence) suggests that the effect is small compared with many other possible causes, such as parental attitudes or knowledge or and experience with the real violence of our society.

"The sheer amount of television violence may be unimportant compared with such subtle matters as what the medium says about it: is it approved or disapproved, committed by sympathetic or unsympathetic characters, shown to be effective or not, punished or unpunished? Social science today cannot say which aspects of the portrayal of violence make a major difference or in what way. It is entirely possible that some types of extensive portrayals of violence could reduce the propensity to violence in society and that some types might increase it. In our present state of knowledge, we are not able to specify what kinds of violence portrayal will have what net result on society." (7-8)

This work appeared at a time when empirical research on violence in the mass media was relatively undeveloped. In the decades that followed, literally hundreds of studies on this topic appeared.

**1245.** Bell, Daniel, ed. *The Coming of Post-Industrial Society A Venture in Social Forecasting*. New York: Basic Books, 1973.

In the 1976 Foreword to this book, Bell wrote "In a narrower, technical sense, the major problem for the post-industrial society will be the development of an appropriate 'infrastructure' for the developing *communications* networks (the phrase is Anthony Oettinger's) of digital information technologies that will tie the post-industrial society together. The first infra-structure in society is transportation -- roads, canals, rail, air -- for the movement of people and goods. The second infra-structure has been the energy utilities -- oil pipeline, gas, electricity -- for the transmission of power. The third infra-structure has been telecommunications, principally the voice telephone, radio, and television. But now with the explosive growth of computers and terminals for data (the number of data terminals in use in the United States went from 185,000 in 1970 to 800,000 in 1976) and the rapid decrease in the costs of computation and information storage, the question of hitching together the varied ways information is transmitted in the country becomes a major issue of economic and social policy.

"The 'economics of information' is not the same character as the 'economics of goods,' and the social relations created by the new networks of information (from an interactive research group communication created by national television) are not the older social patterns -- or work relations -- of industrial society. We have -- if this kind of society develops -- the foundations of a vastly different kind of social structure than we have previously known." One example of the way in which cheap communication created new social patterns was the use of citizen band radio, which became something of a fad during the mid-1970s.

Two ways contemporary society differed from earlier eras was in the pace of change and in the "change of scale," Bell said. "These two concepts -- the pace of change and the change of scale -- are the organizing idea for the discussion of the central structural components of the post-industrial society, the dimensions of knowledge and technology." Chapter 3 deals with "The Dimensions of Knowledge and Technology The New Class Structure of Post-Industrial Society."

Bell said that technology had been a major factor in creating "the radical gap between the present and the past." He offered five ways in which it had created this gap 1) it had raised the standard of living by creating more goods and reduced cost; 2) it had created a new class of engineers and technicians; 3) it created a new definition of rationality emphasizing functional relationships and quantitative techniques; 4) revolutions in communication and transportation had created new social relationships and economic interdependencies; and 5) "esthetic perceptions, particularly of space and time, have been radically altered."

This book considers a good deal more than communication, but new ways of communicating were important to understanding the nature of post-industrial society, Bell believed.

**1246.** ---. "The Social Framework of the Information Society." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 500-49, 571-74.

Bell questions the abilities of computers and raises several ethical issues regarding their use. Of particular interest is Bell's section on "Intellectual foundations of the revolution in communications," in which he discusses Harold Innis and Claude Shannon's theories. See Joe Weizenbaum's rejoinder and Bell's response (pp. 571-74) in *ibid.* This essay originally appeared in Michael L. Dertouzos and Joel Moses, eds., *The Computer Age: A Twenty-Year View* (Cambridge, MA: The MIT Press, 1979).

**1247.** ---. "The Year 2000 --- The Trajectory of an Idea." *Daedalus* 96.3 (1967): 639-51.

Here Bell introduces an issue of *Daedalus* devoted to theme: "Toward the Year 2000: work in progress." The volume groups contributors around five "problems areas" -- "the adequacy of the governmental structure, the changing nature of values and rights, the structure of the intellectual institutions, the life-cycle of the individual, and the international system." See also Bell's "Coda: Work in Further Progress" (985ff) at the end of this issue which attempt to pull together themes in this issue.

**1248.** Bellamy, Edward, ed. *Looking Backward, 2000 - 1887*. Boston: Houghton Mifflin Company, 1887.

One interesting section of Bellamy's book discusses a room in which a wide array of music is broadcast by means of telephone. The volume was adjusted by merely touching "one or two screws." Of course, by this time (1887) concerts had been broadcast by telephone to people who could afford this service in Europe. Other interesting sections in Bellamy's work include the use of a system that employed tubes to deliver messages between stores and warehouses. The author also talks about books, libraries, newspapers, and magazines of the future.

**1249.** Bellion, Wendy. "Heads of States: Profiles and Politics in Jeffersonian America." *New Media, 1740-1915*. Ed. Lisa Gitelman and Geoffrey B. Pingree, eds. Cambridge, MA: MIT Press, 2003. 31-59.

In the early nineteenth century, Americans "anxious about accurate representation seized upon a new mechanical invention -- the *physiognotrace* -- as the answer to their concerns. The *physiognotrace* was a drawing machine.... Literally used, as the name suggests, to trace an individual's physiognomy, the *physiognotrace* produced four identical, miniature silhouettes or *profiles*. The device and the images it yielded were praised in the descriptive terms of *actual representation*, a period rhetoric that optimistically imagined political representation to be direct, particular, and true." The invention "equipped any willing citizen to enact a fantasy of Jeffersonian political subjectivity." (31)

Blake's essay appears in a volume that is part of a larger series on new media technologies entitled *Media In Transition*. This volume offers a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. These ten essays examine media that were new in the eighteenth, nineteenth, and early twentieth centuries. The expore "momemts of transition when each new medium was not yet fully defined, its significance in flux...." They attempt to put these media into their "specific

material and historical environment" and explain the "ways in which habits and structures of communication are naturalized or normalized." (viii)

**1250.** Belton, John. "CinemaScope: The Economics of Technology." *Velvet Light Trap*. 21 (1985): 35-43.

Belton, who has written a book on widescreen cinema, here examining the marketing of CinemaScope.

**1251.** ---, ed. *Widescreen Cinema*. Cambridge, MA: Harvard University Press, 1992.

This book is based on research in the Sponable Collection at Columbia University, the Warner Bros. Archives at USC, the UCLA Film Archives, the Film Study Center at the Museum of Modern Art, and the Lincoln Center Library for the Performing Arts.

Belton writes that "Cinerama, CinemaScope, and other widescreen systems did not emerge magically from the head of Hollywood; their success in the mid-1950s did not occur in a historical vacuum but against a background of earlier failure. A close examination of the factors which led to the abortion of the wide-film revolution of 1926-1930, when Fox and other studios attempted to innovate various wide-film systems, revealed that these 'negative' determinants were reversed in the postwar era, prompting the adoption of technologies remarkably similar to those which had earlier been rejected. I also look forward from the 1950s to the transformations that have taken place in motion picture exhibition during the past thirty years. If the 'rise' of widescreen could be located in the period 1926-1930, then its 'demise' would seem to be integrally bound up with multiplexing, the marketing of widescreen films to television, the advent of the videocassette recorder, and, with it, the growth of a major subsidiary form of distribution for widescreen films through videotape sales and rentals."

**1252.** Bement, Arden L., Jr. "Materials Sector Profile." *Technological Frontiers and Foreign Relations*. Ed. Anne G. Keatley, ed. Washington, D. C.: National Academy Press, 1985. 110-64.

Bement's essay notes that materials science in 1985 was in "transition" (111) and that this field and engineering were "burgeoning -- so much so, that it is difficult to distinguish between future developments and near-term applications." (113) Bement the importance of research and development in the area of materials and the importance that this field has to foreign relations.

**1253.** Benford, Gregory, and Malartre, Elisabeth, eds. *Beyond Human: Living with Robots and Cyborgs*. New York: Forge Books, 2007.

Predicting the future has usually been the province of science fiction writers. Hence, it is no surprise that *Beyond Human: Living with Robots and Cyborgs* is written by the acclaimed sci-fi writer Gregory Benford and his wife, fellow sci-fi writer Elisabeth Malartre. Because Benford is steeped in fiction, most of the evidence in the book comes from sci-fi books and movies, with an emphasis on Asimov, whose three rules of robotics are discussed extensively, and Philip K. Dick. In addition to supporting his claims about the future of robotics with fiction, Benford also interviews several scientists and theologians working in the field of robotics, focusing on M.I.T.'s artificial intelligence lab, a pioneer in robotics technology. M.I.T.'s lab produced one of the most popular home robots, iRobot Roomba, a robotic vacuum cleaner that is designed like a turtle, a trend in small consumer robots.

*Beyond Human* is divided into three main sections: one on cyborgs, another on robots, and the last on bionics and future developments in the field. A woman wearing eyeglasses would be considered a cyborg, the authors say, because a cyborg is simply a "hybrid of man and machine." (p.102) Robots, on the other hand, are stand-alone beings that may even have a soul (according to some scientists). In the last section, the authors discuss the superorganism, using the Internet as an example of a mass of human desires aggregated in one place.

The main argument of *Beyond Human* is that in the future robots will become as ubiquitous as computers; therefore, we need to respect robots and not fear them. We will not be taken over by an all robot army. More

likely, robots will give us emotional support in addition to being able to perform useful tasks. They will be the pets of the mid- to late-twentieth-first century.

--Hallie Lieberman

**1254.** Beniger, James R., ed. *The Control Revolution: Technological and Economic Origins of the Information Society*. Cambridge, MA: Harvard University Press, 1986.

This is a substantial, thought-provoking book. "To what comparable technological and economic 'revolution' might we attribute the emergence of the Information Society?" Beniger asks.

"My answer ... is what I call the Control Revolution, a complex of rapid changes in the technological and economic arrangements by which information is collected, stored, processed, and communicated, and through which formal or programmed decision might effect societal control. From its origins in the last decades of the nineteenth century, the Control Revolution has continued unabated, and recently it has been accelerated by the development of microprocessing technologies. In terms of the magnitude and pervasiveness of its impact upon society, intellectual and cultural no less than material, the Control Revolution already appears to be as important to the history of this century as the Industrial Revolution was to the last."

"The Information Society, ... is not so much the result of any recent social change as of increases begun more than a century ago in the speed of material processing. Microprocessor and computer technologies, contrary to currently fashionable opinion, are not new forces only recently unleashed upon an unprepared society, but merely the latest installment in the continuing development of the Control Revolution. This explains why so many of the computer's major contributions were anticipated along with the first signs of a control crisis in the mid-nineteenth century."

Among the most interesting chapters in this book are chapter 6 ("Industrial Revolution and the Crisis of Control") and Chapter 8 ("Revolution in Control of Mass Consumption"). The latter chapter deals with modern advertising, modern media, government control of broadcasting, and the technology of market feedback. The work has tables throughout dating important communication inventions and related developments.

**1255.** Benjamin, Walter. "A Child's View of Color." *Walter Benjamin: Selected Writings. Volume I: 1913-1926*. Ed. Jennings, Marcus Bullock and Michael W. Cambridge, MA: Belknap Press of Harvard University Press, 1996. 50-51.

Walter Benjamin discusses children and color during the period around 1914-15.

**1256.** ---, ed. *Illuminations: Essays and Reflections. Edited and with an Introduction by Hannah Arendt*. New York: Harcourt, Brace and World.

A few good insights can be found in the chapter on "The Work of Art in the Age of Mechanical Reproduction," although often when Benjamin moves off into theory and speculation he becomes tedious and virtually incomprehensible.

"With the woodcut," he writes, "graphic art became mechanically reproducible for the first time, long before script became reproducible by print.... During the Middle Ages engraving and etching were added to the woodcut; at the beginning of the nineteenth century lithography made its appearance.

"With lithography the technique of reproduction reached an essentially new stage. This much more direct process was distinguished by the tracing of the design on a stone rather than its incision on a block of wood or its etching on a copperplate and permitted graphic art for the first time to put its products on the market, not only in large numbers as hitherto, but also in daily changing forms. Lithography enabled graphic art to illustrate everyday life, and it began to keep pace with printing. But only a few decades after its invention, lithography was surpassed by photography.... Around 1900 technical reproduction had reached a standard that not only permitted

the most profound change in their impact upon the public; it also had captured a place of its own among the artistic processes.

“Even the most perfect reproduction of a work of art is lacking in one element: its presence in time and space, its unique existence at the place where it happens to be....”

**1257.** Bennett, John W. "Using Union Memorabilia as a Teaching Aid." *Labor Studies Journal* 3.2 (1978): 114-30.

Bennett suggests that labor educators could make use of buttons, pins, badges and other ephemera to teach about labor history and politics. Bennett uses materials he has obtained at flea markets and elsewhere to discuss key moments and issues in labor history. For example, he notes, the equilateral triangle on all Knights of Labor artifacts “can be used to remind students that the Knights of Labor admitted workers no matter what their industry, craft, or skill level. There were no separate symbols for carpenters, glass blowers, telegraphers, or shoemakers.” In the early stages of the Congress of Industrial Organizations, the letters CIO figure prominently, suggesting “workers knew they were joining the CIO as well as a union within their industry,” Bennett writes. Bennett also discusses what can be said from buttons, pins and badges about the evolution of individual unions, the railroad brotherhoods, unions and World War II, and labor and politics. The article includes eight pages of illustrations of buttons and pins.

**1258.** Bennetts, Leslie. "Conservatives Join on Social Concerns." *New York Times* July 30, 1980 1980, sec. A: 1A.

This article is about conservatives inveighing about the dangers of pornography and other immorality in mass media. These conservatives formed a coalition supporting Ronald Reagan's candidacy in 1980. The issues they support were often defined as "traditional moral values" which emphasized the sanctity of the family and which often opposed abortion, the equal rights amendment for women, drafting women into military service, homosexuality, and pornography.

**1259.** Bergeron, Bryan, ed. *Dark Ages II: When the Digital Data Die*. Upper Saddle River, N.J.: Prentice Hall PTR, 2002.

The author warns that with the arrival of electronic, digital media, that much of what is being created and saved is in danger of being permanently lost. New technology becomes obsolete rapidly and often data stored on it becomes inaccessible. Moreover, many new media deteriorate very quickly (in historical terms), much faster than more stable media such as paper and microfilm. Many companies and institutions have no plan for data loss.

--SV

Although computers often operate proficiently and effectively in storing and processing data, because of the possibility that something might go wrong, it is important to prepare for alternative measures of data collection. “Millions of computers operate flawlessly for years without anyone ever noticing anything out of the ordinary,” the author writes. “However, given the complexity and interconnectedness of modern society, when a computer system containing critical data fails, the repercussions ripple throughout the fabric of an organization. Knowing what can go wrong with computer systems, learning to recognize the relevant situations, and then preparing to deal with the most likely outcomes is a reasonable approach to managing the risk of digital data loss in a rapidly evolving technological environment.”

Companies may have employees who recognize the importance of data storage backup systems, however there is seldom a specific management plan in place for ensuring the existence of data. “Unfortunately, surprisingly few companies---and even fewer individuals---have a data loss management plan. That is, they may

have an inkling of what should be done and perform backups relatively regularly because everyone knows that backups are important. However, unless there's a written plan that can be read, examined, scrutinized, and followed, one or more of the above stages will be skipped or shortchanged. In particular, without a written plan in place, there is a much greater likelihood that there will be an actual data loss incident. As described here, there are ways to control and understand the economic ramifications of data loss and reduce the chances of it recurring in the future."

The United States has misplaced priorities on deciding what information should be stored via a mandated government system. The health care industry seems to be one that has been left to fend for its data on their own. "The issue of who decides what data are valuable and should be saved and what data should be disposed of seems critical in larger social systems, such as health care. In the United States, short term economics often dictates many corporate practices, with little or no regard for time horizons past, say, five years. However, except for stockholders and those who like potato chips, it seems that the chip companies should decide the fate of their data. To allow other companies, such as large health care enterprises, to decide on their own how to handle patient data seems less appropriate. It may be more appropriate for federal legislation to decree the value of universal health care data."

The best bet for securing digital data for years to come is to transfer it to the latest communication medium, Bergeron argues. Waiting to long can jeopardize any hope of transfer. "Because of competing architectures, rapidly evolving hardware, and the lack of enduring standards, it's difficult to share data among contemporary systems, much less work with media from a decade ago. The rapid evolution of the microcomputer, from Altair to the modern PC, and of media, from paper and cassette tape to floppy disks to flash RAM, illustrates how media, operating systems, and data formats have yet to stabilize. If the world changes to a new microcomputer platform---a descendent of Linux, for example---then prudent computer users will migrate their data to the new system as soon as it's stable."

--Michael Shefky

**1260.** Bergery, Benjamin. "Framing the Future." *American Cinematographer* 82.9 (2001): 76-83.

Cinematographer David Tattersall and a group of imaging experts offer an assessment of the digital cameras and techniques George Lucas used on *Star Wars: Episode II*, a movie that was then in production.

**1261.** Bergman, Andrew, ed. *We're in the Money: Depression America and Its Films*. New York: New York University Press; Harper & Row, 1972.

This work examines common themes (e.g., "rags-to-riches") in Depression- and New Deal-era motion pictures.

**1262.** Bergson, Henri (trans. by Arthur Mitchell), ed. *Creative Evolution*. New York: Henry Holt and Company, 1911.

In this work, Henri Bergson comments on the characteristics of the cinematograph, or motion pictures, and how, in some respects, human knowledge has characteristics of the cinematograph:

"Suppose we wish to portray on a screen a living picture, 304/305 such as the marching past of a regiment. There is one way in which it might first occur to us to do it. That would be to cut out jointed figures representing the soldiers, to give to each of them the movement of marching, a movement varying from individual to individual although common to the human species, and to throw the whole on the screen. We would need to spend on this little game an enormous amount of work, and even then we should obtain but a very poor result: how could it, at its best, reproduce the suppleness and variety of life? Now, there is another way of proceeding, more easy and at the same time more effective. It is to take a series of snapshots of the passing regiment and to throw these instantaneous views on the screen, so that they replace each other very rapidly. That is what the cinematograph does. With photographs, each of which represents the regiment in a fixed attitude, it reconstitutes the mobility of the regiment marching. It is true that if we had to do with photographs alone, however much we might look at

them, we should never see them animated: with immobility set beside immobility, even endlessly, we could never make movement. In order that the pictures may be animated, there must be movement somewhere. The movement does indeed exist here; it is in the apparatus. It is because the film of the cinematograph unrolls, bringing in turn the different photographs of the scene to continue each other, that each actor of the scene recovers his mobility; he strings all his successive attitudes on the invisible movement of the film. The process then consists in extracting from all the movements peculiar to all the figures an impersonal movement abstract and simple, *movement in general*, so to speak: we put this into the apparatus, and we reconstitute the individuality of each particular movement by combining the nameless movement with the per-305/306 sonal attitudes. Such is the contrivance of the cinematograph. And such also is that of our knowledge. Instead of attaching ourselves to the inner becoming of things, we place ourselves outside them in order to recompose their becoming artificiality. We take snapshots, as it were, of the passing reality, and, as these are characteristics of the reality, we have only to string them on a becoming abstract, uniform and invisible, situated at the back of the apparatus of knowledge, in order to imitate what there is that is characteristic of this becoming itself. Perception, intellection, language so proceed in general. Whether we would think becoming, or express it, or even perceive it, we hardly do anything else than set going a kind of cinematograph inside us. We may therefore sum up what we have been saying in the conclusion that the *mechanism of our ordinary knowledge is of a cinematographical kind.*" (emphasis in original text)

**1263.** Berinstein, Paula, ed. *Statistical Handbook on Technology*. Phoenix, AZ: Oryx Press, 1999.

This work provides statistical data, predominantly for the 1990s but some tables give information for much earlier. For example, tables show the sales of color television sets in the United States from 1954 to the late 1990s. The work covers a wide range of technologies. Among those relating to communication include: biotechnology, computers, construction and infrastructure, consumer products and entertainment, materials, military, space, and transportation.

**1264.** Berkman, Dave. "The Promise of Early Radio and Television for Education -- as Seen by the Nation's Periodical Press." *Educational Technology* 32.12 (1992): 26-31.

"The relationship between education and broadcasting in the United States -- unlike Great Britain, Japan and a number of Third World nations -- has been minimal; its significance almost nil. The many and complex reasons for this (which this writer has explored at some length elsewhere) come down to the vested interest which American education had long had in perpetuating a highly labor-intensive, low-productivity system of schooling. But whatever the reasons for the way things would eventually turn out, during radio's earliest years, when broadcasting first exploded into America's consciousness and living rooms during the early '20s, and then especially during the period of television's 'gestation' -- the years between its emergence from the laboratory and its 'take-off' in 1948 -- the nation's periodical press bespoke the positive promises which each of these broadcast media held for education. Here, as has so often been the case, press perceptions -- the education press, itself, not excluded -- of 'things educational' had little relation to reality."

**1265.** Berkowitz, Bruce, ed. *The New Face of War: How War Will Be Fought in the 21st Century*. New York: Free Press, 2003.

The central thesis of this book is that "the Information Revolution has fundamentally changed the nature of combat. To win war today, you must first win the information war." Winning the information war against terrorists in the post-September, 2001 world will be critical and moreover, "U.S. leaders must also be able to decide when and how to strike them before they strike us. Doing this while observing the traditional rules of war will be a challenge," the author admits. So, too, "will maintaining democratic control of U.S. armed forces."

Satellites, optical fibers, and digital media make it possible to deliver information virtually anywhere instantaneously. Terrorist groups can now remain autonomous cells but still be interconnected by modern communication. These networks can be joined together with secure command and control systems that an exploit

both military and commercial communications. These networks can also control extraordinarily power nuclear, biological, or chemical weapons.

Recent thinking about information warfare owed much to Andrew Marshall, who started with the RAND Corporation, and Thomas Rona, a scientist at Boeing Corporation. They met during the late 1970s and Rona became deputy director of the White House Office of Science and Technology Policy after Ronald Reagan's election in 1980. During the George H. W. Bush administration, then Secretary of Defense Dick Cheney ordered that the Department of Defense focus strongly on attacking and defending information systems.

Berkowitz discusses the ability to strike single targets with precision from great distances and also how new communication technologies allow American forces to disrupt opponents infrastructure and "swarm" the enemy unexpectedly. Chapter 12, entitled "Killing," notes that modern precision weaponry makes the assassination of foreign leaders much easier and raises crucial issues in international law. Assassinating Osama bin Laden or Saddam Hussein "covertly would undercut our standing as a country trying to uphold the rule of law," he acknowledges.

At the time of this book's publication, Berkowitz was senior analyst at the RAND Corporation and a research fellow at the Hoover Institution at Stanford University. Earlier he had worked for the CIA and been on the staff of the U.S. Select Committee on Intelligence.

**1266.** Berkowitz, Leonard, ed. *Aggression: A Social Psychological Analysis*. New York: McGraw-Hill Book Company, 1962.

Berkowitz, a psychologist who was Vilas Research Professor at the University of Wisconsin-Madison, puts forth a study on aggression that is a synthesis of both previous work from various scholars in the field and his own definitive work on the issue of aggression and violence. As a study in the field of psychology, the book is laid out by theme, with chapters devoted to the forms of aggression, the causes, and role of the media, and the psychology of murder and domestic abuse. Berkowitz makes a positive correlation between media and violence.

Berkowitz stresses that these particular studies only show a short-term connection between aggression and media. Violence seems to occur only immediately after exposure to publicized violence. Berkowitz calls this a priming effect, in which the publicized violence stimulates other ideas that are likewise aggressive. "Before going further, I should remind you that I am now dealing only with the relatively immediate and transient effects of seeing violence on TV and movies screens or reading about it on the printed page with the long-term consequences of repeated exposure. Nevertheless, I believe it will be helpful to explain these aftereffects in terms of the 'priming' concept . . . the central notion of priming is that when people encounter a stimulus (or an event) that has a particular meaning, other ideas occur to them that have much the same meaning. These thoughts in turn can activate yet other semantically related ideas and even tendencies to act . . . just this type of phenomenon contributes to the aggressive behaviors that results from exposure to a violent movie or TV program or the news report of a violent incident. People in the audience get aggressive ideas."

Aggressive acts depicted in movies likewise will be less likely to incite aggressive actions if the acts are depicted as having negative consequences, or are not shown in a positive light. "This outcome is definitely pertinent to movie violence. A highly aggressive film won't promote aggression-enhancing thoughts and motor reactions when the viewers regard the fighting, shooting, and killing in the movie as morally wrong. But most violent movies don't really question the aggression they portray."

Most movies do not show the negative consequences of violence, however. In fact, Berkowitz notes that often, movies show the hero of a movie triumphantly using aggression to subdue villains. "However, the typical violent movie does more than portray obviously improper aggression. It usually goes on to show the hero triumphantly beating up the bad guys at the end of the story. This is certainly the case in *Bad Day*. After being picked on throughout most of the film, Spencer Tracy finally decides he has taken enough and turns on his

oppressors . . . Audiences love this ending. They enjoy seeing the wrongdoers receive the treatment they deserve and the thoughts activated by this gratifying violence may actually increase the chances that at least some person in the audience will assault another individual soon afterward.”

Berkowitz concludes by emphatically stating that the majority of researchers have shown that violence can incite aggressiveness, and not only among the young or the mentally deranged, but also to an extent among the populace at large. “The public at large and even some media specialists believe that depictions of violence on movie and TV screens and in the print media have at most a very minor effect on audience members. Further, they think that only children or mentally deranged viewers are susceptible to even this minor effect. However, the majority of researchers who have investigated media effects and/or who have carefully studied the pertinent research literature believe otherwise. In this chapter, I show that 1. Portrayals and even news reports of violence increase the chances that people in the media audience, adults as well as children, will behave aggressively themselves. 2. This influence is not trivial, especially when one considers that millions of persons are ordinarily exposed to the media. 3. Psychological concepts that are becoming well accepted can help to identify the factors that heighten or weaken the likelihood of aggressive reactions.”

**--Nicholas Wolf**

**1267.** ---. "Some Effects of Thoughts on Anti- and Pro-social Influences of Media Events: A Cognitive-Neoassociation Analysis." *Psychological Bulletin* 95.3 (1984): 410-27.

Berkowitz, a professor of psychology, is interested in the linkage between news reports of sensational violent crime and subsequent events of a similar nature. The implications of research on this topic, according to him, seem to indicate that “real and fictional depictions by the media of violence – killings, shootings, or suicides – can prompt audience members to act aggressively toward others or themselves. The present essay also argues that some of the now familiar effects of violent scenes on television and movie screens are similar to those producing the suggesto-imitative assaults discussed by [Gabriel] Tarde and documented in the research into the contagion on violence just mentioned. In addition to these negative consequences, the mass media can also promote pro-social behavior.... A comprehensive account of media effects should deal with both positive and negative influences.”

Berkowitz notes that critics of film and television violence believe that children learn to use aggression, or at least favor it, in solving interpersonal problems, and that also that violence in mass media makes some people indifferent to the suffering that results from real violence. Berkowitz also suggests another damaging result of media violence: “people can get ideas from the communications reporting violent incidents and, for a short time afterward at least, these thoughts can help foster antisocial behavior.”

Reprinted in Stephen Prince, ed., *Screening Violence* (New Brunswick, N. J.: Rutgers University Press, 2000), 205-36.

**1268.** Berleur, Jacques, Andrew Clement, Richard Sizer, and Diane Whitehouse, eds., ed. *The Information Society: Evolving Landscapes*. New York: Springer-Verlag, 1990.

This is a collection of original papers delivered at a conference (by the same title as the book) held at the University of Namur in June, 1988. The contributors are international experts in different areas of information technology (IT) and its influence on society. The authors maintain “that the relationship between IT and society has to be considered in an holistic context.” The book’s six sections are divided into themes: “Ethics,” “Roots, Legitimacy and Ideology,” “Towards New Cultural Perspectives?,” “Politics,” “Economics,” and “Artificial Intelligence, Human Mind and Image of Reality.” Like so many conference publications, the entries in this volume are of uneven quality. A work from which to cull isolated insights.

**1269.** Berliner, Emile. "The Development of the Talking Machine." *Roll Back the Years: History of Canadian Recorded Sound and Its Legacy: Genesis to 1930*. Ed. Moogk, Edward B. Ottawa: National Library of Canada, 1975. 375-79.

Berliner talks about the origins of the phonograph in a paper read before the Franklin Institute of Philadelphia, May 21, 1913.

**1270.** Berman, Jerry, and Daniel J. Witzner. "Technology and Democracy." *Social Research* 64.3 (1997).

This article by Jerry Berman and Daniel Witzner is an example of the optimism and enthusiasm that many people feel about the Internet and its potential to reinvigorate democracy around the world. The authors argue that the Internet provides a unique platform for increased deliberation and participation. Because of the informal and decentralized nature of the network, information can flow freely in ways that are different than traditional media outlets. The diversity and scope of opinions and resources are set in sharp contrast to the limited and centralized information sources of the past.

Berman and Witzner argue that the adaptability and flexibility of the Internet are its greatest assets. As society changes, the Internet can change along with it, enhancing and driving much of the debate. Another asset, according to the article, is the bi-directional, interactive nature of the Internet. Each user is both a producer and consumer of information. Users from around the world create a "true diversity of opinion and ideas in online forums."

The article ends with a discussion of issues related to full access. There is currently a large gap between individuals who have access and those who don't. Factors include the cost of computer hardware, the cost of online service, and the cost of the underlying infrastructure that does not exist in all parts of the world. The authors urge governments to ensure that full access is possible for everyone.

--Rob Rabe

**1271.** Bernays, Edward L. "The Engineering of Consent." *Annals of the American Academy of Political and Social Sciences*, 250 (1947).

This short article by Edward Bernays, often called the father of public relations, is interesting as an introduction to the concept of engineered consent. Bernays described the scientific methods and practical procedures used by public relations professionals to assess the audience, shape the message and deliver various forms of content to the public sphere. The entire article is phrased in terms of using these methods for social good; in fact, Bernays argued that leadership and organization are only possible in a mass media society if these principles are used. He wrote, "The engineering of consent is the very essence of the democratic process."

The article is useful because it shows the level of planning and research that go into a public relations campaign. People in this field have done a great deal of research in group psychology and media effects, and can produce very sophisticated and powerful messages. Bernays recognized that these same methods could be used for negative, or anti-democratic, purposes. However, the article plays down the threatening aspects of public relations methods, and instead points out the usefulness and benefits of their socially responsible use.

The field of public relations and engineering consent has taken on a different image in the years since this article was written. Critics see these methods being used to manipulate and misinform. However, it is important to understand that their persuasive methods were developed with largely good intentions. Bernays may have underestimated the intelligence of the public and its ability to make good political or social judgments, but the driving force behind his efforts was to give them the information they need to take part in the democratic process.

--Rob Rabe

**1272.** ---. "Labor Education as a Problem in Public Relations." *Labor and Nation* 3.2 (1947): 19-21.

Bernays argues for using modern public relations concepts to communicate with union members and the public at large. Bernays stressed three key areas for labor education initiatives in the immediate post-war era: Educate workers on union objectives, strengthen the involvement of unions in civic and governmental affairs, and sell the union to rank-and-file members. In addition, Bernays argued for three additional strategies: Make the public understand the value of unions to the country, make the employer understand the value of unions to business, and make the worker understand the industrial system. "A public that understands what unions have done for the good of the country is going to be more open-minded and friendly to union programs. If the public does not understand the value of unions, it will be guided by prejudice, untruth and distortions."

--Phil Glende

**1273.** ---. "Molding Public Opinion." *Annals of the American Academy of Political and Social Science* 179 (1935): 82-87.

Bernays, an early pioneer of public relations and a nephew by marriage to Sigmund Freud, discusses his ideas about using modern media to influence public opinion.

**1274.** Bernhard, Nancy E., ed. *U. S. Television News and Cold War Propaganda, 1947-1960*. New York: Cambridge University Press, 1999.

Bernhard begins with the premise that television news and the Cold War matured simultaneously. Following this, she argues that when the government needed to build public support for long-term armament programs, it looked to television networks to shape public opinion. Bernhard writes This book tells the story of a partnership between government information officers and network news producers to report and sell the Cold War to the American public. It chronicles dozens of news and public affairs series produced in collaboration between the inexperienced federal information bureaus and the fledging network news divisions. Much of the news about the early Cold War on television was scripted, if not produced, by the defense establishment. These programs defined American freedom as the absence of government control (2).

In the course of her study, Bernhard draws on numerous primary and secondary sources. Sifting through the papers of both the television networks and the United States government, Bernhard explores, among other things early Cold War propaganda on television; the rise of the Broadcasters Advisory Council; the television programs *Battle Report -- Washington* and *Meet the Press* which aired on NBC; and various television programs created by the Department of Defense. In her analysis of *Meet the Press*, Bernhard shows that while it seemed to fulfill television's democratic promise of bringing government into the home in an objective and unbiased forum, it was in fact tightly regulated by the network so that it always enacted a supportive function for the government (162-3).

After tracing the intersections and collaborations between the government and television networks manifest in these various programs and institutions, Bernhard meditates on the blurred line between culture and conspiracy. Although she cautions her reader against concluding that there was a vast conspiracy afoot in the early Cold War period, Bernhard acknowledges that certain covert collaboration between government agents and networks supposedly devoted to freedom from governmental regulation is undeniable. This study finally reminds the reader that history is itself necessarily constructed, and, when viewed through the lens of commercial television, the early Cold War can be seen as a period in which truth itself was a contested area (179). In her conclusion, Bernhard leaves the reader with several seminal questions that her study provokes, questions that remain as much unanswered in the early Cold War period as they do in our own time. Does this intimate relationship signal the disappearance of the ostensible line separating news and government, or does it represent reasonable service to country on the part of the broadcasters? Is it conspiracy, or is it culture? When the culture of reporting is so proudly and unapologetically intimate with the government, that line is rather hard to draw. The

lingering question is how such an access-proud news establishment maintains a public image of oppositionalism (187).

U.S. Television News and Cold War Propaganda, 1947-1960 is valuable for the student interested in how seemingly-objective news programs of the early Cold War period were actually constructed with political goals in mind. Bernhard's work is a useful compliment to studies such as Michael Curtains *Redeeming the Wasteland: Television Documentary and Cold War Politics* (1995) because it explains how the very growth and expansion of the television news industry was connected to and influenced by the United States government.

--Steve Belletto

**1275.** Berns, Walter. "On Pornography: -- Pornography vs. Democracy: The Case for Censorship." *Public Interest* 22 (1971): 3-24.

This article was among those written by social, legal, and political conservatives in the aftermath of the 1970 *Report* by the President Commission on Obscenity and Pornography. They warned that pornography dehumanized society, eroded self-restraint, undermined democratic government, and, when disseminated through mass media, could even destroy civilization. The 1970 *Report* of the President Commission on Obscenity and Pornography argued that pornography and erotica were essential harmless and that restrictions imposed on them by society should be loosened.

**1276.** Bernstein, Irving, ed. *Hollywood at the Crossroads: An Economic Study of the Motion Picture Industry*. Hollywood, CA: Hollywood A.F.L. Film Council, 1957.

This work argues that between 1949 and 1957, there was a steady increasing in the number of so-called "runaway" or American-interest films produced in Europe and other parts of the world. These films, made by American film companies with a few American stars and directors, used mostly foreign labor. It was cheaper to film abroad and often quotas imposed by other countries required American films to meet legal standards imposed by the host country. Most of these runaway productions were made in Great Britain, followed by Italy, Mexico, France, and Germany. This work notes the problems this trend posed for Hollywood labor. The work also notes that these hybrid films often were similar to foreign film in their production values and in their content. In trying to satisfy an international audience, movies had to be made with international appeal rather than narrowly made to appeal only to U. S. audiences. The work discusses the reasons for the decline in movies attendance in the U. S. and notes that the Baby Boom generation which will come of age in the 1960s and 1970s will likely provide new opportunities for movie makers.

**1277.** Bernstein, Jeremy, ed. *Three Degrees Above Zero: Bell Labs in the Information Age*. New York:: Charles Scribner's Sons, 1984.

The author accepted an invitation to write about Bell Labs in September 1982 (the divestiture of Bells Labs occurred in 1982). This work is not footnoted and has only a brief bibliography but chapters 5-9 deal with solid state and transistors. Chapters 10-13 deal with telephony. The title refers to the average temperature of the universe (3 degrees above absolute zero), a discovery that began with observations of two Bell lab radio astronomers in 1964.

**1278.** Bernstein, Matthew, ed. *Controlling Hollywood: Censorship and Regulation in the Studio Era*. New Brunswick, NJ: Rutgers University Press, 1999.

This work is a collection of articles on motion picture censorship, most of which have been previously published in such journals as the *Historical Journal of Film, Radio and Television*, *Journal of American History*, *Velvet Light Trap*, *Screen*, *Cinema Journal*, and *Quarterly Review of Film and Video*. The authors include: Garth Jowett, Shelley Stamp, Richard Maltby, Lea Jacobs, Ruth Vasey, Clayton R. Koppes and Gregory D. Black, Matthew

Bernstein, Ellen Draper, Jeff Smith, and Justin Wyatt. The work also includes a twelve-page annotated bibliography.

**1279.** Berry, Graham. "The Budget of the Movies." *The Bookman* 39.6 (1914): 908-20.

Graham Berry examines the transformation in the motion picture business over the previous 15 years. By 1914, a substantial supporting media had grown up around the movies. **"When twenty-four sheet posters announce picture plays on every corner, when electric letters over the entrances of usurped theatres flash the names of film companies and stars, when a well-known periodical advertises in the street cars as a contest for moving-picture patrons 'Which is your favorite leading man?' when in a syndicate of large American dailies is published from week to week a story-version by one of our most popular novelists simultaneously with the picture-version in the theatres, when the news-stands display several periodicals devoted to news of the motion-picture world -- even the man in the street (who, in spite of his location, is never supposed to see anything!) can no longer remain oblivious to the fact that he is perambulating in the midst of an enormous industry.** Then he begins to wonder how it happened and what all this represents." (608-09) (emphasis added)

Berry says that there are about 20,000 movie theaters in the U. S. and Canada. (609) He discusses movies as a trade organization and the "plant" where films are produced. In the making of moving pictures, great waste and realism go hand-in-hand. (615) Editing is required to make the film watchable and sometimes more than half of the origin movies is cut out. (616) The Vitagraph Company was then releasing about six movies a week and putting four other into storage. (618) At this time, "Eighty per cent of the theaters change their programmes daily." (619)

The author concludes by commenting on the rise of movie stars such as John Bunny. As late as 1910, no top-rank actors would take part in movies. Now, because of the money and increased fame, there is no shortage of good actors in films. By 1914, the much larger salaries were important but the **"infinitely wider audience acts as a significant lure in itself. As short a while ago as 1910 not a single prominent actor was willing to enter a film studio, now there are some stars who never leave it. That the extent of the audience has something to do with this is proved by the fact that certain stars in all the companies are now constantly featured. The personal following of a man like John Bunny has probably never been equaled in the history of the world. He is probably known by more kinds of people than any one who ever lived before. In a little Russian village there is a notice at the door of the moving-picture theatre, 'No programme is complete without our dear Pockson.' Pockson is Bunny, 'the man who makes them laugh.'** A man stopped him on Broadway the other evening. 'You are John Bunny,' he said. 'I got acquainted with you in Mombasa. There isn't a nigger in the place who doesn't scream when he sees you!'" (620) (emphasis added)

**1280.** Bertrand, Ina, ed. *Film Censorship in Australia*. St. Lucia, Australia: University of Queensland Press, 1978.

Bertrand, an fine historian of cinema, writes about efforts to censor Australian motion pictures. This solid work provides a comparative context for scholar working on American and British film censorship.

**1281.** Bess, Michael D. "Icarus 2.0: A Historian's Perspective on Human Biological Enhancement." *Technology and Culture* 49.1 (2008): 114-26.

In this article, author Michael D. Bess discusses the "technologies of human enhancement" (114) in three important areas: pharmaceuticals, prosthetics and informatics, and genetics. Bess argues that "today we are in the early stages of an epochal shift that will prove as momentous" as early "important watersheds in human history" such as the use of metal tools, the rise of agriculture, and the use of steam power. (114) "This time around," he writes, the new techniques and technologies are not being applied to reinventing our tools, our methods of food production, our means of manufacturing. Rather, it is we ourselves who are being refashioned." (114) These changes are "raising profound questions about what it means to be human." (114) Where earlier transformations took place over long period of time, what is occurring now taking place much faster. "This time around ... the radical innovations are coming upon us suddenly, in a matter of decades. Contemporary society is

unprepared for the dramatic and destabilizing changes it is about to experience, down this road on which it is already advancing at an accelerating pace." (115) What is at hand is "one of the great disjunctions in human history." (125)

With regard to the use of pharmaceuticals, the use of steroids in athletics obviously comes to mind. But people are using them "in increasingly sophisticated and powerful ways to reshape their bodies and minds.... In the process, our society's sense of what constitute normal ability and basic mental well-being is being destabilized." (118) Bess notes that the Defense Advance Research Projects Agency (DARPA) and the military are much involved in using prosthetic technologies for human enhancement in ways that will affect the future battlefield. Research in genetics is proceeding rapidly and "genetic enhancement of basic human traits is no longer a topic of fantasy," Bess maintains. (121)

Bess sees four challenges confronting us. First, biotechnological modifications, which come to us in small ways, will increasingly add up with the result being a world "in which the very meaning of the word 'normal' is constantly shifting." (123) Second, in the near future, citizens will be able to choose for themselves extraordinary capabilities and traits. "Over the coming century, some of us -- perhaps many of us -- will be increasingly merging with our machines, while at the same time modifying our own biology in every deeper ways." (123) By 2050, our world will likely "include a wide variety of truly hybrid beings, part genetically modified human, part machines." (123) No one can accurately predict what such people in the future will look like. A third challenge is the potential for social disruptions caused by these enhancement technologies. "It is not at all clear whether a population of highly enhanced humans can coexist peacefully alongside a population of unmodified humans." (124) Finally, these new enhancement technologies threaten "the moral ideals of equality and human dignity," Bess writes. (124) "A central moral challenge of the coming decades will be to prevent the technologies of enhancement from eroding the foundations of equality and human dignity on which our political and social systems rest." (125) The challenge will be to see that not just the privileged few have access to these technologies. (126) Bess concludes by saying that "it is not just our weaponry that threatens us, but our technologies of healing as well." (126)

**1282.** Bessant, John, Ernest Braun, and Russell Moseley. "Microelectronics in Manufacturing Industry: The Rate of Diffusion." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 198-218.

This paper gives an overview of the diffusion of microelectronics in industry. While microelectronics bring advantages in terms of flexibility, cost, size, and reliability, there are also complex social factors to be weighed. These include relationships between labor and management, and the fear of unemployment.

**1285.** Beyer, Kurt William. "Grace Hopper and the Early History of Computer Programming, 1944-1960." University of California, Berkeley, 2002.

Abstract from UMI ProQuest Digital Dissertations: "Grace Murray Hopper (1906 - 1991) was a mathematician, teacher, naval officer, programmer, inventor, leader, and computer visionary. She lived a life worthy of reflection, and her story serves as a vehicle to address a variety of themes in the history of programming and computing. The following is an archive-based account that documents Hopper's career in computer programming from 1944 to 1960. Hopper was a pivotal figure in the early years of computing; therefore, an understanding of her

achievements shed light on the evolution of programming techniques, computer language innovation, and the interrelationship between computer hardware and software. Second, the account tracks the development of the community of people who came to refer to themselves as programmers and identifies Hopper's role within that community. Finally, Hopper's case helps to analyze how notions of gender shaped women's opportunities within the nascent computer field. The study explains why certain women such as Hopper were able to rise to preeminent positions within computing in the face of growing post-war antipathy in America towards women in the workplace. Hopper's story should garner interest from a wide audience, including historians of science and technology, military historians, computer scientists, and women studies scholars."

**1286.** Beyer, Walter. "Traveling Matte Photography and the Blue Screen System: Part III -- Special Photographic Phase." *American Cinematographer* 45.4 (1964): 208-210, 226-27.

In this article, the author who was Head of Engineering Research at Universal Pictures Corporation, talks about special effects and the traveling matte, blue-screen technique. See also *ibid.*, Sept., 1964, pp. 502ff; and *ibid.*, Oct., 1964, pp. 565ff.

**1288.** Bickel, Alexander , et al. "On Pornography: II -- Dissenting and Concurring Opinion." *Public Interest* 22 (1971): 25-44.

This article was among those written by social, legal, and political conservatives in the aftermath of the 1970 *Report* by the President Commission on Obscenity and Pornography. They warned that pornography dehumanized society, eroded self-restraint, undermined democratic government, and, when disseminated through mass media, could even destroy civilization. The 1970 *Report* of the President Commission on Obscenity and Pornography argued that pornography and erotica were essential harmless and that restrictions imposed on them by society should be loosened.

**1289.** Bickel, Karl A., ed. *New Empires: The Newspaper and the Radio*. Philadelphia: J. B. Lippincott Company, 1930.

This short book (112 pages) grew out of an address to journalism educators at Ohio State University in April, 1930. The author is interested in how the radio was beginning to change the nature of news and the newspaper business. He notes that several changes are underway that will vastly expand the "boundaries of men's minds": radio, television (which he sees as "just around the corner"), and talking motion pictures which through newsreels are presenting current events. These developments are inevitably merging to enlarge the reporting of news, and Bickel believed this to be a positive trend. Among the changes that radio were bringing, Bickel said, was that radio would come increasingly to be used for flash news, or bulletins, thus leading to the decline of "extra" editions from newspapers. Bickel did not see the new media of radio, talking pictures, and television threatening the existence of newspaper. Rather by widen people's intellectual horizons, there would be an increased demand to read about events in more detail.

Bickel did have concerns about radio. He believed radio broadcasting in 1930 was dominated by the electric power industry in the United States. He believe diversifying ownership of local stations was important. He also realized that radio provided a powerful tool for government or special interest propagandists. He warned that excessive government regulation would damage broadcasting excellence.

This work contains an appendix listing more than 90 U. S. radio stations affiliated with newspapers in 1930. (81-85) Another appendix (86-112) gives a brief summary of the relationship between radio and government in 39 countries.

**1290.** Bidwell, Shelford. "Telegraphic Photography and Electric Vision." *Nature* 78 (1908): 105.

**1291.** Biederman, Charles, ed. *Art as the Evolution of Visual Knowledge*. [Minneapolis]: Charles Biederman, Red Wing, Minnesota, 1948.

Chapter 12 ("Man Captures Records of Light") deals with the influence of photography (as well as films and television) on art. From the fifteenth to the nineteenth century, "painters ruled the world of art without question." But, Biederman writes, "With the invention of the Camera we have witnessed the conclusion of one epoch of painting-history -- that epoch predominantly characterized by the attempt to copy and create a permanent record of nature's appearances."

**1292.** Bigelow, Jacob, ed. *Elements of Technology Taken Chiefly from a Course of Lectures Delivered at Cambridge, on the Application of the Sciences to the Useful Arts*. 2 ed. Boston: Hilliard, Gray, Little and Wilkins, 1831.

Several chapters of this 500-page work are relevant to communication. Chapter 3 deals with the "Arts of Writing and Printing," and covers such topics as coping machines, printing presses, stereotyping, and machine printing. Chapter 4, entitled "Arts of Designing and Painting," treats color, as does Chapter 18, entitled "Arts of Communicating and Modifying Color." Chapter 5 deals with engraving and lithography. Chapter 9, "Arts of Illumination," discusses various lamps (gas, coal, oil). Chapter 10, "Arts of Locomotion," and Chapter 12, "Of the Moving Forces use in the Arts," treats locomotion and has material on roads, railroads, and steam power. Chapter 16, "Arts of Horology," considers clocks and watches.

**1293.** Bilby, Kenneth, ed. *The General: David Sarnoff and the Rise of the Communications Industry*. New York: Columbia University Press, 1991.

This "unofficial biography" traces the life of one of the pioneers of the American communications industry, David Sarnoff. Bilby, a one time associate and RCA manager, traveled with Sarnoff during the 1960s, the General's final active years. The book recounts Sarnoff's work as a Marconi telegraph operator, rising through the ranks to become President of NBC and shepherd of radio, television, and eventually color television.

The book reveals that the story regarding Sarnoff and his relationship with the *Titanic* sinking was a myth. The myth held that Sarnoff was the first telegraph operator to receive word of the sinking of the *Titanic* and stayed on the wire for 72 hours, with the blessing of President William Howard Taft, until all family members were notified. Bilby explains it was actually a Wanamaker's department store promotion, that three men manned the telegraph wire, and Taft was not involved.

Bilby paints Sarnoff as a man obsessed with image, pretense, and legacy. Sarnoff ached to be an important part of his adopted land and to wanted to be remembered as "the Father of Television." Bilby's book follows a traditional rags-to-riches story of the immigrant arriving in America at the turn-of-the-century who goes on to overcome great hardship and poverty, eventually rising to the pinnacle of success.

**--Robert Pondillo**

**1294.** Bimber, Bruce, ed. *The Politics of Expertise in Congress: The Rise and Fall of the Office of Technology Assessment*. Albany, N.Y.: State University of New York Press, 1996.

This brief 128-page book provides an informative look at the Office of Technology Assessment, an agency created by Congress in 1972. This legislative unit, which was concerned with the social effects of new technologies, operated until 1995 when a Republican-controlled Congress voted to terminate it operations. The author's background is in electrical engineering and political science. An underlying theme of this work is the "possibility of isolating objective truths from human values, and the ability to capture what is most important

about public life with science, shapes both experts' attempts to inform policy-making and scholars' struggles to define methodology for understanding political action."

This work focuses on the relationship between experts and politicians rather than on the content of the OTA's many studies about specific technologies. Senator Edward M. Kennedy was one of the initial supports of OTA and later Vice President Al Gore was one of the OTA's major patrons. But Bimber challenges the prevailing theory that experts tend to become more politicized the longer and closer they are near the exercise of power. Because Congress is "an institution with a highly pluralistic distribution of power," it "tends to reward experts who provide broadly applicable, politically uncommitted expertise." This work maintains that "Congress is actually quite successful at producing neutrally competent advisors," unlike the Executive Office of the President where experts are confronted with different incentives. Over the years, the OTA came to provide Congress with relatively unbiased assessments of new technologies' social impact.

Bimber has not attempted an exhaustive history of the OTA. He concentrates on the "essential outlines of the agency's life." The work has nine chapters. After an introductory chapter, Chapter 2 makes comparisons between the OTA and the Office of Management and Budget, and with the President's Science Advisory Committee. Chapter 3 gives an overview of the OTA and some ways legislators used information from the agency. Chapter 4 deals with the OTA origins, while Chapter 5 considers matters of "neutrality and politicization." Chapter 6 examines the OTA's survival strategy with the committee system. Chapter 7 explains why the OTA was abolished. Chapter 8 compares the OTA to the Congressional Budget Office, the Congressional Research Service, and the General Accounting Office. Chapter 9 attempts to draw "lessons from the record of OTA as a case study in the politics of expertise."

**1295.** Binder, J. W. "The Persecuted Movies [letter to editor]." *New York Times* Oct. 23, 1915 1915: 10.

J. W. Binder, Executive Secretary of the Motion Picture Board of Trade, quotes the NYT as saying that "Movie Posters Lure Boys from Their Home." He says movies are only the latest scapegoat for wayward youth. Cigarettes and dime novels had been blamed before.

**1296.** Bird, William L., Jr., ed. *"Better Living": Advertising, Media, and the New Vocabulary of Business Leadership, 1935-1955*. Evanston, IL: Northwestern University Press, 1999.

Business leaders through their use of public relations and advertising associated their corporations with public virtue rather than money making. They sought to sell their corporation over and above any particular product. In this endeavor, they were able to exploit the latest developments in communication technology -- radio, television, visual imagery in magazines and other publications.

**1297.** Bird, William L. , and Rubenstein, Harry R., eds. *Design for Victory: World War II Posters on the American Home Front*. Princeton: Princeton Architectural Press, 1998.

Posters were an important means during the Second World War to mobilize the American home front for the conflict that its country was engaged in. The most important purpose of posters was to link the military front with the home front. Through posters the government tried to convince its people that they too were part of the military machine and that they were obliged to fulfill their patriotic duty. The most important task of the working people in America was to boost production in order to increase the military strength. The government emphasized that an effort war the increase in war productivity would not result in personal gain for the workers. The government wanted people to change their attitude from antagonism of the war to cooperation. The posters celebrated the life of the middle-class families. They showed what kind or role people could have and how efforts during the war would lead to an ideal postwar world.

There were hundreds and thousands of posters produced because the Office of War Information, responsible for the war propaganda, decided that the government had to shout in everybody's face. There was no way for ordinary citizens to stay out of the war. The OWI wanted to have a propaganda poster everywhere people looked.

The most important feature of a successful poster was that it was supposed to appeal to the emotion of the reader. Americans had to become emotionally involved with the war so that they would feel obliged to fulfill their patriotic duty. Appealing to the emotion was not enough, however. The OWI needed to prevent the production of posters which promised the safe return of a loved one if people increased productivity of the war. Furthermore, the posters should not be recognized as a political message because people would not accept political propaganda. Also pictures of mutilation and death would demoralize the public. However, they had to show the seriousness of the conflict to prevent the public from becoming skeptical.

--Pieter Van Den Berg

**1298.** Birren, Faber, ed. *The Story of Color From Ancient Mysticism to Modern Science*. Westport, CT: Crimson Press, 1941.

Birren says that in this book the "ambition is a sizable one, but here in these pages is an attempt to review the history of color." Birren discusses such major figures as Aristotle, Pliny, Da Vinci, Albert Munsell, Wilhelm Ostwald, but his commentary is often discursive and vague on chronology. Two appendices are of interest A) "The Symbolism of Color" and B) "The Psychology of Color."

**1299.** Bishop, Jerry E. & Michael Waldholz, ed. *Genome The Story of the Most Astonishing Scientific Adventure of Our Time -- The Attempt to Map All the Genes in the Human Body*. New York: Simon and Schuster, 1990.

Two science writers for the *Wall Street Journal* produced this thoughtful book aimed at nonspecialized readers. They argue that while genetic discoveries have not been kept secret, their implications for society have not been adequately considered. They note that by 1989, ethicists had begun to warn that "gene discoveries would lead to the creation of a new social stratum called the biological underclass."

Important research unraveling the secrets of genes came during the 1940s when "a series of discoveries began suggesting that genes were composed of an acid found in the nuclei of cells. This nucleic acid which was rich in a sugar called deoxyribose and hence was known as deoxyribonucleic acid, or DNA." In 1953, British physicist Francis Crick and American biologist James Watson discovered the structure of DNA. Progress followed during the early 1960s when the genetic code was broken. By the middle of the 1970s, enzymes had been discovered "that could snip pieces of DNA out of one organism's genome and splice it into the genome of another organism." Techniques known as amniocentesis and later chorionic villus made sampling for chromosomal defects possible and led to widespread prenatal testing during the 1980s, and to the routine termination of pregnancies "for reasons that would have left previous generations aghast."

By the late 1970s, "geneticists and molecular biologists were frustrated in the decades-long hunt for the human gene. It was as though they stood on the steps of some huge Alexandrian library where the accumulated genetic knowledge of three billion years of evolution was stored. They knew the architecture of the library with its twenty-three pairs of wings. They knew the alphabet used to write its 50,000 to 100,000 tomes. They even knew the titles of a few of the genetic tomes. But they had no way of finding which books lay in each wing and on each shelf. What they desperately needed was a map.

"Then, almost unexpectedly, several lines of biological and medical research began to converge, and the means of drawing the genetic map became evident. The 'genomic library' was suddenly accessible. Humans were about to gain unprecedented mastery of their genetic destinies."

**1300.** Bishop, Katherine. "Justice Dept. Team Leading Broad Effort on Obscenity." *New York Times* Aug. 22, 1987 1987: 6A.

This article covers legal strategies to prosecute pornographers in the aftermath of the Meese Commission report on pornography. It discusses a new federal enforcement unit and the use of racketeering laws in obscenity cases.

**1301.** Black, Alexander. "Glimpses into the Future: VII -- Some Photographic Possibilities." *Youth's Companion* 75.29 (1901): 359-60.

Black predicts that the speed of photography will become faster and that photography will move toward the ideal of "instantaneous photography by any light sufficient for the eye." (359) He talks about taking moving pictures in the light of the home to capture family members and to display these the way pictures are displayed in a family album. "In this way we shall have, not an instant of arrested motion, but a series of moments such as we watch in a conversation, and we may, by averaging these, get a broader, truer impression such as the wise painter seeks to express." (359)

Greater speed in photography and discovering a way to transmit "these pictures by wire" will mean "we shall watch war at the library table -- yes, and hear the shells over the same wire." (359) Black sees the day when "we shall have photography in colors ... not merely iridescent surfaces or combination color plates, but the real things, an image in the colors of nature. This color photography will probably be more in the form of a positive, like the ferrotype plate (tintype), than in the form of a negative." (359) Possibly by 1912, we should "have literal copies of works of art, faithful to color as the present useful copies are faithful to form and tone. The value of these in art education would be very great." (359)

Black concludes by saying that "photography must be the great pictorial historian of the future; not absolutely truthful and impartial, for no historian can be that. ... But no historian will be more versatile, more indefatigable, more captivating to the fancy, more suggestive to the thinker, more helpful toward pictorial truth." (360)

**1302.** ---. "How to Give a Picture-Play." *Ladies' Home Journal* 15.11 (1898): 25.

Alexander Black, who was the inventor of the "Picture Play" and literary editor of the *Brooklyn Times*, discusses how to create the Picture Play in this short article. "Allow for about fifty words for each picture -- that is to say, for each change in the grouping of characters," he advises.

**1303.** ---. "Making the First Picture Play: The Forerunner of the Movie Drama Described by the Pioneer Screen Playwright." *McBride's Magazine* 96.574 (1915): 64-69.

This article, written by a writer-artist who helped to develop the "picture play," offers an insightful account of how moving pictures changed in the space of about two decades between 1894 and 1915. It begins with President Grover Cleveland asking "What is a picture play?" (64) The author had "used the term in an outline of my mission at the White House" probably sometime in 1895 or 1896. While gaining access to Cleveland was difficult, once at the White House, Black had the president's cooperation. "And so he found an actual bill that was to be signed, and we worked out the series of pictures quite in accordance with the allusions in the story." (64)

Black hoped to capture reality. "The truth is that my first notion of a play on a white sheet was influenced from the beginning by the conviction that the effect should be of real life; that is to say, not only as to the actual celebrities who might be mentioned in the story, but as to all the other characters, for which I sought those who in each case 'looked the part,' rather than people of the stage made up to look the part." (65)

Black prepared a story of about 14,000 words, about the length of a normal stage play. "The idea of drama on a white sheet was a result of my earlier experiences in exploiting photographs of life in an illustrated talk called 'Ourselves as Others See Us.'" (66) Black continues: "Why not choose characters to illustrate a consecutive story? Why not take a series of pictures with the same setting so that lantern slides might be made to register perfectly enough to give the effect of slow movement in the figures? Muybridge and others had done this with short series. Edison had expanded the idea in much longer series in his kinetoscope." (66)

Although Black was told that photographs, especially of groups, were likely to capture his subjects in an unnatural way, he proceeded. "Miss Blanch Bayliss, whose face had been known to admirers of A. B. Wenzell's drawings, was the heroine in more than title.... (66)

Black discusses the hand camera he used and the use of arc lamps. Indoor scenes proved challenging. He talks about the problems associated with dissolving one lantern slide into another. (67)

Black's picture play projected about four images per minute which gave the impression of slow motion. "The elemental slow motion effect of these first picture plays, while basically the same [as later moving pictures], made, of course, but a limited call on this faculty of the eyes [the illusion of motion], for the changes occurred but four times in a minute. It was a hand-whittled effect compared with the work of exquisite machinery." (68)

Black laments that he did not use the "close up" in his play. "Speaking of realism, let me confess that I hampered myself by the severe logic of the play form. A pictured curtain rose and fell. There were three acts and a 'curtain call.' The picture space had the form of a proscenium arch. I endeavored to keep the figures the same height throughout. While there seems to be less than the needed nicety in the opening and closing of the modern screen play, there can be no doubt of the big advantage gained by forgetting the state in concentrating on one or two figures, and in giving them the full screen for all the emphasis there may be in this method. The interest of the spectator is now, and should be, the basis of treatment. **If a ring on the heroine's hand is the focal point of interest, enlarging that hand to the limits of the screen, so that hand and ring are clearly to be studied by the man in the back seat, is as if the narrator had invited you forward to the very verge of the action, or had come toward you fully to meet the curiosity of the moment.** A use of this method would have saved me much labor." (68) (my emphasis)

Black discusses how one can project a character's thoughts on screen. Referring to his earlier picture play: "While the 'Dream of Fair Women' in 'Miss Jerry' introduced the illustration of a character's thoughts 68/69 by the simple use of the superimposed image, blended and retired, a vast range of illusion was impossible in this halting method. The perfected motion picture machine opened the door to modern inventive device. A stupendous industry, backed by millions in money, with armies of trained camera actors, led by masters of the new medium of expression, have introduced an astonishingly powerful elements into the field of pictorialized fiction." (68-69)

Black speculates on why it took so long for full-length pictures to appear. **Early films were difficult to watch for more than five minutes and difficult to duplicate. There were great technological improvements between 1894 to 1915, comparable to the change from the medieval hand-made pamphlet to the modern newspaper.** "Oddly it was more than sixteen years after the slow-motion 'Miss Jerry' that full length plays in full motion began to appear.

"The delay had not been due to mechanical difficulties alone. It is true that the first full motion pictures were trying to the eyes, so trying that five minutes seemed to approximate the limit of sustained attention. But the picture play as a popular institution had to find itself-- and its audiences. The immense duplication was too fantastically unthinkable even for a dream. Everything associated with a picture play and its putting forward was to me a matter of nicety, of cautious delicacy, of lantern difficulties, of special skill in the operator, of laboriously synchronized smoothness.

**"Of course, I was told that if I wanted to get rich I must duplicate my plays. This was just as plain at the end of five years as at the beginning. The thought of a single duplicate gave me a chill. Artistically the plays might have been duplicated, but artistically I could not have afforded to duplicate them on any basis that would have been profitable. This is to say that only a good reader (they forgave bad reading in the author) in partnership with a highly skilled operator could have worked out the salvation of the idea. And this explains why the first picture plays remained for so many years a one-man experiment.**

**"To-day no reader is needed; and the modern projection machine runs by a motor. The contrast is as wide as between a medieval pen-made pamphlet and a modern newspaper."** (69) (my emphasis)

When one understands the nature of moving pictures as they have evolved in 1915, Black says it hardly unreasonable to pay a movie star like Mary Pickford \$2,000 a week "when you consider that this art which needs no translator is distributed to the ends of the earth, and may be presented in the smallest village precisely as it appears in the finest theater.

"Literally the screen play has made all the world a stage -- and an auditorium. Because it is an art, it can be vulgar as well as powerful.. Because it holds the attention of so many millions of eyes and minds, it can misuse its power. Because it must be spawned so prodigiously, it is always in danger of becoming thin and cheap. Those are trite misgivings. I have no doubt they said the same sort of thing about the first printing types. The interesting fact to realize -- and this is trite, too -- is that the picture play has only passed from the period of infancy to that of ambitious and sometimes ungainly youth. As a field for the exercise of the human imagination it surely offers an extraordinary challenge." (69)

**1304.** ---. "The Photograph." *Los Angeles Times* Dec. 3, 1893 1893: 7.

Alexander Black attempts to demystify trick photography, explaining, for example, how photographs can be made to picture "ghosts." In taking a portrait, the exposure time might be five seconds. At the end of two seconds the camera opening in closed, a person gets up and leaves, and then the camera opening is opened again. Black concludes the articles by saying that "Photography is an energetic science. It has shown us th upper surface of thunder clouds in action. It has shown us the heart of a coal mine. The camera gets into the rigging of ships, and into the catacombs. It registers vibrations in the vocal cords of the human throat. It is reporting men, as well as the earth, inside and out."

The article's subtitle reads: "Its Work Is Not So Mighty Mysterious. When You Know How It Is Done -- The Camera Wizard Always Waits for Your Expression of Astonishment."

**1305.** ---. "Through a Detective Camera." *St. Nicholas: An Illustrated Magazine for Young Folks* 17.12 (1890): 1022-34.

Alexander Black begins by discussing the difficulties of photographing a baby before the invention of portable, handheld cameras. These more portable detective cameras allow the photographer to capture lifelike, often rapid, movement. Black writes that "Before the 'detective' appeared there had been no means of catching those quickly vanishing phases of character and action which we now so delight to study; and the discovery that the portable picture-box could be carried and operated without exciting suspicion, among the children (or among their elders either, for that matter), was a promising discovery. It was like striking a new vein of precious metal in an abandoned mine. It opened up opportunities for picturing much that was curious, much that was beautiful, and, above all, much that was *true*...." (1023) (emphasis in original text) Later, Black says that "The amateur photographer is the historian of the summer boarding-house." (1033)

**1306.** Black, Edwin, ed. *IBM and the Holocaust: The Strategic Alliance between Nazi Germany and America's Most Powerful Corporation*. New York: Crown Publishers, 2001.

Black argues that an alliance developed between Adolf Hitler and IBM, beginning in 1933 and running through World War II. IBM and its subsidiaries created technologies, starting the with Hollerith punch cards machines of the 1930s, that helped the Nazis to identify and locate rapidly European Jews. Indeed, IBM technology helped the Germans to organize not only Jews but censuses, registration, Nazi businesses, the German military, train schedules, and the slave labor in concentration camps. Most literature about the Holocaust, with a few exceptions, do not discuss the Hollerith technology, the author says.

This book is based on research in numerous archives. The author worked in archival collections in the United States, England, Israel, and Germany. Black says that he more than 20,000 pages of documents in fifty archives, museum files, and other collections, including previously classified State Department and OSS material.

He notes that more than 100 people in seven countries helped to locate and translate documents. Black is the son of Polish Holocaust survivors.

**1307.** Black, Gregory D., ed. *The Catholic Crusade Against the Movies, 1940-1975*. New York: Cambridge University Press, 1997.

This, the second volume in Black's history of Catholics and American film censorship, brings the story into the mid-1970s. Some of the ground here has been covered earlier by Frank Walsh (on the Legion of Decency) and such writers as Frank Miller, and Leff and Simmons (on the censorship of specific films). Black is good in discussing the censorship of individual films. For example, he explains that several challenges to the PCA preceded the decision to come down hard on the foreign movie, *The Miracle*, the picture that led to the U.S. Supreme Court in 1952 to give cinema protection under the First Amendment for the first time. It is not clear why Black chose 1940 and 1975 as the starting and ending points of this work. The work deals with efforts to regulate this medium although it does not deal with film technology per se.

**1308.** ---, ed. *Hollywood Censored: Morality Codes, Catholics, and the Movies*. New York: Cambridge University Press, 1994.

This work is the best book on Catholics and movie censorship in the United States during the 1930s. During this decade, Catholic leaders in the United States and elsewhere viewed the technology of cinema as a threat to fundamental values. Black's work is based on research in the Production Code Administration Files in Beverly Hills, CA, and in several archdiocese archives.

**1309.** Blackwood, George. "The Advertising of Ideas." *Labor and Nation* 7.4 (1950): 25-27.

Blackwood describes techniques used to influence public opinion and implies that union members and others should recognize these techniques to counteract idea advertising by big business. Blackwood provides examples of 14 strategies for influencing opinion, including an "appeal to the emotions," especially hope and fear. He notes, for instance, that General Motors tried to generate fear among small property owners during the sit-down strike of 1937. "The most predominant pattern," Blackwood writes of idea advertising, "lies in the adroit use of works, the creation of *symbolism* which results in glittering generalities." He notes that advertisers tied their pro-business and anti-union advertising campaigns in the 1940s to symbolism connected to basic values such as freedom, democracy, and Americanism.

--Phil Glende

**1310.** Blaetz, Robin. "Avant-Garde Cinema of the Seventies." *Lost Illusions: American Cinema in the Shadow of Watergate and Vietnam, 1970-1979*. Ed. Cook, David A. New York: Charles Scribner's Sons, 2000. 453-87.

This chapter in Volume 9 of Scribner's *History of the American Cinema* Series, edited by Charles Harpole, discuss avant garde and underground films during the 1970s. Many of these works used 16mm and 8mm cameras.

**1311.** Blake, Erin C. "Zograscopes, Virtual Reality, and the Mapping of Polite Society in Eighteenth-Century England." *New Media, 1740-1915*. Ed. Pingree, Lisa Gitelman and Geoffrey B. Cambridge, MA: MIT Press, 2003. 1-29.

The author notes that "3-D viewing technology has a very long history." On 3-D device was manufactured in England during the 1740s. "Between the mid-1740s and the mid-1750s, zograscope prints appeared regularly in English magazine copy and newspaper advertisements, as did hundreds of different engraved, hand-colored images designed for use with the device. Curiously, almost every one of the known engravings from that period has the same subject. Zograscope prints depict the manmade environment, particularly urban topography." (1) The author asks why this was so and why other scenery set in nature were not used.

Blake's essay appears in a volume that is part of a larger series on new media technologies entitled *Media In Transition*. This volume offers a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. These ten essays examine media that were new in the eighteenth, nineteenth, and early twentieth centuries. They explore "moments of transition when each new medium was not yet fully defined, its significance in flux...." They attempt to put these media into their "specific material and historical environment" and explain the "ways in which habits and structures of communication are naturalized or normalized." (viii)

**1312.** Blanchard, Charles A. "The Christian and the Theater." *Herald of Gospel Liberty* 106.17 (1914): 527.

The author, who was then president of Wheaton College, a private, interdenominational Christian college, begins by asking "What out Christian people to do about the theater?" He also asks "Is the theater essentially evil?" and "If it is not essentially evil, but if attendance upon it works harm and evil to weak Christian, what then is the duty of a Christian who thinks himself strong?" Blanchard says that no theater "makes it a rule to exclude adulteries and murders from its list of dramatic representations."

Blanchard has a low regard for the theater and for actors. He argues that "the business of furnishing amusement to people is in itself doubtful, if not distinctly evil in character. It is a sad fact that those who live to furnish amusement for other people seem to deteriorate in character. An owner and manager of two theaters not a great while since told me that he would not permit his wife and daughters to know actors and actresses. He employed them to amuse the community, but he would not welcome them into his home. In some way they had become such persons as he did not wish his family to know."

Blanchard suggests that the very process of acting in dramas that deal with adultery and murder are damaging. "Is it possible for a man to play for five years, in twenty-five dramas, that he is the husband of twenty-five or thirty different women without suffering spiritual harm? Is it possible for a woman to play that she has been seduced and become an outcast without being morally injured? It is possible for a woman who is married to play that she is married to other persons than her husband and to act the situation as vividly as possible, so as to awaken the interest and applause of the audience without harm? Is it possible for a man to play a murderer or a thief without being injured in character, and is it possible for people to look on while men and women are playing these things without themselves being injured?"

Opera, according to the author, was not better than a live play. "Take the stories of the operas for example. Give to them the attraction of beautiful dressing, charming music, handsome people, and is it possible for adultery and murder, which is the stock in trade of these dramatic representations, to fail of doing their deadly work in the souls of men?"

Part of the problems from Blanchard's point of view was that cheap theater appealed to a lower class of people. "No theater could live on the moneys gathered from the few high-toned plays patronized by intelligent Christian people. The plays must strike lower down, they must attract another class of people, people who have little sense of responsibility to God for their time or money. This is the only class who can afford a sufficient patronage to make the theater, as an institution, a success."

Blanchard says the theater is especially harmful to the young. "The cheap theater of our time, the five and ten-cent theater, is coining money for the proprietors and which is perhaps ruining as many young people as almost any one instrumentality of evil in our time. If you wish to know what goes on within, take a look at the pictures which are exhibited without...."

**1313.** Blanchard, Margaret A., ed. *Exporting the First Amendment: The Press-Government Crusade of 1945-1952*. New York: Longman, 1986.

This work deals with the effort after World War II by American leaders to export its press system to the rest of the world. The effort reflected a belief in American exceptionalism, that American values and ideals could be exported and would take root elsewhere; that virtually every country could be transformed into "a miniature United States in form of government, traditions, and institutions." The American press system could inform the citizens of other nations about the workings of their governments, thus helping to ensure that another Hitler could not rise to power. This endeavor ran into problems, and many nations became cynical about the motives of American journalists. The free-press crusade became part of the ideological struggle against Soviet communism. It was "part of a larger effort by American diplomats and business leaders to create a world safe for democracy by remodeling that world in the image of the United States," the author writes.

**1314.** Blashfield, Edwin H. "'Movies' Bridge Ages from Cave Man to Us." *New York Times* March 4, 1917 1917, sec. SM: 8.

In this article, Blashfield, who was a well-known artist and decorator and President of the Advisory Committee of the Photoplay League, writes about the artistic and educational future of movies. He notes that movies are popular because they are cheap and are available even in small towns where life is dull. But there is a deeper reason for their popularity and it is because they appeal to the eye and are much easier to understand than the printed word. This deeper reason "reaches into the remotest past. When the world was young, man learned to speak long before he learned to write or read. But before he even spoke intelligibly he learned to observe through his eyes. The visual appear came first of all. And today the immediacy of that visual appeal is the same and bridges the ages between the cave man and the spectator of the movies. From this fact we cannot get away. We must reckon with it and we must make the best of it," Blashfield writes.

Blashfield continues by saying that "Centuries after came St. Augustine and summed up the situation in seven words, 'Pictures are the Books of the Ignorant.' To teach her ignorant the Church used them until each cathedral became a great stone Bible, sculptured without and painted within, storied all over with The Word written in marble and stained glass and mosaic. The popularity of the graphic presentation was universal. No written or spoken sentence can reach the mind as swiftly and concentratedly as the thing seen. Music comes next in the suddenness of appeal, but the latter is to the emotions, the road from the eye to the brain still remains shorter than that from the ear. If such was the case in earlier times, what wonder that, when modern science set the pictures moving, their fascination became irresistible.

"Particularly irresistible it must be to those unused to reading, who find here the quick and easy short cut to the story's understanding. Again think what a mutual message the motion picture carries in a country where common speech is not an inheritance. Before the 'movies' Russian and German, Scandinavian and Italian, Englishman and Frenchman, may sit elbow to elbow and vibrate sympathetically, for here is the tongue that was spoken before ever Babel was built, the language of images.

"The man in the street, the dull, featureless street of the little town, or the even duller street far removed from the centre of the great city, has found the short cut to entertainment. It makes no double draft upon him, he does not have to use ears as well as eyes, he is not puzzled with hard words or construction, he can concentrate at once upon what interests him most. His imagination, if sluggish, is stimulated, and if active, is whipped. No wonder that where the way is so clear for him he persists in it."

Blashfield said that "Crudity, harsh contrasts, violent sensationalism are well liked. The lack of spoken language and the consequent need for dumb show must be supplied by incessant happening...."

Blashfield says that to attempt to censor bad movies will only draw more attention to them. One must encourage good films and only by so doing will cinema become "a read national asset."

The subtitle of this article reads: "Visual Appeal Always the Same; Says Noted Artist, Who Discusses the Educational and Artistic Future of Motion Pictures."

**1315.** Blau, Eleanor. "A Good Time to Ask: What Do We Mean By 'Liberty'?" *New York Times* June 22, 1986 1986: 26.

This article reports that Richard D. Heffner, head of the movie industry's Classification and Rating Administration, will chair a conference called "Liberty -- the Next 100 Years." A number of prominent people will participate: psychologist Dr. Kenneth B. Clark, NOW president, Eleanor Smeal, and Holocaust historian, Elie Wiesel.

**1316.** Bliss, Edward, ed. *Now the News: The Story of Broadcast Journalism*. New York: Columbia University Press, 1991.

This work provides interesting information on the origin and development of broadcasting in the United States. The author notes that as early as 1898, "through facilities provided by Marconi's newly founded wireless company, the Dublin Daily Express received minute-by-minute coverage of the Kingstown Regatta. This was wireless telegraphy- no sportscaster's voice was heard- and the audience was minuscule. But it was news, and it was heard over the air." As for the first voice broadcast, while the origins are debated, certain facts are clear. "Reginald Fessenden, working in his Pittsburgh laboratory, succeeded in transmitting his voice by radio in 1901. Logic led him to use a continuous, smooth flowing electromagnetic wave, instead of trying to use the interrupted or staccato-type wave adopted for the transmission of code. This was a radical departure, a heresy so important to the future of broadcasting that Erik Barnouw calls it 'the foundation of radio.'"

With regard to television, "CBS experimental station, W2XAB, went on the air on July 21, 1931, with a stellar program that included George Gershwin, the Boswell Sisters, and Kate Smith, who sang her radio theme song, "When the Moon Comes Over the Mountain." In the same year, CBS introduced television's first regularly scheduled news program." The author also notes the importance of magnetic tape to broadcasting after World War II: "'One World Flight,' produced by Norman Corwin and Lee Bland, is notable not only because it was the most ambitious documentary series of the late 1940s, but because of its use of magnetic tape, the new reporting tool. For 'On a Note of Triumph,' and his other broadcasts promoting global unity, Corwin had received the Wendell Willkie-Freedom House 'One World Award.' The award consisted of a trip around the world, dramatizing Willkie's concept of one world."

**1317.** Bliven, Bruce, ed. *The Wonderful Writing Machine*. New York: Random House.

In this nicely written, 236-page book, Bliven points out that in 1853 the speed record for hand writing was but 30 word-per-minute. By 1868, Christopher Sholes of Milwaukee, had invented the typewriter. Sholes was not the first person to have invented the typewriter – indeed, he was only the fifty-second, Bliven notes. But his was the first commercial and practical machine to become available. Bliven notes the impact this invention had on women and war. By the 1880s, there was a shortage of trained typists and women increasing entered the workforce in this field. By 1888, there were perhaps 60,000 female typists in the United States. By the mid-twentieth century, the typewriter had been a critical component in military communication. "The captain of a battleship insists that there be fifty-five typewriters on board before he feels equipped to meet the enemy," Bliven says. "On the ground, as the army move forward, there are more writing machines within four thousand yards of the front lines than medium and light artillery pieces combined."

**1318.** Block, Jerry. "How NBC-TV Newsreel Crews Filmed the Israeli-Arab War." *American Cinematographer* 48.12 (1967): 866-68.

This article discusses how Israeli combat photographers and three NBC camera crews shot about 150,000 feet (or 75 hours) of film in about three to four weeks in the 1967 Israeli-Arab war. Much of the film was 16mm with a magnetic stripe for sound.

**1319.** Block, Lauren G. and Punam Anand Keller. "Effects of Self-Efficacy and Vividness on the Persuasiveness of Health Communications." *Journal of Consumer Psychology* 6.1 (1997): 31-54.

The authors write that they used "the literature on self-efficacy and vividness to predict and explain the conditions under which vivid information will be more persuasive than nonvivid information in health communication." The focus on information about sexually transmitted diseases.

**1320.** Blodgett, Nancy. "Porno Blacklist? Magazines Fight Meese Panel." *ABA Journal* 72 (1986): 28.

This article from the American Bar Association deals with efforts by *Playboy* and *Penthouse* to fight efforts by anti-pornography groups to have those magazines removed from stores. The magazine sued Attorney General Edwin Meese and the Meese Commission to prevent it from creating a "blacklist" of pornography distributors.

**1321.** Blondheim, Menahem, ed. *News Over the Wires: The Telegraph and the Flow of Public Information in America, 1844-1897*. Cambridge, MA: Harvard University Press, 1994.

This book examines the rise of the Associated Press and chronicles the AP's battles with other wire services for dominance in the wire service news industry. During the period covered by Blondheim, the AP battled numerous other news agencies, and had run ins with telegraph companies, all on its way to becoming the number one American wire service. As it grew, the AP served as a funnel to channel and nationalize the news, and according to Blondheim, create a demand for national news.

Blondheim begins by explaining that during the nineteenth century, even prior to the invention and employment of the telegraph, the time-lag between an event and its appearance as news in a newspaper was decreasing. The steam engine, canals and roads all helped to improve transportation within the United States, reducing the time it took for news of events to spread and mail to be carried throughout the nation. The author also argues that the rise of the penny papers, and their greater focus on local news, created a demand for more timely news, as did greater interest in speculation and finance.

The desire for news of the Mexican War was a major impetus behind the formation of the New York Associated Press, according to Blondheim. All the New York newspapers wanted news from the war, but the cost of obtaining it individually was prohibitive. The NYAP forced newspapers to share the cost of obtaining war (and later any) news. It was this model that other news sharing organizations followed.

Blondheim is more interested in the formation and activities of the news organizations than the telegraph itself. He does discuss some of the telegraph companies, noting the often secretive or shady business practices were used to lure investors or triumph over rivals. Blondheim states that the Atlantic Telegraph Company, trying to lay a trans-Atlantic ocean cable in the 1850s, may have faked transmissions on its first cable so as to secure investors for a subsequent cable. By 1859, most American telegraph companies had consolidated into Western Union, a large trust controlling a significant share of the telegraph lines and most telegraph operators and repairmen.

The author devotes significant space to the competition between the Western Associated Press and the New York Associated Press. He chronicles the "Press Association War," an all-out battle for supremacy (or monopoly) in 1866 and 1867, ending in the breaking of the previously more powerful NYAP. The onset of telegraph regulation in the late 1870s further diminishes the unbridled competition and less-reputable practices of the past.

Politicians during the Gilded Age courted the wire services in order to get more national press coverage. Many tried to befriend executives of Western Union or one of the wire services, both to secure favorable news stories and also to suppress unfavorable ones. Blondheim observes that in 1881 alone, over thirty politicians made requests for special coverage to the Western Associated Press. Perhaps the most striking example of a politician aided by a wire service is Rutherford Hayes, elected to the presidency in 1876. Hayes was a close friend of the

president of Western Associated Press. The WAP released damaging information on Hayes' rivals at the Republican nominating convention, particularly James Blaine. The same occurred in the general election as bad stories about Tilden surfaced right before the election.

Blondheim provides extensive citations and this book is valuable addition to the literature on the wire services. Blondheim's footnotes are helpful because he often includes additional explanatory information in them. This book, like so many others published in the 1990s, contains an excellent footnote section but no complete bibliography. He lists some primary sources and gives the reader a brief "selected" bibliography. The first time a work is cited the author gives the complete citation, and then refers back to that rather than including a separate bibliography for all materials cited or consulted. But this shortcoming does not undercut this book's value.

--David Henning

**1322.** Blum, John Morton, ed. *V Was for Victory: Politics and American Culture during World War II*. New York: Harcourt Brace Jovanovich, 1976.

In this readable account of homefront propaganda during World War II, Blum discusses the use of radio, motion pictures, and newspapers for propaganda. This book provides historical context for the use of these media during the war.

**1323.** Blumenthal, Ralph. "Porno chic." *New York Times Magazine* (1978): 28, 30, 32-34.

This article talks about the hard-core pornographic movie *Deep Throat* (1972), about the fact that it has played in mainstream theaters, and that it has become "chic" for well-known personalities -- Johnny Carson, Mich Nichols, Jack Nicholson -- to attend. One the film "broke in the society columns, it was O.K. to go," one patron is quoted as saying.

**1324.** Bluth, Joseph E. "More Facts About Vidtronics." *American Cinematographer* 48.11 (1967): 803, 816, 818-20.

This talk before the American Society of Cinematographers by Joseph E. Bluth, then Vice President and General Manager of Technicolor Vidtronics Division (Eastman Kodak?), discusses Technicolor's color videotape-to-film transfer process. Bluth notes that "if you were to analyze what is recorded on a piece of tape and the standards by which a color signal is placed on tape you would immediately be aware of the fact that there are some very severe limitations in extracting this information and putting it onto film. It is not like a simple black-and-white signal where you have one entity -- one signal to, in effect, transfer." (803)

**1325.** Boddy, William, ed. *Fifties Television: The Industry and Its Critics*. Urbana: University of Illinois, 1990.

Boddy documents the sea change in American television that transformed it from a novelty of little consequence to a broadcast medium that reached into the homes of millions of Americans. Boddy focuses largely on the rise of the big three networks--NBC, ABC, CBS--and explains how cultural and economic imperatives put control of broadcast television into the hands of these networks. One of the major threads of Boddy's argument is that as commercial sponsorship of television programs shifted from a single-sponsor format to the shorter commercials familiar today, there was an attendant shift away from live drama to telefilms and other types of pre-recorded programming. As Boddy demonstrates over the course of his study, questions of commercial sponsorship were also bound with the troubled relationship between television networks and the Hollywood film industry.

The multiplicity of perspectives that Boddy evokes in his book--from network executives and television playwrights to critics and magazine editors--is both the book's greatest strength and its greatest weakness. It is the book's greatest strength because it shows that despite the great power the networks eventually came to exert over the industry, during the 1950s, they were buffeted by other forces such as public opinion; multiplicity is also the book's greatest weakness because Boddy tends to bounce around from perspective to perspective within paragraphs, making it difficult for the reader to gain a sense of the book's argumentative arc. That said, it is

possible to trace Boddy's major ideas through the four main sections of the book: "Setting the Stage for Commercial Television"; "The Television Industry in the Early 1950s"; "Programs and Power: Networks, Sponsors, and the Rise of Film Programming"; and "Crisis and Counterattack, 1958-60."

In the first part of the book, Boddy shows that while television eventually came to replace radio as the dominant broadcast medium in America, the television industry in the late 1940s was wary of modeling itself too closely on the early radio industry, which was perceived as too hit or miss (16). Following this contrast with the radio industry, Boddy explains how in 1952 the FCC

located television service in the VHF band (28). Since RCA owned numerous patents relating to this band, they soon became an early leader in the industry. It was RCA, the parent company of NBC, that set the tone for how the television industry would interact with the film industry.

Boddy is perhaps at his best when chronicling the complex relationship between the television and film industries. Traditional historical accounts need to be revised that suggest a mutual lack of interest and collaboration between the film industry and the television networks in the early years of the TV industry. Despite doubts about the viability of either films or original film programming in the early years of the medium, the major Hollywood studios followed events in the television industry very closely (67). In parts two and three of his book, Boddy spends a great deal of time explaining the dimensions of this relationship. Though, for example, there was a certain demand for telefilms, A-list Hollywood films rarely made it onto television, which instead broadcast low-budget films (77). Boddy demonstrates that the networks feared telefilms would lead to deals between individual stations and studio subsidiaries that would leave them out of the financial loop; in order to reassert their control over broadcast content, by the late fifties the networks predominantly showed programs written by their in-house writers.

Despite the sometimes-antagonist relationship between the television and film industries, Boddy shows that once commercial sponsorship began to take off in the mid-fifties, television proved an ideal medium for advertising films. In 1954, for example, the success of the feature-length film *20,000 Leagues Under the Sea* was attributed to its promotion on the Disneyland television show (147). Following discussions of how the television and film industries intersected through advertising, Boddy shows that by the late 1950s, television industry practices and programming came to be inexorably linked to commercial sponsorship. In other words, by 1960, Boddy argues, the television industry recognized television was the ultimate advertising medium and began to develop its policies accordingly.

Because the financial success of network television soon depended on showing the largest number of people the sponsors' product, the industry made some poor choices that resulted in what Boddy calls TV's Public Relations Crisis of the Late 1950s (214). Citing such examples as the well-known quiz show scandals and the fact that Mutual Broadcasting Company made a deal with Dominican Republic dictator Rafael Trujillo that for \$750,000 they would offer 425 minutes of months of favorable coverage, Boddy shows how the television industry grew to become at least partially accountable to the public and vocal television critics. Like their effects on the economic practices of network television, the scandals hardened industry responses to a half-decade of rising critical attacks on the medium. In the process, the television industry, under the leadership of the three networks, offered new public definitions of its programs, its creative workers, and its audience (234).

*Fifties Television* is a useful book for anybody who wants a detailed account of the rise of television from the perspective of the industry. Boddy succeeds in weaving the complicated social, cultural, and economic milieu in which television was formed into a pervasive medium that it remains today.

--Steve Belletto

**1326.** ---. "Redefining the Home Screen: Technological Convergence as Trauma and Business Plan." *Rethinking Media Change: The Aesthetics of Transition*. Ed. David Thorburn and Henry Jenkins, eds. Cambridge, MA: MIT Press, 2003. 191-200.

This essay examines "the introduction of a new consumer product in the U. S., the digital 'personal video recorder' or PVR in the late 1990s."

Boddy's essay is one of twenty-two chapters by different authors that attempt to improve our "understanding of emerging communication technologies." This volume, which part of a larger series on new media technologies entitled *Media In Transition*, tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. The editors of this volume describe the chapters in this work as follows: "Challenging the assumption that new technologies displace older systems with decisive suddenness and have a revolutionary impact on society, the essays in this book see media change as an accretive, graduate process, always a mix of tradition and innovation, in which emerging and established systems interact, shift, and collude with one another.

**1327.** ---. "Senator Dodd Goes to Hollywood: Investigating Video Violence." *The Revolution Wasn't Televised: Sixties Television and Social Conflict*. Ed. eds., Lynn Spigel and Michael Curtin. New York and London: Routledge, 1997. 161-83.

Boddy writes that Senator Thomas J. Dodd's intermittent public hearings between 1961 and 1964 produced no new legislation or reform of regulations but "the thousands of pages of testimony and exhibits, including material generated by the unprecedented subpoena of hundreds of confidential business documents, provide a valuable portrait of the commercial television industry and its contested place in American life." This piece is based on published sources and the published hearings, although apparently not on archival research in Dodd's papers or related collections. The author concludes that "Dodd's investigation marks an instance of the tendency of large television institutions to create what John Hartley calls paedocratic regimes, where the presence of children in the television audience is construed to rule all judgments of programmers and regulators.... Whether permissive or censorious, ... discourses construed the television audience as irresponsible and fundamentally childlike."

**1328.** Boden, Margaret A., ed. *Artificial Intelligence and Natural Man*. New York; and Hassocks, Sussex: Basic Books, Inc.; and Harvester Press, 1977.

The author seeks to describe artificial intelligence in a manner that emphasizes its relevance to humans. She attempts to avoid jargon and specialized language. Readers with philosophical or psychological interests in artificial intelligence may find this work most interesting. "Above all," she writes, "I have tried to convey a sense of the relevance of artificial intelligence to the understanding of natural man. Contrary to what most people assume, this field of research has a potential for counteracting the dehumanizing influence of nature science, for suggesting solutions to many traditional problems in the philosophy of mind, and for illuminating the hidden complexities of human thinking and personal psychology. The common view that machine research must tend to display us humiliatingly to ourselves as 'mere clockwork' is false. The more widely this is realized, the less of a threat will artificial intelligence present to humane conceptions of society." (from Preface) The author at the time was a Reader in Philosophy and Psychology at the University of Sussex.

**1329.** ---. "The Social Impact of Thinking Machines." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 95-103.

Boden offers a sober reflection on research in artificial intelligence, looking at medical diagnosis systems, and legal advice and education in finance. She takes exception to sensationalistic claims for artificial intelligence. This paper was first published in *Futures* (Feb. 1984).

**1330.** ---. "The Social Implications of Intelligent Machines." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 439-52.

At the time of the paper, Boden was a professor of Philosophy and Psychology at the University of Sussex, England. Here she provides a review of scholarship on the ethical and social issues raised by artificial intelligence. Microelectronics is likely to make intelligent machines much more widespread, which poses a threat to our concept of self. This piece appeared first in *The Radio and Electronic Engineer*, Vol. 47, No. 8/9 (Aug./Sept. 1977), and is based on chapter 15 in Boden's book *Artificial Intelligence and Natural Man* (Hassocks, Sussex: Harvester Press, 1977).

**1331.** Boeringer, Pierre N. "The Advertiser and the Poster." *Overland Monthly and Out West Magazine* 38.163 (1896): 41-52.

**1332.** Boettinger, Henry M. "Our Sixth-and-a-Half Sense." *The Social Impact of the Telephone*. Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 200-07.

The author notes that unlike many other inventions that require some expertise in their use lest they be dangerous, the telephone is different. Its "uniquely phenomenal growth and pervasiveness in our lives can in large measure be ascribed to its ease and safety of use."

**1333.** Bogard, William, ed. *The simulation of surveillance: Hypercontrol in telematic societies*. Cambridge, Eng.: Cambridge University Press, 1996.

Bogart explores "the relations between surveillance and simulation technologies, and their significance for issues of control in postindustrial or ... 'telematic' societies at the end of the twentieth century." Theoretically, he relies heavily on poststructuralist or postmodernist writers such as Michel Foucault and Jean Baudrillard. Considering computer profiling, virtual reality, artificial intelligence, and genetic mapping, Bogart builds a "social science fiction" that explains how simulation technology revolutionizes the surveillance at work, in war, in sexuality, and in one's private life.

**1334.** Bohn, Thomas W. and Richard L. Stromgren, ed. *Light and Shadows: A History of Motion Pictures*. Port Washington, N.Y.: Alfred Publishing Co., Inc., 1975.

The author explains the organization of this work as follows: "Although not rigidly defined, the book is divided into three parts. Chapters 1 through 6 present the earliest beginnings of film and continue through the technological improvements and the artistic development that began an industry. The second part (chapters 7 through 11) begins with sound. In this part, the reader is engaged by the problems, frustrations, and inspiration which came from the addition of the new dimension. The final section begins with an international renaissance, the simultaneous arrival of television, a crucial court decision, political pressures, and the beginning of the 'new realism' directly after World War II. The concluding chapters in the three sections are intended to serve as an overview of the period, pulling together the evolution of form and function up to those pivotal periods." (xv-xvi)

In the opening chapter, the author discusses the prehistory and origins of cinema. Five important developments formed the needed theoretical and technology base for cinematography -- 1) persistence of vision; 2) photography; 3) the movie camera; 4) film; and 5) the motion picture projector. During the late 1960s, the author notes, the Cinemobile Mark IV appeared that made it much easier to film on location almost anywhere in the world.

-SV

Chapter 7 in this book is entitled "Sound and Color: A New Beginning." The author takes the position that technology has been essential to the development of the film industry. No artist can transcend the nature of his medium. Especially interesting is the discussion of the ways in which technology directed the movies toward the large mass audience. Among the points made is that technology was extremely expensive, and therefore films needed widespread appeal to recover costs and make money. The point is made that the industry has always turned to technological innovation whenever it has slipped a bit in the affections of the public.

--Gordon Jackson

**1335.** Boliek, Brooks. "Glickman Relishes New Role." *The Reporter (Hollywood Reporter)* (online) July 2, 2004 2004.

This article discusses Dan Glickman who will replace Jack Valenti as head of the Motion Picture Association of America (MPAA). It talks about Glickman's sense of humor and his ability to work with Congress (he was a former congressman from Kansas). "It's always been my style not to be a bomb thrower, but a diplomat," Glickman said. "You have to be able to work both sides of the aisle. At the Agriculture Department, I was often referred to as the red state diplomat." The article notes that Glickman is active as a donor to the Democratic Party (\$20,000 to the Democratic Party, and \$2,000 to Senator John Kerry's campaign). Glickman was Secretary of Agriculture under President Bill Clinton.

**1336.** *La notte brava (aka On Any Street; Les garçons; Bad Girls Don't Cry)*. 1962, 1962 (USA); 1959 (Italy); 1961 (France).

This movie opened in New York City on January 24, 1962, and was one of several foreign films that dealt with themes that were outside Hollywood's Production Code as it was written in 1930. For example, prostitution and homosexuality were subjects that had been permitted with qualifications when the Code was revised in 1956 and 1961 respectively.

Plot summary from American Film Institute Catalog: "Ruggeretto, Scintillone, and Bella-Bella, three indolent young cynics, steal some rifles and pick up two prostitutes on their way to a "fence" on the outskirts of Rome. During the transaction, they pick up a third prostitute who wants a ride back to the city. En route, the youths stop the car, take the women into the woods for the afternoon, and then leave without paying them. They soon discover, however, that one of the women has stolen all their money. Back in Rome, the companions attempt to steal a movie camera from an automobile and get into a brawl with its occupants, three wealthy homosexuals who then treat them to an evening of drinking. At the apartment of one of their newfound friends, Achille, the inquisitive Ruggeretto wanders into a bedroom and finds Laura. He seduces her, although he is unsure whether she is Achille's sister or the maid. Bella-Bella then steals his host's wallet, and the three hoodlums race from the apartment. As Bella-Bella and Ruggeretto argue over the money, Scintillone picks up the wallet and skulks off. He meets an old flame, Rossana, and promises her a night on the town, but he creates a disturbance at a posh restaurant and is led away to jail. Ruggeretto arrives on the scene, grabs the wallet, and takes Rossana to the most expensive club in Rome. When morning comes, he crumples his last bill and tosses it over the side of a bridge."

This film was released in Italy in 1959; running time: 105 min. It was released in Paris in Jan 1961 as *Les garçons*. Also known as *On Any Street*. Re-released in 1965 by Medallion Pictures as *Bad Girls Don't Cry*. English language version credited as a Miller-King production. The original production company was Ajace Cinematografica; Franco London Film.

**1337.** Bolter, J. David, ed. *Turing's Man: Western Culture in the Computer Age*. Chapel Hill: University of North Carolina Press, 1984.

Bolter attempts to assess the computer's impact on western culture. The first couple of chapters are interesting in discussing dominant metaphors of the seventeenth and eighteenth centuries (the clock), and the

nineteenth (the engine). The author writes that "the age of the computer is in some ways a return to the age of the potter's wheel." Chapter 3 ("Principles of Operation") discusses John von Neumann's computer. The remaining chapters (e.g., "Embodied Symbol" and "Electronic Space", etc.) are less oriented toward providing historical perspective. This book was completed before the widespread use of personal computers and the Internet.

**1338.** Bolter, Jay David, and Grusin, Richard, eds. *Remediation: Understanding New Media*. Cambridge, MA: MIT Press, 1999.

Referring to the movie *Strange Days* (1995), about virtual reality, the authors write that "digital technologies are proliferating faster than our cultural, legal, or educational institutions can keep up with them. In addressing our culture's contradictory imperatives for immediacy and hypermediacy, this film demonstrates what we call a double logic of *remediation*. Our culture wants both to multiply its media and to erase all traces of mediation: ideally, it wants to erase its media in the very act of multiplying them.

"In this last decade of the twentieth century, we are in an unusual position to appreciate remediation, because of the rapid development of new digital media and the nearly as rapid response by traditional media."

This book is divided into three parts and mostly concerned with "visual technologies, such as computer graphics and the World Wide Web." Part I considers remediation in the context of cultural and literary theory. Readers not especially interested in theory can skip directly to Part II "which illustrates the work of remediation in such media as computer graphics, film, television, the World Wide Web, and virtual reality. These illustrative chapters should make sense even without the fuller explanations of transparent immediacy, hypermediacy, and remediation provided in Part I." Part III turns back to theory to examine "how new digital media are participating in our culture's redefinition of self." The authors offer references ("the tinted equivalent of hyperlinks") for those who do not wish to read this book in a linear fashion.

**1339.** Bolton, Richard, ed., ed. *The Contest of Meaning: Critical Histories of Photography*. Cambridge, MA: MIT Press, 1989.

This anthology stresses that photography is regarded not only as a form of the aesthetic practice but also a medium of ideology. Photography, according to this volume, should be understood in a larger social, economic and political context. Being aware of the dissatisfaction of traditional photographic history which "emphasizes homogeneity and continuity" (p. x), the writers shift their focus to the disruptions and change within the history of photography. Some writers discuss about the social impact generated by the dual role of photography as a means of serving democracy and promoting social control. Some focus on the photographic technology which is endowed with spiritual value of people's everyday life on the one hand. On the other hand, photographs also make the familiar become strange. Hence, the question in the social consequence of photography and the politics of photographic truth is concerned with the heterogeneous interpretations of photographic images. These essays in this volume attempt to demonstrate the works of power relation behind the representation of photographic images and their contested meanings. Contributors include: Douglas Crimp, Christopher Phillips, Benjamin Buchloh, Abigail Solomon Godeau, Catherine Lord, Deborah Bright, Sally Stein, Jan Zita Grover, Carol Squiers, Esther Parada, Richard Bolton, Rosalind Krauss, Martha Rosler, and Allan Sekula.

--Huai-Hsuan Chen

**1340.** Bonniwell, Bernard L. "The Social Control of Pornography and Sexual Behavior." *Annals of the American Academy of Political and Social Science* 397 (1971): 97-104.

This article was among those written by social, legal, and political conservatives in the aftermath of the 1970 *Report* by the President Commission on Obscenity and Pornography. They warned that pornography dehumanized society, eroded self-restraint, undermined democratic government, and, when disseminated through mass media,

could even destroy civilization. The 1970 *Report* of the President Commission on Obscenity and Pornography argued that pornography and erotica were essentially harmless and that restrictions imposed on them by society should be loosened.

**1341.** Boorstin, Daniel J., ed. *The Americans: The Democratic Experience*. New York: Vintage Books, 1973.

This book was the third volume in Boorstin's trilogy on the American experience. Written for a literate and broad reading public, this work discusses numerous inventions that transformed the United States after the Civil War. Boorstin deals with developments in communication but provides a much broader context of inventions during the Industrial Revolution.

**1342.** ---, ed. *Democracy and Its Discontents: Reflections on Everyday America*. New York: Random House, 1971.

This 124-page book is not one of Boorstin's best works, yet does offer interesting observations. It is a revision of the William W. Cook Lectures on American Institutions which Boorstin delivered at the University of Michigan, Ann Arbor, in April, 1972.

"Perhaps the most important single change in the human consciousness in the last century, and especially in the American consciousness," he argues, "has been the multiplying of the means and forms of what was called 'communications.'..."

Boorstin distinguishes "information" from "knowledge." Information's "most prominent and distinctive characteristic is its randomness. Knowledge is a coherent structure, where each part is related to every other, and where discovery consists of finding these relationships. (William James defined a genius as a person especially adept in this ability)...."

Boorstin's treatment of photography and repeatable experience brings to mind William Ivin's treatise on the significance of prints and photographs. Boorstin also discusses the role of the phonograph in repeatable experience, and argues that "the triumphs of American industry have led to the decline of the miraculous." Photography, the phonograph, motion pictures, instant replay and "done much to remove ... spontaneity."

Boorstin, a critic of 1960s counterculture, worried about the decline of civility and its effect on democracy. "Democracy thrives on selective communication. And to keep the society democratic, the selection must be made not by some outside political agency, but by the self-controlled citizen."

Boorstin advocated better programming to make television "less a solvent and more a cement in our American community."

**1343.** ---, ed. *The Image: A Guide to Pseudo-Events in America, 25<sup>th</sup> Anniversary Edition*. 1961. New York: Atheneum, 1961.

Boorstin's book is an exploration of the culture of the manufactured and artificial event, the pseudo-event in the United States. Boorstin argues that as the demand for information has grown, journalists have been forced to create news that would not have ordinarily been reported. In order to fill the multiple daily editions and hourly news broadcasts, journalists have resorted to new techniques, such as the interview, and new perspectives, such as the news analysis and summary. The trend is apparent in all parts of our culture, as people become more interested in image than reality, and in celebrity over character.

Boorstin traces the history of what he calls the Graphic Revolution. This is the rise of mass print culture, made possible by technological advances in papermaking and printing. It also includes new methods of image reproduction, such as photography and high-quality reproduction, which have filled our print media. As this has happened, Americans, in Boorstin's view, have become enamored of the image, and now have lost touch with reality. All aspects of society have been affected by this change. In the political arena, spin and public relations

have replaced truth and character. Americans now vote for an image rather than a candidate. The same can be said of travel and first-hand experience. A culture that is focused on the image wants travel that is exciting and exotic, but also convenient, inexpensive, and most importantly, conforming to the preconceived idea of the place visited. Boorstin also discusses the decline of literature and serious art in a world where complexity, thoughtfulness and originality are marginalized.

Advertising is the clearest example of this kind of social shift. The advertiser purposely creates the pseudo-event, the public relations image that will focus attention on the product or service out of nowhere. Brand recognition, corporate logos and the like are all artificial, pseudo-events created to shape opinion and reinforce passive conformity rather than critical thinking. Boorstin is highly critical of this shift, and the overall culture that has developed.

This 25th anniversary edition was reprinted in 1987 with little revision. In his introduction, Boorstin explains that the same forces are at work and that even the same examples and illustrations are adequate for his discussion. The book is interesting, though one-sided. Boorstin offers little analysis of the social or economic forces that drive this change, or at the more specific effect it has on public opinion, voting, foreign policy debate, economic policy or consumption decisions.

--Rob Rabe

**1344.** ---. "Political Revolutions and Revolutions in Science and Technology." *America's Continuing Revolution*. Vol. 9. Washington, D.C.: American Enterprise Institute for Public Policy Research, 1975. 161-80.

Boorstin delivered this address in October, 1973 as part of the Distinguished Lecture Series on the Bicentennial, sponsored by the American Enterprise Institute. This, the ninth volume in a series, was edited by Irving Kristol, et al.

"A hallmark of the great technological changes is that they tend *not* to be reversible," he said.

"What is most significant ... about technology in modern times (the eras of most of the widely advertised 'revolutions') is not so much any particular change, but rather the dramatic and newly explosive phenomenon of change itself. And American history, more perhaps than that of any other modern nation, has been marked by changes in the human condition -- by novel political arrangements, novel products, novel forms of manufacturing, distribution, and consumption, novel ways of transporting and communicating. To understand ourselves and our nation, then, we must grasp these processes of change and reflect on our peculiarly American ways of viewing these processes."

**1345.** Bordwell, David, Janet Staiger, and Kristin Thompson, ed. *The Classical Hollywood Cinema: Film Style & Mode of Production to 1960*. New York: Columbia University Press, 1985.

This work has two sections that deal with the technology of cinema. Part Four, "Film style and technology to 1930," have the following essays: **David Bordwell and Janet Staiger**, "Technology, style and mode of production"; **Kristin Thompson**, "Initial standardization of the basic technology"; **Kristin Thompson**, "Major technological changes of the 1920s"; **David Bordwell**, "The Mazda tests of 1928"; and **David Bordwell**, "The introduction of sound."

Part Six, "Film style and technology, 1930-60," is written by Bordwell and has chapters entitled: "Deep-focus cinematography," "Technicolor," and "Widescreen processes and stereophonic sound."

This work also has a useful "Select Bibliography."

--SV

This work takes the position that technological innovation in the movies was strictly governed, and hence restrained to a degree, by the requirement to conform to the classical style of film making and narrative exposition, and to traditional modes of production. Hollywood is presented here as an essentially conservative industry, in which the vested heavyweights systematically grind down the competition. On this reading, technology does not shape the idea content of the movies, but is enlisted to help elaborate the preexisting conventions. The book uses both secondary and primary sources.

--Gordon Jackson

**1346.** Bordwell, David. "Widescreen Aesthetics and Mise en Scene Criticism." *Velvet Light Trap*. 21 (1985): 18-25.

Bordwell writes: "An adequate theoretical account of widescreen filmmaking does not yet exist, but the most important step toward it was taken by a tradition that is usually considered 'Bazinian.' The *Cahiers du cinéma* critics of the 1950s and early 1960s and the *Movie* critics of the 1960s have left us a rich legacy of ideas about the aesthetics of the wide screen. It is worthwhile to glance back at this 'mise en scene' criticism (as I shall call it) in order to assess its theoretical premises and conclusions -- to ask, even, to what extent it is accurately called 'Bazinian.'"

**1347.** Bordwell, David and Kristin Thompson. "Technological Change and Classical Film Style." *Grand Design: Hollywood as a Modern Business Enterprise, 1930-1939*. Ed. Balio, Tino. New York: Charles Scribner's Sons, 1993. 109-41.

This chapter appears in Volume 5 of Scribner's *History of the American Cinema*, Charles Harpole, editor. Much of the material for this chapter comes from trade publications. A more extended discussion of the chapter's theme is found in David Bordwell, Janet Staiger, and Kristin Thompson, *The Classical Hollywood Cinema: Film Style and Mode of Production to 1960* (New York: Columbia University Press, 1985), chapters 19-23, and 27-29.

**1348.** Borst, Arno (English translation), ed. *The Ordering of Time: From the Ancient Computus to the Modern Computer*. Chicago: Verlag Klaus Wegenbach; University of Chicago Press, 1993.

In this 132-page book, Borst argues that "the prevailing notions of time and numbers were little altered even by the invention of the mechanical clock, whose revolutionary influence tends to be overrated by modern scholars."

"The eighteenth century saw the beginning of changes in the European concept of time. These were too uneven, too slow in forming, to be described as part of a revolution, but they finally brought the 1,400-year-old history of the computus to an end...."

"...What is new about the modern age is not the uniqueness of events or the changeability of structures. Each generation has always justifiably felt that what happened to them and was expected of them in their lifetime was without precedent. In the modern age, it is only the acceleration of historical change, far beyond human comprehension, which has increased. Changes no longer occur gradually, between generations and regions, but within a few years and throughout the world. It is no longer just the scholars in their studies who feel the piercing wind of change, but people on the street as well. Most of these upheavals have considerably prolonged and substantially enriched human life; if its very existence is to be ensured, permanent innovations will be needed in the future, too."

**1349.** Boulding, Kenneth E., ed. *The Meaning of the Twentieth Century: The Great Transition*. New York: Harper & Row, 1964.

This book is Volume 34 in the series *World Perspectives*. The thesis of this series, according to editor Ruth Nanda Anshen, is that "man is in the process of developing a new consciousness which, in spite of his apparent

spiritual and moral captivity, can eventually lift the human race above and beyond fear, ignorance, and isolation which beset it today."

Boulding, an economist and leader in the area of conflict resolution, said that "the twentieth century marks the middle period of a great transition in the state of the human race. It may properly be called the second great transition in the history of mankind." That first transition "was that from precivilized to civilized society which began to take place about five (or ten) thousand years ago." That first transition was nearing its end and humans were now making the "transition from civilized to post-civilized society."

One indicator of the magnitude of change, Boulding believed in 1964, was that for many kinds of activities, "the date that divides human history into two equal parts is well within living memory." For example, an equal number of chemical publications appeared between 1950 and 1964, as appeared before 1950. People extracted as much from mines after 1910 as they did in all the years before that date. About 90 percent of all the scientists who ever lived were alive in 1964. While mankind's destructive powers had become unprecedented, so too had its recuperative abilities. The rate of change in society had been accelerated, Boulding believed. He also thought (in 1964), that "we are now on the edge of a biological revolution which may have results for mankind just as dramatic as the nuclear revolution of a generation ago."

**1350.** Bowen, Edward G. "Thomas Alva Edison's Early Motion Picture Experiments." *A Technological History of Motion Pictures and Television*. Ed. Raymond Fielding, ed. Berkeley: University of California Press, 1967. 90-96.

This article originally appeared in *Journal of the Society of Motion Picture and Television Engineers*, 54 (Sept. 1955).

**1351.** Bowers, Q. David. "Souvenir Postcards and the Development of the Star System, 1912-1914." *Film History* 3.1 (1989): 39-45.

This article begins by saying that as late as 1911, the identities of moving picture actors were either kept secret or considered to be relatively unimportant. As the "star system" began to emerge, however, identities became more important and were publicized in such publications as the *Moving Picture World*, *Moving Picture News*, *Motography*, and other trade journals. Souvenir postcards were also used to publicize actors and actresses. The cards were often given away free as a means of advertising and enticing patrons into the theater. Bowers notes that few of these postcards were apparently used to send messages through the postal system. Rather "the vast majority were kept as souvenirs." (40) This article's final pages (41-45) are illustrations of these cards and the personalities they publicized.

**1352.** Bowie, Nolan A. "Voting, Campaigns, and Elections in the Future: Looking Back from 2008." *Democracy and New Media*. Ed. Henry Jenkins and David Thorburn, eds. Cambridge, MA: MIT Press, 2003. 143-67.

This essay was written four years prior to the 2000 U. S. presidential election. Bowie speculates about the consequences new media's impact on politics and culture. He argues that the 2004 election was (would be) a crisis for democracy and lead to fundamental changes in opinion. The public would call for major changes in the political system.

The volume in which Bowie's chapter appears is part of a larger series on new media technologies entitled *Media In Transition*. The volume tries to offer a historical and comparative perspective on its subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. As the editors explain, the "essays in this volume capture something of the complexity and disagreement in current discourse about the politics of cyberspace. Some contributors offer us front-line perspectives on the impact of emerging technologies on politics, journalism, and civic experience. What happens when we reduce the transaction cost for civic participation, or increase access to information, or expand the arena of free speech? Other contributors place our shifting understanding of citizenship in historical context, suggesting that notions of cyberdemocracy and online

community must grow out of older models of civic life. Still others expand this conversation to consider the global flow of information and to test our American conceptions of cyberdemocracy against developments in other parts of the world. How, for example, do new media operate in Castro's Cuba, or in post-apartheid South Africa, or in the context of multicultural debates on the Pacific Rim? Some contributors examine specific sites and practices, describing new forms of journalism or community organizing. Some voices here are deeply skeptical; other are optimistic. For some writers the new technologies endanger our political culture; for others, they promise civic renewal.

"Most of the papers on which these chapters are based originated in series of public forums and conferences hosted by MIT from 1998 to 2000 under the title 'Media in Transition.' Funded by the John and Mary R. Markle Foundation and organized by the MIT Communications Forum, these events aimed to nourish a broad civic conversation about the political impact of new media technologies. The essays have been revised for this book."

**1353.** Bowker, Geoffrey C. "Archival Technology in the Historical Sciences, 1800-1997." *History and Technology* 15.1-2 (1998): 69-87.

The author writes: "Taking examples from the science of geology in the 1830s and floristics over the past two decades, it is argued that the technology of information storage and retrieval dominant at the time serves as both means of archiving scientific results and as metaphor for the interpretation of the earth as an archival system. It is maintained that the interplay between means and metaphor provides a site for the importation and exploration of techniques from communities of scientific and work practice both in the ordering of scientific information and in its interpretation. It is further tentatively argued that when the technology infrastructural to information storage changes, this leads to radical discontinuities in scientific models."

**1354.** Bowling, W. H. "The Living Voice with the Living Picture." *Moving Picture World* 6.25 (1910): 1095.

In this article, the Rev. W. H. Bowling talks about moving pictures combined with the phonograph to produce talking films.

**1355.** Bowman, Lisa M. "City May Ask Theaters Not to Screen NC-17 Films." *Los Angeles Times* Sept. 30, 1995 1995, sec. B (Metro): 1B.

This article concerns efforts in the Los Angeles area to persuade theaters not to show NC-17 rated movies such as *Showgirls* (1995).

**1356.** Bowser, Eileen, ed. *The Transformation of Cinema, 1907-1915*. New York: Charles Scribner's Sons, 1990.

This, the second volume in Scribner's *History of the American Cinema* series (Charles Harpole, editor), "is an effort to understand, through a better knowledge of how films were seen and experienced at the time they first appeared to their audiences and of the surrounding circumstances of their production, distribution, and exhibition, and the prevalent cultural and social ideas at the time, just how it was that films and filmmaking were transformed in this period. Film forms changed as drastically in the seven years covered by this volume as at any point in motion-picture history. At the same time, the film business itself changed from a hand-crafted amusement enterprise and sideshow to a gigantic entertainment industry and the first mass-communication medium. One of the goals of this book is to demonstrate that these two phenomena were in certain ways related."

The work's fifteen chapters are devoted to such topics as: "The Nickelodeon"; "The Recruiting Station of Vice"; "Acting: The Camera's Closer View"; "Movie Palaces"; "Detours on the Way to Hollywood"; "The Genre Film"; "The Feature Film"; and "Scene Dissection, Spectacle, Film as Art."

**1357.** Boyer, Jacques. "The Belin Process of Telephotography." *Scientific American* 97.25 (1907): 456-57 (APS Online).

This article describes a process of transmitting images that differs from the one developed by professor Arthur Korn in Germany. "With the apparatus of Prof. Korn, of Munich, described in these columns, only photographs of faces can be transmitted to a distance, since pictures of busts and landscapes give poor results, owing to insufficient distinctness. This problem, however, has been solved in a much more perfect manner by a Frenchman, M. Edouard Bélin, as has been shown by the experiments performed by him in the laboratory of the Société Française de Photographie. The transmitting apparatus of this ingenious inventor is wholly mechanical in all its details. A carbon print of the photograph to be telegraphed is placed on a revolving cylinder, while a stylus traveling over this print imparts to the line conductor by means of a lever current differences corresponding with the differences of relief, through a rheostat."

**1358.** Boyer, Paul S., ed. *Purity in Print: Book Censorship in America from the Gilded Age to the Computer Age*. 2nd ed. Madison: University of Wisconsin Press, 2002.

This book is the second edition of Boyer's well-known and important examination of efforts to censor works that often contained modern themes. Many of those themes were of a sexual nature. Boyer comes down strongly on the side of those who believed that books and other written communications should have greater latitude to deal with the complexities of human existence. The final two chapters in this edition cover developments from the 1960s to the end of the century. Boyer deals with such topics as conservative reaction to the President 1970s Commission on Obscenity and Pornography, the Meese Commission (1985-86), and attempts to censor material in libraries.

**1359.** ---, ed. *Purity in Print: The Vice Society Movement and Book Censorship in America*. New York: Charles Scribner's Sons, 1968.

This well-known and important book deals with efforts to censor works that often contained modern themes. Many of those themes were of a sexual nature. Boyer comes down strongly on the side of those who believed that books and other written communications should have greater latitude to deal with the complexities of human existence.

**1360.** Boyer, Richard O. "Color Nut." *Reader's Digest* 36.213 (1940): 102-05.

This is a condensed version of an article that appeared in *The New Yorker*. It considers the theories of Raymond G. Twyeffort about color and clothes. Twyeffort was a past president of the National Association of Merchant Tailors of America. "The wearing of red, Twyeffort claims, actually makes a man strong and dynamic, just as yellow makes him gay, green makes him amorous and blue soothes him. Dress American businessmen in scarlet, he says, and business will boom...."

**1361.** Brady, Thomas. "Hollywood Wire: Two Studios in Conflict With Legion of Decency Screen Writers Elect." *New York Times* Nov. 20, 1949: X5.

This article indicates that the movie *Beyond the Forest*, starring Bette Davis, was playing in several first-run theaters even though the Roman Catholic Legion of Decency had condemned the film. The movie was based on Stuart Engstrand's novel by the same title. One of the controversial issues from the movie censors' point of view was the treatment of abortion in this film.

**1362.** Brady, Tim and Sonia Liff. "Job Losses Now, Maybe Some Later." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 381-89.

New information technology may eventually create new jobs but it will be a while before the losses in traditional industries are offset by gains. This is from a British-backed study, *Monitoring New Technology and Employment* (Sheffield, Eng.: Manpower Services Commission, 1983).

**1363.** Brady, Thomas F. "Hollywood Checks: 'Born Yesterday' Controversy Sheds Light On Another Delicate Censorship Issue." *New York Times* Dec. 10, 1950 1950: X9.

This article notes that Joseph Breen, head of the Production Code Administration in Hollywood, regularly intervened in movies thought to have an anti-capitalist tone. Specific films such as "Born Yesterday" and "The Lawless" are discussed.

**1364.** Bragdon, Claude. "An Art of Light." *American Architect* 111.2164 (1917): 363-68.

**1365.** Brand, Stewart, ed. *The Clock of the Long Now: Time and Responsibility*. New York: Basic Books, 1999.

Brand poses two questions: "How do we make long-term thinking automatic and common instead of difficult and rare? How do we make the taking of long-term responsibility inevitable?" One device to help us think about these question is the "Clock/Library." Brand places these question into the context of our modern communication revolution. "The pace of Moore's Law has become the pacesetter for human events," he writes. "According to a rule of thumb among engineers, any tenfold quantitative change *is* a qualitative change, a fundamentally new situation rather than a simple extrapolation. Moore's Law brings such tenfold structural changes every three years or so, thus three revolutions every decade, for five decades straight."

--SV

The Ancient Greeks distinguished between two different types of time. There was the "kairos" which is the opportunity or the propitious moment. The other kind is the eternal or ongoing time, which is called chronos. "While the first...offers hope, the second extends a warning. Kairos is the time of cleverness, chronos the time of wisdom. Our dead and unborn reside in the realm of chronos, murmuring opportunistic, kairotic seizures of the day."

The clock/library serves as a point of reference for humans. It is more of a thesis than a thing but the clock also allows people to think long-term. "The main characteristic of the Clock is its linearity. It treats one year absolutely like another, oblivious of Moore's Law accelerates, national fares, wars, dark ages, or climate changes. In its company there is nothing special about now. While we discount on a sliding scale both the future and the past, the Clock does neither. Far future and near future are the same; distant past and recent past have equal value."

Richard Benson, dean of Yale Art School says the library of the future is not a library but is a museum. "Embed the Clock, as a centerpiece, in a new museum of the history of technology. If technology is to be the future of the living world, then we have to admit that it is at its starting block. We are the Cambrian explosion of technology, and we are at the perfect point in time to gather the fossils as they are being made and discarded..."

--Amanda Novak

**1366.** ---, ed. *The Media Lab inventing the future at MIT*. New York: Viking, 1987.

This work is based on 70 hours of interviews, and by reading papers written by people who worked in the Media Lab at MIT. "The rest of the book explores 'so what?' ... The structure of communications is so fundamental to a society that when the structure changes, everything is affected.... Each time the means of communications advanced, the 'world' metamorphosed." Brand quoted from Peter Drucker's *Innovation and Entrepreneurship* (1985): after World War II the "model of technology" became "the biological process, the events inside an organism. And in an organism, processes are not organized around energy in the physicist's meaning of the term. They are organized around information."

Of interest in this book are Chapter 1, "Demo or Die"; Chapter 2, "New Media 1 -- Receiving"; Chapter 3, "Terminal Garden"; Chapter 5, "The Science of Apparition"; Chapter 8, "The Room Who Will Giggle"; Chapter 11, "The Politics of Broadcast"; Chapter 12, "The World Information Economy"; and Chapter 13, "The Quality of Life."

**1367.** Branigan, Edward. "The Articulation of Color in a Filmic System: Deux ou trois choses que je sais d'elle (Two or Three Things I Know About Her)." *Wide Angle* 1.3 (1976): 20-31.

This article begins with the intriguing statement that "Criticism of film to the present day [1976] has largely proceeded as if all films were made in black and white. Few theorists or filmmakers even comment on the use of color in a film much less consider the structural possibilities that color opens for the filmic text. Jean-Luc Godard through his work is a stunning exception. Scanning his color films one immediately senses an unparalleled rigor in the organization of color. Overall, one might say, the color appears 'artificial' or stylized with respect to the more familiar 'natural' or postcard color of traditional films. But this generalization is unsatisfactory." (20) Branigan then proceeds to analyze the Godard's color strategies in his film *Deux ou trois choses que je sais d'elle* [*Two or Three Things I Know About Her*] (1966-67).

Branigan says that "Almost all color theorists -- even those holding expressionist views of the nature of art -- maintain that color has neither an absolute perceptual base, nor an absolute meaning (emotional or intellectual): color depends on relationships and comparisons, and in this regard its closest analogue may be music." (21)

For Sergei Eisenstein, "the reassembly of color in a text is an explicitly ideological enterprise which reveals, in one light or another, the dominant ideology. There arises then the possibility that a textual system of color -- as a 'discourse' involving repetition, variation, permutation -- may actually propose new ways of reading color and color organizations, and so may recast cultural formulations," Branigan says. (21)

Branigan analyzes Godard's use of color "in terms of four major tendencies: color tends to appear as a certain of *solid* color, in a regular shape, with an arbitrary relationship to the surface of its object, and in primary opposition to other colors. It is important to note that not every color in *Deux ou trois choses* fits these specifications. This demonstrates that pertinent oppositions, when they appear, become structurally significant in terms of Godard's overall color system. In order to throw that color system into relief, I will employ various traditional color 'rules' (conventions, codes) as a background set." (21) Here he draws on the discussion about "traditional rules of color harmony" in Elizabeth Burris-Meyer's *Color and Design in the Decorative Arts* (1935) and Faber Birren's *Principles of Color* (1969) (p. 31, n. 7) Branigan hopes that his approach "will provide a point of entry to a system of representation and ideology radically opposed to that of classic Hollywood film." (21)

Branigan concludes: "The colors of *Deux ou trois choses* cannot be read in terms of character psychology, the exigencies of drama, or of verisimilitude. Instead, color -- divorced from its natural (probable) object through such strategies as the above -- becomes an element of equal significance with the other elements of the text. The consistent use of color strategies means the construction of forms -- positions and differences -- which are the very foundation of the articulation of color in a pictorial system. *Deux ou trois choses* is one of the few color films which, to borrow Eisenstein's phrase, is in color and not merely colored." (30)

**1368.** ---. "Color and Cinema: Problems in the Writing of History." *Movies and Methods: Volume II*. Ed. Bill Nichols, ed. Vol. 2. Berkeley: University of California Press, 1985. 121-43.

Branigan examines how four scholars have dealt with the historical question of why color film stock, which has been available since the early 1900s, but has only been in use widely since the late 1930s, was introduced into Hollywood moviemaking. In each case, he points out, the conclusions reached by the scholar conducting the study have been largely determined by the way in which the question has been asked.

--Matt Lavine

This article was reprinted from *Film Reader* 4 (Evanston, IL: Northwestern University Press, 1979), 16-34.

1369. Brady, Leo, ed. *The Frenzy of Renown: Fame & Its History*. New York: Oxford University Press, 1986.

Brady comments on the way photography changed the nature of fame. **“The emotional intimacy that the photograph helped foster between the famous and their audience was also reflected in the movement away from former standards of how prominence was conveyed. ... But nothing in artistic portraiture really anticipated the almost total break with the traditional look of a European public face expressed in Brady’s photographs of Lincoln. This was a look unadorned by the motifs of fame and glory that even the 494/495 French Revolution had only transformed instead of obliterating (which Napoleon III was spending a good deal of energy from 1852 on trying to revive)....”**(494-95). [my emphasis]

1370. Braun, Ernest. "From Transistor to Microprocessor." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 72-82.

An account of development from the invention of the transistor in late 1947 to the microprocessor in 1971.

1371. Braun, Ernest and Stuart MacDonald, ed. *Revolution in Miniature: The history and impact of semiconductor electronics*. Cambridge, Eng.: Cambridge University Press, 1978.

The authors write that “The main impetus for the development of solid state electronics came from three directions: the invention and development of wireless telegraphy and all that it led to in radio and television, the success of valve electronics, which widened the scope of electronics far beyond the original wireless telegraphy applications, and finally pure research in solid state physics which had, from time to time, almost by accident, brought about various solid state devices....”

This is an interesting work on the technical developments leading up to the discovery of the transistor and the industry that grew up in its aftermath. The authors discuss the invention of the transistor and the roles of Bardeen, Brattain, and Shockley. Their interactions often were less than harmonious. The final chapter speculates on the future (as it then appeared to the authors who wrote in 1978). Much of their speculation, of course, has come to pass.

1372. Braun, Marta, ed. *Picturing Time: The Work of Etienne-Jules Marey (1830-1904)*. Chicago and London: University of Chicago Press, 1992.

This biography examines the life of Etienne-Jules Marey, who made contributions to photography, cinematography, aviation, and such other fields as cardiology, physiological instrumentation, and the science of labor. Braun places Marey in the context of nineteenth century positivism and scientific thought. Although Marey’s work is often associated with that of Eadweard Muybridge, the author that there an “enormous difference between Marey’s photographic study of locomotion and the one ... Muybridge carried out in Philadelphia at roughly the same time.” Like Muybridge, Marey’s work was influential in the field of art.

This 450-page book is generously illustrated with many of Marey’s photographs. The work also has a bibliography of Marey’s works, arranged by year (1857-1904).

1373. Braxton, Greg. "200 Christians Protest Universal's Depiction of Jesus." *Los Angeles Times* July 17, 1988 1988, sec. 2 (Metro): 4.

This article reports that 200 Christians protested the scheduled opening of Martin Scorsese's film *The Last Temptation of Christ* (1988). The protest occurred outside Universal Studios.

1374. ---. "Morning Report: TV & Video." *Los Angeles Times* May 21, 1990 1990, sec. F (Calendar): 2F.

This brief piece announces that Jack Valenti, president of the Motion Picture Association of America, will appear on television with film critics Roger Ebert and Gene Siskel to discuss whether adult, non-pornographic movies

deserve rating other than the industry's X. Valenti defended the present system, although later that year the industry adopted the NC-17 rating.

**1375.** Breitrose, Henry. "The New Communication Technologies and the New Distribution of Roles." *The Media Revolution in America and in Western Europe: Volume II in the Paris-Stanford Series. Paris-Stanford Series.* Norwood, NJ: Ablex Publishing Corporation, 1985. 68-79.

Although written before the appearance of the Internet, this piece describes a system of communication not unlike the Internet. "A basic shift in the locus of power is occurring in society, as the new communication technologies are empowering the audience with an active control over the flows of information. This shift is a Communication Revolution. The old media of mass communication, like television, radio, and print, are means by which a relatively few creative individuals prepare and transmit various kinds of expensive messages to a large audience through a relatively few scarce channels. These old technologies will continue, but are increasingly being supplemented with a set of new communication technologies that center around the semiconductor chip, which provides a communication system with low-cost, high-speed memory. As a result, the new technologies have a higher degree of *interactivity*, the ability to engage in an 'conversation' with a human participant who is using the technology. An example is the newer cable television systems, especially their interactive channels through which individuals can make information requests, go 'teleshopping', etc. Such a television of abundance (a) carries the idea of paying for information (which runs counter to the prevailing custom of the past), and (b) raises policy issues concerning privacy." This is the second volume in the *Paris-Stanford Series*, edited by Everett M. Rogers and Francis Balle.

**1376.** Briggs, Asa, ed. *The Birth of Broadcasting: The History of Broadcasting in the U. K.: Volume I.* Vol. 1. London: Oxford University Press, 1961.

**1377.** ---, ed. *The Golden Age of Wireless: The History of Broadcasting in the U. K.: Volume II.* London: Oxford University Press, 1965.

**1378.** ---. "The Pleasure Telephone: A Chapter in the Prehistory of the Media." *The Social Impact of the Telephone.* Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 40-65.

Briggs notes that many first thought of the telephone as a medium to broadcast entertainment. "Once it became possible to transmit sound along telephone wires in both directions—a very early achievement of 1876 itself—it might have seemed inevitable that the telephone would establish itself mainly as an instrument of person-to-person or organization-to-organization communication rather than broadcast communication. Yet....it continued to be publicized as a device to transmit music and news as much as or more than speech."

--SV

Briggs uses the phrase pleasure telephone to explore one of its uses as it was disseminated across the globe - for entertainment. To understand this use, we must understand the complexity of communication at the time. Briggs writes: "The newspapers and periodicals that prophesied what the future of communications would be like were themselves a part of the same complex within which electronic communications were changing. 'We take it that everything which can knit a community together,' one of the new specialized periodicals put in 1884, 'and which can cause a rapid interchange of sentiment and ideas, annihilate, isolation, and prejudices of the greatest happiness to the greatest number,' ... To consider the history of the 'pleasure telephone,' therefore, we

must first study it in the light of a longer history of communications and then relate it to a cluster of other inventions patented during the last quarter of the nineteenth century."

**1379.** Briggs, Kenneth A. "Evangelicals Debate Their Role in Battling Secularism." *New York Times* Jan. 27, 1981 1981, sec. A: 12A.

This article deals with critics of secular humanism, many of them Christian evangelicals and supporters of Ronald Reagan. In general, they were interested in changing the tone of modern mass media. Many were also against what they considered to be the high level of pornography in mass media entertainment. This article discusses Rev. D. James Kennedy, a pastor of Coral Ridge Presbyterian Church in Fort Lauderdale, FL, who challenged radio and television broadcasters to fight secular humanism which he said was "the established religion of America." Kennedy said much of the American public had been "brainwashed" by secular humanism.

**1380.** Bright, Charles, ed. *Submarine Telegraphs Their History, Construction, and Working*. London: Crosby Lockwood and Son, 1898.

The author starts this book by saying: "The idea of transmitting thought across the seas by means of the electric fluid -- that wonderful agent [electricity] which reserves fresh surprises for us every day -- dates back to the first years of this century...." Appendix II has interesting material on submarine telephony, and Chapter V, entitled "Recent Developments," has information on types of cable used. Pages 695-702 deal with Marconi's "Wireless" telegraphy. This work has good maps on the cable system worldwide and many illustrations.

**1381.** Brigman, William E. "Politics and the Pornography Wars." *Wide Angle* 19.3 (1997): 149-70.

"The usual legal analysis divides obscenity into three phases," the author writes. "(1) the period prior to 1957; (2) the Roth Period, 1957-73; and the (3) Miller Period, from 1973 to the present. Although such a conceptualization is valid, it is too narrow to convey the nature of the conflict over pornography in the United States during the past forty years. The Supreme Court provided the overall legal framework, or at least set the out boundaries, but the battle over pornography has been inextricably intertwined with the changes in American society for the past half century. Supreme Court decisions have been the highly visible portion of the iceberg: the real struggle has been at policymaking and enforcement level in all levels of government." Brigman's essay attempts to "go beyond the standard legal framework and include the political factors that have impacted on the laws as written and as interpreted by the courts." (150)

**1382.** Brinkley, Joel, ed. *Defining Vision: The Battle for the Future of Television*. New York: Harcourt Brace & Company, 1997.

**1383.** Brittain, James E., ed., ed. *Turning Points in American Electrical History*. New York: IEEE Press, 1977.

This work reproduces seminal articles on a wide range of electrical technologies. Part I covers the Colonial period to 1876. It includes such topics as Benjamin Franklin's experiments, electrochemical batteries and electromagnetism, the telegraph and telephone, and electrical lighting. One selection is an 1858 report in the *American Journal of Science* reporting on the successful completion of the Atlantic cable.

Part II covers the century from 1877 to 1976. Topics include the professionalization of the electrical profession, electric lights and power systems, and electrical communication systems (which includes telegraphy, telephones, radio, the kinescope and early experiments with television, coaxial cable, radar, transatlantic communications by means of telephones and satellites, and advances in antennas). Also included in Part II are sections on electronics, feedback control and computers.

**1384.** Brittan, David. "Being There: The Promise of Multimedia Communications." *Technology Review* 95.4 (1992): 42.

This piece covers virtual reality entertainment and media convergence. It discusses innovations in these areas.

**1385.** Broadbridge, Seymour, ed. *Studies in Railway Expansion and the Capital Market in England, 1825-1873*. London: Frank Cass & Co., 1970.

This book is based on the author's Ph.D. dissertation in economic history completed at the University of London. This work concentrates almost exclusively on the question of railway finance, with a case study on the Lancashire and Yorkshire Railway (main line was completed in 1841). This work is based on primary sources, including traffic receipts and expense reports, gross receipts, data on revenue accounts, and other institutional records. This narrow focus enables the author to show in a detailed manner the flow of capital investment in this period, particularly the tendency in Britain to "over-invest" per mile in comparison with other nations.

--**Nicholas Wolf**

**1386.** Broddason, Thorbjörn, ed. *Television in Time: Research Images and Empirical Findings*. Lund, Sweden: Lund University Press, 1996.

The author summarizes his work in the following manner: "The main theme of this book is the development of television from a position as a newcomer and an outsider in society to its present status as a ubiquitous phenomenon, tightly integrated into the fabric of society. The author maintains that when television became a mass medium during the early post-War era it was variously regarded as a spectacle, as an intruder or even as a menace. Several decades later it had turned into a valued companion, a fixture of our existence, and even an object of worship.

Broddason reviews scholarly literature in an effort "to clarify the development of the image of television." He then "moves on to historical comparisons and concludes with the presentation of empirical results obtained from repeated surveys among young people in Iceland over a period of 23 years. The empirical material is used to test the applicability of basic concepts introduced in the first part of the book. At the same time it is used to throw light on the dynamics in the relationship between television and the rest of society. This is accomplished through an analysis of some survey questions central to the problem of television in society."

Chapter 2, "The Image of Television: The Development of Three Research Perspectives," is an informative and thought-provoking discussion of television's changing image during the latter half of the 20th century. The author notes that the initial reaction to television -- like the reaction to the appearance of virtually all new media since the printing press -- was one of moral panic. This chapter offers a good survey on how researchers and other commentators -- Wilbur Schramm, Marshall McLuhan, Raymond Williams, Paul F. Lazarsfeld, Daniel Boorstin, Joshua Meyrowitz, James Carey, Harold Innis, Karl Erik Rosengren, Neil Postman, and many others -- viewed television's impact on society. The chapter is interesting on the metaphors (intruder, menace, companion, etc.) that have been used to describe television, and it offers an excellent introduction to theoretical research that has been done on this medium.

**1387.** Brode, Douglas, ed. *The Films of Steven Spielberg*. New York: Citadel Press, 1995.

There is some discussion in the work of Spielberg's use of special effects in such films as *Poltergeist* (1982).

**1388.** Broderick, Peter. "Moviemaking in Transition: Digital video cameras and editing equipment are transforming the way movies are made -- and even *which* movies get made." *Scientific American* 283.5 (2000): 61-63, 66-69.

This article discusses the ways in which digital video cameras are changing movie making. This technology has the potential to bring a major transformation in motion pictures.

**1389.** Brodie, John. "NC-17 Threat Highly Rated by Marketers." *Chicago Sun-Times* Sept. 6, 1994 1994, sec. 2: 27.

This article reports that people who market movie find the NC-17 rating helpful. Richard Rush, the director of *Color of Night* (1994), says Disney marketing people used the rating controversy to stir controversy. The film featured full-frontal nudity from its star Bruce Willis. "From the beginning this was a kinky picture," Rush said. "It was Disney's plan all along to use the erotic elements to attract an audience."

**1390.** Broeske, Pat H. "Outtakes: Missing Link." *Los Angeles Times* Sept. 18, 1988 1988, sec. Calendar: 19.

This brief piece covers an eight-page "discussion guide" that Universal Pictures funded that was mailed to religious leaders, teachers, and librarians to counter criticism of Martin Scorsese's *The Last Temptation of Christ* (1988). Approximately 200,000 copies were mailed by the nonprofit Cultural Information Service.

**1391.** Brolin, Don. "Mobile Camera Mount Aids in Filming of High-Speed Ski Sequences for 'Caprice'." *American Cinematographer* 47.9 (1966): 630-33.

This article discusses the use of light weigh mobile cameras to film skiers going 40 mph in the movie "Caprice." It discusses the Arriflex, Model 11-B, equipped with a 50mm lens and a CinemaScope anamorphis lens. It considers the how the camera offers anti-vibration features to make the picture steady. The author says that he used his arms and legs and shock absorbers. He notes that "individual location presented little or no problem." (633)

**1392.** Bromberg, Joan Lisa, ed. *The Laser in America, 1950-1970*. Cambridge, MA: MIT Press, 1991.

The book grew out of the Laser History Project, started in 1982, at the Laser Institute of America. Four scientific societies encouraged the study: the American Physical Society, the Institute of Electrical and Electronics Engineers' Quantum Electronics and Applications Society (now the Lasers and Electro - Optics Society), the Laser Institute of America, and the Optical Society of America. Chapter 2 deals with masers, chapter 3 with the laser, with the next two chapters on the acceleration of laser research and the marketplace. Chapter 6 is "Explaining the Laser," while the final chapter discusses the laser "now and in the future."

**1393.** Bronowski, J., with Gerald Barry, James Fisher, and Julian Huxley, ed. *Technology: Man Remakes His World*. Garden City, N.Y.: Doubleday & Company, Inc., 1963.

This book, part of the *Doubleday Pictorial Library* series, attempts an encyclopedic treatment of technology. The first of its 16 chapters is historical, attempting to give an overview of technology through human history. Subsequent chapters are devoted to techniques of measurement (e.g., time, weights, temperature, etc.); power; natural resources; chemical technology; metals; glass and ceramics; agriculture and food production; textiles; building technology; land, water, and air transportation; military technology; communications, including printing, photography, recording, motion pictures, radio, television, computers, cybernetics, and more. A final concluding chapter explores social consequences. The authors predict that soon "the moon will be covered with semiconductors and photoelements that will convert the sun's energy into power" that can be used on earth. But the social impact of technology is not examined very deeply. The work says that "new discoveries unfailingly bring social changes, and society must adapt to them or die."

**1394.** Bronstein, Carolyn. "Porn Tours: The Rise and Fall of the American Feminist Anti-Pornography Movement." doctoral thesis, University of Wisconsin, 2001.

This doctoral thesis examines the activities of three grassroots feminist organizations, Women Against Violence Against Women (WAVAW), Women Against Violence in Pornography and Media (WAVPM), and Women Against Pornography (WAP). The groups had disparate goals. WAVAW was essential opposed to violence more than to pornography. WAP targeted pornography and exhibited pro-censorship tendencies that alarmed feminist who were advocates of free speech and who were pro-sex. By 1986, the feminist anti-pornography movement had lost

much of its political clout. This work also has a discussion of changes sexual attitudes during the 1960s and 1970s, as well as the role that new media technologies (e.g., cable and video recording) played in these changes.

**1395.** Bronstein, Carolyn , and Vaughn, Stephen. "Willard G. Bleyer and the Relevance of Journalism Education." *Journalism and Mass Communication Monographs* 166 (1998): 1-36.

This article discusses Willard G. Bleyer and the founding of the School of Journalism at the University of Wisconsin, Madison. The context of Bleyer's efforts was the rapidly changing media environment. Electricity, photography and moving pictures (and newsreels), telephones, improvements in transportation, the growth of public relations and advertising, all posed challenges to good journalism. Bleyer believe journalists needed professional training and standards no less than did medical doctors and lawyers.

**1396.** Brook, James and Ian Boal, eds., ed. *Resisting the Virtual Life: The Culture and Politics of Information*. San Francisco: City Lights, 1995.

Is there a *virtual* public? The question is of course quite difficult to answer because, in part, those who study public discourse cannot agree on the existence of an *actual* public. But if one applies the definitions of "the public" offered by those scholars to the activity now observable on the Internet, at least a partial answer can be found.

The premise of *Resisting the Virtual Life* is that public life has already been diminished by television and other technologies, and further erosion of the public sphere is likely with the spread of the global Internet. The book is a collection of essays edited by Ian Boal, who teaches in the Geography Department at Berkeley, and James Brook, a Silicon Valley technician-turned-poet. The editors call virtual technologies "pernicious" because they are substitutes for face-to-face interactions. This is a recurrent theme in the book, and follows closely the arguments of John Dewey, Juergen Habermas and James Carey on the importance of talk and public assembly. If democracy depends upon, and the "public sphere" is created by face-to-face rational-critical discussions, then anything which reduces such contacts could indeed be viewed as "pernicious."

This view is effectively argued in the chapter by Chris Carlsson, a multimedia designer and critic. Carlsson believes the erosion of the public sphere may be responsible for some users' retreat into cyberspace, particularly evident in the proliferation of electronic forums called newsgroups or bulletin boards. But Carlsson says the geographic distance between participants does not allow them to "reclaim the public space essential to a free society." They are engaged in what he terms "empty, pointless verbiage." Carlsson calls them dreamers.

A similar point is made in the essay by Howard Besser, a professor of Information Science at Berkeley. Besser believes that time spent online will necessarily reduce the amount of time spent with real people. For example, Besser says museum attendance will decline as people choose the safe, predictable "virtual" world and shun public spaces where chance encounters could occur.

The Besser and Carlsson essays typify the conceptualization of "the public" found in *Resisting the Virtual Life*. Because time spent in front of a computer screen is not time spent talking with people, "virtual reality" diminishes the public sphere. Democratic life is therefore embodied by face-to-face conversation. This view would not be shared by Michael Schudson. Schudson argues against what he calls this "romance-of-conversation." He emphasizes the contributions made by the printed word and even mass media messages. And it is not, according to Schudson, free, equal and spontaneous discussion which makes conversation democratic, but equal access to the floor, and rules which encourage pertinent speaking, and careful listening. Without this structure, the loudest or most articulate speaker will often dominate the process. The kind of public debate which Schudson proposes can now be found in online chat rooms and discussion groups. Each person, regardless of status, or appearance, or speaking style can post messages to the group. They can spend as much time as needed to express their views, without fear of being interrupted or shouted down. Debate is kept focused by the variety of discussion groups available and the grouping of messages by topic. Do these forums serve no purpose? Are they filled with "empty pointless verbiage?"

One essay in *Resisting the Virtual Life* does address the egalitarian nature of some parts of the Internet. Laura Miller, a freelance journalist, disputes the popular notion that cyberspace is no place for women. While acknowledging that some men will try to intimidate women online, Miller argues that their usual tools of intimidation, physical size, deep voice and threats of violence, are neutralized in virtual reality. Would Schudson's Vermont town meeting where the men spoke twice as often as the women have played out the same way if it had been conducted online? In Miller's view, the playing field is leveled in cyberspace because bodies are absent and only thoughts exist. To think otherwise assumes women's minds are, as Miller puts it "weak, fragile and unsuited to the rough and tumble of public discourse."

The Internet offers one other advantage over the print and broadcast media, the possibility of two-way communication or "interactivity." Several essays in *Resisting the Virtual Life* address, and ultimately reject the potential of this new feature. Most of the essayists fail to see the human-to-human aspects of interactivity, focusing solely on human-to-computer interactive programs. These are criticized as the latest examples of human withdrawal from the "real" world. The book's editors see interactivity as means of "intensifying" passive behavior. However, two contributing authors do address the potential for two-way communication. Jesse Drew, a producer of alternative media and a doctoral student at the University of Texas, predicts interactivity which is now used for real interaction will eventually be limited to home shopping and movies on demand. He says technology usually attends to profit, not to public need. This view is reiterated by Besser who believes the current two-way flow of information will eventually be like a "ten-lane highway coming into the home, with only a tiny path leading back out," and that path will be just large enough to accommodate credit card numbers.

Is this view of the future overly cynical, or are the authors right on track? In reality, the contributors to *Resisting the Virtual Life* don't want to be right. The books' main purpose is one of caution. While sounding quite Luddite, in the end most of the authors ask, actually implore, the users of new technologies to consider the long-term ramifications of their behavior. Drew, while skeptical of "cybermedia," recognizes the communal spirit evident in such developments as "shareware" and free access to the Internet provided by libraries. He wants its users to take what they can from it and try to make a positive difference in the "real" world.

So is there a virtual public? If public life only occurs during face-to-face contact then the answer must be "no." But if we look at the other defining characteristics of the public sphere, the answer might be "yes." Citizens are coming together to engage in rational-critical debate over political and moral issues. Participation is open to anyone who wants to post a message (and can get access to the Internet, certainly a difficulty for some). A code of conduct is even apparent, although enforcement is problematic. The status of the communicator is not important and usually unknown, and any topic is open for discussion. The combination of these factors makes for debate which is more "democratic" than you'll find just about anywhere in the "real" world, but alas, it is not conducted in person, face-to-face. On that basis, *Resisting the Virtual Life* would have us reject it.

--Mark Tremayne

**1397.** Brooker, Floyde E. "Motion Pictures as an Aid to Education." *The Annals of The American Academy of Political and Social Science* (1947): 103-09.

This article discusses the use of film for educational purposes. It considers the history of educational films and factors limiting their use. The author predicts that by 1950, schools will have 100,000 16mm projectors, an increase from the 35,000 sound projectors in use in 1947.

**1398.** Brooks, John. "The First and Only Century of Telephone Literature." *The Social Impact of the Telephone*. Ed. Ithiel de Sola Pool, ed. Cambridge, MA: MIT Press, 1977. 208-24.

The author examines how the telephone has appeared in literature. Such authors as James Joyce, Marcel Proust, Carl Sandburg, F. Scott Fitzgerald, Robert Frost, Dorothy Parker, J. D. Salinger, and several more are surveyed.

1399. ---, ed. *Telephone: The First Hundred Years*. New York: Harper and Row, 1976.

1400. *Blackboard Jungle*. 1955, 1955.

This movie was controversial when it came. Some critics, such as U. S. Ambassador to Italy Clare Booth Luce, would not attend the film when it was to be shown abroad because she felt it cast the United States in a bad light. Dore Schary felt the movie was one of the primary reasons the Kefauver hearings investigated the relationship between movies and juvenile delinquency. The film was based on the novel *The Blackboard Jungle* by Evan Hunter (New York, 1954). The rock n roll music and violence were part of what the film controversial. Songs included: "Rock Around the Clock," words and music by Max C. Freedman and Jimmy DeKnight, performed by Bill Haley and His Comets, Courtesy of Decca Records, Inc; "Go Down, Moses," traditional, arranged by Harry Thacker Burleigh. Music included: "Invention for Guitar and Trumpet" by Bill Holman, performed by Stan Kenton and His Orchestra, Courtesy of Capitol Records, Inc.; "The Jazz Me Blues" by Tom Delaney, played by Bix Beiderbecke and His Gang, Courtesy of Columbia Records.

Plot Summary from American Film Institute Catalog: "As Richard Dadier, a soft-spoken ex-serviceman, accepts his first teaching job in a tough New York City high school, he asks his new principal, Mr. Warnecke, about the school's discipline problem and is assured that at North Manual High, "there is no discipline problem." The other teachers, particularly the cynical Jim Murdock, who calls the all-male school a "garbage can" and cautions Dadier not to turn his back on the students, do not lessen his anxiety. That evening, Dadier celebrates his new job with his wife Anne, who, although deeply in love with her husband, worries not only that her pregnancy will make her unattractive to him, but that she will miscarry as she had once before. Dadier's first day teaching English is discouraging. The pupils, mostly lower-class juvenile delinquents, ignore his requests and call him "Daddy-O," and when he asks Gregory W. Miller, a bright but alienated black student, to use his leadership abilities to promote cooperation in the classroom, the young man just shakes his head. That afternoon, Lois Judby Hammond, another new teacher who seems attracted to Dadier, is nearly raped by one of the students. Dadier severely beats the boy, and the next day, the students greet him with threatening glares and angry silence. After work, Dadier accompanies Joshua Y. Edwards, a new math teacher who passionately loves jazz and swing, to a bar, where they have a drink too many and bemoan the students' hostility. While cutting through an alley to the bus stop, both teachers are brutally beaten by Dadier's student Artie West and his gang of hoodlums. Anne urges Dadier to leave the school, but he declares, "I've been beaten up, but I'm not beaten." While recuperating, Dadier visits his former professor, who assures him that students do want to learn, but that urban schools need more instructors who care. Dadier returns to school, and when the police question him, he refuses to identify his attackers. In class, Artie calls fellow student Pete Morales a "spic," whereupon Dadier remarks that calling one another names, like "spic, mick, and nigger," can lead to big trouble. Later the principal, acting on a confidential student complaint, accuses Dadier of bigotry, but Dadier angrily defends himself. Warnecke finally apologizes and puts Dadier in charge of the Christmas play. Soon afterward, West destroys Josh's prized record collection while his class looks on, leading the discouraged math teacher to resign. Meanwhile, Anne begins receiving anonymous letters and phone calls accusing her husband of infidelity. Unaware of Anne's growing suspicion, Dadier concentrates on his students. He convinces Miller and his singing group to perform their version of "Go Down, Moses" in the Christmas play, and he stimulates an animated class discussion by showing a "Jack and the Beanstalk" cartoon in class. Summarizing the discussion, Dadier encourages the young men to consider the real meaning of what they hear and to think for themselves. Miller later tells Dadier that because black people have limited options, he will drop out of school at term's end, but Dadier maintains that blacks can succeed in the modern world and that some teachers do care. At Christmas, Anne, tormented by the letters, gives birth prematurely, and when Dadier learns what has happened, he assumes the students are responsible for the letters and decides to resign. Defeated, Dadier bemoans that, after everything teachers must endure, they earn less even than cooks. Murdock, cured of his cynicism by Dadier's dedication, and Anne, admitting that she should not have doubted her husband, encourage Dadier to remain, and

he does take heart when the doctor says his baby son is out of danger. Back at school, Dadier orders West to see the principal when the gang leader flagrantly cheats in class. West threatens him with a knife, ordering the other gang members to jump the teacher. To West's surprise, only Belazi obeys his orders. Following a scuffle, Dadier accuses West of having sent the anonymous letters and then drags him and Belazi to Warnecke's office. Later that day, Miller, having heard that Dadier plans to quit, promises to remain in school if Dadier will do the same."

**"Note:** Before the opening credits are given, a rolling written introduction to the film states: "We, in the United States, are fortunate to have a school system that is a tribute to our communities and to our faith in American youth. Today we are concerned with juvenile delinquency--its causes--and its effects. We are especially concerned when this delinquency boils over into our schools. The scenes and incidents depicted here are fictional. However, we believe that public awareness is a first step toward a remedy for any problem. It is in this spirit and with this faith that [H]Blackboard Jungle was produced."

"Evan Hunter's novel was serialized beginning with the Oct 1954 issue of Ladies Home Journal. According to an Apr 1954 NYT news item, M-G-M paid Hunter \$95,000 for the rights to his novel. In May 1962, a HR news item reported that writers Murray Burnett and Frederick Stephani accused Hunter of plagiarizing their work, but their suit was dismissed. According to a modern source, director Richard Brooks was originally hired to direct M-G-M's Ben Hur and William Wyler to direct [H]Blackboard Jungle, but Brooks convinced Wyler to switch assignments with him. In his autobiography, Dore Schary, M-G-M's head of production, recalled that he was urged not to make the film by both Paramount executive Y. Frank Freeman and MPPA head Eric Johnston. Schary dismissed their concerns, but soon was asked by Loew's president Nicholas M. Schenk to reconsider. "I had only one argument for Schenk," Schary wrote. "'Nick, you're suggesting I give up on a film that might earn us nine or ten million dollars.' Nick asked me how much it would cost. I had a rough estimate of \$1,200,000. He said go ahead." Schary added that the final cost of the film was \$1,160,000.

"In a 1983 NYT interview, Brooks recalled that M-G-M wanted one of their contract players, either Mickey Rooney or Robert Taylor, to play schoolteacher "Mr. Dadier." Brooks insisted upon casting new, unknown faces, and as a result, hired unpolished actors with little camera experience for many of the roles, thus infusing a raw realism into their performances. Among the actors making their screen debut in this picture were Vic Morrow, Rafael Campos, Dan Terranova, Danny Dennis and Jameel Farah (who later changed his name to Jamie Farr.) Although the studio wanted the film shot in color, Brooks insisted upon black and white because he feared that "color would beautify everything," according to the interview. A 6 Dec 1954 HR news item adds Victor Paul, Loren James, Bill Chaney, Lennie Smith and Mickey Martin to the cast, but their appearance in the final film has not been confirmed.

"Upon its release, the film was greeted by controversy. According to an Apr 1955 DV news item, the school authorities of New Brunswick, NJ, objected to the depiction of school conditions in the film. As a result, the theater circuit was forced to add a disclaimer stating: "To our patrons, the school and situations you have just seen are NOT to be found in this area. We should all be proud of the facilities provided OUR youth by the Public School of New Brunswick..." According to a Mar 1955 HR news item, the film was banned in Memphis, and a Jun 1955 news item in Var reported that the film was banned in Atlanta because it was deemed "immoral, obscene, licentious and will adversely affect the peace, health, morals and good order of the city."

" According to a 21 Mar 1955 HR news item, the Institute for Public Opinion sent postcards to film critics claiming that the film was "anti-public schools" and denying that the conditions depicted onscreen really existed. M-G-M's Schary responded by citing research and news accounts that supported the film's depiction of certain inner-city schools. Claire Boothe Luce, at the time the U.S. Ambassador to Italy, prevented the film's screening at the Venice Film Festival by threatening to walk out if it was shown. Luce claimed that if she attended a performance of the film, she would be "giving ammunition to Italian Communist and anti-U.S. propaganda."

Finally, Schary wrote in his autobiography, "Senator Estes Kefauver came to Hollywood to investigate movies--he meant one movie, [H]Blackboard Jungle....He called me as his first witness. He explained that he was in Hollywood to learn whether we acted responsibly when making [this] film." Schary related that after providing Kefauver with volumes of data on juvenile delinquency, he asked the senator what he found objectionable about the film. "He admitted he had not yet seen it," Schary wrote. "I suggested that there seemed to be a lack of responsibility in his investigation."

"The picture's soundtrack also created a stir. According to Brooks's NYT interview, a Boston theater ran the first reel in silence for fear that the rock and roll music on the soundtrack would over-stimulate the audience. "Rock Around the Clock," the song played beneath the film's credits, was one of the top ten songs of the year and played an important part in expanding the rock and roll market. In a modern source, Peter Ford, the son of the film's star, Glenn Ford, noted that Brooks borrowed the record from Peter's collection. The article goes on to say that M-G-M purchased limited rights to the song from Decca Records for \$5,000. Under that agreement, the studio was granted the right to use the song only three times in the film. The film was nominated for the following Academy Awards: Best Original Screenplay, Best Film Editing, Best Cinematography (black and white) and Best Art Direction/Set Decoration (black and white). According to a 14 Dec 1954 HR news item, the Producers Theatre was to present a Broadway production based on the Hunter novel, but that production apparently never opened."

**1401.** Brosnan, John, ed. *Movie Magic: The Story of Special Effects in the Cinema*. London: MacDonald and Jane's St. Giles House, 1974.

This work deals with innovations in special effects and how they increased the ability to show violence and horror in motion pictures. The work is nicely illustrated.

**1402.** Brown, Elspeth H., ed. *The Corporate Eye: Photography and the Rationalization of American Commercial Culture, 1884-1929*. Baltimore: Johns Hopkins University Press, 2005.

This work's four chapters are: 1) "The Physiognomy of American Labor: Photography and Employee Rationalization"; 2) "Industrial Choreography: Photography and the Standardization of Motion"; 3) "Engineering the Subjective: Lewis W. Hine's Work Portraits and Corporate Paternalism in the 1920s"; 4) "Rationalizing Consumption: Photography and Commercial Illustration."

**1403.** Brown, Henry B. "The Twentieth Century." *Forum* (1895): 641-57.

U. S. Supreme Court Associate Justice Henry B. Brown told the graduating class at Yale Law School in 1895 that steam power electricity were among those invention "destined to revolutionize the world, and in comparison with which all the prior discoveries since the Christian era were of minor importance." (642) It had already "profoundly affected the inner life of the people," he said. (642) Brown, who would write the landmark Supreme Court decision *Plessy v. Ferguson* (1896) which justified separate equal facilities for blacks and whites, goes on in this address to discuss universal suffrage (which he linked to "municipal corruption" [650], corporate greed, trusts, "the tyranny of labor" (654, emphasis in original text), railroads.

**1404.** Brown, Julie K., ed. *Contesting Images: Photography and the World's Columbian Exposition*. Tucson: University of Arizona Press, 1994.

**1405.** Brown, Richard D., ed. *Knowledge is Power: The Diffusion of Information in Early America, 1700-1865*. New York: Oxford University Press, 1989.

Brown looks at the ways in which the diffusion of information in America changed from the colonial period to the early decades of the republic. Essentially, those changes moved American society toward a far more egalitarian system of information distribution. The colonial period was characterized by a "top-down" mode of distribution in which information of general concern often came first through conversation or correspondence to elites, who then decided the degree to which it would be promulgated to the public at large. As print culture in the post-Revolution period expanded the ways in which information might be obtained, the general public acquired more ready access to knowledge that previously had been disposed of by the elites. In many ways this helped to realize the republican ideal of an informed and educated citizenry fit for self-government. But it also led to the trivialization and commercialization of information, as well as to a system in which the individual chose what he deemed to be valuable for his own purposes. These latter trends sped up the process of fragmentation and community dissolution that arguably characterize modern American life.

-- Gordon Jackson

Brown writes that at least one implication “jumps out from the evidence assembled here. Colonial society, for all its diversity, had been essentially a collection of local societies in which both a patina and much of the substance of a common, coherent Christian culture was maintained. Reading and oratory were dominated by religious messages, and the themes of order and stability expressed by church and state were mutually reinforcing. Competition, while real, was subordinate to cooperation in community and even, in many instances, in commercial life. But as the 19<sup>th</sup>-century republic developed, coherence was supplanted and competition ruled. Clergymen like Henry Ward Beecher, politicians like Daniel Webster who could win the largest followings, lyceum speakers who could sell the most tickets, authors whose works sold widely became influential not because of any office they held or any prescribed public role, but because of their engaging popular performances. In a competitive environment of regional or national dimensions, where purveyors of each type of information had to compete with others conveying similar information as well as with a multitude of entirely different sorts of information, each individual was invited to discover his or her own coherent culture from within the galaxy of religious sects, political parties, and reform societies that were thriving in the new republic. The new patterns for the diffusion of information were not in themselves responsible for these developments, but they would have been inconceivable without the new configuration of information diffusion that offered many choices to many people.”

**1406.** Brown, Robert M., ed. *The Electronic Invasion*. New York: John F. Rider Publisher, Inc., 1967.

This book provides historical perspective on the use of electronic technology to bug and otherwise invade the privacy of citizens. It describes the state of the art in 1967. The author begins by saying that “despite the protection against insidious invasions of privacy afforded by the Fourth Amendment to the Constitution, electronic bugging is so shockingly widespread and so ingeniously devised that no one can be certain any longer than his home is his castle. Widespread attention to this problem from the President on down testifies to the serious threat many persons feel this situation poses to the society in which we live.”

The opening chapter discusses how electronic snooping evolved. A turning point came in 1960, Brown believes, when then United States ambassador to the United Nations, Henry Cabot Lodge, revealed that the Soviet had bugged the Great Seal of the U.S. Public interest in this topic increased thereafter, as did the efforts by many countries to engage in this activity.

Some indication as to how far miniaturization had proceeded by 1967 is found in this work. One picture shows a thimble containing 8,000 wafers, each a complete circuit. Future amplifiers, the author says, will probably be the size of these wafers. Another picture shows a human tooth that has been bugged.

Brown devotes chapters to buyers and sellers of this technology, telephone bugging, eavesdropping microphones and miniature audio amplifiers, FM wireless microphones and room bugs, bumper beepers, recording devices, spy receivers, electronic bug detection, speech scramblers, and bugging and de-bugging circuits. A chapters also lists who then sold this equipment, and legal restrictions on eavesdropping.

**1407.** Brownlow, Kevin, ed. *Behind the Mask of Innocence*. New York: Alfred A. Knopf, 1990.

This substantial, well-researched book is a study of cinema in the silent era. Brownlow shows that silent pictures dealt with an “astonishing range of subjects.” “While few of these films made history,” he writes, “all of them -- if only for a few moments -- recorded it.” Brownlow show that nudity, adultery, drug addition, abortion, and many other themes were treated in films. An excellent source for the content of moving pictures, many of which are difficult to find, if in fact, they still exist.

**1408.** Brownstein, Ronald, ed. *The Power and the Glitter: The Hollywood-Washington Connection*. New York: Pantheon Books, 1990.

This book examines the growing relationship between movie celebrities and political leaders. It demonstrates how closely woven the movie industry is to American political culture. Early in the twentieth century, movie stars were often regarded with great suspicion by politicians. That began to change during the Franklin D. Roosevelt administration as studio executives such as Jack and Harry Warner courted the president. Brownstein's chapter on John F. Kennedy and Hollywood, especially relation with Frank Sinatra, make excellent reading. Of course, Ronald Reagan, himself a former movie actor, was elected President in 1980. His administration marked a high point in the connection between Hollywood and the corridors of power.

**1409.** Brozan, Nadine. "Chronicle [Richard Heffner, 71, and Open Mind]." *New York Times* Aug. 5, 1996 1996, sec. B: B8.

This article reports that Richard D. Heffner, the former head of the movie industry's Classification and Ratings Administration, turned 71 and celebrates the 40th anniversary of his television program, "The Open Mind."

**1410.** Bruce, Robert V., ed. *Bell: Alexander Graham Bell and the Conquest of Solitude*. Boston: Little, Brown and Company, 1973.

This 497-page biography provides valuable detail on both the invention of the telephone, and on Bell's life before and after the invention.

**1411.** Bruck, Connie. "The Personal Touch." *The New Yorker* (2001): 42-54, 56-59.

This article chronicles the career of Jack Valenti, from his Houston origins, to working with Lyndon Johnson in the White, to his position as head of the Motion Picture Association of America (MPAA). The author is essentially kind to Valenti; little of a critical nature comes through in this piece. She notes the role that Lew Wasserman had in Valenti's selection as MPAA head and in Valenti's subsequent work. This work makes some use (briefly) of Richard D. Heffner Oral History at Columbia University. Heffner was head of CARA. The author is listed as a staff writer for *The New Yorker* and is working on a book about the Music Corporation of America (MCA).

**1412.** ---, ed. *When Hollywood Had a King: The Reign of Lew Wasserman, Who Leveraged Talent into Power and Influence*. New York: Random House, 2003.

This book is based to a large degree on about 250 interviews (including Lew Wasserman and many of his associates) and to a lesser degree on oral histories and other documents. The work is not footnoted and so it is difficult to know the precise location of quotations and other cited materials. There are also errors: "Will Hayes" should be "Will Hays"; the "Motion Pictures Producers Association" should be "Motion Picture Producers and Distributors of America"; Eric A. Johnston retired from the MPAA in 1961. (231)

This work does provide a good deal of information about Wasserman including his political connections with Washington, D.C. Wasserman and Jack Valenti claimed that Lyndon Johnson offered Wasserman the cabinet post of Secretary of Commerce in 1964, but that Wasserman declined. Bruck argues that Valenti and Wasserman are the sources for this story and that other close to the President doubted that Johnson would have made such an offer to Wasserman, feeling that Senate confirmation hearings might have raised possible connections between Wasserman and organized crime.

**1413.** Brusatin, Manlio, ed. *A History of Colors (translated from Italian by Robert H. Hopcke and Paul Schwartz)*. Boston: Shambhala, 1991.

The author opens this book by writing: "The universe of colors is a little jewel box of images, a place where Newton built his theory of modern physics with sunlight and certainty, where Goethe in turn constructed an entire history to enshrine a principle he had sought after madly -- namely, the unpredictability of nature and the natural simplicity of the arts, of knowing how to see and feel."

He then asks: "But what has science proposed concerning this universe of colors?"

Brusatin goes on to write: "In this brief history, we will be noting how much actually is derived from the material aspects of colors, the mode of their manufacture, their use and the fate of these colors, up until the tragic beginning of the industrial age, tracing a history from natural dyes subject to the fading of time and the violet-colored ghosts they leave behind, to strong chemical dyes as violent and basic as poison. Beyond this line of inquiry, this will be a story with many fleeting events, wherein we will draw close to the production of ancient marvels so near themselves to the body and yet not to be confused with mere corporeality, a time capable for the art of knowing, without feeling either the weight or the space of it."

The author devotes a few pages on nineteenth-century colors that were the product of the chemical industry.

"This book is dedicated to the rebirth of painting," the author says.

**1414.** Brzezinski, Zbigniew. "America in the Technetronic Age." *Encounter* 30.1 (1968): 16-26.

Brzezinski in 1968 wrote that "men living in the developed world will undergo during the next several decades a mutation potentially as basic as that experienced through the slow process of evolution from animal to human experience. The difference, however, is that the process will be telescoped in time -- and hence the shock effect of the change may be quite profound. Human conduct will become less spontaneous and less mysterious -- more predetermined and subject to deliberate 'programming.' Man will increasingly possess the capacity to determine the sex of his children, to affect through drugs the extent of their intelligence and to modify and control their personalities. The human brain will acquire expanded powers, with computers becoming as routine an extension of man's reasoning as automobiles have been of man's mobility. ...

"...Cybernetics and automation will revolutionize working habits, with leisure becoming the practice and active work the exception -- and a privilege reserved for the most talented. The achievement-oriented society might give way to the amusement-focused society, with essentially spectator spectacles (mass sports, TV) providing an opiate for increasingly purposeless masses."

**1415.** ---, ed. *Between Two Ages: America's Role in the Technetronic Era*. New York: Viking Press, 1970.

This book was written by the man who later would become President Jimmy Carter's national security adviser. Brzezinski argued in 1970 that the United States and other advanced industrial nations were emerging from the industrial stage of their development and moving into an age of "technetronics" (in which technology and electronics were becoming the primary factors in determining social change, altering values, and creating a global society). Brzezinski's set out these ideas earlier in an article, "America in the Technetronic Age," *Encounter* (Jan. 1968). He acknowledges the influence of Daniel Bell, who later would write about "post-industrial" society.

The book is divided in to five sections. The first considers the impact of the revolution in science and technology on the U.S. and Third World. "A new pattern of international politics is emerging," Brzezinski wrote. "The world is ceasing to be an arena in which relatively self-contained, 'sovereign,' and homogeneous nations interact, collaborate, clash or make war." In America, this revolution, driven especially by computers and communication, was already creating a society unlike the industrial era. New social patterns were appearing. Cybernetics and automation were replacing machines operated by people. Unemployment and obsolete skills plagued blue-collar workers. Barriers to education were falling. People with special skills and intellectual abilities challenged the urban-plutocratic leadership elite of the industrial era. Universities were becoming "think tanks" more political and social planning and innovation. These and other changes promised to make "the technetronic society as different from the industrial as the industrial was from the agrarian."

Brzezinski saw that satellite television would "enable some states to 'invade' private homes in other countries," creating "unprecedented global intimacy." America was the primary disseminator of this global revolution.

Of interest is Brzezinski's assessment of Soviet technological capabilities. They were near the bottom of developed nations in radios, telephones, air communication, cars, highways, and computers. In 1968, he notes that 50,000 to 70,000 computers were in use in the United States (of which only 10 percent were used by the Pentagon). In the USSR, only 2,000 to 3,500 computers were in nonmilitary use.

**1416.** Buchanan, David A. "Using the New Technology." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 454-65.

The author maintains that one cannot predict what influence new information technology will have on the quality of work simply from the technology's technical features. This work appeared earlier in the *European Management Journal*, Vol 1, (No. 2, 1982). A fuller version of this research is in David A. Buchanan and David Boddy, *Organisations in the Computer Age* (Aldershot, Eng.: Gower Press, 1983).

**1417.** Buchanan, R. A. "Public Utilities." *An Encyclopedia of the History of Technology*. Ed. Ian McNeil, ed. London and New York: Routledge, 1990. 949-66.

This survey deals with such themes as water and power supplies, waste disposal, roads and postal services, and telegraph and telephone services.

**1418.** Buckley, Tom. "Oh! Copenhagen." *New York Times Magazine* (1970): 32-46.

This work discusses the growing popularity of erotica and pornography in mass media, this in the context of the President's Commission on Obscenity and Pornography.

**1419.** Bucknall, Rixon, ed. *Our Railway History*. London: George Allen and Unwin, Ltd., 1970.

This work is more of an enthusiast's history of the railways. Largely nostalgic, this book concentrates largely on the locomotives with brief backgrounds on the industry. The work is grouped thematically by rail lines, and includes railways in Scotland, England, and Wales. Well illustrated, but otherwise lacks cited source material. A bibliography included at the beginning of the book lists railway studies from the late nineteenth- and early twentieth-centuries.

#### --Nicholas Wolf

**1420.** Bucy, J. Fred. "Computer Sector Profile." *Technological Frontiers and Foreign Relations*. Ed. Anne G. Keatley, ed. Washington, D. C.: National Academy Press, 1985. 46-78.

Bucy covers, among other topics, developments relating to software and artificial intelligence. Bucy notes that "although the potential applications of AI are numerous and exciting, much work remains to be done in refining the generic rules of logic (i.e., how the human mind learns and reasons) and in transferring this knowledge to the computer system for each field of application." (56)

**1421.** Bud, Robert. "In the engine of industry: regulators of biotechnology, 1970-86." *Resistance to new technology: nuclear power, information technology and biotechnology*. Ed. Martin Bauer, ed. New York: Cambridge University Press, 1995. 293-309.

This piece surveys efforts to regulate biotechnology in Japan, Europe, and the United States. The author concludes that the "attempt to cope with anxiety over technology has ... not been merely a retarding force, rather it has helped to steer, to power and even, at first, to constitute its development."

**1422.** Buder, Robert, ed. *The Invention that Changed the World: The Story of Radar from War to Peace*. Boston: Little, Brown and Company, 1996.

This book is part of the Sloan Technology Series, which seeks to reach a non-specialized audience. Buder was formerly the technology editor of *Business Week*. This work discusses the scientists “who created the microwave radar systems that not only helped win World War II, but set off an explosion of scientific achievements and technological advances that have transformed our daily lives.” A team of British scientists came to Washington in September, 1940, bringing with them the cavity magnetron, “a revolutionary new source of microwave energy.” This device “triggered the dramatic mobilization of America’s top scientists, who enlisted in the ‘war within the war’ to convert the invention into a potent military weapon....” The author follows these radar scientists into the postwar era “as they applied the knowledge gained from their wartime work in many different fields. Among their numerous accomplishments, these scientists helped to create the field of radio astronomy and discover the transistor, nuclear magnetic resonance, and the maser, all advances that won Nobel Prizes. During the Cold War, others continued to push for the development of early warning systems. Still others came up with discoveries that were the basis for digital computer memories. “In countless ways,” the author maintains, “radar and its spin-offs have changed our world forever.”

Buder writes: “The Radiation Lab, coupled with related microwave radar endeavors in the United States and Britain, emerged as a science and technology incubator on a scale probably unprecedented in history. At least two Nobel Prizes -- for nuclear magnetic resonance and the maser -- can be traced directly to wartime radar work. Every day several thousand commercial air carriers take to the skies. Virtually all the aircraft are tracked continuously by radar, sometimes to and from their gates. It takes more than three hundred radars, backed up by a ponderous array of display screens, communications nets, and personnel, just to keep the U.S. skies organized. Thousands more radar sets provide extra eyes for ships, boats, and pleasure craft. Many vessels also draw on the global navigational network Loran. Virtually all of these sprang directly from the Rad Lab, as do much of the world’s storm-watching systems and the TV weather report.

“The transistor -- via the legacy of the solid-state semiconductor crystals that formed the heart of radar receivers -- is largely a product of work contracted by the Rad Lab to places like Purdue University, the University of Pennsylvania, and Bell Labs, the second largest of the wartime radar houses. Digital computers, including the cathode ray displays and memories, owe a great debt to radar: they are the offspring of World War II systems. Microwave telephones and early television networks got critical boosts from wartime radar. The technology made a huge impact on astronomy by opening a region of the electromagnetic spectrum -- radio as opposed to optical -- that ultimately brought on the discovery of pulsars, quasars, and a plethora of hidden galaxies. And the list hardly stops there. Early particle accelerators owe a great debt to [the discovery of radar]. So does microwave spectroscopy. So, too, do the microwave ovens common in today’s homes, for a secret radar transmitter carried from Britain to America in fall 1940 forms the very core of these time-saving appliances.”

**1423.** Buel, Richard. "Freedom of the Press in Revolutionary America: The Evolution of Libertarianism, 1760-1820." *The Press and the American Revolution*. Ed. Bailyn, Bernard and John B. Hench, eds. Worcester, MA: American Antiquarian Society, 1980. 59-97.

Buel writes that the “breakdown of effective control over the press in America owed something to the demand for printed matter and the increase in printers; it owed more to the geographic diffuseness of American society. Though England had her provincial presses, most publishers, up through the seventeenth century, were in London and therefore the more easily controlled. The colonies lacked both an obvious center for the trade and a common legal system, so that people wishing to publish matter that might offend the authorities in one place could usually find a neighboring jurisdiction which took a more tolerant attitude.”

**1424.** Bulkeley, Rip. "Harbingers of Sputnik: The Amateur Radio Preparations in the Soviet Union." *History and Technology* 16.1 (1999): 67-102.

The author recounts early indications that the Soviet Union was planning to launch a satellite in 1957. He presents new material from the Soviet government's publication for radio amateurs, *Radio*. He describes instructions given to Soviet radio amateurs for tracking satellites. He then considers the fact that western radio amateurs, as well as intelligence agencies and scientists were unsuccessful in picking up clues about Soviet plans. "To complete the picture, contemporary assessments of the scientific values of amateur radio observations of the early satellites are surveyed. The article concludes by discussing the surprise aspect of the first sputniks in the light of the fresh information presented, and by noting some still unanswered historical questions."

**1425.** Bunch, Bryan, and Hellemans, Alexander, eds. *The Timetables of Technology: A Chronology of the Most Important People and Events in the History of Technology*. New York: Simon & Schuster, 1993.

This useful reference work begins with the Stone Age (2,400,000 - 4000 BC) and moves forward rapidly to more recent developments. Chapter 2 deals with the Metal Ages: 4000 BC - 1000 CE. Chapter 3 is "The Age of Water and Wind: 1000-1732." Chapter 4 covers "The Industrial Revolution: 1733-1878." Chapter 5 deals with "The Electric Age: 1879-1946." There follows a chapter that covers the years from 1947-1972 on "The Electronic Age," followed by a chapter entitled "The Information Age: 1973-1993."

The timelines for each year are broken into developments in the following categories: General, Architecture and Construction, Communication, Energy, Food and Agriculture, Materials, Medical Technology, Tools and Devices, and Transportation. The work has both extensive name and subject indexes. It also has occasional short essays on such topics as "The integrated circuit, or chip," "Scientists and defense," to name only two.

**1426.** Burke, Colin, ed. *Information and Secrecy: Vannevar Bush, Utlra, and the Other Memex*. Metuchen, NJ and London: Scarecrow Press, Inc., 1994.

**1427.** Burke, James, ed. *Connections*. Boston: Little, Brown and Company, 1978.

Burke writes that "the more the tools, the faster the rate of change.

"It is with that aspect of change that this book is concerned. Today the rate of change has reached a point where it is questionable whether the environment can sustain it. My purpose is to acquaint the reader with some of the forces that have caused change in the past, looking in particular at eight recent innovations which may be most influential in structuring our own futures and in causing a further increase in the rate of change to which we may have to adapt. These are [1] the atomic bomb, [2] the telephone, [3] the computer, [4] the production-line system of manufacture, [5] the aircraft, [6] plastics, [7] the guided rocket and [8] television." This book attempts to set these developments into a broad historical context dating back hundreds, if not thousands of years. It is nicely illustrated in both color and black and white.

**1428.** Burke, John G. "Bursting Boilers and the Federal Power." *Technology & American History: A Historical Anthology from Technology & Culture*. Ed. Stephen H. Cutcliffe and Terry S. Reynolds, eds. Chicago: University of Chicago Press, 1997. 105-27.

Burke argues that the steam engine changed attitudes toward government regulation. "The introduction of steam power was transforming American culture, and while Thoreau despised the belching locomotives that fouled his nest at Walden, the majority of Americans were delighted with the improved modes of transportation and the other benefits accompanying the expanding use of steam. However, while Americans rejoiced over this awesome power that was harnessed in the service of man, tragic events that were apparently concomitant to its use alarmed them -- the growing frequency of disastrous boiler explosions, primarily in marine service. At the time, there was not even a governmental agency that could institute a proper investigation of the accidents. Legal definitions of the responsibility or negligence of manufacturers or owners of potentially dangerous equipment

were in an embryonic state. The belief existed that the enlightened self-interest of an entrepreneur sufficed to guarantee the public safety. This theory militated against the enactment of any legislation restricting the actions of the manufacturers or users of steam equipment."

**1429.** Burnham, David. "Data Protection." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 546-60.

Burnham, a journalist then with the *New York Times*, argued that "cheap computing power makes it possible to keep masses of 'transactional information' -- records of phone calls, credit card payments, and so on -- in huge data bases and to transmit it across the country at low cost. The danger... is that these new computer networks increase the power of big organizations over the individual -- and they are wide open to abuse." This piece is the third chapter in the author's book *The Rise of the Computer State* (New York: Random House, 1983).

**1430.** ---, ed. *The Rise of the Computer State*. New York; and London: Random House; and Weidenfeld & Nicolson, 1980.

*The Rise of the Computer State* is well-written. In it, Burnham argues that inexpensive computing power makes it possible to keep enormous amounts of transactional data such as telephone records, credit card transactions, etc., and to transmit such information virtually anywhere at low cost. These new computer networks strengthen the power of large organizations over individuals and this power is easily abused. Chapters include: "Surveillance," "Data Bases," "Power," "The National Security Agency -- The Ultimate Computer Bureaucracy," "Values," and more. Burnham's bibliography also provides a helpful introduction to the topic.

At the time this book appeared, Burnham was with the *New York Times*. Earlier he had published articles on corruption in New York City, based on information from Frank Serpico, and which led to the formation of the Knapp Commission. He also had written about the Kerr-McGee plutonium factory in Oklahoma, was to have interviewed Karen Silkwood, a worker at the plant, the night she was mysteriously killed.

**1431.** Burns, Edward, ed. *The American Idea of Mission: Concepts of National Purpose and Destiny*. New Brunswick, NJ: Rutgers University Press, 1957.

This work details how intellectuals, political, military, and religious leaders, and others have promoted the idea of American mission from the Puritans into the twentieth century. The press played a role in promoting such ideas as manifest destiny. Political oratory, sermons, art, and letters helped build American nationalism.

Burns writes that "Americans have devoted much time and energy to rationalization of their idea of mission . . . . Nearly every speaker and writer, whether liberal or conservative, has assigned the credit for our national superiority to such qualities as initiative, independence, aggressiveness, perseverance, industry, frugality, and enterprise. That a nation might experience a call to greatness for its generosity, humanity, tolerance, or justice seems never to have crossed their minds. Though America is officially proclaimed a Christian nation, it is not the virtues of Christianity that are credited with making her great. It is the ethics of the Book of Proverbs and of the Book of Kings and Chronicles that is exalted above all others. . . .

"There can be no doubt that industry, frugality, ambition, and glorification of material success are deeply imbedded in our folkways, but Puritanism is not necessarily their only source. . . . Among the movers and shakers of American social and intellectual history at least half have had antecedents essentially non-Puritan. . . . They undoubtedly exalted the individual and the virtues associated with ambition and self-assertion. But it was an individualism derived from the Enlightenment, from German Idealism, from Darwinism, and from the humanism fostered by an increasing awareness of man's helplessness in a complex society. It had nothing to do with the Puritan conception of man as the instrument of divine omnipotence."

Burns argues that before the nineteenth century, warfare played a small part in the idea of mission. "Recognition of war as a beneficent institution was almost unknown in America prior to the nineteenth century.

The Puritans and their immediate descendants saw fighting as merely another evidence of the depravity of man. For Roger Williams and the Quakers, war conflicted with the basic principle that all men are brothers, regardless of their nationality, status, or color skin. The men of the Enlightenment conceived of international war as both inhumane and irrational and therefore unworthy of civilized beings who professed to follow the system of nature. But the French Revolution, and to some extent the American Revolution also, introduced into the world a fanatical idealism, which recognized bloodshed as a desirable means of attaining ends. . . Fanatical nationalism was born, and every war became a people's war, with whole nations fighting against each other in self-defense or for some hallowed purpose. Whereas the wars of the eighteenth century had been chiefly wars of maneuver, with limited armies striving to win by superior strategy, the post-Revolutionary conflicts became total wars with annihilation their cardinal object."

**1432.** Burns, J. Christopher. "The Automatic Office." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 220-31.

This piece discusses new technology available in 1977 that would enable office manager to improve efficiency. While there may be dramatic changes in store, many problems also have to be worked out. This piece, who at the time was a research for international consultant Arthur D. Little, Inc., first appeared in *Datamation* (April 1977).

**1433.** Burns, Robert, ed. *British Television: The Formative Years*. London: Peter Peregrinus Ltd., 1986.

**1434.** Burrows, William E., ed. *Deep Black: Space Espionage and National Security*. New York: Random House, 1986.

"'I wouldn't want to be quoted on this,' Lyndon Johnson told a small group of local government officials and educators in Nashville in March, 1967, 'but we've spent thirty-five or forty billion dollars on the space program. And if nothing else had come out of it except the knowledge we've gained from space photography, it would be worth ten times what the whole program has cost. Because tonight we now how many missiles the enemy has and, it turned out, our guesses were way off. We were doing things we didn't need to do. We were building things we didn't need to build. We were harboring fears we didn't need to harbor.'" So begins Burrows's book. By 1961, satellite photos were so good that U.S. intelligence could identify practically every car in Red Square in Moscow. Chapter 5 gives an information account of this technology during the Cuban Missile Crisis in 1962. Chapter 6 is entitled "Arms Control and the Acceptance of 'Spies' in the Sky." Chapter 10, "Real Time: The Advent of Instant Intelligence," discusses President Carter's use of information from spy satellites. Chapter 11 considers "killer satellites."

A former reporter, Burrows at the time of this book was teaching journalism at New York University.

**1435.** Bush, Vannevar, ed. *Endless Horizons*. Washington, D. C.: Public Affairs Press, 1946.

This book is a collection of articles and speeches by Bush from 1933 to 1945 (most are from 1943-45). Chapter 1 ("The Inscrutable Past") appeared in *Technological Review* (Jan. 1933) and talks about the typical life of a professor. Here one finds observations about the telephone, radio, television, advertisements, contemporary music. In discussing the library used by the professor, Bush writes that the "idea that one might have the contents of a thousand volumes, located in a couple of cubic feet in a desk, so that by depressing a few keys one could have a given page instantly projected before him, was regarded as the wildest sort of fancy."

Chapter 2 ("As We May Think") is a famous piece that original appeared in *Atlantic Monthly* (July 1945). "The world has arrived at an age of cheap complex devices of great reliability; and something is bound to come of it," Bush said. He discusses the coming of dry photography (instant photos), facsimile transmission, and microfilm. "The *Encyclopedia Britannica* could be reduced to the volume of a matchbox. A library of a million volumes could

be compressed into one end of a desk. If the human race has produced since the invention of movable type a total record, in the form of magazines, newspapers, books, tracts, advertising blurbs, correspondence, having a volume corresponding to a billion books, the whole affair, assembled and compressed, could be lugged off in a moving van."

Bush talks about recording processes, complex calculating machines, and "selection devices" that will aid a person to find specific information buried in a mass of data. "One cannot hope thus to equal the speed and flexibility with which the mind follows an associative trail, but it should be possible to beat the mind decisively in regard to the permanence and clarity of the items resurrected from storage." (See the section "Memex Instead of Index.") "Consider a future device for individual use, which is a sort of mechanized private file and library. It needs a name, and, to coin one at random, 'memex' will do. A memex is a device in which an individual stores all his books, records, and communications, and which is mechanized so that it may be consulted with exceeding speed and flexibility. It is an enlarged intimate supplement to his memory.

"It consists of a desk, and while it can presumably be operated from a distance, it is primarily the piece of furniture at which he works. On the top are slanting translucent screens, on which material can be projected for convenient reading. There is a keyboard, and sets of buttons and levers. Otherwise it looks like an ordinary desk.

"In one end is the stored material. The matter of bulk is well taken care of by improved microfilm. Only a small part of the interior of the memex is devoted to storage, the rest to mechanism. Yet if the user inserted 5,000 pages of material a day it would take him hundreds of years to fill the repository, so he can profligate and enter material freely."

**1436.** ---, ed. *Science: The Endless Frontier: A Report to the President*. Washington, D.C.: Government Printing Office, 1945.

In this seminal work Bush attempted to justify long-term government support for scientific research in the post-World War II era. Of course, linking science to the metaphor of the frontier was a stroke of inspiration. The government had underwritten research and development in science in an unprecedented way during World War II, something that Bush oversaw. But whether that support would remain was questionable. Bush argued that "Government should accept new responsibilities for promoting the flow of new scientific knowledge and the development of scientific talent in our youth. These responsibilities are the proper concern of the Government, for they vitally affect our health, our jobs, and our national security. It is in keeping also with basic United States policy that the Government should foster the opening of new frontiers and this is the modern way to do it. For many years the Government has wisely supported research in the agricultural colleges and the benefits have been great." The time had come, he maintained, to extend such support to other fields, especially medicine and the military.

**1437.** Bushman, Brad J., and Anderson, Craig A. "Media Violence and the American Public: Scientific Facts Versus Media Misinformation." *American Psychologist* 56.6/7 (2001): 477-89.

The authors argue that despite the fact that there are hundreds of studies showing a correlation between violence in mass media and damaging social effects, and that there is a consensus among researchers on this issue, the press has reported a weak correlation and lack of consensus among researchers.

The authors write: "Fifty years of news coverage on the link between media violence and aggression have left the U. S. public confused. Typical news articles pit researchers and child advocates against entertainment industry representatives, frequently giving equal weight to the arguments of both sides. A comparison of news reports and scientific knowledge about media effects reveals a disturbing discontinuity: Over the past 50 years, the average news report has changed from claims of a weak link to a moderate link and then back to a weak link between media violence and aggression. However, since 1975, the scientific confidence and statistical magnitude of this link have been clearly positive and have consistently increased over time. Reasons for this discontinuity between

news reports and the actual state of scientific knowledge include the vested interests of the news, a misapplied fairness doctrine in news reporting, and the failure of the research community to effectively argue the scientific case."

**1438.** Bushman, Brad J. , and Cantor, Joanne. "Media Ratings for Violence and Sex: Implications for Policy Makers and Parents [in press]." *American Psychologist* (2003).

The authors discuss what research has shown about the likely effects of large amounts of violence and sex in mass media and how this knowledge can be applied to rating entertainment.

**1439.** Bushman, B. J. , and Cantor, J. "Media Ratings for Violence and Sex: Implications for Policy Makers and Parents [in press]." *American Psychologist* 58 (2003): 130-41.

The authors discuss what research has shown about the likely effects of large amounts of violence and sex in mass media and how this knowledge can be applied to rating entertainment.

**1440.** Butcher, Lee, ed. *Accidental Millionaire: The Rise and Fall of Steve Jobs at Apple Computer*. New York: Paragon House, 1988.

A biography of Steven Jobs and history of Apple Computer with no notes or bibliography.

**1441.** Butrica, Andrew J. "Telegraphy and the Genesis of Electrical Engineering Institutions in France, 1845-1895"." *History and Technology* 3.4 (1987): 365-80.

This article examines the origins of electrical engineering in France and its connection to the telegraph. "The key figure in the development of French electrical engineering institutions prior to the 1890s was the State Telegraph Administration," Butrica writes.

**1442.** Butterfield, Roger. "Pictures in the Papers." *American Heritage Magazine* 13.4 (1962): 9 pages.

This article provides a history of newspaper illustration beginning with the *Illustrated London News* in 1842. In that year the paper published the first "candid" picture of Queen Victoria. Some critics argued that the picture invaded the Queen's privacy, was unpatriotic, and maybe even illegal. Butterfield quotes William Wordsworth's sonnet "Illustrated Books and Newspapers," and he says that the pictorial press probably reached a peak during the 1880s and 1890s. Butterfield discusses James Gordon Bennett's *New York Herald* and the illustrations it used for Andrew Jackson's funeral. The article also covers other early illustrated publications including *Gleason's...*, *Frank Leslie's Illustrated Newspaper*, the *Daily Graphic*, *Police Gazette*, and the use of cartoons. There is also brief discussion of illustrations in Joseph Pulitzer's *New York World*, and William Randolph Hearst's *New York Journal*. The author says little about the role of photography, jumping from the late nineteenth century to the early 1960s.

**1443.** Buxton, Edwin O. "The Social Evil and Its Remedy." *American Journal of Politics* 3 (1893): 39-50.

The author of this article reveals an anti-urban, anti-modern bias and an admiration for Anthony Comstock. Buxton discusses a number of social evils plaguing society including "Sins committed in the name of pleasure, with an accompaniment of music and wine, and under the shadow of night where the trail of the serpent can easily be covered, attract little attention to their awful character and fearful results. It is the black plague of modern civilization. Yet it flourishes in all our great cities unmolested, and is permitted to grow luxuriant as the passion of many may require." (39) The author goes on to say that "No form of sin writes its language so quickly and indelibly as sensuality." (40)

Buxton argues that "the family is the integral part of the state," and that "Without the family there may be a horde but there can be no nation." (40) Social evil, especially prostitution, "discourages home-making by seducing men and women to sensual indulgence which disqualifies the poor dupes from the holy estate of matrimony." (40)

The house of prostitution is especially deplorable but "Large sections of nearly all our great cities are given over to this vice. The loathsome and degrading French forms of the evil have lately been adopted. These houses, the moral ulcers of municipal life, are the objective points of attack." (40)

Buxton discusses various approaches to social evil -- a policy of "tacit consent" (40), methods of regulation, a license system, methods of suppression (40-43), and then turn to considering the "causes of the social evil." (43) Among the causes are (a) "violation of the hygienic laws (43-44); (b) "Artificial and stimulated life" (44); (c) "Impure literature" (44-45); and (d) "obscene pictures." (45) As for the artificial and stimulated life, much of it is tied to urban living and "the stifling dance house, the crowded theater, the sensuous opera, the beer-garden, saloon, and bawdy house received the inmates. Two articles of commerce are found in or near all these places -- liquor and lust. When passion is inflamed by the former and the judgment dethroned, modesty is stabbed and virtue destroyed." (44) As for impure literature, Buxton reveals himself to be an admirer of Anthony Comstock (44-45). Obscene pictures were apparently at every turn. "In thousands of places in all our large cities, displayed in shop-windows and saloons, may be seen illustrations of vile character. At all hours of the day and evening groups of men and boys are found eagerly feasting their eyes upon this savory dish of wickedness." (45)

Theater advertising -- billboards in color -- were a particular problem. **"The display of theatrical bill-boards is no less an evil. The illustrations are nearly of life size, and with the addition of flesh tone make the appeal to the baser nature still stronger.** [emphasis added] The advertising is so public that he, who would escape the debauch of imagination cannot. If the picture of the stage is such, what must the reality be upon which young men and women gaze, without blushing! Remove all obscenity in language and action from the stage, put actors in clothing suitable to a family parlor, the theater could not live a year. Exposure of the body in immodest attire; suggestions of the vile in language, look, and act; gross familiarity of the sexes upon the stage; these are the chief attractions of the modern theater. In other words, people spend money for the very purpose of inflaming passion!" (45) The author links the house of prostitution to the theater and other urban institutions. **"So long as the shop-windows, bill-boards, and the stage continue to educate the beastly part of human nature, the house of ill-fame will be an essential feature of modern civilization. Inflammable material cannot be thrown upon a fire without flames appearing in some quarter."** (46) [emphasis added] All these things serve to lead young boys astray.

Buxton calls for "organized virtue" (47) and see the church, the ballot-box and the school-house as lines of defense from social evil. "Excessive individualism prevails among good people. They hold themselves aloof from united action." (47) The author says there is a need for "a powerful national organization for the suppression of vice, with branches in every city and town...." (47)

As for women, "the abandoned, lewd woman does more than destroy life, she murders character," Buxton argues. (49) Lust and liquor have become too popular. "Government should make it easy to do right and hard to do wrong. We have faith in human nature, sinful though it be. Give the people a chance to be virtuous and they will be virtuous," the author concludes. (50)

**1444.** Byerly, Greg, and Rubin, Rich, eds. *Pornography: The Conflict over Sexually Explicit Materials in the United States: An Annotated Bibliography*. New York and London: Garland Publishing, Inc., 1980.

The contents of this work are divided into eight categories: books and dissertations; psychological articles; sociological articles; philosophical and religious articles; popular articles; government documents; legal articles; and court cases.

**1445.** Bylinsky, Gene. "Here Comes the Second Computer Revolution." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Cambridge, MA; and Oxford, Eng.: MIT Press; and Blackwell Publisher, 1980. 3-15.

This piece was the first full-length feature on the microelectronics revolution to appear in a nonspecialist publication. "In its impact, the microcomputer promises to rival its illustrious predecessors, the vacuum tube, the transistor, and the integrated-circuit logic chip," Bylinsky writes. The discussion by Everett Rogers and Judith K. Larsen in their book *Silicon Valley Fever's* (1984) on the revolutionary impact of the microprocessor (invented in 1971) draws on this article. Bylinsky's article first appeared in *Fortune* (Nov. 1975).

**1446.** ---. "What's Sexier and Speedier Than Silicon?" *The Materials Revolution: Superconductors, New Materials, and the Japanese Challenge*. Ed. Tom Forester, ed. Cambridge, MA: MIT Press, 1988. 193-202.

Science writer Bylinsky argues that "the strategic importance of the semiconductor industry can hardly be overestimated, so the arrival of new material for making chips will have major implications for manufacturer nations and user nations. The synthetic compound gallium arsenide is being used increasingly in certain types of chips and chip applications," although critics are skeptical about its future application for chips. The growth of optoelectronics, though, is giving a significant boost to this material. This piece appeared originally in *Fortune* (June 24, 1985).

**1447.** Bylinsky, Gene with Alicia Hills Moore. "Flexible Manufacturing Systems." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 284-94.

The authors argue that the next stage in automating factors is FMS, or flexible manufacturing systems. This development moves society in the direction of a workerless factory, something the Japanese appear to have the lead in. This piece appeared first in *Fortune* (Feb. 21, 1983).

**1448.** Byrnes, Mark E., ed. *Politics and Space: Image Making by NASA*. Westport, CT: Praeger, 1994.

While this work does not have much on the technology of space communication, it does discuss the image-making efforts of NASA. "NASA has used three images -- nationalism, romanticism, and pragmatism -- to build political support over its history....Nationalist statements have emphasized that the space program should be supported because it is good for America as a nation.... Nationalism was NASA's primary image during the late 1950s and into the 1960s.

"Romanticism has played to the emotional aspect of the human character. It has highlighted the excitement and adventure inherent in NASA's activities and described how space exploration fulfills some basic human yearnings....NASA employed romanticism often during the middle to late 1960s.

"Pragmatism has emphasized that the space program produced practical benefits for all citizens, thus appealing to individuals' material self-interest.... According to pragmatism, the space program stimulates technological advances, generates new products and techniques, delivers economic returns, enhances scientific knowledge, offers educational opportunities, and provides a space transportation system. NASA stress pragmatism throughout the 1970s and well into the 1980s."

The book's last chapter, "Transmitting the Images" talks about NASA's use of the media and its effort to control the flow of information about the agency.

**1449.** Cadegan, Una M. "Guardians of Democracy or Cultural Storm Troopers? American Catholics and the Control of Popular Media, 1934-1966." *Catholic Historical Review* 87.2 (2001): 252-82.

Catholics, it should be said, adopted a more complex set of attitudes about movies and American culture after World War II. Whereas during the 1920s and 1930s they often were "almost exasperatingly certain about the rightness of their view of the world," by the late 1950s, when it came to motion pictures and other forms of culture, Catholics assumed an attitude of "confident ambivalence" and believed the outlook was fitting for the world they lived in. This change in attitude reflected, in part, Cold War beliefs in the United States that associated censorship with Soviet communism and totalitarianism, both of which Catholics strongly opposed. As if to keep

pace with changing attitudes among Catholics, the Legion of Decency became more flexible. It altered its classification scheme in 1957 to expand the films that adolescents could attend, and for the first time recommended films for Catholics. It soon abandoned its pledge requirements and changed its name to the National Catholic Office of Motion Pictures.

From the article's Abstract: "The writers examines the roles and strategies of the Legion of Decency and the National Organization for Decent Literature (NODL), two American Catholic organizations involved with the control of popular media. She maintains that although they were separate organizations, they both exemplify the transition in mid-century American Catholicism from 'innocence' to 'maturity,' from defensive complacency to confident ambivalence. Their strategies, she contends, were part of the means by which the Catholic community defined itself economically, socio-politically, religiously, and theologically. The Legion and the NODL ... were frequently motivated by their attempts to reconcile the traditional aspects of such traditions as Neo-Thomism and Mystical Body theology with the American traditions of empirical investigation and individual discernment. The organizations ... ultimately worked in some ways to reinforce dominant cultural values and in others to pose persistent challenges to those values."

**1450.** Calder, Nigel, ed. *1984 and Beyond*. New York: Viking Press, 1983.

The author describes this work as follows: "A book that quotes and evaluates many past predictions about the 1980s, and looks to the decades ahead, is here cast in the form of a dialogue with a perfect retrieval system."

"The tin interlocutor is itself open to appraisal as a part of the foreseeable future. The quest for superhuman intelligence seems to stand on a par with the development of nuclear weapons, as a misapplication of scientific knowledge. The name O'Brien [the retrieval system] is ostensibly an acronym for Omniscient Being Re-interpreting Every Notation. A more sinister meaning emerges as the conversation proceeds, and links O'Brien's name with the writings of George Orwell, to whose percipience this book is an oblique tribute." (7-8)

**1451.** Callenbach, Ernest and Albert Johnson. "The Danger Is Seduction: An Interview with Haskell Wexler." *Film Quarterly* 21.3 (1968): 10.

Wexler was the cinematographer for such movies as *Who's Afraid of Virginia Woolf?* (1966), for which he won an Academy Award, and *The Thomas Crowne Affair* (1968). He was a veteran of cinema-verite and made civil rights and anti-Vietnam documentaries. One of his from Hollywood films was *Stakeout on Dope Street* (Warner Bros., 1958), and he also worked with filmmaker Roger Corman on the movie about racism, *The Intruder* (1962).

**1452.** Calvert, Louis. "Actor and the Stage." *New York Times* March 9, 1919 1919: 46.

This is a condensed version of an article Calvert did for *Equity*, the official publication of the Actors' Equity Association. Calvert says that actors too often have no sense of their responsibilities or of the stage's power for good or evil. "The stage excites massed emotions," he says. He notes, for example, how a performance of the "Merchant of Venice" flamed anti-Semitism. Calvert says that hard work is needed to make actors good craftsmen and he call for greater effort to uplift the theater. "We give our livess for the civilization of the world, and we give our money and our work to feed the starving, but we do not give even a crust or a cup of water to our Modern Art, without whose aid we could not, as actors, live."

**1453.** *Titantic*. 1997, 1997.

**1454.** Campbell, Angela J. "Self-Regulation and the Media." *Federal Communications Law Journal* 51.3 (1999): 711-72.

This article provides an overview of self regulation in radio, television, and advertising. For example, the National Association of Broadcasters (NAB) adopted a Television Code in 1951. It was based on the movie industry's Production Code and the Radio Code that had emerged during the New Deal. The TV Code had its greatest impact on programs, movies broadcast on television, and commercials during the 1950s, 1960s, and into the 1970s. It relied heavily on complaints from viewers, although it never had total participation by all members of the TV industry. Overall, its enforcement was ineffectual. The punishment for violating the Code was that the offending station could not display the NAB's "seal of good practice." Few, if any, stations were denied the seal and only the rare viewer would have noticed even if they had been. After deregulation, the NAB discarded the Television Code in 1983. This article also discusses such topics as cigarette advertising and advertising for children.

From the article's Abstract: "Self-regulation has been portrayed as superior to government regulation for addressing problems of new media such as digital television and the Internet. The literature on self-regulation is reviewed to define what is meant by the term, to identify the purported advantages and disadvantages of self-regulation, and to identify the conditions needed for its success. The effectiveness of self-regulation is then analyzed by examining instances where self-regulation has been employed in connection with the media. It is concluded that self-regulation rarely lives up to the claims made for it, although in some cases, it has been useful as a supplement to government regulation. Five factors are identified that may account for the success or failure of self-regulation: 1. industry incentives, 2. the ability of government to regulate, 3. the uses of measurable standards, 4. public participation, and 5. industry structure."

**1455.** Campbell, Robert, ed. *The Golden Years of Broadcasting: A Celebration of the First 50 Years of Radio and Television on NBC*. New York: Scribner's, 1976.

**1456.** Campbell-Kelly, Martin, ed. *Computer: A History of the Information Machine*. New York: Basic Books, 1996.

This book is part of the *Sloan Technology Series*. It was written for a broad public and provides a good introduction to the history of computing. The book is divided into four sections. Section one deals with the way people handled computing before electronic computers. Chapter 1 shows that sophisticated information processing existed before the twentieth century. Chapter 2 treats the "origins of office machinery and the business machine industry." Such leading firms in the modern computing industry as IBM started in the last decades of the nineteenth century and manufactured business machines. Between World War I and World II such companies were major innovators in the computing field. Chapter 3 discusses Charles Babbage's efforts during the 1830s to build a calculating engine. Babbage failed but a century later IBM and Harvard University realized his dreams.

Sections two and three cover the period roughly from 1945 to 1980, and treats the creation and evolution of computers. Section two focuses on the invention of electronic computing during World War II through the 1960s when IBM established its dominance in this area. Chapter 4 describes the building of ENIAC during the war at the University of Pennsylvania and its successor, the EDVAC, which became the "blueprint" for subsequent computers up to the present. Chapter 5 discusses changes in the computer industry in which computers became more than mere instruments to make scientific or mathematical calculations and reached into the realm of data processing for businesses. Chapter 6 deals with the growth of the mainframe computer industry.

Section three "presents a selective history of some key computer innovations" between the end of World War II and the appearance of the first personal computers. Chapter 7 looks at the technologies of computing in real time (e.g., its use in airlines reservations and at supermarkets). Chapter 8 examines the evolution of software technology. Chapter 9 covers "key features of the computing environment at the end of the 1960s: time-sharing, minicomputers, and microelectronics." This chapter revises the notion that the change from using mainframes to personal computers came abruptly.

The last section covers the origins of personal computers and the Internet, and the new computing environment they have created. Chapter 10 covers events from the mid-1970s and the use of the first “hobby computers” to the arrival of the first personal computers by the end of the decade. Chapters 11 examines the environment of personal computers during the 1980s and the development of “user-friendly” software. Here the rise of Microsoft and other companies are discussed. The last chapter covers the Internet, and the relation between the World Wide Web and the information sciences.

**1457.** Canby, Vincent. "Adult Themes' Head for Screen: Many of Old Taboos Seen Rapidly Disappearing." *New York Times* Jan. 5, 1967 1967: 27.

Canby writes that in the aftermath of the revised movie Production Code of 1966, "the movies, once the mass medium of entertainment, are going through a revolution that could remove all the old taboos concerning subject matter and treatment."

**1458.** ---. "'Alfie' May Speed Film Code Change: Abortion Sequence in British Import Challenges Taboo." *New York Times* July 19, 1966 1966: 33.

This article notes that this movie, *Alfie*, had an abortion (performed off-screen, but described vividly by one of the characters), in direct violation of the U. S. motion picture Production Code. Canby speculates that this film may push the MPAA and Jack Valenti to revise the Code.

**1459.** ---. "Appeal by 'Alfie' Wins a Movie Code Certificate." *New York Times* Aug. 3, 1966 1966: 43.

Canby explains that the British-made film, *Alfie*, has won a seal of approval from Hollywood's Production Code Administration, despite violating the Code's prohibition on treating abortion in films.

**1460.** ---. "'Blow-Up' May Get New Code Review: Picture Shown May Differ from One Disapproved." *New York Times* Feb. 7 1967 1967.

After the MPAA revised the Production Code for a last time in 1966, *Blow-Up* was the first movie to test it. Geoffrey Shurlock, who was head of the PCA, objected to the movie's scenes of intercourse and nudity, first viewed the movie in black-and-white. It was a color film, though, and contain a brief glimpse of pubic hair. Some censors felt that the color magnified the impact of the nudity.

**1461.** ---. "Czar of the Movie Business." *New York Times Magazine* (1967): 38-39, 42, 44, 47, 49, 52, 57, 59.

This article deals with Jack Valenti, the new president of the Motion Picture Association of America. Canby commented that there remained “about Valenti-in-action a good deal of the Houston huckster, tempered by the Valenti-the-small-town-boy-who-made-good-and-enjoys-every-minute-of-it.” The article gives a good deal of background on Valenti and the Motion Picture Association of America. It notes that Valenti, unlike Louis Nizer who had campaigned to be MPAA president, did not have a past connection to the Production Code. Valenti was much more willing to move the industry in new directions.

**1462.** ---. "Film Trade Body May Elect Nizer." *New York Times* March 26, 1966 1966: 14.

This article speculates that an attorney, Louis Nizer, who has represented many of the major studios in legal matters, will be chosen to be the new president of the Motion Picture Association of America. Ralph Hetzel, who had been an economist in the Truman administration, had filled the post on an interim basis since the death of Eric Johnston in August, 1963.

**1463.** ---. "Filmmakers Show Less Fear of Catholic Office." *New York Times* Oct. 13, 1967 1967: 35.

This article notes that even though the Catholic Church had condemned five movies, they were released under the movie industry's 1966 Production Code with a rating of "for mature audiences." The movies included *Blow-Up*, *Hurry Sundown*, *The Penthouse*, and *Reflections in a Golden Eye*.

**1464.** ---. "Films Exploiting Interest in Sex and Violence Find Growing Audience Here." *New York Times* Jan. 24, 1968 1968: 38C.

This article by *New York Times* film critic, Vincent Canby, discusses the growing audiences for movies with sex and violence.

**1465.** ---. "For Better or Worse, Film Industry Begins Ratings." *New York Times* Nov. 1, 1968 1968.

In this article, Canby discusses the new rating system that the motion picture industry had just put into place. It replaced the Production Code. A clipping of this article can be found in the U. S. Senate Committee on Commerce Papers, RG 46, Sen 90A-E6, Box 53, National Archives I, Washington, D. C.

**1466.** ---. "'I Am Curious (Yes)'." *New York Times* March 23, 1969 1969: D1, D16.

In discussing the controversial Swedish film *I Am Curious - Yellow*, film critic Canby says that "a revolution in movie mores of really stunning rapidity and effect" occurred in the United States since 1952 and the *Miracle* case.

**1467.** ---. "A New Movie Code Ends Some Taboos." *New York Times* Sept. 21, 1966 1966: 1, 42.

This article discusses the new motion pictures Production Code, adopted in September, 1966. It gave the PCA more flexibility in determining what was permissible in movies, and for the first time established a classification scheme with a "for mature audiences only" category. Louis Nizer, Geoffrey Shurlock, and Jack Valenti are quoted on the Code.

**1468.** ---. "New Production Code for Films Endorsed by Theater Owners." *New York Times* Oct. 1, 1966 1966: 34.

Jack Valenti tells theater owners that the revised 1966 Production Code "will unleash the creative man from artificial fetters." The National Association of Theater Owners (NATO) endorsed the new Code even though it had a provision they had long resisted -- a form of film classes called "suggested for mature audiences" designed to point out films inappropriate for those under 18.

**1469.** ---. "Public Not Afraid of Big Bad 'Woolf'." *New York Times* June 25, 1966 1966: 20.

This article notes that about 2,000 people attended the first two showings of Warner Bros.'s *Who's Afraid of Virginia Woolf?*, despite its controversial dialogue. Canby speculates that this film may push the MPAA and Jack Valenti to revise the motion picture Production Code so that "it will allow the public morality in films to reflect more accurately the state of private morality."

**1470.** ---. "Talent Appeal Big with Yanks." *Variety* 238 (1965): 1.

As restrictions were relaxed on American productions, foreign films that showed in the United States -- and American -financed) movies that had been filmed in foreign locations -- challenged the Production Code. [note that those after 1966 came after the Code was dead.] Some of them scored "handsome boxoffice returns," film critic Vincent Canby notes in this article.

**1471.** ---. "Valenti Disowns Movie Quotation: Hasn't Seen Bad One Since He Stopped Seeing Any." *New York Times* May 20, 1966 1966: 40.

Jack Valenti, the new president of the MPAA, denies saying that "I don't ever remember seeing a bad movie," a statement attributed to him. He says that he had not seen "any really bad movies recently." The article also

says that Valenti intended to initiative MPAA policy, something that his predecessor Eric Johnston had been criticized for not doing.

**1472.** ---. "Valenti Facing First Film Crisis: Movie Association Refuses Seal to 'Virginia Woolf'." *New York Times* May 28, 1966 1966: 12.

This article notes that Warner Bros. is threatening to withdraw from the MPAA because the PCA has refused to approve *Who's Afraid of Virginia Woolf?*, because of its strong language. The articles notes this brings to mind the reaction to an earlier film, *The Man With the Golden Arm*.

**1473.** ---. "Valenti Suggests Classified Films: Asks a Change Producers Have Long Resisted." *New York Times* Aug. 18, 1966 1966: 27.

Jack Valenti asks the National Association of Theatre Owners (NATO) to revised the Production Code and add a "suggested for mature audiences" classification for films inappropriate from those under 18. Theater owners and movie producers had resisted this form of classification believing that if it failed, it would give the state and local government increased leverage to pass censorship laws.

**1474.** ---. "'Virginia Woolf' Given Code Seal: Industry's Censors Exempt Film from Speech Rules." *New York Times* June 11, 1966 1966: 46.

This article says that the MPAA's appeals board over turned a decision by the industry Production Code Administration rejected *Who's Afraid of Virginia Woolf?* because it violated the Code's rules on profane language. It notes that only 18 months earlier, the appeal board had overturned another PCA rejection of *The Pawnbroker*, which violated the Code's ban on nudity.

**1475.** ---. "What Are We To Think of 'Deep Throat'." *New York Times* Jan. 21, 1973 1973, sec. 2: 1, 33.

*New York Times* film critic Vincent Canby discusses the public reaction to the X-rated film, *Deep Throat* (1972), a film that was being shown in mainstream movie theaters. "For reasons that still baffle me, 'Deep Throat' became the one porno film in New York chic to see and to be seen at," Canby wrote. He went on to say that obscenity laws "are wrong but the film isn't worth fighting for."

**1476.** Canfora, Luciano (translated by Martin Ryle), ed. *The Vanished Library*. Berkeley: University of California Press, 1987.

This brief, 197-page book raises questions about longevity of libraries and knowledge. "Surveying this series of foundations, refoundations and disasters, we follow a thread that links the various and mostly vain, efforts of the Hellenistic-Roman world to preserve its books," the author writes. "Alexandria is the starting point and the prototype; its fate marks the advent of catastrophe, and is echoed in Pergamum, Antioch, Rome, Athens. At Byzantium there was to be one last reincarnation -- a palace library, once again, in the palaces of the emperor ... and the patriarch.

The great concentrations of books, usually found in the centres of power, were the main victims of these destructive outbreaks, ruinous attacks, sackings and fires. The libraries of Byzantium proved no exception to the rule. In consequence, what has come down to us is derived not from the great centres but from the 'marginal' locations, such as convents, and from scattered private copies."

**1477.** Cantor, Joanne. "'I'll Never Have a Clown in My House! -- Frightening Movies and Enduring Emotional Memory.'" *Poetics Today: International Journal for Theory and Analysis of Literature and Communication* 25.2 (2004): 283-304.

Cantor, one of the leading researchers on the effects of violence and fear in mass entertainment, discusses the influence of horror movies, especially on children. She delivered this paper at the International Communication Association meeting, 2003.

**1478.** ---. "'I'll Never Have a Clown in My House!' -- Frightening Movies and Enduring Emotional Memory."

Cantor, one of the leading researchers on the effects of violence and fear in mass entertainment, discusses the influence of horror movies, especially on children. She delivered this paper at the International Communication Association meeting, 2003. The essay was then in press at *Politics Today*.

**1479.** ---, ed. *"Mommy, I'm Scared": How TV and Movies Frighten Children and What We Can Do to Protect Them*. New York: Harcourt Brace & Company, 1998.

This book is by one of the leading scholars of media effects, especially the effects of motion picture and television violence and horror. Here Cantor is looking at fear research, an area that communication researchers have begun to develop – this in addition to an already substantial body of empirical research on the influence of media violence. Cantor examines the reactions of children to such movies as *Jaws* and *Poltergeist* and maintains that such films may have long-lasting and damaging effects.

**1480.** ---. "Ratings for Program Content: The Role of Research Findings." *Annals of the American Academy of Political and Social Science* 557 (1998): 54-69.

This article is by one of the leading scholars of media effects, especially the effects of motion picture and television violence and horror. Here she discusses how ratings systems can be made more effective by using research on media effects.

**1481.** Cantor, Joanne, Harrison, Kristen, and Krcmar, Marina. "Ratings and Advisories for Television Programming: University of Wisconsin, Madison Study." *National Television Violence Study: Executive Summary, 1994-1995*. Studio City, CA: Mediascope, Inc. 41-47.

The authors evaluate the effectiveness of rating systems in light of a study done at the University of Wisconsin, Madison.

**1482.** Cantril, Hadley, ed. *Invasion From Mars: A Study in the Psychology of Panic*. Princeton: Princeton University Press, 1940.

Cantril examined public reaction to Orson Welles' 1938 radio program "War of the Worlds," a program that caused many people to panic. This work is an example of an early effort to measure the impact of radio. Long after the broadcast, people talked about it and newspapers ran stories about the shock of terror. A poll taken by the American Institute of Public Opinion found that about twelve percent of the people said they listened to the show. Cantril estimated that approximately 9,000,000 Americans heard the broadcast. "The panic was clearly a nationwide reaction. The figures dictate the percentage of those who heard the broadcast as a news report and were frightened." In terms of regional averages all but the northeast had more than 69 percent of those polled believed the broadcast was real. In the south, more than 80 percent believed the broadcast was a news report – the highest in the nation. (58)

**1483.** Carbonara, Corey Patrick. "A Historical Perspective of Management, Technology, and Innovation in the American Television Industry." University of Texas, Austin, 1989.

A 569-page Ph. D. thesis. See DAI-A 51/02, p. 330, Aug. 1990.

**1484.** Carey, James W., ed. *Communication as Culture: Essays on Media and Society*. Boston: Unwin Hyman, 1989.

Four essays in this book are of special interest. They are: "The Mythos of the Electronic Revolution" (with John J. Quirk); "Space, Time, and Communications: A Tribute to Harold Innis"; "The History of the Future" (with John J. Quirk); and "Technology and Ideology: The Case of the Telegraph."

Carey argues that there are two views in communication research, one emphasizing transmission, the other ritual. Until recently, the research in mass communication emphasized effects but gave less consideration to the ritual view. The whole picture needs to be studied if communication phenomena are to be understood.

In a ritual definition, this work contends, communication is linked to terms such as 'sharing,' 'participation,' 'association,' 'fellowship,' and 'the possession of a common faith.' This definition exploits the ancient identity and common roots of the terms 'commonness,' 'communion,' 'community,' and 'communication.' A ritual view of communication is directed not toward the extension of message in space but toward the maintenance of society in time; not the act of imparting information but the representation of shared beliefs." ...

"If one examines a newspaper under a transmission view of communication, one sees the medium as an instrument for disseminating news and knowledge, sometimes *divertissement*, in larger and larger packages over greater distances. Questions arise as to the effects of this on audiences...."

"A ritual view of communication will focus on a different range of problems in examining a newspaper. It will, for example, view reading a newspaper less as sending or gaining information and more as attending a mass, a situation in which nothing new is learned but in which a particular view of world is portrayed and confirmed. News reading, and writing, is a ritual act and moreover a dramatic one.... Moreover, as readers make their way through the paper, they engage in a continual shift of roles or of dramatic focus. A story on the monetary crisis salutes them as American patriots fighting those ancient enemies Germany and Japan... The model here is not that of information acquisition, though such acquisition occurs, but of dramatic action in which the reader joins a world of contending forces as an observer at a play."

**1485.** ---. "The Internet and the End of the National Communication System: Uncertain Predictions of an Uncertain Future." *Journalism & Mass Communication Quarterly* 75.1 (1998): 28-34.

Although the title suggests this piece will deal mostly with the Internet, the best part of it deals with the development of a national communications network that emerged during the 1890s, if not before.

"Roughly a hundred years ago the modern era of communication begins. A precise date is unnecessary but the decade of the 1890s can serve as the approximate moment when, in the United States, space and time were enclosed, when it became possible to think of the nation as everywhere running on the same clock of awareness and existing within a homogeneous national space. This 'communications revolution,' presaged by the growth of the telegraph and the penny press in the decades before and after the Civil War, decisively began in the 1890s with the birth of the national magazine; the development of the modern mass, urban newspapers; the domination of news dissemination by the wire services; and the creation of early, primitive forms of electronic communication. Together these instruments constituted the infrastructure of a nationwide system of signaling tied to a largely local network of telephony. By the 1920s, the dominant tendencies of this revolution were clear, although they continued to work themselves out even into the 1970s."

"Since the late 1970s, we have been undergoing a similar communications revolution but one whose scalar dynamic is at the global rather than the national level, a revolution producing in the words of the former chairman of Citicorp, 'the twilight of sovereignty.' ..."

“The precise dating of the shift from a modern to a postmodern organization of communication can be roughly set in the 1970s when the combination of cable and satellite undercut the network system on which the national hegemony of communication was built. The Internet represents a further development in the integration of this complex of technologies that have withdrawn the coordinates of time and space and with it categories of human identity and structure of social relations.”

**1486.** ---. "Introduction to the Rowman & Littlefield Edition." *Changing Concepts of Time*. Ed. Innis, Harold A. Lanham, MD: Rowman & Littlefield Publishers, Inc., 2004. vii-xx.

In this Introduction to this new edition of Harold A. Innis's book, Carey sets the Canadian political economist's work into historical context. He discusses Innis's participation in a "Values Discussion Group" in 1949 with other University of Toronto faculty that included Marshall McLuhan. With regard to the idea of monopoly of knowledge, a theme in Innis's work, Carey writes: "those in political power exercised a monopoly of knowledge over the public domain. They were exclusively present-minded, seeking the satisfaction of their own interests, driven by shortsighted hatred and desires for revenge that they systematically implanted and exploited in public discourse. Power was indifferent to the long run and the larger interests of humankind. The voice of the scholar was silenced or, even worse, co-opted by power into a tool of the state. This monopoly of knowledge was founded on the media of print and broadcast, which reinforced the tendency to live exclusively in the present, in a world defined by the news cycle: the day or increasingly the hour or quarter-hour. We are kept waiting for the news as a substitute for participation in politics. The temporal horizon collapsed into the present, and forethought, planning for the future, thinking in terms of posterity, became obsolete." (xv)

**1487.** Carey, James W., ed., ed. *Media, Myths, and Narratives: Television and the Press*. Newbury Park, CA: Sage, 1988.

In his Introduction to this anthology, Carey writes: "The essays in this volume attempt two things: to elucidate concepts such as myth, narrative, and story, and, then, to apply them to specific phenomena and episodes in televisions and the press."

Among the essays in this volume are: Roger Silverstone, "Television Myth and Culture," pp. 20-48; Thomas H. Zynda, "The *Mary Tyler Moore Show* and the Transformation of the Situation Comedy," pp. 126-45; and Michael Cornfield, "The Watergate Audience: Parsing the Powers of the Press," pp. 180-204.

**1488.** Carlat, Louis. "'A Cleanser for the Mind': Marketing Radio Receivers for the American Home, 1922-1932." *His and Hers: Gender, Consumption, and Technology*. Ed. Roger Horowitz and Arwen Mohnun, eds. Charlottesville: University of Virginia Press, 1998.

This chapter, based on a paper presented at an April, 1994, conference on gender and technology at the Hagley Library in Wilmington, Delaware, seeks to outline advertising strategies employed by RCA and other radio manufacturers as they marketed radio receivers for the home market in the 1920s and early 1930s. Carlat argues that gender played a deciding factor in both the physical appearance of radio hardware and in the appeals evident in advertisements from the period. Radio in the 1920s underwent a "transition from male toy to a component of domestic space," which required the "recasting of radio hardware as a feminine object and listening as a feminine activity." Part of this transition involve repositioning the radio as an elegant and practical piece of home furnishing, rather than an ugly and erratic contraption that men and boys tinkered with in basements and garages. New radio sets on the market in the 1920s were artfully designed to reflect contemporary styles and were engineered to be as simple to use as turning a single knob, which reflects in many ways the image of the female consumer as motivated by form over function and unable to grasp the workings of anything complicated or mechanical.

As Carlat observes, ads for radios in the 1930s were pitched to the more affluent consumer, who was both more likely to be able to afford the "new luxury" and also served as trend-setters in many communities. Perhaps

more interesting is Carlat's claim that radio advertisements were directed at both men and women. Due to the relatively high cost, the purchase of a radio set was seen as a man's decision, something the woman would not be willing to purchase on her own. Therefore radio ads had to appeal to women in the sense that they created demand among those who controlled the domestic space and also to the men who controlled the household finances. This is described as "cultivating female users as a route to the wallets of male purchasers."

The chapter is based largely on magazine advertisements as primary sources and a smattering of the secondary literature on radio and advertising history. Much of this material was taken from Carlat's PhD dissertation on classical music and radio during the 1920s and 1930s.

-- Rob Rabe

**1489.** Carlebach, Michael L., ed. *The Origins of Photojournalism in America*. Washington, D. C.: Smithsonian Institution Press, 1992.

Carlebach describes the tremendous increase and diffusion of photographs in America between 1839 (the year Daguerre's invention was announced) and 1880. He notes that "long before the establishment of mass-circulation picture magazines like *Life*, *Look*, and *Colliers* in the 1930s, even before the invention of the halftone process and rotogravure printing press in the 1880s, photographs were used to inform the public about events, people, and places in the news." Often pictures were displayed crudely, sometimes even pasted into books and magazines. "Most often, however, artists copied photographs, and they were printed in magazines, books and newspapers as woodcuts or steel engravings; often, only the caption suggested their photographic origin. In addition, early photographic methods made it difficult to record fast-moving events or unposed human activity. Until hand-held cameras and roll film revolutionized photography late in the century, photographers in America performed most camera work indoors, in studios, under conditions they rigidly controlled."

Carlebach says that the "idea that photographs could be printed with words, even crudely printed with words, was epochal and led to fundamental changes in the way information was gathered and disseminated to the public. The combination of text and photographs is, indeed, the guiding principle and single most important characteristic of photojournalism. Wilson Hicks, the redoubtable editor of *Life* magazine from 1937 to 1950, said as much in his classic study, *Words and Pictures*, published in 1952. He rightly contends that the basic unit of photojournalism is not the gritty hard-news picture standing alone, but photographs and text printed together. In this informational mix, picture content matters less than the manner in which the picture is used. Photojournalism does not consist exclusively of those familiar, powerful, and persuasive images of accident and mayhem, death and destruction; its content is really as varied as journalism itself. In photojournalism, words that provide a context for the photograph are vital; so, too, is the publication of the picture.

"The ability of photographs to inform and persuade a mass audience is based upon the public's belief in their infallibility and objectivity. In mid-nineteenth-century America, the photographic process was understood to rely less upon the imagination of the photographer than on the mute precision of solar energy. Photography was a more perfect art not because photographers were more artistic, but because their product was created by light itself. 'No man quarrels with his shadow,' wrote Ralph Waldo Emerson more than a century ago, 'nor will he with his miniature when the sun was the painter. Here is no interference, and the distortions are not the blunders of an artist.'"

**1490.** Carlen, Claudia, IHM, ed. *The Papal Encyclicals, 1903-1939*. Raleigh: McGrath Publishing Company, a Consortium Book, 1981.

This, the third volume in a series, contains papal encyclicals including Pope Pius XI's 1936 encyclical on motion pictures.

**1491.** ---, ed. *The Papal Encyclicals, 1939-1958*. Raleigh, N. C.: McGrath Publishing Company, a Consortium Book, 1981.

This, the fourth volume in a series, contains the Vatican's response to many issues including those raised by modern communications. This volume, for examples, has Pope Pius XII's 1957 encyclical dealing the motion pictures, radio, and television.

This article discusses movie special effects. The article's subtitle reads: "Wonderful Moving Picture Reel Played. A Complete Placer Mine Dynamited. Rex Beach's Novel, 'The Spoilers'."

**1498.** Carroll, Noël. "Film/Mind Analogies: The Case of Hugo Munsterberg." *Journal of Aesthetics and Art Criticism* 46.4 (1988): 489-99.

**1499.** Carter, Ian, ed. *Railways and Culture in Britain: The Epitome of Modernity*. Manchester: Manchester University Press, 2001.

As the title suggests, this work examines the railway as an image in culture, particularly in terms of literature and print. The author seeks to understand the railway as a symbol for modernity by measuring its impact on culture. The works of many Victorian novelists and artists, from George Cruikshanks and J.M.W. Turner to Charles Dickens are cited in this argument. Naturally, source material includes the works of these artists, along with historical, sociological, and psychological studies that treat issues of modernity. This project is particularly apt when one considers the relationship of the railway--a means of communication--with other nineteenth-century communications media such as the novel.

**1502.** Castells, Manuel, ed. *End of Millennium*. Malden, MA: Blackwell Publishers, 1998.

This is the concluding work in a three-volume study entitled, *The Information Age: Economy, Society, and Culture*. While somewhat redundant, these works represent a major accomplishment by the author. In these three volumes, Castells attempts to document "a new historical landscape, whose dynamics is likely to have lasting effects on our lives, and on our children's lives." He maintains that the last quarter of the twentieth century has been marked by a "transition from industrialism to informationalism, and from the industrial society to the network society, both for capitalism and statism."

In *End of Millennium*, Castells examines the collapse of the former Soviet Union, and notes that the inability of Soviet "statism to manage the transition to the Information Age" played a crucial part in this downfall. The Soviets had attempted to control information flow, regulating everything from paper, to typewriters, to photocopy machines. They failed to keep pace with the information technology revolution of the 1970s, however. "What had been a situation close to parity [with the United States] in computer design in the early 1960s became, in the 1990s, a 20-year difference in design and manufacturing capability." Gorbachev, who attempted to modernize Soviet communism, inadvertently unleashed forces that brought down the USSR. He "will remain the hero who changed the world by destroying the Soviet empire," Castells writes, "although he did it without knowing it and without wanting it."

In addition to treating developments in the former USSR and in post-Soviet Russia, Castells considers other areas of the world: Africa (chapter 2), Japan, China, Taiwan, Singapore, South Korea, Hong Kong, and other Asian regions (chapter 4), and the unification of Europe (chapter 5). He also devotes chapter 3 to the worldwide criminal economy.

A concluding chapter, "Making Sense of our World," pulls together themes developed in this work and in the two previous volumes in his trilogy, *Rise of Network Society*, and *The Power of Identify*. "A new world is taking shape in this end of millennium. It originated in the historical coincidence, around the late 1960s and mid-1970s, of three *independent* processes: the information technology revolution; the economic crisis of both capitalism and

statism, and their subsequent restructuring; and the blooming of cultural social movements, such as libertarianism, human rights, feminism, and environmentalism. The interaction between these processes, and the reactions they triggered, brought into being a new dominant social structure, the network society; a new economy, the informational/global economy; and a new culture, the culture of real virtuality.”

What is “new” about this era? Castells suggests the following “Chips and computers are new; ubiquitous, mobile telecommunications are new; genetic engineering is new; electronically integrated, global financial markets working in real time are new; and inter-linked capitalist economy embracing the whole planet, and not only some of its segments, is new; a majority of the urban labor force in knowledge and information processing in advanced economies is new; a majority of urban population in the planet is new; the demise of the Soviet Empire, the fading away of communism, and the end of the Cold War are new; the rise of the Asian Pacific as an equal partner in the global economy is new; the widespread challenge to patriarchy is new; the universal consciousness on ecological preservation is new; and the emergence of a network society, based on a space of flows, and on timeless time, is historically new.”

**1503.** ---. "High Technology, Economic Restructuring, and the Urban-Regional Process in the United States." *High Technology, Space, and Society*. Ed. Manuel Castells, ed. Beverly Hills, CA: Sage Publications, 1985. 11-40.

Castells wrote in 1985 that “we are in the middle of a major technological revolution that is transforming our ways of producing, consuming, organizing, living, and dying. Cities and regions are also changing under the impact of new technologies.” Two features characterized this technological innovation. One was that “the object of technological discoveries, as well of their applications, is *information*.” The second feature concerned “the fact that the outcome is *process-oriented*, rather than *product-oriented*.” Castells went on to argue that the “*most important global process conditioning the relationship between new technologies and spatial dynamics is the economic restructuring that U.S. capitalism is currently undergoing, superseding the structural crisis of the 1970s.*” (italics in original text)

**1504.** Castells, Manuel, ed., ed. *High Technology, Space, and Society*. Beverly Hills: Sage Publications, 1985.

This collection of original essays samples current research (as of 1985) on “the existence of a web of interactions between technology and space, mediated by economic, cultural and political processes.” The common ground for these essays “is the recognition of the importance of technological change for the evolution of spatial and social forms, *together with an emphasis on the need to integrate technology in a broader framework of social relationships* to understand the diversity of its effects on people’s lives, on institutions, and, ultimately, on spatial forms and processes.” The editors contend that these essays represent a “new frontier of urban studies” but do not attempt to construct “a coherent view” of this phenomenon. Two opening chapters, one by Manuel Castells, the other by geographer Peter Hall, provide an overview of this field, but do not provide a synthesis of the other contributions to this volume. Castells writes that “We are in the middle of a major technological revolution that is transforming our ways of producing, consuming, organizing, living, and dying. Cities and regions are also changing under the impact of new technologies....

“Two features are characteristic of the stream of technological innovation under way. First, the object of technological discoveries, as well of their applications, is *information*....

“The second feature concerns the fact that the outcome is *process-oriented*, rather than *product-oriented*.”

Among the essays in this volume are **Manuel Castells**, “High Technology, Economic Restructuring, and the Urban-Regional Process in the United States”; **Peter Hall**, “Technology, Space, and Society in Contemporary Britain”; **AnnaLee Saxenian**, “Silicon Valley and Route 128 Regional Prototypes or Historic Exceptions?”; **Ann Roell Markusen and Robin Bloch**, “Defensive Cities: Military Spending, High Technology, and Human Settlements”; **Claude Fischer**, “Studying Technology and Social Life.”

**1505.** Castells, Manuel, ed. *The Informational City: Information Technology, Economic Restructuring, and the Urban-Regional Process*. Cambridge, MA: Basil Blackwell Inc., 1989.

This work focuses on the United States, and argues that during the 1970s major changes occurred simultaneously in communication technology and in the restructuring of capitalism to produce societies' "fundamental matrix of institutional and economic organization." The changes in communication led to the "emergence of a new mode of socio-technical organization" which Castells calls the "informational mode of development." At the core of this "new technological paradigm" is microelectronics, and a series of innovations that built on the discoveries of the transistor in 1947, the integrated circuit around 1957, the planar process in 1959, and the microprocessor in 1971. "Computers, spurred on by exponential increases in power and dramatic decreases in cost per unit of memory, were able to revolutionize information processing, in both hardware and software. Telecommunications became the key factor for the diffusion and full utilization of the new technologies by enabling connections between processing units, to form information systems." Applying microelectronic-based informational system in workplaces made for more flexible and integrated systems of management and production. "Around this nucleus of information technologies, a number of other fundamental innovations took place, particularly in new materials (ceramics, alloys, optical fibers), and more recently, in superconductor, in laser, and in renewable energy sources. In a parallel process, which benefitted from the enhanced capacity to store and analyze information, genetic engineering extended the technological revolution to the realm of living matter. This laid the foundations for biotechnology, itself an information technology with its scientific basis in the ability to decode and reprogram the information embodied in living organisms."

Two features characterize the new technological paradigm<sup>1</sup>) the paradigm's most distinguishing features is that "the core new technologies are *focused on information processing*." 2) another characteristic of these technologies, one "common to all major technological revolutions," is that the "main effects of their innovations are on *processes*, rather than on *products*." These points, of course, were also made in *High Technology, Space, and Society* (1985).

Occurring along with these changes in technologies was a restructuring of capitalism during the 1980s. The relation between this restructuring and technology is complex. The social and political system in many ways shapes the technology; at the same time, without the technology, the restructuring of capitalism would have surely taken a different form.

Castells sees three phases of capitalism. The pre-1929 era was characterized by laissez-faire, and was thrown into crisis by the Great Depression and World War II, which triggered a restructuring. What emerged was state-regulated capitalism which flourished from 1945 until the mid-1970s when this system fell into crisis. The oil shortages of 1974 and 1979 help bring on this crisis, although its causes ran much deeper. During the 1980s, another restructuring took place that gave birth to a new model of capitalism, one characterized by "the overpowering of labor by capital, the shift of the state toward the domination-accumulation functions of its intervention in economy and society, and the internationalization of the capitalist system to form a worldwide interdependent unit working in real time." Castells is particularly good in explaining how new communication technologies made possible the internationalization of capitalism.

**1506.** ---, ed. *The Power of Identity*. Oxford, UK,: Blackwell Publishers Ltd., 1997.

Castells presents an account of what he argues are two great and conflicting trends shaping the world at the end of the 20<sup>th</sup> century: globalization and identity. He sees the information-technology revolution restructuring capitalism, which has, in turn, meant the demise of statism. Such instability has changed the notion of national identity and created a "network society" ushering in globalization of strategic economic activities, a workforce dangerously in constant flux, and a culture of "real" virtuality. Castells see the emerging virtual culture as an expression of collective identity. Castells also says the techno-economic forces that use the media to promote their own agenda are in fundamental, ideological conflict with the idea of the nation-state and the notion of

political democracy. During this time of globalization, he asks who regulates powerful multinational corporations that have no clear national boundary or character? Can a nation exist without a state? Castells examines the effect of the feminist and environmentalist movements (and other proactive and reactive movements as he terms them) that have dug the trenches of resistance on behalf of ethnicity, locality, family, God, and the idea of nationhood.

**--Robert Pondillo**

**1507.** ---, ed. *The Rise of the Network Society*. Oxford, UK: Blackwell Publishers Ltd., 1996.

This book develops themes set out in Castells' *Informational City* (1989), and it is the first volume of a trilogy. Volume II, *The Power of Identity*, explores the interaction of the Net and Self in the context of the patriarchal family and the national state, two institutions in crisis. Volume III, *End of Millennium*, pulls together themes in the first two volumes and is more theoretical. Among other themes covered is the collapse of the former Soviet Union.

*The Rise of Network Society* is a *tour de force*. Castells examines the complex interaction between historic changes in communication brought by the microelectronics revolution of the 1970s, and the restructuring of capitalism during the 1980s. "My starting point," he writes, "is that, at the end of the twentieth century, we are living through of these rare intervals in history. An interval characterized by the transformation of our 'material culture' by the works of a new technological paradigm organized around information technologies." We should not underestimate the current revolution in technology, he argues, because it is "at least a major a historical event as was the eighteenth-century Industrial Revolution, inducing a pattern of discontinuity in the material basis of economy, society, and culture."

Castells distinguishes between "information society" and "informational society." The former term "emphasizes the role of information in society. But I argue that information, in its broadest sense, e.g. as communication of knowledge, has been critical in all societies, including medieval Europe which was culturally structured, and to some extent unified, around scholasticism, that is, by and large an intellectual framework.... In contrast, the term informational indicates the attribute of a specific form of social organization in which information generation, processing, and transmission become the fundamental sources of productivity and power, because of new technological conditions emerging in this historical period."

Castells' opening chapter on "The Information Technology Revolution" is informative, thought-provoking, and provides good leads to related literature. Chapter 2 is "The Informational Economy and the Process of Globalization," while chapter 3 is entitled "The Network Enterprise: The Culture, Institutions, and Organizations of the Informational Economy." Chapter 4 explores "the transformation of work and employment." Chapter 5 is "The Culture of Real Virtuality," which discusses the rise of interactive networks and the end of the mass audience. Chapter 6 deals with "The Space of Flows," while the final chapter is "The Edge of Forever: Timeless Time."

Castells, who was born in Spain, is a professor of sociology and planning. This work is based on research in Asia, Latin America, the United States, and Europe.

**1508.** Cate, Phillip Dennis. "The French Poster, 1868-1900." *American Art Posters of the 1890s*. New York: Metropolitan Museum of Art; Distributed by Harry N. Abrams, Inc., 1987. 57-69 (text); 70-96 (posters).

**1509.** Cate, Phillip Dennis , and Hitchings, Sinclair Hamilton, eds. *The Color Revolution: Color Lithography in France, 1890-1900*. Santa Barbara, CA and Salt Lake City, UT: Peregrine Smith, Inc., 1978.

During the 1890s, French avant-garde artists preferred color lithography over other means of printmaking. Cate and Hitchings devotes two chapters to this development. Chapter 1 is "The 1880s: The

Prelude," and Chapter 2 is "The 1890s: Revolution." There follows numerous color illustrations. At the end of this work are short biographies of several artists: Henri de Toulouse-Lautrec, Pierre Bonnard, Henri-Gabriel Ibels, Edouard Vuillard, Maurice Denis, Ker-Xavier Roussel, Alexandre Lunois, Benjamin Jean Pierre Henri Rivière, Charles-Marie Dulac, Georges de Feure, Hermann René Georges Paul, Jean Veber, Théophile Alexandre Steinlen, Eugè-Samuel Grasset, Paul Signac, and Maximilien Luce.

This volume also contains chapters by Sinclair Hamilton Hitchings entitled "Simplicity of Means" and "Eighty Years of an Artist's Medium"; and a reprint of André Mellerios' 1898 short book, *La Lithographie originale en couleurs (Original Color Lithography)*, translated by Margaret Needham. Cate provides a short biography of Mellerios who lived from 1862 to 1943.

Cate and Hitchings have tried to build on the work of Mellerios and others "by documenting the early history of the medium as well as the events in commercial and noncommercial color printing which led up to the 1890s and which helped to set the atmosphere which was favorable to color printing; by revealing the vehicles of support which began to emerge in the mid-eighties – the print and poster dealers, color lithographic printers, independent exhibitions, print albums and journals; by indicating the conflicting printmaking aesthetics of the period, and by discussing the variety of stylistic approaches to the medium.

"Finally, as an epilogue to the color revolution, achievement in color lithography by twentieth-century artists in Europe and the United States are discussed. Though original work in color lithography slowed at the turn of the century, the medium has remained an important means of expression for many artists throughout the last seventy-eight years."

**1510.** Cavell, Stanley, ed. *The World Viewed: Reflections on the Ontology of Film*. New York: Viking Press, 1971.

In chapter 13, "The World as a Whole: Color," Cavell talks about specific films -- *Gone With the Wind*, *The Wizard of Oz*, *Vertigo*, *Rosemary's Baby*, among others -- and about how they establish "a world of private fantasy." The consideration of color technology is disappointing.

"The great example of this combination of fantasy and color symbolism is Hitchcock's *Vertigo*," the author writes. "The film establishes the moment of moving from one color space into another as one of moving from one world into another. In *Rosemary's Baby* this is accomplished by showing the modernizing of one apartment in the Dakota building, then moving between its open chic and the darker elegance. An instance in *Vertigo* is James Stewart's opening of a storage-room door -- the whole car-stalking passage leading up to this moment shot in soft washed-out light -- into a florist shop alive with bright flowers, predominantly red. The moment is almost comic in its display of assured virtuosity."

**1511.** Cawelti, John G. "America on Display: The World's Fairs of 1876, 1893, 1933." *The Age of Industrialism in America: Essays on Social Structure and Cultural Values*. Ed. Frederic Cople Jaher, ed. New York: Free Press, 1968. 317-63.

Cawelti argues that world fairs bring together into one setting many innovations and achievement and give insight into how Americans viewed "the unity of their culture." (319) He examines world fairs held in Philadelphia (1876) and Chicago (1893, 1933-34) and argues that these exhibitions reflect changing political and cultural values. "American culture defined itself in traditional political terms in 1876," he writes, "in terms of leadership of a special business-artistic elite in 1893, and as a system of corporate institutions in 1933." (320)

The discussion of the Century of Progress in Chicago in 1933-34 is interesting. Such people as film censorship Joseph Breen and future U.S. president Ronald Reagan attended this world's fair. The author writes that "in 1933, planning meant not only a conscious rejection of the past, but an acceptance of the impermanence and fluidity of the present. The exposition's designers tried to create a flexible, dynamic, and technologically advanced environment that was capable of continuous change and motion and therefore responsive to the

modern imperative of continuous scientific progress and technological development. The future had become the locus of value." (357)

**1512.** Cawkell, A. E. "Forces Controlling the Paperless Revolution." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 244-74.

Offices need to communicate with other offices and sources of information; they are not isolated. The "information revolution" brought innovation in computing, electronics, and telecommunications converge. Cawkell gives a "comprehensive review of the technological forces and social factors shaping the new electronic office information systems," and discusses electronic mail, teleconferencing, and Prestel. It calls for a new type of "sociotechnologists." Some sociologists should be "able to master the technology, and some engineers who are prepared to study the social issues and politics," he writes. This piece originally appeared in *Wireless World* in 1978, in the July and August issues.

**1513.** Cazamian, Louis, ed. *Criticism in the Making*. New York: Macmillan Company, 1929.

Louis Cazamian, who was at the time of this work as professor of English literature at the University of Paris, devotes a chapter (63-80) on "The Method of Discontinuity in Modern Art and Literature." He observes that "in all the arts" there was "a movement away from a need which, whether in the ascendant or not, was always felt and honored: the craving for some sort of continuity in form." (64) The author discusses modern painting (e.g., impressionism and cubism), music, sculpture, literature and psychology (e.g., Joyce's *Ulysses*). He discusses cinema (76-78) and notes its appeal to those people "without the training and refinement of higher culture." (76) The enjoy a film, he says, one need have "only a mood of passiveness; and to such moderate demands, the many were eager to respond." (77) The movie theater provided an "atmosphere in which the principle of literary discontinuity has been able to thrive." (77)

"The spell of discontinuous art, in music, painting, the drama, and writings of all kinds," Cazamian wrote, "works upon us like a hallucination; the intelligence, always exacting and diffident, is set at rest; our senses and imaginations are drowned in the soft-whirling, rippling current of things. A trance seizes our minds and our wills. The audiences in picture palaces know that hypnotic effect well, and are very probably fond of it." (78)

**1514.** Census, U. S. Bureau of the, ed. *Historical Statistics of the United States: Colonial Times to 1957: A Statistical Abstract Supplement*. Washington, D. C.: U. S. Government Printing Office, 1960.

Several categories pertain to communication in this volume. Chapter Q on Transportation, covers railroads, water transit, highways, and air travel. Chapter R, Communications, has data on telephone and telegraphy systems, radio, television, postal service, newspapers and books. Chapter S -- Power -- deals with electrical energy. Chapter W, Productivity and Technological Development, has statistics on copyrights, patents, and research and development.

**1515.** Center for Communication and Social Policy, University of California, Santa Barbara ed., ed. *National Television Violence Study: 2*. Thousand Oaks, CA: Sage Publications, 1998.

This, the second of three volumes, argues that there is a strong consensus in communication research on media effects linking violence on television to real world problems. "While recognizing the complexity in determining the causes of violent behavior," numerous medical and professional associations "have concluded that the mass media bear some responsibility for contributing to real world violence," this national study concluded in 1997. "Viewing media violence is not the only, nor even the most important, contributor to violent behavior." Nor did every violent act shown affect every child or adult who saw it. But "children's exposure to violence in the mass media, particularly at young ages, can have lifelong consequences," this study found. There was "clear evidence that exposure to media violence" contributed significantly to violence in society in at least three ways. First, it

increased aggression toward other because some people imitated what they had learned by watching. Second, it desensitized people, or made them the more callous, to violence toward others. Finally, it elevated people's fear of becoming a victim. These conclusions were "based on careful and critical readings in the social science research collected over the last 40 years." (Quotations from Volume I)

**1516.** ---, ed. *National Television Violence Study: 3*. Thousand Oaks, CA: Sage Publications, 1998.

This, the third of three volumes, argues that there is a strong consensus in communication research on media effects linking violence on television to real world problems. "While recognizing the complexity in determining the causes of violent behavior," numerous medical and professional associations "have concluded that the mass media bear some responsibility for contributing to real world violence," this national study concluded in 1997. "Viewing media violence is not the only, nor even the most important, contributor to violent behavior." Nor did every violent act shown affect every child or adult who saw it. **1518.** Ceplair, Larry & Steven Englund, ed. *The Inquisition in Hollywood: Politics in the Film Community, 1930-1960*. Garden City, NY: Anchor Press/Doubleday, 1980.

The authors note that after the arrival of sound technology in Hollywood, studios had to turn increasingly to screenwriters for their story treatments. While this book does not discuss moviemaking technology per se, it is an excellent treatment of the efforts by writers to use motion pictures for social reform during the Great Depression, World War II and the Cold War. The work is based on substantial research in primary collections and on oral histories.

**1519.** Ceram, C. W., ed. *Archaeology of the Cinema*. London: Thames and Hudson, 1965.

This work deals with the history of cinema up to 1897, and has material on the history of photography in the 19th century. Ceram's purpose "is to make order out of a vast amount of material which has been accumulating for decades: the prehistory and early history of the cinema. What I am really concerned with is the genesis of the cinema as a technique, and my book ends in 1897, the year which saw the birth of the cinema industry." This work is richly illustrated with black and white photographs. It deals with cinema in Europe and Russia, but also deals with Edison and Eastman in the United States.

**1520.** Ceruzzi, Paul. "An Unforeseen Revolution: Computers and Expectations, 1935-1985." *Imagining Tomorrow: History, Technology, and the American Future*. Ed. Joseph J. Corn, ed. Cambridge, MA: MIT Press, 1986. 188-201.

Ceruzzi wrote in 1986 that "there are perhaps half a million large computers in use in America today, 7 or 8 million personal computers, 5 million programmable calculators, and millions of dedicated microprocessors built into other machines of every description.

"The changes these machines are bringing to society are profound, if not revolutionary. And, like many previous revolutions, the computer revolution is happening very quickly. The computer as defined today did not exist in 1950. Before World War II, the word *computer* meant a human being who worked at a desk with a calculating machine, or something built by a physics professor to solve a particular problem,...."

**1521.** Ceruzzi, Paul E. "Moore's Law and Technological Determinism: Reflections on the History of Technology." *Technology and Culture* 46.3 (2005): 584-93.

**1522.** ---, ed. *Reckoners: The Prehistory of the Digital Computer, from Relays to the Stored Program Concept, 1935-1945*. Westport, CT: Greenwood Press, 1983.

Although somewhat technical, this work does have useful information and insights. Chapter 2 deals with "Computers in Germany." Chapter 4 treats computers at Bell Labs, and chapter 5 is on "The ENIAC." Chapter 6 is called "To the First Generation." Chapter 7 (the last chapter) is entitled "The Revolution?"

**1523.** Chafee, Zechariah, Jr., ed. *Government and Mass Communications: A Report from the Commission on Freedom of the Press*. Chicago: University of Chicago Press, 1947.

The Commission on Freedom of the Press, which was made up of several distinguished scholars in addition to Chafee, argued that the "word 'press' should not confine us to newspapers or printed matter generally; the inquiry should include other means of communicating news and opinions such as films and radio broadcasting of news and comment. And 'freedom' must mean more than the traditional conception of immunity from government control."

This work is divided into two volumes. Chafee's Introduction to Volume I is entitled "The Relations of the Government to the Press Today and Tomorrow." This volume considers "Protection of Individual Interests Against Untruthful and Unjustifiable Publications," "Protection of Common Standards of the Community," and "Protection Against Internal Disorder and Interferences with the Operation of Government."

Volume II deals with "Affirmative Governmental Activities for Encouraging the Communication of News and Ideas," and considers: "The Provision of Essential Physical Facilities Accessible to All," "Traffic Regulations," "Applications to the Press of General Legislation," and "The Government as a Party to Communications." An Appendix list the Commission's recommendations and a list of all the Commission's publications is also included.

**1524.** Chamberlain, Stephen C. "Preserving the Present for the Future." *SMPTE Journal* 91.3 (1982): 227-.

Chamberlain is interested in the problems of preserving film and television, sources from which future history can, and should be, written. He writes: "I want to examine the physical record of the process of innovation, and the disposition of those records generated both today and in the future after they cease to have any direct and profitable use." (227) He notes, also, that a March, 1981 editorial in *IEEE's Spectrum*, pointed to this issue as a national problem.

**1525.** Champlin, Charles. "Critic at Large: Lasting Imprint of 'Last Temptation'." *Los Angeles Times* Aug. 16, 1988 1988, sec. 6 (Calendar): 1.

*Los Angeles Times* Arts Editor Charles Champlin writes that the "first and last irony about *The Last Temptation of Christ* is that it is certainly not guilty of blasphemy as charged, but that its honorable and admirable intentions are only intermittently achieved." Champlin offers a favorable portrayal of Martin Scorsese, the film's director.

**1526.** ---. "Critics at Large: MPAA Ratings: A Crisis of Confidence, a System in Disarray." *Los Angeles Times* July 24, 1990 1990, sec. F (Calendar): 3F.

Champlin, a film critic for the *Los Angeles Times*, discusses the criticisms of the motion picture rating system and pressure to adopt a new "adult" rating category, which would become NC-17. Having experts on the rating board such as psychiatrists would be "a nightmare of intrusion in the creative process that would dwarf any of the present cries that the ratings constitute censorship," Champlin writes. The article speculates that legal challenges may result in the ratings being "sued out of existence."

**1527.** ---. "Critics at Large: Scorsese in the Wake of "Temptation"." *Los Angeles Times* Jan. 19, 1989 1989, sec. 6 (Calendar): 1.

In this article, film critic Champlin discusses Martin Scorsese's reaction to attacks on his movie, *The Last Temptation of Christ* (1988), from Christian and other conservative groups. It notes that actress Barbara Hershey had first given Scorsese Niko Kazantzakis' novel on which the movie was based.

**1528.** ---. "Small Screen Takes on the Big Issues -- Again; Show-Biz Star Makers Dazzled by a Luminary from Another Galaxy." *Los Angeles Times* Sept. 17, 1987 1987, sec. 6 (Calendar): 1.

Champlin, a film critic for the *Los Angeles Times*, reports on Pope John Paul II's visit to Los Angeles and his address to members of the entertainment industry. This piece gives a good account of the Pope's views about mass media. The Pope tells his audience that "working constantly with images, you face the temptation of seeing them as reality. Seeking to satisfy the dreams of millions, you can become lost in a world of fantasy."

**1529.** ---. "What Will H. Hays Begat: Fifty Years since His Code Rule Hollywood." *American Film* 6.1 (1980): 42-46, 86, 88.

This is an informative piece on Will H. Hays and the motion picture Production Code. Champlin was a film critic for the *Los Angeles Times*.

**1530.** Chanan, Michael, ed. *Repeated Takes: A Short History of Recording and Its Effects on Music*. London and New York: Verson, 1995.

The author attempts "to provide a general history of the medium from Edison's talking tin foil of 1877 to the age of the compact disc." This work is a "spin-off" of a larger work on Western music, entitled *Musica Practica*.

**1531.** Chandler, Alfred D., Jr., ed. *The Visible Hand: The Managerial Revolution in American Business*. Cambridge, MA: The Belknap Press of Harvard University Press, 1977.

This work, by a major economic historian, has a section entitled "Communication: The Postal Service, Telegraph, and Telephone" in Chapter 6 ("Completing the Infrastructure").

**1532.** Chandler, Russell. "25,000 Gather at Universal to Protest Film." *Los Angeles Times* Aug. 12, 1988 1988, sec. 1: 1.

This article deals with protesters who appeared at the gates of Universal Pictures to protest the movie *The Last Temptation of Christ* (1988).

**1533.** ---. "Protests Aided "Temptation," Foes Concede." *Los Angeles Times* Aug. 14, 1988 1988, sec. 2 (Metro): 1.

This article by the *Los Angeles Times* religion writer is about how protests, especially from religious groups, actually helped the box office for *The Last Temptation of Christ* (1988). The protests generated publicity for a movie that otherwise would have attracted far less attention. Generating publicity, even negative in nature, was often a strategy of studio marketers.

**1534.** Changas, Estelle , and Farber, Stephen. "Insiders Rate Film Code Board as 'Unreformed'." *Los Angeles Times* Aug. 8, 1971 1971, sec. Calendar: 1, 22-25.

The authors were both interns on the Code and Rating Administration (later Classification and Rating Administration). They are critical of the leadership of CARA director, Aaron Stern. They argue that Stern and another board member, Dr. Jacqueline Bouhoutsos, a child psychologist, were repressive. Stern and Bouhoutsos both opposed films about rebellion against the Establishment or movies with the "theme of insurrection," preferring to give them restricted ratings. The repressiveness amounted to making CARA another censorship body. Stern, it should be noted, was a psychiatrist. The authors contend that their psychological theories about the possible damaging effects of movies on children were unproven. However, they warned that psychologists and psychiatrists may well impose controls over movies no less severe than those imposed earlier by the Catholic Church.

**1535.** Charney, Leo and Vanessa R. Schwartz, eds., ed. *Cinema and the Invention of Modern Life*. Berkeley: University of California Press, 1995.

The essays in this volume vary in quality and are divided into four sections. 1) "Bodies and Sensation" contains essays by Tom Gunning, Jonathan Crary, and Ben Singer. "The essays explore such techniques as photography, detective fiction, scientific psychology, Impressionist painting, the mass press, and 'thrilling' entertainments, all of which endeavored to regulate and manage the newly mobilized subject." 2) "Circulation and Consumer Desire" has essays by Marcus Verhagen , Erika Rappaport, Alexandra Keller, and Richard Abel. They "elaborate a culture of market mechanisms that challenged boundaries between private and public spheres and reconstituted gender and national identities. These essays also make clear that cinema participated in but did not create an urban leisure culture that pivoted on women's active participation." 3) "Ephemerality and the Moment" features essays by Margaret Cohen, Jeannene Przyblyski, and Leo Charney. They "suggest that modernity resided in an immersion in the everyday; yet the everyday was, by definition, ephemeral. In response to this problem, such forms as panoramic literature, photography, and film endeavored to freeze fleeting distractions and evanescent sensations by identifying isolated moments in the 'present' experience. In these literary, artistic, and philosophical discourses, the negotiation between ephemerality and stasis emerged as a defining feature of modernity." 4) "Spectacles and Spectators" has essays by Venessa R. Schwartz, Mark Sandberg, and Miriam Bratu Hansen. They "investigate the allure of such diverse phenomena as wax museums, folk museums, amusement parks, and cinema in the development of a mass audience."

These essays identify six elements of "modernity" and ways in which cinema relates to the "modern": 1) "the rise of a metropolitan urban culture leading to new forms of entertainment and leisure activity; [2] the corresponding centrality of the body as the site of vision, attention, and stimulation; [3] the recognition of a mass public, crowd, or audience that subordinated individual response to collectivity; [4] the impulse to define, fix, and represent isolated moments in the face of modernity's distractions and sensations, an urge that led through Impressionism and photography to cinema; [5] the increased blurring or the line between reality and its representations; and [6] the surge in commercial culture and consumer desire that both fueled and followed new forms of diversion."

**1536.** Chatfield-Taylor, H. C. "The 'Movies' Old and New." *The Dial* 59.697 (1915): 17-20.

This article says that during the past 19 years, the movies have become the fifth largest industry in American and that "the motion-picture play -- or the photoplay, as it is technically called, -- far more than the stage play, has become the amusement of the nation." (17) The author goes on to say that "Indeed, the photoplay offers to the

writer his widest means of artistic expression." And, "Better would it be to exclaim: 'I care not who makes the laws of the nation, if I may write its 'movie' plays!'" (17)

Chatfield-Taylor dismisses critics who consider the movies to be only "vulgar clap-trap" for they "know little of the possibilities of this new form of theatrical art. Scarcely eighteen years old, it is only within the last five years -- it might almost be said within the past year, -- that the photoplay has been developed into the multiple reel play, or the feature film, so-called." (18) He then considers the differences in writing a stage play and a photoplay.

The requirements of movie acting differ from those on stage. "The slow, studying actor, whom the stage manager can by patience whip into a part, or the actor who depends upon reading rather than acting for his effects, will fail ignominiously before the camera," the author says. The "actor must possess a face which in the technical language of the 'movie' studio 'registers' effectively; more than one actor who succeeded because of his good looks on the regular stage has failed in the 'movies' because his features do not photograph well." (20)

**1537.** Checkovich, Alex. "Mapping the American Way: Geographical Knowledge and the Development of the United States, 1890-1950." University of Pennsylvania, 2004.

Abstract for this doctoral dissertation is from UMI ProQuest Digital Dissertations: "This dissertation is an environmental history of American cartography. It focuses on a family of applied field scientists who mapped the natural and economic landscapes of their diverse and rapidly developing nation. The geographical knowledge they produced had a dual character. It both facilitated the on-going development of the American landmass, and was itself a concrete development of field scientists' work within particular places, environments, and regions. From 1890 to 1950, a distinctive historical-geographical frontier for this kind of knowledge opened up which the cohort of mappers learned to exploit. The knowledge they created still informs our pictures of American resources, limits, and diversity. The dissertation makes three related historiographical contributions. First, it draws attention to an important kind of fieldwork. Mapping's constitutive practices (traversing, measuring, bounding, classifying) have their own distinctive histories that have gone largely ignored. These practices were in fact career strategies with their own virtues and pitfalls that grew apparent over time and in different places. Second, the dissertation fills a gap in the social history of cartography. Most histories of American cartography focus on the famous expeditions of the nineteenth century, not on the twentieth century's explosion in scientific and commercial maps. Similarly, most focus on maps' aesthetics, not on the environmental and institutional conditions of their production and use. Treating maps as technologies, as specialized social tools with origins in specific physical places, illuminates these neglected themes. Finally, the dissertation makes a contribution to our notions of public works, applied science, and development in general. Numerous spatial transformations unfolded upon American landscapes in this period; road networks, suburbs, airports, and planned regional developments were only a few. Intensive, detailed maps were a crucial component of this historical-geographical package. Indeed, land-use mapping itself evolved as a distinctive form of land use suited to environmental conditions in the post-frontier republic. The knowledge embodied in such maps, while always contingent upon local practices and places, actually played a basic role in the nation's physical and economic development."

**1538.** Chen, Jiunn-Shyong. "The Development of Photography under the Government of Japan in Formosa (Jihchu shichi de Taiwan hsiejan fachang)." Master's Thesis, Catholic Fu-Jen University (Fu-Jen ta hsue), 1995.

Although the history of photography in Taiwan began during the nineteenth century, studies on history and theory of photography in Taiwan are still tenuous. This master thesis seeks to be a history of photography in Taiwan during the Japanese colonization, and attempts to understand how photography (*hsiejan-shiashin*) developed within political, economic, and social perspectives. The study starts with locally published photographic albums as analytical subjects, and then focuses particularly on the work by the Taiwanese photographers. The author finds that during the Japanese colonial period, photographers tended to belong to higher social classes. Many characteristics of contemporary Taiwanese photography have roots in the colonial period, such as collection of photographs by the ruling class and the nature of amateurism. One interesting finding of this study is that the

emergence of salon photography during the Japanese colonial period was due to the escapism from the government's surveillance. Because Japanese photographers residing in Taiwan were sent back to Japan after the second World War, academic or practical photographic techniques during the Japanese colonization gradually disappear. Photography shifted drastically as more photographers arrived from Mainland China, thus creating differences in techniques and aesthetics between the two periods.

**1539.** Chen, Jo-Shui. "A Tentative Discussion of the Application of the Electronic Database of Classical Chinese Texts in the Institute of History and Philology." *Disquisitions of the Past & Present (Ku chin lun heng)* 1 (1998): 53-57.

**1540.** Cheney, Margaret , and Uth, Robert, eds. *Tesla: Master of Lighting*. New York: Barnes & Noble Books, 1999.

This well-illustrated, 173-page work offers a history of Nikola Tesla's life and inventions. It also has a good bibliography (175-78) on Tesla. This book deals with Tesla's work with electricity and other topics such as his attempt to build a particle beam weapon (or death ray) ("A Weapon to End War," the title of Chapter 15).

**1541.** Cherry, Colin, (compiled and edited by William Edmondson), ed. *The Age of Access: Information Technology and Social Revolution Posthumous Papers of Colin Cherry*. London; Dover, NH: Croom Helm, 1985.

Cherry finished only the first three chapters of this work before his death. He argued that "society is currently experiencing a second industrial revolution, consequent upon a widespread adoption of information technology."

Cherry's earlier work included *On Human Communication: A Review, a Survey, and a Criticism* (Cambridge, MA: MIT Press, 1957, 1966).

**1542.** Cherry, Colin. "The Telephone System: Creator of Mobility and Social Change." *The Social Impact of the Telephone*. Ed. Pool, Ithiel de Sola, ed. Cambridge, MA: MIT Press, 1977. 112-26.

Cherry considers how inventions such as the telephone produce change. He wrote that there are rare occasions "in history when, through some remarkable human insight, discovery, creative work, or invention, human life and social institutions take a great leap." Inventions such as the telephone are not in themselves revolutionary, nor do they cause revolutions. "Their powers for change lie in the hands of those who have the imagination and insight to see that the new invention has offered them new liberties of action, that old constraints have been removed, that their political will, or their sheer greed, are no longer frustrated, and that they can act in new ways." The author drew parallels between the early use of the telephone and the computer. Both were at first seen as "adult toys." He noted, though, that person-to-person communication which the telephone enhanced was important to democracy.

**1543.** Cherry, Dick. "The Vietnam War as Filmed by U. S. Air Force Cameramen." *American Cinematographer* 49.9 (1968): 658-61, 706-07.

This article discusses how cameramen were filming the Vietnam War. "Today, the state of the art is nearly as sophisticated as the supersonic airborne weapons systems it serves. To supply 'instant intelligence' on Vietnam missions, for example, color motion pictures shot by Air Force fighter-bombers are being processed in the field." (658) It was possible to produce a print within 45 minutes after a plane returned from a mission. Usually, though, film shot in the morning was available for viewing by commanding officers that evening, and within 24 hours, individual combat pilots could view film shot on their last mission.

This article mentions the "Helivision," "a gyro-mounted camera which eliminates the effect of aircraft vibration during photography." (660) It also discusses the use of a 70mm camera with a rotating prism, used initially for mapping. Formerly film from the 70mm camera took 20 to 30 days to process and was virtually useless for combat situations. Now, a positive print could be made only 40 minutes after technicians in the field get the raw film.

**1544.** Chester, Giraud and Garnet R. Garrison, ed. *Television and Radio: An Introduction*. 1950. New York: Appleton-Century-Crofts, Inc., 1950.

This book is a substantial text aimed at students during the mid-1950s who were interested in radio and television broadcasting. The authors note that when the first edition of the book appeared in 1950, there were 100 television stations broadcasting several hours per day and there were about 5 million sets. By 1956, 450 stations existed, some broadcasting up to 18 hours per day, and there were about 37 million sets. With regard to the technology of radio and television during this era, chapter 16 ("Technical Aspects of Radio") and chapter 17 ("Technical Aspects of Television") are perhaps most useful. These chapters discuss microphones, cameras, radio's relation to the telephone network, color television, recording equipment, transmitters, the studio, and film and slide projectors. The work has a decent, but unannotated bibliography, including a section on "Techniques."

**1545.** Chew, V. K., ed. *Talking Machines 1877-1914: Some aspects of the early history of the gramophone*. London: Her Majesty's Stationery Office, 1967.

This brief, 78-page book, surveys early sound recording.

**1546.** Child, John, Ray Loveridge, Janet Harvey, and Anne Spencer. "The Quality of Employment in Services." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 419-38.

New information technology is rapidly changing jobs in banking, health care, and retailing. This piece was presented to the annual meeting of the British Association for the Advancement of Science, at the University of Sussex, England, in August, 1983, and appeared in the conference's proceedings *New Technology and The Future of Work and Skills* (London: Frances Pinter, 1984).

**1547.** Chisholm, Brad. "Widescreen Technologies." *Velvet Light Trap*. 21 (1985): 67-74.

This article examines the "technological differences between each of the major widescreen processes that were instituted by the Hollywood film industry between 1952 and 1962."

**1548.** Chiu, Chi-Lin. "Photography and Cinema: The Concept of "Reality" and Its Discursive Transformation (Shaying yu Tianyin: Jangshi gainian de luanshu yangbian)." Master's Thesis, Catholic Fu-Jen University (Fu-Jen ta hsue), 1997.

In the beginning, photography and motion picture aimed to record slices of real life. However, as they were developed into the realm of art, the subjects inevitably departed from reality and gradually became incorporated with verbal language. And motion pictures, through editing processes, offered different imagery worlds. This master thesis studies the development of photography and motion pictures. Based on the emergence of different aesthetic theories and ontology, this research searches for the conversation on the concept of "reality" and explores the relationship between these media in terms of theories, technological innovations, and practices. Within the interaction between the two media, this study also attempts to find the conceptual and empirical reciprocity, and then returns to Hastrup's skepticism of the "truthfulness" of imageries.

--Amy Chu

**1549.** Chiu, Chiung-You. "History and Future of Electronic Publishing." *Information Management for Buddhist Libraries (Fochiao tu shu kuan kuan hsun)* 23 (2000): 6-17.

**1550.** Chomsky, Noam, ed. *Necessary Illusions: Thought Control in Democratic Societies*. Boston: South End Press, 1989.

This book, based on a series of lectures by Noam Chomsky, provides an outline of his theories on the press and press manipulation. Chomsky argues that the mass media should be seen as an instrument by which corporate elites manage information, maintain social control, and retain political and economic power. Chomsky believes that the corporate nature of the mass media ensures that they share the same goals and motivation as other powerful corporations. To Chomsky, the government, a far lesser threat to freedom, is an active supporter of the corporate agenda and acts to ensure that business interests are enhanced at home and abroad. These institutions seek to create the “necessary illusion” of democracy, freedom of information, and informed debate. In actuality, none of these exist in any meaningful form.

Chomsky has described a propaganda model of the press in his previous work, and this book offers more discussion and examples of this model in practice. Scholars looking for a fully detailed explanation of the model should read *Manufacturing Consent*. This book, however, includes a series of updated examples of how the media can shape the range of policy debate by avoiding or playing down certain stories, and how almost all coverage of any issue falls within a narrow, pro-corporate domain. Chomsky argues that the corporate press and the state set the terms of discussion and thus limit democratic deliberation.

Chomsky also discusses ways in which certain leaders or groups are cast as “terrorists” or “leftists” if they are opposed to American corporate initiatives. This often misleading or simplistic representation leads to an artificially constructed understanding of foreign policy. This book, and all of Chomsky’s work, provides excellent examples of this process in the Middle East, Vietnam, and Latin America, as well as domestically. Chapter 1 (pp. 1-20) is entitled “Democracy and the Media.”

--Rob Rabe

**1551.** ---, ed. *On Power and Ideology: The Managua Lectures*. Boston: South End Press, 1987.

Chomsky writes that “the basic question reduces to this: To what extent is the United States a democratic society, in which the general population is able to influence public policy? ... One crucial dimension in terms of which one can evaluate the democratic credentials of some political system has to do with the power of the state to coerce its citizens and protect itself from their scrutiny and control, its power to prevent free expression and free association, to maintain state secrets and conduct its affairs without public awareness and influence.”

**1552.** Christensen, F. M., ed. *Pornography: The Other Side*. New York: Praeger, 1990.

*Pornography: The Other Side* is a response to the common, yet myopic view, that pornography is strictly harmful and nothing else. Christensen, at times a critic of experimental pornography research himself, argues that the increasing power of the feminist and moral-right movements have led to stricter regulations on pornography as well as decreasing public sentiment. He also argues that since the decision-makers, such as those leading the 1986 Final Report on Pornography, entered into the fray with their decision in hand, pornography is bad and we must find ways to regulate it. An additional consideration is the shame and guilt that are levied on those that do use pornography. What is missed, according to Christensen, are the potential positive uses of pornography such as stimulation, use in sexual therapy, and as a tool in sexual relationships.

--Michael Boyle

**1553.** Christie, Ian, ed. *The Last Machine: Early Cinema and the Birth of the Modern World*. London: BBC Educational Developments, 1994.

Commissioned by the BBC to celebrate movie making’s centennial in 1996, this work places film in the context of the larger technological revolution taking place during that century. Particularly noted are the changes

in transportation and the extent to which this encouraged immigration and created the immigrant populations that made up the movies' first large group of customers. Christie is particularly interesting in discussing realism in the movies and its relationship to industrialization. When the modern world finally became too complex and obtrusive as a result of industrialization, the movies served as a refuge and helped create a collective fantasy life for the twentieth century.

--Gordon Jackson

**1554.** Chu, Li. "Re-Examination of the Model of 'Communication and National Development'." *Mass Communication Research (Hsinwenhsue yanjiu)* 46 (1992): 111-29.

**1555.** Churchill, Douglas W. "Hollywood's New Color Scheme." *New York Times* Jan. 31, 1937 1937: 159.

This article discusses the Dunning Process, developed by Carroll H. Dunning, for making color motion pictures. It covers how the Dunning Process works and how it differed from Technicolor.

**1556.** Clapperton, Robert Henderson, ed. *Modern Paper-Making*. Oxford: Basil Blackwell, 1952.

This, the third edition of Clapperton's book, covers then recent advances in wood pulp and pulps from other materials in Great Britain, Scandinavia, and North America. The author notes that "quite revolutionary changes in the methods of preparation of paper-stock have also taken place, and new machinery has been introduced, which in some cases has made obsolete the plant which was in use before the war. [World War II] There have also been important improvements in the use of suction-rolls and vacuum transfer on the paper-machines, and very definite improvements in the paper-finishing equipment, such as slitters and cutters. The book's twenty-seven cover such topics as the history of papermaking and the manufacturing of newsprint. This edition has advertisements for different papermaking plants.

**1557.** Clark, Joel P. and Merton C. Flemings. "Advanced Materials and the Economy." *The Materials Revolution: Superconductors, New Materials, and the Japanese Challenge*. Ed. Tom Forester, ed. Cambridge, MA: MIT Press, 1988. 163-78.

The authors, who at the time were at MIT, argue that "materials science sets limits to the rate of economic growth but that advanced materials have the potential to solve basic problems such as the finiteness of nature resources." Computers can make complicated decisions about which materials and production processes should be used, but using advanced materials may pose hazards to the environment and to health. This article originally appears in *Scientific American*, Vol. 255, no. 4 (Oct. 1986).

**1558.** Clark, Kenneth, et al. *Report of MPAA Subcommittee on Self-Regulation*. Dore Schary Papers.

In early 1956, MPAA president Eric Johnston appointed a committee of four studio executive and himself to make suggestions for revising the movie industry's Production Code. The work was farmed out to a subcommittee chaired by Kenneth W. Clark and composed of J. Raymond Bell, Paul J. Quinn, Robert J. Rubin, Sidney Schreiber, and PCA director Geoffrey Shurlock. On Oct. 11, 1955, they made several recommendations for abandoning social taboos that included miscegenation, abortion, drug addiction, prostitution, and kidnapping. They also made recommendation about streamlining the Code's approach to profanity.

**1559.** Clark, Kate Upson. "A Tainted Drama and Press." *The Independent* 48.2506 (1896): 7.

The author offers a dour assessment of both the theater and the press. She begins by talking about a mother who took her daughters to the theater but they had to leave "blushing all over." Then there was another mother who took her 15-year-old boy to the theater. "The play in question was a dream of color and of art, but its

voluptuous beauty could not cover its sensuality." Another lady is quoted as saying that "'it could not fail to leave foul marks upon the soul of every one who listened to it.'"

Clark then takes on French literature and the modern press. First, "it must be remembered that the whole literature of the French is tainted with moral impurity.... To the wholesome Saxon mind, the very idea of the French drama is repugnant. It revels in a heated and noxious atmosphere which sickens our honest nostrils." But French culture has also infected other parts of modern life. "There are lectures and readings and concerts, tho the echoes of French prurience have largely invaded our music also. Amusement, if it cannot be found without debilitating and debasing us, had better be dispensed with," Clark advises. Then there was the press, the "large daily journals." "These papers stand constantly on the very verge of obscenity, and print every day, in blunt English, tales of shame and crime, elaborated to nauseous detail; tales which, from every possible motive, should be untold, or mentioned only in the coldest and briefest manner. The sole effect of these sensational narratives is to corrupt society. Creatures whom decent people never wish to know or to see, are pictured, with their homes, their relatives, their very cats and dogs, in these widely read pages. Their silly or wicked deeds are recited at length under enormous 'scare-type' heads. Unspeakable men and women, most of them fit only for our prisons and reformatories, are thus often made the topics of town talk." Clark says that the "four or five 'great journals'" in American cities "as now conducted" are "powerful engines, deliberately planned to inflame the lowest curiosity and the basest passions of men, in order that the owners themselves may become rich.... But nothing which these scavengers of vice could do can atone for their salacity, and for the manner in which they search out and unfold demoralizing tales of crime...."

**1560.** Clark, Paul F. *Building More Effective Unions*. Ithaca, NY: ILR Press, 2000. 119-22.

Clark provides examples of the use of computer technology, especially, e-mail for union activity. He noted that the United Food and Commercial Workers used e-mail in 1997 to establish communication between workers trying to organize at a Borders bookstore in West Des Moines, Iowa, and workers who successfully organized a store in Chicago. The same union used e-mail in another organizing campaign in Manhattan and set up an Internet web site on how to organize. The International Association of Machinists also used e-mail and a web site to communicate during a United Airlines organizing campaign in 1998. "An increasing number of unions are mounting \_'cybercampaigns' to get information out about, and mobilize support for, their disputes with employers." He noted that the International Federation of Chemical, Energy, Mine, and General Workers used a cybercampaign in a dispute with General Tire, a multinational company based in Germany.

--Phil Glende

**1561.** ---. "Union Image-Building at the Local Level." *Labor Studies Journal* 14.3 (1989): 48-68.

Clark examines the problem for union public image and suggests approaches, activities and materials that can be used in labor education to address labor's image at the local level. For example, for addressing media in shaping labor's image, Clark recommends use of a slide/tape program entitled *Changing Labor's Image: Unions, the Media, and Public Opinion*, produced at Penn State University, and the UAW pamphlet *The Media Business*. He also recommends using real examples of distorted, biased or inaccurate reporting about such issues as strikes to illustrate the importance of mass media image. Clark argues that national unions are working to shape public image but that it rarely occurs on the local level. "It is at this point that union members have the greatest opportunity, through day-to-day contact, to tell labor's side of the story," Clark writes. Suggestions include a public relations committee in the union local, having designated spokesmen, writing letters to the editor, and using cable and public television to reach a local audience.

--Phil Glende

**1562.** Clark, Ronald W., ed. *The Rise of the Boffins*. London: Phoenix House Ltd, 1962.

The term "boffin" refers to scientists who work with the British government during the 1930s, sometimes defined as "a civilian technician who advises air crew and others on specialized subjects." This book deals with the work of scientists in Britain before and during World War II and their impact on policy. It covers early investigations into stories about death ray weapons that might be built for air defense and notes that the Tizard Committee concluded by 1935 it was not possible with the technology that then existed to build such weapons. However, British scientists did believe that radio waves could be used to locate airplanes and this line of research led to the discovery of radar.

**1563.** Clarke, Arthur C., ed. *The Challenge of the Spaceship: Previews of Tomorrow's World*. 1953. New York: Harper & Brothers, 1958.

This interesting work offers insight into how a visionary writer viewed space exploration during the 1950s, before the transistor and computer had entered the equation. For example, Clarke predicted that only atomic energy would be able to carry large payloads outside the earth's gravitational field. He says that scientists will be able to build "radio tubes miles long" if they so desire.

Clarke said that space exploration was one of four great turning points in human history. The first two were the development of agriculture and the harnessing of fire. The third was the splitting of the atom and the release of atomic energy, dating to 1942. Clarke advocated exploration of the planets and beyond. He believed that the spaceship would become "the ultimate toy that may lead mankind from its cloistered nursery out into the playground of the stars."

Clarke thought that the space exploration might affect thought as profoundly as the Copernican revolution in astronomy, Darwinian evolution, and Freudian psychology. He speculated that artificial satellites would make weather prediction much more accurate and perhaps even lead (together with other technologies) to controlling the weather. A global system of satellite television would give any nation a tremendous advantage in imposing their culture on other parts of the world. He believed that it would make "the more extreme forms of nationalism" less likely. "Interplanetary travel is now the only form of 'conquest and empire' compatible with civilization," he wrote.

The book is interesting, too, in giving some measure of how profoundly intellectual life has changed since the 1950s. It reflects an optimistic, no doubt naive, view about atomic energy's potential to replace fossil fuels. Clarke notes that as late as 1947, it was commonly accepted that life could not have formed spontaneously, but rather its appearance needed some "organizing force," perhaps "the hand of God."

Yet Clarke's work is forward looking. He discusses global warming, and the possibility of melting the South Pole, revealing the Antarctic continent and its rich natural resources buried beneath the surface.

The chapter "The Radio Universe" gives a brief and informative account of the development of radio astronomy. Only in 1931 did Jansky discover radio signals coming from outer space in the general direction of the Milky Way. Clarke also discusses how radio astronomy after World War II used surplus radar equipment from the war.

**1564.** ---. "Extra-Terrestrial Relays: Can Rocket Stations Give World-wide Radio Coverage?" *Wireless World* 11.10 (1945): 305-08.

Clarke argued that satellites and space stations would allow world-wide radio and television communication. While "many may consider the solution proposed in this discussion too far-fetched to be taken very seriously," he wrote, "everything envisaged here is a logical extension of developments in the last ten years -- in particular the perfection of the long-range rocket of which V2 was the prototype." He went on to say that "A true broadcast service, giving constant field strength at all times over the whole globe would be invaluable, not to say indispensable, in a world society." Clarke also thought that atomic power would accelerate space exploration.

"The advent of atomic power has at one bound brought space travel half a century nearer. He predicted that atomic powered rockets would be developed in less than two decades, and that they would make exploration of the planets possible. This interesting piece appeared twelve years before Sputnik.

**1565.** ---. "The Mind of the Machine." *Playboy* 15.12 (1968): 116-18, 122, 293-94.

Clarke looks into the not-too-distant future and sees a time when artificial intelligence will likely surpass human intelligence. "Though we have to live and work with (and against) today's mechanical morons, their deficiencies should not blind us to the future. In particular, it should be realized that as soon as the borders of electronic intelligence are passed, there will be a kind of chain reaction, because the machines will rapidly improve themselves. In a very few generations -- *computer* generations, which by this time may last only a few months -- there will be a mental explosion; the merely intelligence machine will swiftly give way to the *ultraintelligent* machine."

Clarke traces fears about intelligence machines back to the late 19th century. In this piece, he also discusses artificial intelligence and automation, noting that machine may alleviate our need to work. He suggest that automation may have created more jobs than it has destroyed. In the future, Clarke predicted that few towns or cities will exist. "Most homes will be completely self-contained and mobile, so that they can move to any spot on Earth within 24 hours." Much of Earth will have reverted to wilderness and "will be much richer in life forms (and much more dangerous) than today." He concludes: "It may be that our role on this planet is not to worship God -- but to create him." And, in keeping with the *Playboy* ethic of the 1960s, "then our work will be done. It will be time to play."

**1566.** ---. "Prediction, realization and forecast." *Communication in the Space Age: The use of satellites by the mass media*. Ed. UNESCO. Paris: Place de Fontenoy, 1968. 30-38.

This essay was prepared in 1965, on the twentieth anniversary of Clarke's "Extra-terrestrial Relays" article (May, 1945). Here Clarke predicts that "low-powered orbital shuttle vehicles" will be available by 1975 to service communication satellites. He also accepts the view that satellites will help lead to a world community. "'Comsats' will end ages of isolation, making us all members of a single family, teaching us to read and speak, however imperfectly, a single language," he says.

Clarke sees the communication satellites as perhaps more of a new historical development than **Wilbur Schramm**, who also has an article in this volume. No group will "be more than a few milliseconds from any other. The social consequences of this, for good or evil, may be as great as those brought about by the printing press or the internal combustion engine." He predicts much letter writing, "teaching English on a global basis," that we shall argue less and sleep less, and that the city will decline. "The traditional role of the city as a meeting-place is coming to an end; Megapolis may soon go the way of the dinosaurs in now resembles in so many respects."

This volume was produced by the United Nations Educational, Scientific and Cultural Organization (UNESCO).

**1567.** ---, ed. *Profiles of the Future: An Inquiry into the Limits of the Possible*. New York: Harper & Row, 1962.

This book first appeared in 1962 and grew out of essays written between 1959 and 1961. Here Clarke speculates about the future, not to "describe *the* future, but to define the boundaries within which possible futures must lie." Clarke predicts planetary landings and personal radios by the 1980s, colonization of the planets and a global library by the first decade of the twentieth-first century, the control of gravity by 2050, and that during the latter part of the twenty-first century, machine intelligence will have exceeded human intelligence. One might compare this work to Ray Kurzweil's later speculations in *The Age of Spiritual Machines* (1999).

**1568.** ---, ed. *Voice Across the Sea*. New York: Harper & Row, 1959.

Arthur C. Clarke (1917-2008) dedicates *Voice Across the Sea* to a vital engineering achievement: the submarine telecommunications cable. The book telling this story is divided into two sections: the first half is a romantic story about communications pioneering, the second half is purely scientific. Clarke's goals are to entertain as much as to instruct. The entertainment part is by far the most interesting, as the author sheds light on unknown but important key figures of the era in which transatlantic communication systems were established by telling little stories and anecdotes that combine into a complete and pleasant to read history of the establishment of worldwide communications systems.

Clarke wrote: "In 1858 a handful of far-sighted men succeeded in laying a telegraph cable across the North Atlantic, and at the closing of a switch the gap between Europe and America dwindled abruptly from a month to a second." (14)

#### **-Bart Nijman**

**1569.** ---, ed. *Voice Across the Sea*. New York: Harper & Row, 1959.

This book was started soon after the laying of the first transatlantic telephone cable in 1956. It not only discusses the laying of cable, but Chapter 25 is about communications satellites, including Telstar. Clarke, also a science fiction writer, says that "technology may be possible without Civilisation; but Civilisation is not possible without Technology."

**1570.** Clarke, Arthur L. "Report of Big Fight at Napal." *Chicago Tribune* Oct. 14, 1899 1899: 1.

This article reports K. L. Dickson is making moving pictures of the Boer War. "Kennedy L. Dickson, who accompanies General Buller to take moving pictures of the battles, is praised by the papers as a hero, and they say he is doing the people a great service in showing just how the troops act under fire." The sub-title of this article reads: "British Troops Said to Have Repulsed the Boers North of Ladysmith. First Blood of the War. Fifteen English Soldiers Believed to Have Been Killed in Attack on Armored Train. Buller To Sail Today."

**1571.** Clarke, I.F., ed. *The Pattern of Expectation*. New York: Basic Books, 1979.

**1572.** ---, ed. *Prophesying War, 1763-1984*. London: Oxford University Press, 1966.

**1573.** Clarke, Joel P., and Frank R. Field III with John V. Busch, Thomas B. King, Barbara Poggiali, and Elaine P. Rothman. "How Critical Are Critical Materials?" *The Materials Revolution: Superconductors, New Materials, and the Japanese Challenge*. Ed. Tom Forester, \_ ed. Cambridge, MA: MIT Press, 1988. 273-86.

The potential shortage of critical materials (e.g., because of disruptions in politically unstable countries) will not shut down American industries and will, in fact, serve as a catalyst to find completely new materials. Ceramics and plastics, the authors believe, have especially promising potential. This piece appeared first in *Technology Review* (Aug.-Sept., 1985).

**1574.** Claxton, Philander P. "The Booklovers of Tomorrow: Teaching Literature." *The Bookman* 52.5 (1921): 326-29.

The movies were here to stay, acknowledged Philander P. Claxton, the United States Commissioner of Education in 1921, and he thought that they could be used by schools to promote the study of great literature. But the "careless contemplation of the screen" must never be allowed to "supplant the thoughtful reading of a book," he said, not "if we are to avoid national deterioration." (326, emphasis in original text) For Claxton, motion pictures could never be more than an aid to stimulate appreciation for great books and they could not inspire the ideals

that came from "the habit of reading good literature." Movies could not replace reading nor should it be allowed to. "The moving-picture can present to the eye only such things as may be seen without its help. The purpose of literature ... is not so much to present facts as it is to interpret life. The moving-pictures themselves need interpretation of the kind that can be given only through words. Most of the attempts to present literature through the film have not been successful," he said. "Moving-pictures, like still pictures, are necessarily particular and concrete. The spoken word moves from the particular and concrete to the general and abstract." (326)

**1575.** Clemmons, C. J. , and Puzanghera, Jim. "How a Ban Changed All." *Newsday* July 7, 1993 1993, sec. Nassau and Suffolk edition: 7.

In January, 1991, the nation's biggest retailer of videos, Blockbuster, announced that it would not carry movies designated for adults only (the chain later considered unrated movies on a case-by-case basis). Pope John Paul II commended this decision. Blockbuster Video grew rapidly during the early 1990s and altered the dynamics of the video rental business. Between early 1991 and mid-1993, its outlets expanded from 1,600 to 3,000. The chain put many local video rental stores out of business. Many of these smaller concerns had carried NC-17 and X-rated films, and as they disappeared from the scene, speciality shops that offered adult rental entertainment moved in to fill the vacuum. By the end of 1992, K-Mart and Walmart had also refused to handle NC-17 films. These two outlets plus Blockbuster accounted for more than half of the video cassette sales in the United States.

**1576.** Cleveland, Harlan. "The Twilight of Hierarchy: Speculations on the Global Information Society." *Information Technologies and Social Transformation*. Ed. Bruce Guile, ed. Washington, D.C.: National Academy Press, 1985. 55-80.

Cleveland examines five hierarchies and how new information technologies may weaken them. These hierarchies include power grounded in control, influence dependent on secrecy, class requiring ownership, privilege gained by early access, and politics grounded in geography. He concludes that the "informatization of society will force dramatic changes in some long-standing hierarchic forms of social organization."

**1577.** Clifford, C. R. "The Relationship of Decoration to the Illuminating Engineering Practice." *Illuminating Engineer* 5.2 (1910): 62-65.

In this article C. R. Clifford discusses the potential for improving the use of color and lighting in decorating the home and also in the theater. He discusses the "Restfulness of Warm-Toned Light" (63) and the "Danger of Overlighting" (63-64) "The home is the theater of life," he says. (64) He comments on the importance of lighting in the theater in the section "Lessons in Lighting to be Learned from the Theatre." (64) "Go to the mimic stage and observe the great work that is done there. No longer does the orchestra give the key to the emotion. We are not aroused to an extra heart beat by the shiver-music of the strings. It is the man with the light, and why? Because the play is always seen by artificial light, and whether the light simulates nature by daylight or moonlight the colorings on the stage are so selected that they are beautiful under the lights used and are not a discordant element, a sacrifice to the demonstrations of illumination." (64)

In a section entitled "Psychology of Light," (64-65) Clifford argues that color has a greater impact on some people than does music. "Chromotherapy is the science based on the effect of colored lights on the human body. For years Schopenhauer, as well as Herbert Spencer, searched for an explanation of the effects of music on the emotions, and yet the effect of color upon the nerves of nervous people is more distinctly shown than the effects of music." (64) He goes on to maintain that "Nature provides vast fields of green because favorable in its effect upon animals," (65) and that some "men of extreme sensibilities exposed to red light show excitement, giving increased muscular development." (65)

Clifford read this paper before the New York Section of the Illuminating Engineering Society on March 17, 1910.

**1578.** Cline, Victor B., ed., ed. *Where Do You Draw the Line? An Exploration into Media Violence, Pornography, and Censorship*. Provo, UT: Brigham Young University Press, 1974.

The article critical of the motion picture industry's rating system and what he believes to be entertainment that is too promiscuous.

**1579.** Clines, Francis X. "Reagan See U.S. Regaining "Moral Bearings"." *New York Times* March 7, 1984 1984, sec. A: 1.

This article deals with President Ronald Reagan speech to the 42d annual meeting of the National Association of Evangelical in Columbus, Ohio and his hopes to combat pornography and secular humanism, and to raise the general level of national morality. Reagan described the 1970s as a time of rampant drug abuse, sexual promiscuity and abortion. "In recent years, we must admit, America did seem to lose her religious and moral bearings," the President said.

**1580.** Cobb, Irvin S. "'How to Act in Movies' Told by Irvin S. Cobb." *New York Times* July 5, 1914 1914, sec. X: 6.

In this article, Cobb gives an account of his experience as a movie actor. Also under this headline, there is a paragraph saying that Woodrow Wilson had seen d'Annunzio's *Cabiria* at the White House and that "the President pronounced it the most remarkable spectacle he had ever seen, and said it seemed almost unbelievable in its magnitude." Wilson said the film "revealed new and wondrous possibilities in motion photography as a real art."

**1581.** Cobbe, Frances Power. "The Love of Notoriety." *Forum* (1889): 170-79.

This article draws a distinction between fame and notoriety and argues that Americans, much more so than people from Great Britain, are eager to give up their privacy for publicity. The author sees a decline in the classic kind of fame whereby one is recognized for great achievements. In 1890, the poet, politician, or soldier would rarely admit that they sought fame because "to admit that we thirst for fame, and act with a view to winning it, would be to make ourselves the laughing-stock of our contemporaries." (171) Cobbe continues by saying that "Such a change in the common estimate of a once universally-applauded passion is, of itself, noteworthy. It become still more singular when we find, growing up in the vacant place, a bastard-brother sentiment, the love of notoriety, and observe that though no man yet openly avows harboring this last in his breast, multitudes are credited with it both by friends and foes, and not thought much the worse of in consequence. To confess to the ambition for fame would be to fall into mock-heroics and bathos and become the mark of satire. To betray the love of notoriety may be slight vulgar, but readily passes muster as a rather amiable weakness by no means ridiculous, but, on the contrary, possessing many advantage, political and commercial." (171) The author concludes "that men have ceased to avow their desire to be renowned for 'things known to their advantage,' but are not ashamed of being supposed to desire to be renowned for things known to their disadvantage! Notoriety, in short, is fame, *minus* that element of honor and approval of the public conscience which rendered the thirst for it commendable. [emphasis in original text] **Men in our own day, like gluttons, care for the quantity of their celebrity, not, like gourmets, for its quality.**" (172) [my emphasis] Later, the author says that "When we pretend to drop the desire of fame, it is only to fall into the love of notoriety; and of the two there can be no question but that the former is the nobler." (179)

For the British and many old-world Europeans, the idea of giving up privacy for notoriety was repellent. "To the man who inherits the old-world sentiments (or prejudices, whichever we may call them) in favor of privacy, it is impossible that notoriety, even of the most favorable kind, should not bring with it a sense of violence of the *benséances*, of being 'rubbed the wrong way,' of derogation of dignity, almost such as is felt by the poor inmate of an Eastern *zenana* [emphasis in original text] when brought unveiled into the street. **On the other hand, a man or woman brought up with the sense of publicity, for instance, a person connected with the stage, generally accepts any amount of notoriety without roughening a hair.**" (174) [my emphasis]

The author believes there were national differences in attitudes toward publicity. "The difference extend to nations. On no subject do English and American tastes differ more widely than on the pains and pleasures of publicity. The average Englishman, from the highest to the lowest, entertains a profound conviction that privacy is an invaluable privilege for which it is quite worth while to barter, as regards his abode and grounds, light, air, and beauty; and as regards his domestic circle, all the intellectual pleasures of varied society." (174) Cobbe says that "Until the rise of the pestilent 'society papers' in London, no public journal described the homes, furniture, the dress, or the habits of eminent men and women,...." (174) (with the possible exception of the *Morning Post*). By contrast, **"the invasion of a man's privacy, so far from being held to constitute an affront, is rather felt in America to involve a compliment."** (175) [my emphasis] In the United States, "That anybody, young or old, male or female, should entertain an objection to being 'interviewed,' and described at length as to height, weight, complexion, features, dress, voice, manners, and habits, for the benefit of the world at large, or that he or she should shrink from seeing his or her parents, husband, wife, 175/176 brother, sister, son, or daughter exposed in a similar pillory, is an idea which seems never to occur to the contemporary American mind. On the contrary, an impression obviously prevails that to draw a man's portrait in pen and ink, even if it be a caricature, is a tribute of respect which ought to be accepted with gratitude." (175-76) In America, the public loves to hear about the notorious person; **"there exists in the great Republic an all-pervading hunger for elaborate descriptions of human being, great, small, and mediocre, which has no counterpart in the British soul."** (176) [my emphasis] Cobbe says that **"It is the interest in nobodies, in men, women, and children whose achievements, if any, are of a wholly insignificant kind, which is so remarkable among Americans."** (177) [my emphasis]

The author says that there is a connection between attitudes toward privacy and notoriety. "It would lead us too far to attempt to fathom the sources of these correlated sentiments, the indifference to privacy, and the excessive interest in people, which together combine to make the love of notoriety more prominent in America than it is, as yet, in England. A great deal of kindness and genuine human sympathy must assuredly be at the bottom of both sentiments. We attach much importance to privacy only when we have a certain shy mistrust of our fellow-creatures *en masse*. And, ... we can scarcely interest ourselves in ordinary people, unless we are richly endowed with sympathy and warm with the sense of human brotherhood. The manifestations of these feelings may be foolish or absurd or vulgar, but at the root they must be better and more wholesome than exclusiveness or indifference." (178)

If the love notoriety is to be good, it "must be the desire of notoriety for some excellence or bravery." (179) But the pursuit of a notoriety which little more than "the thirst for the applause of fools and scoundrels ... is a weakness deserving, not of the indulgence it commonly receives, but of contempt. (179)

**1582.** Cobbett, W. J. "Personal Magnetism." *The Phrenological Journal and Science of Health* 113.1 (1902): 3-6.

This article attempts to explain what accounts for personal magnetism, a vague and ill-defined term. "Many and varied are the artificial means advertised whereby this enviable acquisition may be cultivated. It has been explained in many ways." (3) Cobbett offers five qualities. 1) "Great individual size or capacity ever attracts," he says. (4) So, too, does "large intellectual capacity: A large head, accompanied by a physiognomy expressing intellect, will, and balanced feelings...." (4) That "commands respect." (4) Cobbett comments on the eyes and facial features: "Intensity: High quality of organism and intellectual acuteness. Another individual, whose intelligent eye and thoughtful face many solicit a second glance, seems to possess but little power of attraction under ordinary circumstances. Yet in conversation and in certain situations his keen judgment, refined eloquence, lofty ideals, raise him in the estimation of those who thus become acquainted with him, and he soon exercises a magnetic influence over them." (5) Other qualities include: 4) "Harmony: A healthy, active organism with sentiments, feelings, and intellect, in harmonious activity." (5) And, 5) "Facility of function producing special talents...." (5) "High quality of personal magnetism ... obviously seems to depend upon the amount of energy conserved in the individual." (5)

**1583.** Cochrun, Crete M. "Cashing In On Color." *Printers' Ink* 140.11 (1927): 150, 153-54.

This article argues that "color is the sex appeal of business" and that "there is hardly a product which sells to the general consuming public that cannot be sold more extensively with the aid of color." (150)

**1584.** Cockburn, Alexander. "Violence Has Become the Pornography of the '80s." *Wall Street Journal* June 19, 1986 1986, sec. 1: 31.

This article notes a growing "militaristic spirit" in America and contrasts the Ronald Reagan's administration attack on pornography with its lack of a similar program against rising levels of violence in society.

**1585.** Cockerill, John A. "Some Phases of Contemporary Journalism." *Cosmopolitan* 13.6 (1892): 695-703.

Cockerill touches on a range of topics in this article. He says that "the most shocking thing about news, it seems to me, is the absolute lack of respect for privacy and decency which must attend its gathering." Despite all the marvelous technical advances in newspapers, it is "astounding" that one "should find nothing more worthy of presentation to the eye of the thoughtful man or woman than the most recent divorce, the most painful death, the most disgusting elopement that can be heard of by fair means or foul...." (697)

Cockerill goes on to say that "'Give the people what they want, and that, too, the very worst of it,'" seems to be "the guiding principle -- if that be so called which is the abnegation of all principle -- of sensational journalism." (698)

Cockerill worried about the growth of illustrated journalism. "Perhaps the most salient phase of contemporary journalism, to the non-expert view, is its illustration. The future of newspaper illustration is a grave problem. It is difficult to see how the better Sunday newspapers can very much more nearly approximate to weekly magazines, and yet there is every reason to believe that cheaper paper and more perfect mechanical processes will render them even more perfect in detail and appearance. **I once heard a millionaire non-resident newspaper owner say: 'Any picture is better than no picture.' If one thinks of what this means, it is easy to see. Just as the sign language and picture alphabet appeal more cogently to the savage mind than any written characters can, so the picture on the front page of a newspaper, which is so folded as to best display that picture, not only catches the eye of the casual observer and buyer, but assists the reader's imagination and excites his curiosity.** [my emphasis] News stand illustration is, indeed, a part of the newspaper business, just as big headlines are. The most attractive picture must be put on the upper fold of the first page, in order to serve its purpose as an advertisement to purchasers at the news stands. A casual comparison of such pictures, as the papers lies on the stands, all the pictures representing the same event or person -- say a prominent criminal who, of course, furnishes the most desirable subject matter of a newspaper illustration, provided the crime is still fresh -- is only necessary to create at once the impression that uniformity in pictures of the same person or thing -- in other words, pictorial veracity -- is absolutely unessential. Five great morning dailies may each have a picture of 'Jack the Ripper,' caught red-handed over one of his victims, and each of the five will represent the wretch in a different costume, with different weapons, of different sizes, different in personal appearance, with different features and widely divergent expressions of animal ferocity. What serious moral or public good can be accomplished by such illustration as this?" (701)

**1586.** Codel, Martin, ed., ed. *Radio and Its Future*. New York: Harper & Brothers, 1930.

Although radio was still in its infancy in 1930, Lee DeForest notes in his essay on "The Future of Radio" in this volume that already there were 600 stations broadcasting to about 50 million Americans, in addition to many daily shortwave broadcasts from around the world.

This volume contains 29 essays divided, somewhat arbitrarily, among five broad themes: Broadcasting, Communications, Industry, Regulation, and Some Scientific and Other Considerations. In addition to DeForest, other contributors include: Martin Codel ("The Radio Structure"), William S. Paley ("Radio and Entertainment"), Major General James G. Harbord ("Radio in World Communications"), E. H. Colpitts ("Radiotelephony"), David

Sarnoff ("Art and Industry"), and more. Other topics covered include radio in U.S. military and naval communications, short waves, long waves, radio and the law, and television.

**1587.** Coe, Brian, ed. *Cameras: From Daguerreotypes to Instant Pictures*. [New York]: Crown Publishers, Inc., 1978.

This well-illustrated book provides a good introduction to different types of cameras. Its 20 chapters are devoted to such topics as "The Evolution of Photography," "Concealed Cameras," "Magazines and Multiple Images," "Roll-Film Box Cameras," "The 35-mm Camera," "Small and Miniature Cameras," "Stereoscopic Cameras," "Lenses," "Flash Equipment," and more.

**1588.** ---, ed. *The History of Movie Photography*. Westfield, N. J.: Eastview Editions, 1981.

This work, one of several books Coe's has written on photography, examines cinema. The work starts in the eighteenth century and examines shadow plays, the camera obscura, and attempts to provide "illusions of reality." Coe then deals with early photography and attempts by Eadweard Muybridge and others to capture movement. Chapter 4 discusses inventors such as Louis Le Prince, who first explored the possibilities of Eastman's paper roll film, Thomas Edison and the Kinetoscope, William Dickson, and others. Chapter 5 treats early moving pictures projected onto screen, and explains such developments as the Lumière Cinématographe show. Subsequent chapters consider the coming of sound in film, color movies, widescreen cinema and 3-D. The final chapters discuss home movie making and deals with 16 mm, 9.5 mm, and 8 mm photography.

This book is richly illustrated with black and white, and color photographs of camera technology. Although it covers developments from the end of World War II up to the early 1970s, it is strongest on the pre-World War II era. The author provides a brief, half-page bibliography at the end.

**1589.** ---, ed. *Kodak Cameras: The First Hundred Years*. Hove, East Sussex, Great Britain: Hove Foto Books, 1988.

The author was Curator of the Kodak Museum between 1969 and 1985. The Museum was located at the Kodak factory in Harrow, England, and much of the research for this work was done there as well as in the Kodak Research Laboratory Library. The book, however, was not sponsored by either Kodak Limited or by the Eastman Kodak Company. This work builds on earlier chronological lists of Kodak cameras – first by Vic Moyes of the Kodak Patent Department Museum in Rochester and then expanded by Don Ryon and later David Gibson. These early lists concentrated primarily on the United States, but Coe notes that many, sometimes different, Kodak cameras were produced in Great Britain, France, and Germany.

This book is more comprehensive than previous works on Kodak. It concentrates "on the 'mainstream' Kodak and Brownie cameras." It begins with a brief history of George Eastman and the Kodak Company. There follow descriptions and remarks about the many different cameras, each illustrated with a photograph.

**1590.** Coe, Lewis, ed. *The Telegraph: A History of Morse's Invention and Its Predecessors in the United States*. Jefferson, NC: McFarland Press, 1993.

This brief book purports to tell the history of the telegraph's invention in the United States. The author argues that for much of mankind's history people have set up systems to signal others at a distance, and that the telegraph is merely an extension of that process. Coe limits his discussion to inventions and devices constructed in America, only briefly touching upon relevant European technology as a means for comparison or refinement.

Coe notes that both Native Americans and ancient Greeks used fire and smoke signals for long-distance communication. Through a system of pre-arranged codes (one fire, two fires, various puffs of smoke), a few simple ideas could be communicated rapidly to others far away, who in turn transmitted that signal to the next signal watchers. In a matter of minutes a simple message, such as "the enemy is on the march toward us," could be sent by fire signal hundred of miles.

Coe's discussion of pre-telegraph signaling methods includes both the semaphore system and the heliograph. The semaphore system usually employed flags displayed in different positions to communicate messages one letter or idea at a time. In late-eighteenth-century France there was a system of semaphores connected by long chains to facilitate automatic signaling. The semaphore system is still in use in the United States Navy and in other maritime services throughout the world. The heliograph is a way to communicate with small mirrors which reflected sunlight to an observer miles away. This system was employed by the U.S. Army in the nineteenth century.

Coe spends a good deal of the book cataloging the numerous improvements on Morse's invention. He provides some detail about the introduction of Thomas Edison's quadruplex telegraph, a device which made it possible to send four messages over the same line simultaneously. Coe spends the better part of two chapters examining the role of the telegraph in the Civil War, relating the exciting story of telegraph-tappers and other special telegraph units. Coe argues that the U.S. telegraph system was much more advanced than that in Europe, something the American signal corps found out upon arrival in France in 1917.

Although this book contains valuable information and fascinating tidbits, from a historian's standpoint it is a problematic book. Coe offers no citations for the many quotations he uses. He overuses block quotes, tossing them in liberally without any introduction or explanation. He reproduces conversations and relays anecdotes as if he heard them himself, an impossibility for someone publishing in 1993. Coe's bibliography is brief and mostly unhelpful for someone interested in tracking references.

In addition to the lack of citations or useable references, the writing itself detracts from the author's presentation. Although the major figures in this book are given some biographical detail in an appendix, Coe introduces many other names without any biographical information at all. This book is poorly written, with awkward sentences, misplaced punctuation and a confusing narrative. In places it reads like a high school history text. Coe states the obvious too much frequently— e.g., "during the Morse era, there were no cassette tape recorders."

This book is of value to students of the telegraph or mass communications, although not a definitive study.

**1591.** Coe, Richard L. "Senator Smith Vs. Violence in Films." *Washington Post* Feb. 4, 1968 1968.

This article covers Maine Senator Margaret Chase Smith's criticism of motion pictures which she believed had become too sexually explicit and violent. In June, 1968, Smith chair a brief Senate hearing on movie classification. A clipping of this article can be found in the Margaret Chase Smith Papers, Margaret Chase Smith Library, The Northwood Institute, Skowhegan, ME.

**1592.** Cohen, Allen. "The *San Francisco Oracle*: A Brief History." *Serials Review* 16.1 (1990): 13-46.

The author was the founder and editor of the *San Francisco Oracle*. In addition to discussing the history and content of this paper, Cohen also recalls how the paper experimented with color. The *Oracle*, like other underground paper during the 1960s, made novel use of color. The *Oracle* avoided color in its advertising but experimented with it to highlight artwork, poems and articles. The editors hoped the paper would be "an agent of mind expansion" (for some readers, the design reminded them of taking drugs), and changed to a bigger printer to expand the application of color, using "the presses like a paint brush" to create "a rainbow newspaper."

**1593.** Cohen, Liz, ed. *Making a New Deal: Industrial Workers in Chicago, 1919-1939*. Cambridge, Eng.: Cambridge University Press, 1990.

Cohen devotes some space (pp. 129-43 and 324-46) to discussing radio and labor. He argues that the rise of radio provided a common, unifying experience for ethnic laborers in Chicago and that this "common ground" was an important factor in the development of unionism. By the 1930s, the CIO unions recognized the importance of unity and attempted to use radio to reach workers with a union message. Before the networks, "all radio programming was local, and radio consequently brought familiar distractions into the homes of Chicago's workers: talk, ethnic nationality hours, labor news, church services, and vaudeville-type musical entertainment by hometown, often ethnic talent. ... Workers discovered that participating in radio, as in mass consumption and the movies, did not require repudiation of established social identities." The growth of radio required financing, and the introduction of advertising led to the creation of networks that could deliver mass audiences. This mass working-class audience shared a common experience that broke down ethnic, racial and geographic boundaries, Cohen argued. "Workers in the 1930s were more likely to share a cultural world, to see the same movies and newsreels in the same chain theaters, shop for the same items in the same chain stores, and listen to the same radio shows on network radio. ... Radio, probably more than any other medium, contributed to an increasingly universal working-class experience." As workers listened to the same programs, they shared an experience that transcended job differences on the shop floor and neighborhood differences off the job. The radio, according to Cohen, made workers feel they were part of a national culture, which helped to establish unionism between plants in isolated cities. "In sum, rank-and-file workers were communicating better in their work groups and factories and feeling more akin to each other within Chicago and across the nation." According to Cohen, the CIO attempted to build on the common experience that radio and other mass culture experiences provided to "cultivate a culture of unity among the rank and file of America's factories."

**1594.** Cohen, Mary Morley. "Forgotten Audiences in the Passion Pits: Drive-in Theatres and Changing Spectator Practices in Post-War America." *Film History* 6.4 (1994): 470-86.

The drive-in, a postwar novelty, combined movies with privacy, transforming the "motor car into a private theater box." Religious leaders and the League of Women Voters condemned drive-ins as "passion pits" during the late 1940s, and studios were initially reluctant to rent first-run films to them. Drive-ins were places where many different types of people went, including those of varied economic backgrounds and people with disabilities.

**1595.** Cohen, Richard. "Pornography: The "Causal Link" [Op-Ed]." *Washington Post* June 3, 1986 1986: 19A.

This Op-Ed piece questions the assertion made by the majority of Meese Commission members that there was a causal link between pornography and asocial, if not outright criminal, behavior. The Commission's conclusion, "more a wish than a scientific finding, was a foregone conclusion," Cohen writes.

**1596.** ---. "Soft-Core Hypocrisy." *Washington Post* March 22, 1986 1986, sec. A: A27.

In the Op-Ed piece, Cohen criticized the hypocrisy involved in the effort to have 7-Eleven stores remove *Penthouse* from its shelves. He notes that the most recent issue of the magazine runs an excerpt from a book by conservative William F. Buckley.

**1597.** Cole, Gordon H. "The Union's Public Relations." *The House of Labor: Internal Operations of American Unions*. Ed. J. B. S. Hardman and Maurice F. Neufeld, eds. Englewood Cliffs, NJ; Westport, CT: Prentice Hall; Greenwood Press, 1970. 205-08.

Cole argues that union leaders must work to generate favorable news coverage on the radio and in print. "If we are going to get our story to our neighbors outside the labor movement, we must aim at the newspapers and the magazines they read and the radio stations they listen to." Cole, editor of the weekly publication of the International Association of Machinists, noted that labor unions could not afford to compete with management interests through advertising. Union officials must work to "aim our story at the news and feature columns and the

special events broadcasts." Good public relations, he argued, requires labor unions to have good contacts with newspaper and radio reporters. "A union's chance for favorable publicity can be improved by personal contact between union officers and the editor." He urged union public relations officials to work to get positive stories about labor into the paper and on the radio. "As many union leaders have learned, it isn't only what you do that counts, but what people *think* you're doing."

Collini devotes a few pages to "the micro-electronic revolution" which has taken place since Snow wrote and lectured. Snow's lectures originally were published in 1959, and has been reprinted several times.

**1601.** Collins, Frederick. "'Heroes by Any Other Name'." *New York Times* Oct. 2, 1921 1921: 8, 25.

This article seems to be a tongue-in-cheek reflection on the nature of modern heroes in 1921. "Think most people are hero worshippers, don't you? Only nowadays they do not pick their heroes from the ranks of soldiers and Senators. Five years of war gave us no outstanding figure, but one year of peace gave us Babe Ruth? Foch merely saved the world. The Babe has founded a legend. His is the fame of Ulysses and Charlemagne and Chaplin. His deeds will be told from father to son. His place in history is secure. He's a hero.

"...My sister Minnie, with whom I live in New Rochelle, doesn't agree with me. She says John Barrymore is the greatest American. Minnie is one of those people there seems to be thousands of them who are quite without shame in their attitude toward the people on the bright side of the footlights...." 8/25?

"...Thus is hero worship spread from Broadway to Main Street.

"But it wasn't until they found a way of putting up heroes in cans and shipping them all over the world that the truly universal character of this emotion was thoroughly demonstrated...."

"... Several fat men with bald spots may think they had something to do with the popular success of the motion picture, but it was little Mary [Pickford?] the first of the celluloid heroines projecting her personality from the silver screen to the public heart that first institutionalized the movies by giving the world a new thing to worship. She and her contemporaries have made a permanent place for the screen by bringing hero worship within the

reach of all. They may not have cornered heroism, but they certainly have trade-marked it. The movie has revived the Heroic Age and made it pay!"

This is list as starting on page 47 (APS Online) although the copy indicates pages 8 and 25 in the original paper/

**1602.** Collins, Francis A., ed. *The Camera Man: His Adventures in Many Fields, With Practical Suggestions for the Amateur*. New York: The Century Co., 1916.

This book's sixteen chapters deal with a number of interesting topics. Chapters are devoted to "War Stuff," "Aero-Photography," "The News Photographer," "Motion News Pictures," "Commercial Photography," "Government Work," "Scientific Research," "Travel and Adventure," and "The Future."

This work says that by 1919 "Actual moving pictures of events of public interest may be seen in the motion - picture theaters almost as quickly as the news itself can be reported and printed in the newspapers." (82)

It also predicts that "in a few years the transmission of photographs by wireless electricity, even across the Atlantic Ocean, will probably be a commonplace. An actual photograph taken in London or Paris of some important news event will be transmitted by this unseen force and appear in the newspapers in American within a few hours. We will have a wireless telegraph picture service just as to-day the cable service knits the entire world so closely together. In other words, the camera man will in effect enable us to see across the Atlantic, or to the furthestmost corners of the world." (226)

**1603.** Collins, Glenn. "Guidance or Censorship? New Debate on Rating Films." *New York Times* April 9, 1990 1990, sec. C: 11C.

Film makers were unhappy in 1990 that no rating existed for serious adult films that were not pornographic. The uncensored X, originally designed for such adult pictures (e.g., *Midnight Cowboy* and *Last Tango in Paris*), had become synonymous with the hard-core industry. To be X-rated, or unclassified, had several drawbacks. Many newspapers would not take advertising for such movies. It meant being excluded from desirable theater locations because some theater chains would not play X-rated films, and many malls had real estate contracts that prohibited their showing. Television stations often would not carry such entertainment. All this amounted to economic coercion and it was nothing less than censorship, movie makers complained. This article runs about 2,300 words.

**1604.** ---. "Judge to Rule in July on X Rating for 'Tie Me Up!'" *New York Times* June 22, 1990 1990, sec. C: 4C.

This article deals with the suit challenging the X-rating given to the movie *Tie Me Up! Tie Me Down!* (1990).

**1605.** ---. "Judge Upholds X Rating for Almodovar Film." *New York Times* July 20, 1990 1990, sec. C: 12C.

This article deals with the suit challenging the X-rating given to the movie *Tie Me Up! Tie Me Down!* (1990). The Motion Picture Association of America found Judge Charles E. Ramos's ruling troubling. Although he upheld the X rating and agreed that Miramax had brought the suit, in part, to gain publicity, he questioned the system's integrity. The ratings amounted to "censorship from within the industry" and they failed to shield children from inappropriate images. "The industry that profits from scenes of mass murder, dismemberment and the portrayal of war as noble and glamorous apparently has no interest in the opinions of professionals, only the opinions of its consumers," the judge concluded. He criticized the lack of medical and psychiatric professionals to advise CARA. The MPAA's more lenient approach toward violence was inexcusable, and he urged the industry either to revise the system or to abandon it. Ramos did not rule out future legal challenges. "My hands were tied," he remarked after releasing the opinion, "but I left open the door ... for a case to be made of discrimination against foreign film makers, or against certain types of film makers."

**1606.** Comer, Edward A., ed. *The Global Political Economy of Communication: Hegemony, Telecommunications and the Information Economy*. New York: St. Martin's Press, 1994.

This volume is a collection of essays by political scientists and economists about the deployment of new communication technologies and international political economy (IPE). Contributors see recent developments as but "the latest manifestation of a much older pattern. For a century and a half -- at least since the perfection of the electrical telegraph -- technology has promised the abolition of distance and the globalisation of everyday life. Twice before -- in 1865 with the creation of the International Telegraph Union and in 1906 with the creation of the Radiotelegraphy Union -- international agreement to encourage and then to regulate new international communication technologies have marked the beginning of generation-long conflicts over the boundaries of new, larger (but certainly less-than-global) economic orders....

"Perhaps some future historian will look back on the creation of the International Telecommunication Satellite Organisation (Intelsat) in the mid-1960s not only as the beginning of a third generation-long conflict over the shape of the global economic order, but as the vanguard of the globalised, co-operative world order that actually may take shape in the 1990s. But, right now at least, the communication revolution of which Intelsat was part looks more like a harbinger of world disorder and a real contributor to today's global uncertainties." (from Craig N. Murphy's Foreword)

Essays include: Comer's "Introduction: The Global Political Economy of Communication and IPE"; Ian C. Parker, "Myth, Telecommunication and the Emerging Global Informational Order: The Political Economy of Transitions"; Martin Hewson, "Surveillance and the Global Political Economy"; Adam Jones, "Wired World: Communications Technology, Governance and the Democratic Uprising"; and James D. Halloran, "Developments in Communication and Democracy: The Contribution of Research."

**1607.** Commager, Henry Steele, ed. *The American Mind: An Interpretation of American Thought and Character since the 1880s*. New Haven: Yale University Press, 1950.

This well-known intellectual history of American thought is extraordinarily well-written. Commager was not writing a history of technology per se, but he does consider the major changes in the currents of American thought. He saw the 1890s, for example, as a watershed. Such developments were made possible by the great technological changes brought by the Industrial Revolution which made possible the expansion of newspapers and magazines. This work provides context to the changing technological landscape in the United States during the late nineteenth and first half of the twentieth century.

**1608.** Comments, "Spectator's". "The Motion Picture Field." *New York Dramatic Mirror* May 14, 1910 1910: 18.

This article discusses the hypnotic or magnetic power that moving pictures seem to have on their audiences. "It is the opinion of the 'The Spectator' that every individual connected with the production or exhibition of motion pictures should consider carefully the thought presented last week in this column, vis.; that the strange power of attraction possessed by motion pictures lies in the semblance of reality which the pictures convey; that by means of this impression of reality the motion picture exerts on the minds of the spectators an influence akin to hypnotism or magnetism by visual suggestion; that this sort of limited hypnotic influence is capable of more powerful exertion through the medium of motion pictures than is possible in any sort of stage production or in printed fact or fiction, and that it is therefore the part of wisdom to cultivate absolute realism in every department of the motion picture art. Artificial drama and artificial comedy appeal to have no attraction for the public mind when displayed in motion pictures, no matter how satisfactory they may be on the stage or in printed literature."

This article offers advice about how actors can appear more realistic. Don't face the camera or let on that you know you are being filmed. Advice for actors not to play to the "front": "Realism being the chief end of motion picture acting and directing, just as probability is the thing most to be desired in framing the original story, we may now turn to some of the details. The most conspicuous offense committed by motion picture producers and

players against this quality of reality is the tendency that nearly all of them have at times to play to the front, thus betraying unconsciously that they know they are being pictured, and giving the impression to the spectators that they are going through their parts before an audience which is not seen in the picture but which appears to be located in front of the scene. The arrangement of interiors almost invariably accentuates this impression. The chairs almost always face the camera, sometimes reminding one of a minstrel first act. The actor almost always sits at a table sideways so that he can show his full face front. Sometimes he will seat himself with his back squarely to the table located behind his chair while he faces the camera trying to eat, write or talk by occasionally twisting his neck and body into unnatural positions. Two people conversing will deliberately walk down front and instead of facing each other as in real life will face the camera, turning only occasionally to look at the person addressed. An entire room full of people may be seen facing front we see nothing but a sea of white faces with never a back or side view.

“Many actors and directors will contend that it is necessary to get the facial expressions over to the spectators and that this continual and monotonous facing front is there unavoidable. How weak this contention is must be apparent after a moment’s thought. When the movement or attitude of the player is obviously unnatural in turning his face toward the camera he betrays by the act the fact that he is acting that there is some one in front unseen by the spectators to whom the actor is addressing himself. Immediately the sense of reality is destroyed and the hypnotic illusion that has taken possession of the spectator’s mind, holding him by the power of visual suggestion, is gone. It is as if the hypnotist were to snap his finger in the face of the subject and say ‘[Light!?’] The motion picture spectator does not realize and analyze this shock, but he experiences it, and the subtle charm of the picture action is weakened. It therefore follows, and this writer advances it as fundamental, that no player should face the front except when his movements and attitudes may be made to appear to consistently permit it. Be natural above all things, and it will be found that the face may be presented to the front quite frequently enough for all real purposes of perfect expression.”

“There are other ways to convey expression than by making faces to the front. Side views should be just as expressive when the situations call for them. Even the back may be eloquent if the actor knows his business. Indeed, the player who can only express his emotions by contortions of the face is no real picture player at all, and he should get out of the profession....”

**1609.** ---. "The Motion Picture Field." *New York Dramatic Mirror* June 18, 1910 1910: 17.

This article answers newspapers that denounced “the way the common people continue blindly and ignorantly to attend these ‘vicious,’ ‘degrading,’ ‘demoralizing,’ ‘hell holes,’ and ‘dens of iniquity,’ especially in face of the repeated warnings of certain good clergymen and jurists, ably assisted by those great moral agents, the cub reporters....

“The whole evil of the motion picture, therefore, lies in its cheapness. They are so cheap that people flock to see them. That is the real curse and no other. Pay \$2 on Broadway and you could see Maud Odell stark naked or the Duncan woman and a score of others nearly so, and you can hear nasty jokes that will make your face burn red for a week, but pay 5 or 10 cents to see a picture show of Pippa Passes or the Life of Moses and you’re eternally damned by the cub reporters for the daily press.”

**1610.** ---. "The Motion Picture Field." *New York Dramatic Mirror* May 28, 1910 1910: 20.

This article offers advice to actors to act natural and not look directly at the camera. “The tendency to be theatrical is perhaps the most difficult thing the stage player has to overcome in working before the camera. Formerly nearly all picture players raved and posed on all occasions, ... The remedy lies in the simple rule already laid down in this discussion: Be natural! ....

....

“To make a picture appear real every detail should be carefully watched, not alone in the manner of the acting but also in the properties and settings, and in the general directing of the scene....

“...Too many people know that picture shows are not ‘hell holes,’ as one clergyman called them, nor are they ‘the principle cause for young people going astray,’ as a city magistrate alleges....”

**1611.** Comments, "Spectator's". "The Motion Picture Field." *New York Dramatic Mirror* June 25, 1910 1910: 17.

This article gives advice on how actors can project realism control eyes and not let on that you know that you are being observed. “Another word about this business of actors playing to the front, since the matter of realism is again under discussion. Improvement can be discovered in the work of nearly all film makers in this respect, especially since *The Mirror* in this department has taken the matter up for treatment. But there is great room for still further improvement. Not until the motion picture players learn to make their eyes behave entirely will the fault be even measurably eliminated. And making a player’s eyes behave is a difficult matter, beyond doubt. This Spectator has in mind an excellent picture of recent issue that was marred by the leading lady’s frequent tendency to glance momentarily toward the camera, as if she knew there was an audience in front. The situation in the picture did not suppose any such audience to exist. No motion picture drama or straight comedy supposes an unseen audience to be located out in front looking at the action. We, the spectators, are not a part of the picture, nor is there supposed to be a camera there making a motion photograph of the scene. And yet this young actress, and many others like her, male and female, just can’t make their eyes behave. Many of them try, but few succeed.

“...Let the motion picture players endeavor to imagine themselves out in front looking on and then ask themselves this question: Are we making this action appear like reality or are we betraying by the slightest glance or movement the fact that we are actors, and that we know we are being observed?”

**1612.** Comments, "Spectator's". "The Motion Picture Field." *New York Dramatic Mirror* April 9, 1910 1910: 17.

This article comments on the importance of having a "big idea" in making a compelling motion pictures. “Second, we may inquire how one may be able to decide on the qualities necessary to the popularity of the individual film, and it is here that we come to the meat of this entire matter.... Let us call it the big idea not commonplace or trivial, but novel or unusual and always logical, telling a story that make a lasting impression. Therefore it follows that the first essential is the big or unusual logical idea....”

**1613.** ---. "The Motion Picture Field." *New York Dramatic Mirror* May 7, 1910 1910: 18.

This article discusses how moving picture acting differs from the live stage and the importance of projecting realism before the camera. “The picture play also differs from the stage play in this: There is no hint of footlights, nor an audience, nor even outside spectators. This writer has before now pointed out this fact as constituting one of the chief charms of motion pictures and at the risk of tiresome repetition....

“It should therefore be the aim of the picture producer and the picture player to strive all the time to give the impression of reality and to avoid, above all other things, the slightest intimation to the spectator that what he is looking at is not the genuine record of actual events. Any action or situation that betrays to the spectator that the players know they are being looked at destroys or weakens the advantage that has been gained by the illusion of the motion picture. The appreciation of the art value and the psychological influence of the motion picture should encourage producers, players and exhibitors to join in doing their utmost to maintain throughout the element of reality. It is the foundation of motion picture effect the secret of motion picture power. It is the reason why the inanimate reflection on the on the screen appears sometimes to exert personal magnetism on the spectators, like the magnetic actor or speaker. It is, in short, a species of hypnotism by visual suggestion. Then why not make the most of it?”

**1614.** ---. "The Motion Picture Field." *New York Dramatic Mirror* May 21, 1910 1910: 19.

This article, one of a series, gives advice to actors. Don't face the camera, avoid pantomime, and don't talk to yourself on camera. "...The camera must be made to see, as with the eyes of spectators who are to be, all that take place, but that which the camera sees and records should appear truthful and natural and should not bear on its face the stamp of counterfeit. It is no doubt a difficult matter to arrange a scene so that it shall appear to be the real thing and yet permit the camera to record clearly all that occurs, and this is precisely where superior directing and acting comes in. As for facial expression, too much dependence is placed upon it by the average picture player. The face is only one small part of the body, and with a great majority of players when the face is turned toward the front it has about as much real expression as a wooden Indian. Either this or it is distorted into a unnatural grimace that defeats the very purpose of the player.

"... The chief purpose of the good player being to further the impression of reality, he should avoid rather than make use of pantomime, except where pantomime is legitimately called for...."

**1615.** Commission, Chicago Motion Picture, ed. *Report: Chicago Motion Picture Commission*. Chicago: np, 1920.

This Commission emphasized the negative impact that movies had on the education of young people. The report asked why should the community turn over this important function of educating the young to amoral movie makers? The work assumed that movies had a much more powerful effect on children than books. As Carl Roden, Librarian of the Chicago Public Library said: "'We do not approve of putting books out without restriction. We want to feel that the books on the shelves will not harm any one. A film can be absolutely absorbed merely by seeing it. It is probably the easiest way to receive impressions that the world has yet discovered.'" (17)

This work comments on the powerful appeal that movie actors had on children. "Emphasizing the great interest that school children take in the movies, it may be well to give the experiences of Principal Stephenson, of the Lincoln 19/20 Public School, Chicago, during the Liberty Loan Drive. Mr. Stephenson appeared before the Commission, and explained the incident of the visit to his school of Charley [sic] Chaplin, Mary Pickford and Douglas Fairbanks. He said in part:

"I simply marvel at the power of the movies. It was my school which Miss Pickford, Mr. Chaplin and Mr. Fairbanks came to visit last year. You will remember that they "blew in" here and went to a school and spoke to the children. That happened to be the school of which I am principal. I never have in all my life seen the electrical, wonderful grasp that those people had over a school. Why, they seemed to take it right off of our hands. We were nothing when these people came along. Their power was marvelous. It interfered with our studies completely. Everybody was as light as though they had inhaled some laughing gas.'" (19-20)

Speaking of the government's use of film during World War I, the Report says that "No such publicity power has ever been known to the world." (20)

**1616.** Commission, Federal Communications. "The V-Chip: Putting Restrictions on What Your Children Watch". 2002. (April 25, 2002). Nov. 7, 2005. <<http://www.fcc.gov/cgb/consumerfacts/vchip.html>>.

This explanation of the V-chip, and how it works is on the website of the Federal Communications Commission. Congress mandated that new television sets must have the V-chip which allowed parents to block violent or other types of entertainment they felt to be inappropriate for their children. For the V-chip to work, of course, depended on the television industry adopting a rating system to which the V-chip could be calibrated.

**1617.** ---. "V-Chip: Viewing Television Responsibly". 2002. (April 3, 2002). Nov. 7, 2005. <<http://www.fcc.gov/vchip/>>.

The Federal Communications Website explains the V-chip and the television rating system. It discusses the TV Parental Guidelines and the TV Parental Guidelines Monitoring Board.

**1618.** Commission, Federal Trade. "Excepts from the Violence Report." *New York Times* Sept. 12, 2000 2000, sec. A: 24.

These are excerpts from a Federal Trade Commission report that revealed that movie studios, music producers, and video game makers marketed graphically violent entertainment to very young children. Such studios as MGM/United Artists, Columbia TriStar, Disney, frequently targeted children, some as young as 10, for violent, adult-oriented movies, music, and electronic video games, the FTC discovered. They used advertising, comic books, and cartoon programs to reach children. Both President Bill Clinton and Vice President Al Gore threatened to support strong regulatory legislation unless such advertising stopped.

**1620.** ---. "Marketing Violent Entertainment to Children: Self-Regulation and Industry Practices in the Motion Picture, Music Recording, and Electronic Game Industries". 2001. (July 20, 2001). Nov. 7, 2005. <<http://www.ftc.gov/os/2001/07/violencetest.htm>>.

A Federal Trade Commission report that revealed that movie studios, music producers, and video game makers marketed graphically violent entertainment to very young children. Such studios as MGM/United Artists, Columbia TriStar, Disney, frequently targeted children, some as young as 10, for violent, adult-oriented movies, music, and electronic video games, the FTC discovered. They used advertising, comic books, and cartoon programs to reach children. Both President Bill Clinton and Vice President Al Gore threatened to support strong regulatory legislation unless such advertising stopped. These findings were presented to *Hearings Before the Subcommittee on Telecommunications and the Internet, Committee on Energy and Commerce, United States House of Representatives*, Washington, D. C.

**1621.** Committee on Pornography and Prostitution, Department of Justice of Canada, ed. *Pornography and Prostitution in Canada*. Ottawa, Ontario: Communication and Public Affairs, Department of Justice of Canada, 1985.

Due to the increasing concern with pornography at the time, 1983, a Special Committee on Pornography and Prostitution was formed by the Department of Justice of Canada. This committee was similar to the committees formed in the United States (1970 & 1986) in that experts were called on to speak at hearings on the uses and impacts of pornography and prostitution. Of particular concern to this committee was the issue of access to pornographic materials and what the ultimate effects of those materials are. These areas were accentuated in the committees concern with the beginning of the proliferation of video-taped pornography into the general public. The committee puts an emphasis on classification of videos so that users, or potential users, are aware of the content of such videos. Additionally, the committee is against prohibition or censorship of pornographic materials, however, they stress the need to keep these materials out of the hands of minors. This report gives an indication of how the change to video as a viable form of pornographic media acted as a catalyst for much of the discussion and research on pornography.

**1622.** Comolli, Jean-Louis. "Technique and Ideology: Camera, Perspective, Depth of Field." *Movies and Methods: Volume II*. Ed. Nichols, Bill, ed. Vol. 2. Berkeley: University of California Press, 1985. 40-57.

Comolli, a Marxist film theorist and historian, focuses on how film style and technology create and sustain relationships between individual works and society that reflect capitalist ideology. Comolli draws on Louis Althusser's ideas about the nature of ideology. In this essay, Comolli considers how one particular aspect of style, depth of field (the extent to which a filmed image conveys a sense of three-dimensional depth, often by keeping several planes within the image in focus at the same time) has developed throughout history to articulate and reinforce a capitalist worldview. After briefly discussing how film scholars have defined ideology in the cinema, Comolli moves to a historical account of the invention of cinema. He argues that the birth of cinema can be linked to economics more than pure scientific inquiry. Hence, film ideology is largely a matter of the capitalist principles in accordance with which the medium was invented.

**1623.** Compaine, Benjamin. "The New Literacy: Or How I Stopped Worrying and Learned to Love Pac-Man." *Understanding New Media: Trends and Issues in Electronic Distribution of Information*. Ed. Benjamin M. Compaine, ed. Cambridge, MA: Ballinger Publishing Company, 1984. 329-42.

This piece originally appeared in *Daedalus*. Compaine argues that it is likely that "society is on the verge of a new step in the evolution of its concept of literacy. Early indicators of the change are the 7 million people [as of 1984] in the work force who use video display screens attached to computers for reading and interacting with information; the rapid proliferation and use of video games at home and in arcades, and the growing application of personal computers at home and in the schools; and the trend of higher costs for paper and physical delivery contrasted to growing availability and lower costs for electronic delivery of information. Thus the skills required to store, retrieve, and manipulate information using a computer are becoming increasingly requisite proficiencies to be added to the existing bundle of skills we call literacy."

**1624.** Compaine, Benjamin M. "Shifting Boundaries in the Information Marketplace." *Understanding New Media: Trends and Issues in Electronic Distribution of Information*. Ed. Benjamin M. Compaine, ed. Cambridge, MA: Ballinger Publishing Company, 1984.

This piece originally appeared in *An Information Agenda for the 1980s* (pp. 67-89), published by the American Library Association in 1981. According to Compaine, "It describes the need for each of the traditional pieces of this business to refine its role in view of fundamental policy questions raised, including: Who will pay? Who will have access? Who will profit? How will conflicts be resolved?"

**1625.** Compaine, Benjamin M., ed., ed. *Understanding New Media: Trends and Issues in Electronic Distribution of Information*. Cambridge, MA: Ballinger Publishing Company, 1984.

This work contains research reports and papers that Harvard University's Program on Information Resources Policy previously published. The book seeks to help policymakers and strategic planners identify issues and problems that are likely to be most significant during the 1980s. The work is divided into three parts. Part I provides an overview of the information industry. Part II looks at trends and factors influencing information distribution. Part III examines strategic implications of changes that have taken place in media formats and processes. Articles in this part include **William H. Read**, "The First Amendment Meets the Second Revolution"; **Benjamin M. Compaine**, "Videotex and the Newspaper Industry: Threat of Opportunity?"; and **Benjamin F. Compaine**, "The New Literacy: Or How I Stopped Worrying and Learned to Love Pac-Man."

**1626.** Comstock, Anthony, ed. *Traps for the Young*. New York: Funk & Wagnalls, 1884.

This book was written by a man whose name became synonymous with censorship during the late nineteenth and early twentieth centuries. Already by 1884, there was much in modern communication that Comstock feared

would damage children and weaken the morality of adolescents. The work has ten chapters and Comstock devoted chapters to "Household Traps ---- Newspapers" (13-19), "Half-Dime Novels and Story Papers" (20-42), and "Advertisement Traps" (43-55). The newspapers, of course, were filled with stories of crime. The cheap novels traded in romance and violence. As for the ads: "Millions of copies of daily and weekly papers contain tens of thousands of advertisements. Along this great highway of communication the vendors of obscene and infidel publications, the lottery and policy gamblers, the quacks, the frauds, the poolsellers, the liquor-saloon keepers, the managers of low theatres display their fingerboards. Here are thousands upon thousands of traps set to ruin youth and rob the unwary." (43) He goes on to talk about "vile books, papers, novels; and the headquarters of men and women engaging in most shameful practices -- all these and more are posted here with flaming colors." (43)

**1627.** Comstock, Daniel F. , and Troland, Leonard T., eds. *The Nature of Matter and Electricity: An Outline of Modern Views*. New York: D. Van Nostrand Company, 1917.

The 203-page book discusses the state of knowledge about electricity. Readers who are interested in Leonard Troland and his work with Technicolor will find a brief discussion of "Color and the Absorption and Reflection of Light" (157-59). The authors write that "Physics as such offers no explanation of the fact that light of one wave-length gives us a sensation quality almost wholly different from that produced by light from another wave-length. Neither does it account for the fact that a mixture of lights of many different wave-lengths gives white. These are problems in physiology although their solution is, of course, closely connected with the physics of light." (158)

**1628.** Comstock, George A., Eli A. Rubinstein, and John P. Murray (eds.). Rockville, MD: National Institute of Mental Health.

The U. S. Congress funded the Surgeon General's Scientific Advisory Committee on Television and Social Behavior, and, in 1972, the investment yielded a five-volume examination of TV's effects on social learning, adolescent aggressiveness, and daily life. Several of the studies in this report indicated that what children learned from television could be good or bad, and that the effects of this learning could be strongly influenced by parents. The studies showed that even though parents were uneasy about what their children learned from TV, they often failed to provide supervision for even the youngest child. In this, the fifth volume, it is reported that the thrust of research conducted in experimental settings confirmed that "more overt aggressive behavior follows exposure to violent content than to nonviolent content or no content."

**1629.** Comstock, George A., Eli A. Rubinstein , John P. Murray (eds.). Rockville, MD: National Institute of Mental Health.

The U. S. Congress funded the Surgeon General's Scientific Advisory Committee on Television and Social Behavior, and, in 1972, the investment yielded a five-volume examination of TV's effects on social learning, adolescent aggressiveness, and daily life. Several of the studies in this report indicated that what children learned from television could be good or bad, and that the effects of this learning could be strongly influenced by parents. The studies showed that even though parents were uneasy about what their children learned from TV, they often failed to provide supervision for even the youngest child. This is the fourth volume, and it examines how people use television and the role of television in daily life.

**1630.** Conant, Michael, ed. *Antitrust in the Motion Picture Industry: Economic and Legal Analysis*. Berkeley: University of California Press, 1960.

This book provides an analysis of the legal and economic dimensions of antitrust problems in the motion picture industry.

**1631.** ---. "The Paramount Decrees Reconsidered." *The American Film Industry (Revised Edition)*. Ed. Tino Balio, ed. Madison: University of Wisconsin Press, 1976. 537-73.

In this chapter, Conant re-examines the 1948 *Paramount* case in which the U. S. Supreme Court required studios to divest themselves of their large theater chains. This case helped to weaken the industry's system of self-regulation as exercised through the Production Code Administration.

**1632.** Conconi, Chuck. "Personalities." *Washington Post* March 30, 1990 1990, sec. B: 3.

This article discusses Jack Valenti and his relationships with Lyndon B. Johnson and Ronald Reagan. Valenti was highly critical of Robert Caro's biography of Johnson.

**1633.** Congress, Library of, ed. *Papermaking: Art and Craft*. Washington, D.C.: Library of Congress, 1968.

This nicely illustrated work resulted from a Library of Congress exhibition on papermaking that opened in late April, 1968. It provides an excellent introduction to this topic.

**1634.** Connolly, Charles B. "The Ethics of Modern Journalism." *Catholic World, A Monthly Magazine of General Literature and Science* 75.448 (1902): 453-62.

This article discusses the impact of "mechanical advancements" on the modern newspaper, and provides a critique of yellow journalism. "Modern journalism, in its yellow form, represents a decline either in the moral and tone of the reading public, or a degeneration in the editorial profession; or, perhaps, both." (453)

The author provides a definition of "yellow journalism": "A daily publication wherein news is featured, not 453/454 according to its objective truth or public interest but with a view of bringing out some novel, unique, or hitherto underdeveloped phase; which aims rather to present an attractive appearance than to give the happenings of the day; which appeals to the eye and prejudices of the reader than to his intellect; which introduces, colors, and suppresses facts in conformity with its own editorial policy, the orders of its business office, and the dictates of its proprietor; and which never misses an opportunity to chronicle its own achievements for the benefit of humanity, and to boast of its extensive circulation as compared with its competitors." (453-54) Another "essential for every would-be yellow journalist" was an "irrepressible desire to search for uninteresting and unimportant details..." (461) Connolly quotes a "well-known [but unnamed] journalist" who characterized these papers as "picture books for children." (quoted, 462)

Connolly argued that yellow journalism had been made possible "by the progress of photography, the invention of the linotype, the introduction of stereotyping, color press-work, zinc etching, the absolute freedom from restraint conceded to press utterances here, and the well-known facility with which the American people take to anything new." (454) The origins of yellow journalism traced back to "the circus poster and patent medicine 'ad' of the last generation," he writes. (455) How can the modern newspaper which is produced so hurriedly "be a power for good?" (459)

The author ends by speculating that yellow journalism will be replaced by more responsible news reporting and that the "American reporter will become a professional man, a scholar and a gentleman, and not a professional meddler, amateur detective, and inventor of plausible impossibilities all in one." (462)

**1635.** Connors, Joanna. "Real Erotica More than Skin Deep; Many Hollywood Movies Fail to Flesh Out Spiritual, Truly Human Side of Sex." *The Plain Dealer [Cleveland]* Jan. 24, 1993 1993, sec. H: 1H.

This article notes that "after a brief -- but heralded -- pause during the ascendancy of both the Reagan era and AIDS" in the exploitation of explicit sex, the movie "industry went right back to the business of merchandising sex. In 1992, it raced to make up for lost time" with such movies as *Basic Instinct*, *The Lover*, *Damage*, and *Body of Evidence*.

**1636.** Connors, Michael, ed. *The Race to the Intelligent State: Charting the Global Information Economy into the 21st Century*. Oxford, UK: Capstone, 1997.

One useful feature of this book is an appendix entitled "The Infostructure Index." It ranks nations' use of mass communication. Categories include literacy rate, newspapers, radios, TV sets, and telephones per 1,000 people.

This work "describes the evolution of information infrastructures in the past, considering the role of technology and other factors, and predicts the course of events up to the year 2005. Its principal messages are that technology, the major drive of the process, is essentially predictable in that time frame, that the information revolution will have marked negative, as well as positive consequences and that, perhaps contrary to popular perception, it will be the developing world, not the developed nations, which will be its major beneficiaries." Among these so-called "info-tigers" in the developing world are India and Thailand. This work as a brief, two-page bibliography, and no notes.

**1637.** Conroy, J. C., ed. *A History of Railways in Ireland*. London: Longmans, Green, and Co. Ltd., 1928.

This book is an extended study of the development of the railway industry in Ireland largely reconstructed from the legislation that shaped its course. This work is based extensively on Parliamentary papers and committee reports starting from the 1840s and extending to the 1920s. Though an older work, this book still holds merit for detail and completeness in considering the business and policy side of the subject. An interesting early chapter considers the relationship between food distribution during the Great Famine and the push for railways.

--Nicholas Wolf

**1638.** Conway, Paul, ed. *Preservation in the Digital World [report]*. Washington, D. C.: Commission on Preservation and Access, 1996.

This report notes the central dilemma of modern media and its preservation: "Our capacity to record information has increased exponentially over time while the longevity of the media used to store the information has decreased equivalently." This report sets out a plan for action, speaks to priorities that should be given in preserving digital materials, and notes the differences and similarities between preservation as it is currently practiced and future needs. The report "suggests that many of the basic tenets of preservation management can be applied in a highly technological environment, but that some long-held principles may not longer apply." The report also addresses where it will be difficult to bring change.

**1639.** Conway, Paul and Shari Weaver, ed. *The Setup Phase of Project Open Book: A Report to the Commission on Preservation and Access On the status of an effort to convert microfilm to digital imagery [report]*. Washington, D.C.: Commission on Preservation and Access, 1994.

"Digital image quality, indexing structures, and production workflow" were the three primary issues examined in this report. "In 1993 Yale set up and evaluated the components of an in-house production conversion facility, converted and indexed 100 volumes in a test run, and prepared for the conversion from preservation microfilm of the next 3,000 volumes of a projected 10,000 volume digital library. The setup phase built upon the first phase of the project -- the organizational phase -- in which Yale conducted a formal bid process and selected Xerox Corporation to serve as the principal partner in Project Open Book."

**1640.** Cook, David A, ed. *Lost Illusions: American Cinema in the Shadow of Watergate and Vietnam, 1970-1979*. New York: Charles Scribner's Sons, 2000.

In this, the ninth volume in the *History of the American Cinema* series, David Cook writes about major developments during the 1970s. Chapter 9 is devoted specifically to "Technological Innovation and Aesthetic Response," and covers cinematography, lens technology and aesthetics, lighting and film stock, camera technology, stabilization systems and camera mounts (e.g., the Steadicam), Video-assist technology, special effects and motion control, Dolby stereo optical sound, sound design and post-production (e.g., attempts at electronic editing), projection technology, and the relationship between technology and narrative form.

This book, for course, deals with other topics including the manufacturing of blockbuster movies, auteur cinema, different film genres, and the rising cost of film making, agents, and movie stars. In addition to Cook, three other authors contribute chapters. Douglas Gomery writes about American movie exhibition during the 1970s (chapter 10). William Rothman deals with documentary films during the decade (chapter 11), and chapter 12 by Robin Blaetz is about avant-garde cinema. It also has an avant-garde cinema filmography.

Appendices cover annual box office receipts, average weekly attendance, inflation figures, ticket prices, number of theaters, marketing data, top rental films, and major academy awards.

--SV

Cook looks at the period of American film making when a European-style cinema of social criticism and emphasis on the creativeness of the auteur gave way to the blockbuster mentality. Between 1967 and 1975, due largely to Vietnam and Watergate, American movie making was far more introspective and socially critical than it ever was before or has been since. This was, of course, supplanted in the mid-1970s by the Lucas/Spielberg genre of expensive blockbusters centering around dazzling special effects. This trend in the movies mirrored the political culture, which was withdrawing altogether from the progressive tradition and embracing an ascendant Reaganism. The blockbuster frame of mind discredited the modest though respectable earnings of early 1970s movies, and meant that the idea content would once again center around a mythos directed at the masses. This lengthy book uses mostly secondary sources.

--Gordon Jackson

In *Lost Illusions*, David A. Cook shows how the 1970s changed the nature and production of modern American cinema. The greatest and most visible change came in the form of the blockbuster. Up until that time, movie producers believed that Hollywood stars were the engine that drove a movie's profits; that it was folly to believe that any customer would pay to see a movie more than once; and movie elements such as sound quality and special effects were secondary to a movie's box office appeal.

"Jaws" and "Star Wars," changed every concept of what it took to make a movie profitable, much less a 'blockbuster.' "The Godfather" was the first movie to use the 'event' idea- the notion that a customer wasn't going to see a movie, they were participating in an important 'event.' But "Jaws" took it to a whole new level with its combination of proven plot devices, new camera technologies and a clever marketing strategy meant to maximize interest by reducing it to one image, the familiar shark icon from shirts and posters.

Then George Lucas took it one step farther when he made sound and special effects key aspects of his Star Wars franchise and unleashed a barrage of toys and other products to go with the films. Few films viewed 'licensing' as a viable means to money making, but Lucas millions more in licensing the Star Wars brand to products than he did on the movie itself.

But it wasn't just these two films that characterized the decade's movies. Several directors released edgy, counter-culture films in a variety of formats. Martin Scorsese gave Americans a hard-edged urban world in films such as "Taxi Driver"; Robert Altman invented overlapping dialogue for his counter-culture films, such as "M\*A\*S\*H"; and William Friedkin showed that horror and vulgarity could equal big money with "The Exorcist."

The decade introduced many other film styles to American culture. It was the decade that all but invented the horror film with classics like "The Omen" and "Halloween"; established the cult followings for blaxploitation (such as "Shaft"), kung-fu and martial arts (i.e. "Enter the Dragon"); created a new style of film called "Vietnam

Westerns" (such as "Little Big Man"); and showed new ways of presenting old styles, such as film noir (i.e. "Chinatown").

When the directors weren't making history with their movies, they were doing it with their movie technology. Advances in movie-making technology led to the invention of Dolby sound systems for theater and the Steadicam, which allowed directors and cinematographers to shoot films while standing next to actors or from moving vehicles.

Although the book does an excellent job of outlining the decade in movie making, it serves more as a categorical look at the movies, people and technology that made the decade historic. Rarely, does the book delve into how Watergate and Vietnam influenced the plots and stories of those movies.

#### **-Patrick Wright**

**1641.** Cook, E. Wake, ed. *Anarchism in Art: Chaos in Criticism*. London: Cassell and Company, Limited, 1904.

This book contains series of article which the author had previously published in *Vanity Fair*. Ebenezer Wake Cook was a critic of Impressionism, post-Impressionism, and degeneracy art. He drew parallels between what he consider to be degenerate art and degenerate politics which produced anarchy. Cook, who himself was an artist, insisted on "truth to nature." In this book, Cook writes in his opening chapter ("The Situation") that "the goddess of Vulgarity is ousting the modest must of Painting; and some of the narrowest doctrines that ever gained a moment's credence of the unthinking are preached as saving evangels." ([p. 9]) In chapter 4 ("Impressionism"), he begins: "'The Impressionist,' it has been wittily said, 'is a man with an independent income!'" (38)

In chapter 10 ("The Future of Art"), Cook writes: "The democratisation of Art by reproductive processes is the new factor which differentiates the present state of things from anything every known. The plethora of pictures caused by over-production and reproduction, and the consequent jading of the aesthetic faculties of those having most to do with them, created a desire for change which led to blind experimenting. The newly-discovered power of advertising, and the introduction of something closely resembling the claque to support new men or cliques, led to anarchy. The confusion created by the new 'criticism' resulted in a set of circumstances which a quick-witted student planning his career might have thrown into this series of propositions: (69)

"(a) A picture unusually good, or unusually bad, will look 'distinguished.' The attainment of unusual excellence is increasingly difficult, while its antithesis is easy enough. (b) Insanity is allied to genius; in the absence of genius, may not assumed insanity be mistaken for it, at least by the new critics? (c) Notoriety brings the emoluments of fame; it is easier of attainment, and may be mistaken for fame itself. (d) In Realism the criterion of excellence is always at hand, and shortcomings are sure of detection. Then, why not adopt Impressionism with its arbitrary criteria, by which incompetence may pass as genius?" (69)

Cook is also discussed in S. K. Tillyard, *The Impact of Modernism: The Visual Arts in Edwardian England* (New York: Routledge, 1988), 106-08.

**1642.** ---. "Progress or Decadence in Art?" *Eclectic Magazine of Foreign Literature* 143.6 (1904): 701-13.

This article attempts to access the impact of mechanical reproduction -- printing, photography, sound recording -- on art. "What might be called the democratization of Art, or art-products, by cheap printing and various reproductive processes is quite revolutionary," Cook writes. (701) The author notes that the "rapid rise of photography has revolutionized the reproductive printing processes," and that the camera has become a "toy; everything is snap-shotted, and photographs are becoming like visible memories, recording the multitudinous impressions of the roving eye." (701) This article discusses color photography and also mechanical sound reproduction such as the hand organ and mechanical piano. The phonograph, it argues "does for the ear what photography does for the eye.... The photograph gives form truly, but translates a colored world into black and white, or a monochrome; there is no such translation in the phonograph, which records time, tune and words of a

song -- its form and color." (702) Cook notes that the gramophone puts good music with reach of those who are not wealthy. When we "think of this magic little disc which, operated by Nature's own nerve fluid -- electricity -- can not only speak but sing with full 702/703 orchestral accompaniment, we see what a marvel it is." (702-03) In addition to describing electricity as "Nature's own nerve fluid," there are other descriptions: the phonograph as "mechanical witchery" (703); "the cinematograph, recording and reproducing in lightning flashes moving objects" (703); the cinematograph is a "magic mirror." (703) Understanding the true nature of these modern innovations is liberating: "A flash of insight causes us to break our earthly bonds and burst into a larger life." (703)

Cook discusses the "demand for novelty" and how many of these seemingly miraculous inventions now seems commonplace. "This wearying of the faculty of appreciation and wonder is a prime factor in the decadence of Art..." (701) Cook says that many "writers who deal only with the pictorial and plastic arts have shown singularly little insight into the real nature of these new departures." (711) Cook complains about "the glut of Art, and the wearying of faculty which has caused a cry for change, and a revolt against nearly all forms of accepted excellence. A divine melody and a soul-stirring symphony may sicken us if done to death on street pianos or gramophones, but they do not cease to be beautiful tone-poems because our taste is vitiated by surfeit. Yet this elementary fact is continually overlooked in current criticism, the writers failing to realize the personal equation." (711)

Cook sees several characteristic in modern life and art: 1) "an utter relaxation of the artistic conscience"; 2) lessening demands on the artist; 3) making art less attuned to "Nature's subtle methods....."; 4) a "blasé revolt against things hitherto considered good, and the invention of new forms of bad work, or the return to primitive blundering." (712) Cook believes that "this new fever is the sign of Art sickening to its death rather than of birthpangs; and that the 'advanced' artists and their friends on the Press have mistaken decadence for progress, and are judging largely by inverted criteria....." (713)

This article, under the same title, appeared in *Living Age*, 243, No. 3148 (Nov. 5, 1904), 321-33.

**1643.** Cook, James. "The X-Rated Economy." *Forbes* 122.6 (1978): 81-88, 92.

*Forbes* reported in 1978 that pornography grossed \$4 billion a year, "about as much as the conventional motion picture and record industries combined." This figure included not only movies but also magazines, adult book stores, peep shows, and commercial ventures. The industry in pornographic movies developed outside the auspices of mainstream Hollywood and the Motion Picture Association of America. By the end of the 1970s, there were about 780 adult movie theaters in the United States (out of 16,827 theaters) that took in more than \$365 million annually.

**1644.** Cook, T. D. , Kendzierski, D. A., and Thomas, S. V. "The Implicit Assumptions of Television Research: An Analysis of the 1982 NIMH Report on Television and Behavior." *Public Opinion Quarterly* 47 (1983): 161-201.

The authors maintain that "the evidence indicates that a small association can regularly be found between violence on television and later aggression when individual differences in aggression are controlled at one time. But is the association causal? If we were forced to render a judgment, it would be: Probably yes.

"What's missing in the NIMH report [1982], as in nearly all television research, are mechanisms for going from the evidence produced by television researchers to changes in television practice."

**1645.** Cook, Timothy E., ed. *Governing With the News: The News Media as a Political Institution*. Chicago: University of Chicago Press, 1998.

Timothy Cook uses this book to explain his vision of the press as an instrument of government. He believes that the idea of an independent press, operating outside of the government, is inaccurate. Instead, he sees the press as a social institution that is used by the government to manage the population. It plays an intermediary role in providing selected information and opinions. He goes further to argue that our system of constitutional government could not exist today without the media playing this role.

The heart of this argument is that the press enjoys a special relationship with the state. It is protected by the First Amendment and receives various kinds of subsidies. It is also given special access to information through press releases and news conferences. Journalists are allowed to follow military campaigns, election campaigns and any number of behind-the-scenes situations. In return, the press comes to rely on these official sources of news as the most accurate or authoritative. The press naturally focuses on the government as the source of news.

Cook argues that this leads to "government by press release" in which leaders relate to the public indirectly through the media. Both those in power and those seeking recognition use the media to set agendas and publicize programs or achievements. In effect, this democracy is played out in the media, and it is not clear how it relates to real life situations.

Cook is not entirely critical of this development, but he does suggest that there are problems. He believes that the Internet may evolve into a means for citizens to reclaim a voice in the process and become involved in direct democracy. He also argues that journalists need to become more aware of their role and take it more seriously.

--Rob Rabe

**1646.** Cookman, Claude, ed. *A Voice Is Born*. Durham, N. C. (?): National Press Photographers Association, 1985.

This book attempts to document the founding of the National Press Photographers Association and the early years of its history under the leadership of Joseph Costa. The book is based on Costa's papers (about 90 file boxes) at Syracuse University, the first decade of the *National Press Photographer* magazine, and interviews with Costa and about 35 other people. The work is illustrated with black-and-white pictures and is indexed primarily by people rather than by topics. A brief "Chronology" (174-75) covers events each year from 1945 to 1956.

**1647.** Cooper, Gail. "Custom Design, Engineering Guarantees, and Unpatentable Data: The Air Conditioning Industry, 1902-1935." *Technology & American History: A Historical Anthology from Technology & Culture*. Ed. Stephen H. Cutliffe and Terry S. Reynolds, eds. Chicago: University of Chicago Press, 1997. 239-69.

**1648.** Cooper, Richard N. , and Hollick, Ann L. "International Relations in a Technologically Advanced Future." *Technological Frontiers and Foreign Relations*. Ed. Anne G. Keatley, ed. Washington, D. C.: National Academy Press, 1985. 227-65.

Among the "key technological developments" (230) Richard N. Cooper and Ann L. Hollick consider are energy, new materials, computers, telecommunications, aviation and aerospace, and biotechnology. They attempt to assess the likely future political, social, and economic implications of these technologies, and their significance of national policy. The authors cite four secondary sources in their bibliography.

**1649.** Cooper, Thomas W. "New Technology Effects Inventory: Forty Leading Ethical Issues." *Journal of Mass Media Ethics* 13.2 (1998): 71-92.

Cooper says that new technologies create hidden effects in their environments, altering the social order that they penetrate. These changes are tied closely to ethical issues such as free speech and censorship. But other problems "have new names and dimensions, and may even be new issues. Forty of these issues pertaining to the new communication technologies of the 1990s and next millennium are catalogued here. The author argues that each new communication technology either retrieves, amplifies, transforms, obsolesces, or mixes ethical issues from the past or creates new issues for the future." It is likely, moreover, that issues as yet unknown will emerge as new technologies are combined.

**1650.** Coopersmith, Johnathan, ed. *The Electrification of Russia, 1880-1926*. Ithaca, NY: Cornell University Press, 1992.

Coopersmith's study looks exclusively at the development of an electricity industry in Russia between 1880 and 1926. This span of years is broken up into three period of electrification: under the tsarist government, 1880-1917; during the Revolutions and civil war, 1917-1920; and under communism and the New Economic Policy (NEP) of 1921-1926. Coopersmith relies on technical journals and state archives, as well as some secondary studies of Russian industrialization and development.

The author argues that the "paucity of commercially successful inventors is a striking aspect of Russian electrification and indicative of the societal and economic weaknesses that hindered its development. Russian engineers and scientists were not passive recipients of foreign technologies; they invented and developed their own equipment too . . . Yet only three Russian inventors received national and international recognition in the late nineteenth century . . . Why did invention not translate into success in innovation and application? Responsibility falls on two intertwined causes: a systematic failure of the Russian economic and social environment to support and foster domestic inventions, and technological prematurity, the development of an idea before its supporting materials and components attain technological and economic feasibility."

Coopersmith sees World War I as a turning point. "World War I was the single most important factor in the transition from electrification in Russia to Russian electrification. The war drastically worsened the environment for utilities, which lost their technology, financing, and fuel just as military requirements sharply increased demand for electricity. This inability to satisfy wartime needs brought electric power to the attention of state officials and industrialists more effectively than a score of prewar petitions. The war forced the government to recognize the economic importance of electro-technology, but the state's response was too little, too late, and too disorganized to forge an accommodation with the private sector and electrical engineers."

After the war, Lenin was an enthusiastic proponent of electrification.

#### – Nicholas Wolf

This text explores the process in which Russia became electrified during the last years of tsarist Russia through the revolutions, the period of Civil War, and finally the first years of Soviet Russia. According to Coopersmith's evidence, Russia's progress lags far behind the West in its production, invention and implementation of electrification. This was due in part to many reasons, but most evident was the crippling bureaucracy that plagued the country and stifled invention and new ideas. Russian's inventors often went abroad to produce their ideas instead of working at home. Russia required foreign work, and investment in order to implement electrification, but was plagued by poor ideas, centralization to such a scale that most cities got little or no electric power, or failure of implementation to such a level that cities such as St. Petersburg were wired with a system that was different in each region of the city, and completely incompatible with each other.

The coming of World War I, forced changes to the country as modernization was required in order to fight the war. During Soviet times, electrical engineers, encouraged by Lenin took new precedence in the country. The grand GOELRO plan was to be implemented using the same framework of previous Russian plans, centralized through St. Petersburg and Moscow, and then to be extended out to other areas. But, the engineers attempted to bite off more than they could chew, as the effort was plagued by lack of resources. Foreign dollars were limited after the Bolshevik revolution. It took until 1924 before the great cities of Russia began to turn the corner and reach their pre-war levels. With Lenin's death in 1924, Stalin's industrialization plans began to take precedent over the work of the engineers, and the country traded its focus from giving power to the people, instead to power for heavy industry. The moment available for Russia to catch up to the West in electric power during the NEP years,

was lost. The Soviet Union would constantly battle issues with power output throughout the rest of its history, despite bountiful natural resources.

In the second chapter, Coopersmith looks at the invention that did occur in Russia by Russians. Most of the best work done by Russians were done abroad, due to the restrictions and tsarist bureaucracy that crippled new ideas. Russia's best work was done by its military that encouraged new ideas, but the government scared of rivals to its throne, prevented any wide-scale work. Instead the foreign looking court, turned to more expensive foreign ideas and investments, due to its suspicions of its own people. This was situation that set Russia far behind the west infrastructure-wise a gap evident by World War I.

Chapter 3 focuses on how electrification was implemented in Russia prior to World War II. Coopersmith uses numerous statistics as evidence of just how much Russia lagged. Here facts about the cities of Russia show how poorly electrification was implemented and how disastrous the coming war would be due to the poor infrastructure.

Chapter 4, "The Rise of Electrification, 1914-1917," focuses on how electrification was implemented in Russia prior to World War II. Coopersmith uses numerous statistics as evidence of just how much Russia lagged. Here facts about the cities of Russia show how poorly electrification was implemented and how disastrous the coming war would be due to the poor infrastructure.

The fifth chapter looks at electrification during the Civil War and the War Communism period. With the country suffering from strife, depression and starvation, electrification took a back seat as the Bolsheviks struggled to keep their foothold on power in the country. But, the engineers, admired by Lenin, gained a foothold and began planning a much more centralized and promoted from the top plan to fully electrify Russia. Electrification was one of the first steps toward the planned communist economy.

Chapter 6 focuses on the development and implementation of the GOELRO plan for Russian state electrification. It would be put along the lines of Regional plans in the past with the focus being Moscow and St. Petersburg. It also allocated plans for the development of new power stations, and the development of Russia's first massive hydroelectric facilities. GOELRO's ideas were beyond what was possible given the resources, but Lenin's encouragement gave the engineers clout to implement such a plan. In the end GOELRO was hardly as successful as expected due to the lack of foreign investment and resources and failure to come up with long term solutions, but rather to implement short term ideas.

"The NEP Years, 1921-1926" is a look with statistics at GOELRO's work with implementation of its plans. GOELRO succeeded to an extent of getting the country back on its feet and improving conditions for the major cities. However, the program never had the resources or the know how to electrify the countryside. GOELRO was able to be as successful as it was due to the power of its leaders, whose ideas were propaganda for the forward and technologically thinking Bolsheviks, and encouraged by Lenin. After Lenin's death in 1924 and the end of the NEP in 1926, any plans to move beyond the strict regionalization of work were abandoned in favor of the 5-year plans of the Stalinist period for rapid industrialization. This took away from countrywide electrification, as resources were allocated for industry. Stalin's reduction of electrification's role was a reversal of Lenin's ideas.

Coopersmith's short conclusion notes that the high point of electrification certainly came during the NEP, and by 1926 Russia's electrical production had finally exceeded pre-war levels and were steadily improving. Though GOELRO was never as successful as intended, it provided the network that allowed for Russia's industrial boom of the 1930s. But, like other sectors, the independence engineers enjoyed during the 1920s, was reduced under Stalin's suspicions and implementation of the of a statewide plan that controlled all sectors of the economy. Electrification became subordinate as opposed to the focal point it was in the 1920s.

**-Jason Karnosky**

**1651.** Copp, David , and Susan Wendell, eds., eds. *Pornography and Censorship*. New York: Prometheus Books, 1983.

The editors at the time of the book's publication taught in the philosophy department at Simon Fraser University in British Columbia. This anthology grew out of a conference on pornography during fall, 1979. The editors describe the orientation of the work's essays as follows: "The essays are by contemporary philosophers in the Anglo-American tradition, and the issues are approached from a number of theoretical points of view. It is worth mentioning, though, that the essays are secular; those whose thoughts on the morality of pornography are based on a theological position, or on faith, will not find their underlying viewpoints discussed here.

Part One of the book is devoted to philosophical essays: Ann Garry, "Pornography and Respect for Women"; Lorenne M. G. Clark, "Liberalism an Pornography"; Fred Berger, "Pornography, Sex, and Censorship"; Joel Feinberg, "Pornography and the Criminal Law"; T. M. Scanlon, "Freedom of Expression and the Categories of Expression"; Susan Wendell, "Pornography and Freedom of Expression"; Committee on Obscenity and Film Censorship, Chairman, Bernard Williams, "Offensiveness, Pornography, and Art"; and Bonnelle Strickling, with David Copp and Susan Wendell, "Selected Bibliography of Academic and Popular Philosophy."

Part Two contains essays from social scientific research. Authors include: Diana E. H. Russell, Edward Donnerstein, Donnerstein and Leonard Berkowitz, Neil M. Malamuth and James V. P. Check, Dolf Zillman, Jennings Bryant, et al., Berl Kutchinsky, and a select bibliography compiled by Bonnelle Strickling.

Part Three contains Judicial Essays on *Regina v. Hicklin*, *Shaw v. Director of Public Prosecutions*, *U. S. v. Roth*, *Miller v. California*, *Paris Adult Theatre v. Slaton*, *Regina v. Pink Triange Press*, and a select bibliography.

**1652.** Corliss, Richard. "He Lost It at the Movies." *Time* 139 (1992): 64.

This work mentions the movie *Basic Instinct* (1992) and the ratings controversy it stirred.

**1653.** ---. "Murder Gets an R; Bad Language Gets NC-17." *Time* (1994): 68.

This article criticizes the motion picture rating system which appeared to be more willing to give a severe rating (NC-17) to films with bad language and non-violence sex, than it to movies with high levels of violence.

**1654.** ---. "Stone Crazy." *Time* 144.9 (1994): 66.

This article's subtitle is "Oliver Stone's *Natural Born Killers* is wild and demonic -- and the work of a virtuoso." This violent 1994 movie, according to Stone and Warner Bros. marketers, was a satire on media violence. Corliss says of the film: "The ride is fun, too, daredevil fun of the sort that only Stone seems willing to provide in this timid film era."

**1655.** ---. "Taking the Hex out of X." *Time* 136 (1990): 70.

Many film critics, including Richard Corliss, and movie makers were dissatisfied with the NC-17 and believed the system remained inconsistent, providing no clear distinction between the R and the new rating category. The NC-17 had merely taken movies out of the "forbidden zone" and placed them in "limbo," said Corliss.

**1656.** ---. "What Ever Became of NC-17?" *Time* 139 (1992): 64.

Richard Corliss of *Time* called *Basic Instinct* a "cop-and-copulation thriller" with a climatic scene "drenched in violence." It had, he said, "courted scandal" from the start. Other critics of this movie, which starred Michael Douglas and Sharon Stone, argued that the producers had exploited the movie rating system in order to gain publicity.

**1657.** Corn, Joseph J., ed., ed. *Imagining Tomorrow: History, Technology, and the American Future*. Cambridge, MA: MIT Press, 1986.

An interesting collection of essays on several media including radio (Susan J. Douglas); X Rays (Nancy Knight); computers (Paul Ceruzzi); and electric lights (Carolyn Marvin). It also has pieces on "The Home of Tomorrow, 1927-1945" (Brian Horrigan); World's Fairs during the 1930s (Folke T. Kihlstedt); and "The Technological Utopians" (Howard P. Segal). See also under individual authors.

**1658.** Corn, Joseph J. and Brian Horrigan, ed. *Yesterday's Tomorrows: Past Visions of the American Future*. New York: Summit Books, 1984.

A nicely illustrated (color as well as black and white) book prepared by the Smithsonian Institution Traveling Exhibition Service with interesting discussions of several topics including death rays (one illustration, dated about 1920, shows such a ray knocking a plane out of the sky and is attributed to the Germans), and the "Electronic Battlefield of the Future." The book has a short but useful bibliography on related works. The work was edited by Katherine Chambers, and was part of the Smithsonian Institution's Traveling Exhibition Service.

**1659.** Cornwell-Clyne, Adrian, ed. *Colour Cinematography*. London: Chapman & Hall, Ltd., 1936.

This 780-page book, first published in 1936, is a broad survey of color cinematography, a subject for which at the time there was, in the author's view, "a woeful lack of knowledge of fundamental principles" among those who made motion pictures. The objective here was not so much a detailed history of the subject but rather "to give the reader a reliable description of processes now being worked, and to give a simple outline of the principles upon which all systems have been based." In the Prefaces to the different editions of this work, the author provides a brief discussion on what he feels are effects of color on audiences and how color on a movie screen differs from our vision of color in the real three-dimensional world.

The book is divided into three parts. Part I, the longest (580 pages), provides a history of color cinematography; a lengthy discussion of the theoretical basis for this technology; two long chapters, one on additive processes, another on subtractive processes; a chapter on color camera and beam-splitting processes, and a chapter on the bipack which had an important role as a way of recording negatives for color cinematography.

Parts II and III are shorter. Part II has chapters on process projection, color film sound tracks, toning, processing of two-color prints by deep tank methods, color stereoscopic motion pictures, make-up, and color sensitometry. The chapters in Part III deal with "The Phenomena of Colour Vision and the Making of Films in Colour," color harmony, and color standards (with a consideration of the future of color film).

The book has several appendices. One contains a chart of color film (35-mm and 16-mm) sound tracks characteristics. Another is a complete list of British patents "containing every patent having some bearing on colour cinematography."

**1660.** Corry, John. "'Open Mind' Speaks of Ideas." *New York Times* April 26, 1987 1987, sec. 2.

This article deals with the public television program "The Open Mind," hosted by Richard D. Heffner, who was also then head of the motion picture industry's Classification and Rating Administration. "The Open Mind" interviewed leading intellectuals and political leaders.

**1661.** Cortada, James W., ed. *Before the Computer: IBM, NCR, Burroughs, and Remington Rand and the Industry They Created, 1865-1956*. Princeton: Princeton University Press, 1993.

Complex mechanical devices gradually found their way into business offices and government agencies. The typewriter, adding machines, tabulating machines, cash registers, and keypunch systems evolved during decades of development. These basic machines became the foundation for computers. The tasks performed by

each were incorporated when technology had progressed. The lesson of these machines was that information had to be processed for analysis and that control of any business or entity depended on the accurate and timely generation of relevant data.

Cortada writes that “Like typewriters, adding and calculating machines became permanent fixtures in organizations of any size. They also came closer than the typewriter to fitting the image of a precursor for the modern computer because they computed and handled numeric and, later, alphabetic data. These devices were the direct ancestors of computers. Their evolution led to the creation of computers capable of work that could not be done by calculators. In short, adding machines and calculators contributed to the foundation of the American data-processing industry while they introduced thousands of office workers and scientists to the possibilities presented by mechanical aids to data calculation and handling.”

According to Cortada, such technology, to use James R. Beniger’s phrase, “reflected part of the ‘Control Revolution,’ in which technology was employed to support the flow of greater amounts of information in ever-larger organizations. Most contemporary writers and historians lean toward the economic interpretation of the development of adding and calculating machines.

“As organizations evolved in size and were characterized by multiple layers of management or locations, such structures provided economic incentives to generate cost-effective, useful information. Statistical reports and numerical data, in particular, made it possible for middle and upper management to carry out one of their most vital functions: to inspect performance. The information-handling process directly contributed to the expansion of the managerial class that Chandler called the new mandarins of the economy.”

Cortada discusses the importance of calculating machines to the government, in collecting taxes, and also during World War I and World War II.

--James Landers

1662. ---, ed. *Making the Information Society: Experience, Consequences, and Possibilities*. London and New York: Prentice Hall, 2002.

Cortada maintains that contemporary discussions of the so-called “information society” frequently fail to appreciate that this development is the process of “historical evolution” that has been centuries in the making. “I have concluded that our relationship with information is a far more pervasive feature of American life than journalists, historians, sociologists, or political scientists have told us before. Until now, when they discussed the Information Age, many observers treated it as if it were something new, an emerging world of connectivity through the Internet with vast quantities of information. The discussion is normally all about computers. As you will see, they basically missed the big point, namely that we have been at this for a long time and that it is about much more than computers. As a result, information and its technologies have been a greater part of who we are than otherwise has been acknowledged. New waves of technology are part of a larger pattern making up the American experience.”

The book’s twelve chapters are organized into three groups. Chapters 1-4 offer a general discussion of information technologies over three centuries. Chapters 5-9 look at information technology’s relationship to different aspects of American life: work, leisure, religion, public policy, and democracy. Chapters 10 (“The Future of Information in America”), 11 (“Leveraging Information for Fun and Profit”), and 12 (“Learning More About Info-America”) deal with the question of “so what?” A prominent theme in this work “is the profound influence information technologies have on how information is used.”

Cortada describes himself as a trained historian who spent most of his adult life working for IBM “selling, managing, and consulting on computer-related issues.”

**1663.** Cortissoz, Royal, ed. *The New York Tribune: Incidents and Personalities in Its History*. New York: New York Tribune, 1923.

This brief 78-page history of the *New York Tribune* seeks to recount the most significant people and dates in the paper's history, starting with its founding in 1841 by Horace Greeley. In addition, the author discusses the paper's use of new innovations such as the linotype during the 1880s (52-53) and the use of half-tone photographs by the paper beginning on January 21, 1897. The author, drawing on his own personal experiences, tells of Stephen Horgan's proposal to James Gordon Bennett, Jr. of the *New York Herald* (53-54) to handle "the half-tone in such wise that it could be printed from the curved stereotyped plates of a newspaper." (54) Bennett's expert mechanic thought Horgan was "merely an idiot" and as a result Horgan was fired. He presented his idea to Whitelaw Reid of the *Tribune* who in early 1897 published a half-tone of Thomas C. Platt who had just been elected to the U.S. Senate. The paper continued to refine Horgan's process "making a substantial contribution toward the universal adoption of the half-tone as a means of newspaper illustration. It still flourishes," the author says in 1923, "holding its own even beside those developments, exemplified in the rotogravure supplements of The Tribune to-day, for which it pave the way." (54)

**1665.** ---, ed. *Fax: The Principles and Practice of Facsimile Communication*. Philadelphia: Chilton Book Co.

**1666.** Cotterell, Arthur, ed. *Advanced Information Technology in the New Industrial Society: The Kingston Seminars*. New York: Oxford University Press, 1988.

This work is a collection of addresses delivered during autumn, 1986, to British businessmen, government officials, journalists, and others. They were designed to encourage thinking about the impact of "fifth generation" computers. In 1982, Britain's Alvey Committee on Advanced Information Technology had issued a report responding the Japan's Fifth Generation Computer Programme.

The addresses in this volume include: Brian Oakley, "An overview of research and co-operation in Advanced Information Technology"; Chris Humphries, "Implications for education and training"; Sir Geoffrey Allen, "The experience of corporate users: Experience of Information Technology at Unilever"; Derek Seddon "Experience of IT innovations in ICI"; Derek Barker, "Directions for research and development: Directions for Information Technology research and development"; John Taylor, "Expert Systems -- where do we go from here?"; Bill Jordan, "Implications of Advanced Information Technology: a trade union view: Social effects of IT -- past and future"; Dave Rogers, "The problems of IT and their solutions"; and Igor Aleksander, "The Management of Advanced Information Technology." An Appendix is entitled "The Bide Report."

**1667.** Council], [National Research, ed. *The Digital Dilemma: Intellectual Property in the Information Age*. Washington, D.C.: National Academy Press, 2000.

This work explains the important changes that have been brought to publishing and the creation of intellectual property by digital media. These media poses major problems for copyright law, much of which were formulated in an predominantly analog world and before the digital revolution. The developments affect libraries, the entertainment industry, and other major parts of the economy.

**1668.** Council], [National Science and Technology, ed. *Strategic Planning Document -- Information and Communications*. [Washington, D. C.?]: [National Science and Technology Council?], 1995.

This planning documents builds on the work of the interagency High Performance Computing and Communication program, and "sets forth a high level strategy for the Federal government's research and development investment in information and communications technologies." It includes an "Executive Summary" and an "Implementation Plan" (in four sections), plus Appendices A-G, and a Bibliography. The bibliography has interesting citations.

**1669.** Court, J. H. "Pornography and Sex Crimes -- Re-Evaluation in Light of Recent Trends Around the World." *International Journal of Criminology and Penology* 5 (1977): 129-57.

Court, an Australian researcher, argues that pornography seen through mass media has damaging effects on society. His conclusions disagreed with those of the 1970 President's Commission on Obscenity and Pornography that held there were few harmful effects from pornography and that legal restrictions should be eased.

**1670.** Courtwright, David T., ed. *Violent Land: Single Men and Social Disorder from the Frontier to the Inner City*. Cambridge, MA: Harvard University Press, 1996.

Courtwright, a historian of violence, has some discussion in this book on motion pictures and television programs and the possible effects on those who watch them.

**1671.** ---. "Way Cooler Than Manson: *Natural Born Killers*." *Oliver Stone's USA: Film, History, and Controversy*. Ed. ed., Robert Brent Toplin. Lawrence, KS: University Press of Kansas, 2000. 188-201.

Courtwright, a historian of violence, compared director Oliver Stone and his movie *Natural Born Killers* (1994) to a baseball batter who had just "beaned some kids in the cheap seats" with a "low," hard, line drive. This essay also discusses the film and copycat killers.

**1672.** Cousins, Norman. "Let's Look at the Message." *Saturday Review of Literature* 33.9 (1950): 12-13, 28.

In this article, Cousins responds to Eric Johnston's article in the same issue ("Messengers from a Free Country") in which the MPAA president defends American movies abroad. Johnston was replying to three pieces that Cousins had written attacking the impact of American film abroad. Johnston in his piece listed many movie titles that he said projected a good image of America. Cousins says that the films Johnston's cited "are in fact the 'good-will ambassadors' referred to by President Truman." But he goes on to say that "I seriously doubt, however, that the President has seen reports from American public servants in the field concerning the effects of the preponderance" of American films abroad. (13) Of the movies, Cousins goes on to say that "no medium of communications or entertainment in the world exercises the power -- actual or potential -- of the motion picture. No medium can claim the attentions of as many millions of people for such interrupted periods of time each week or each month. And, as it concerns the war of ideas today, no medium is as effective in projecting America for foreign audiences. Which leads to the basic question: is its sense of public responsibility comparable with its position of public power?" (28)

**1673.** Couvares, Francis G. "The Good Censor: Race, Sex, and Censorship in the Early Cinema." *Yale Journal of Criticism* 7.2 (1994): 233-51.

This article by one of the leading historians on film censorship discusses efforts to regulation race and sex in early motion pictures. "The purpose of this essay," Couvares writes, "is to explore efforts to control cinematic representations of sexuality and ethnicity earlier in this century and to suggest that little has changed over time in the arguments pro and con, in proposals for the control of such representations, and even in the nature of the political coalitions that have assembled on both sides of these issues. In particular, the question of harm was always at the center of critiques of movies and mass culture. Whether children, women, or racial and ethnic minorities themselves was seen to be an undeniable justification for action to prevent or punish assaultive expression. Moreover, the effect of movies on potential aggressors was just as strong asserted: some movies, it

was argued, aroused while to mistreat, even physically assault blacks; other movies aroused men to assault women, or, at the very least, to view them with contempt."

**1674.** Couvares, Francis G., ed., ed. *Movie Censorship and American Culture*. Washington, D. C.: Smithsonian Institution Press, 1996.

This book is a collection of essays by several historians of cinema. Among the topics included in this volume is blacklisting and the Hollywood Ten.

**1675.** Cowan, G., C. Lee, D. Levy, and D. Snyder. "Dominance and Inequality in X-Rated Video Cassettes." *Psychology of Women Quarterly* 12 (1988): 299-311.

This study used a content analysis of popular X-rated videos to examine them for prevalence of dominance and exploitation of women. A total of 45 movies released between 1979 and 1985 were used in this analysis yielding a total of 443 sex scenes. The authors found that 54 percent of the sexually explicit scenes coded had dominance and exploitation as themes. Typically, male characters were presented as dominating or exploiting female characters. There was also some evidence for objectification of women in that the majority of scenes containing self-gratification were of women. Moreover, women were more likely to be the subjects of close-up shots. The authors conducted this research from a feminist perspective. They argue that the evidence demonstrates that there is a great deal of material presenting sexual inequality and objectification of women. Moreover, they argue, this could lead to disastrous consequences.

--Michael Boyle

**1676.** Cowan, G. and R. R. Campbell. "Racism and Sexism in Interracial Pornography: A Content Analysis." *Psychology of Women Quarterly* 18 (1994): 323-38.

Critics and scholars alike have long considered the content of pornography to be sexist, demeaning to women, and to result in negative effects. There has also been speculation that the content of pornography has similar implications for race. Cowan and Campbell examine the prevalence of racist and sexist themes in 54 X-rated videos. Each instance of a sexually explicit scene involving two characters was coded yielding a total of 476 characters. Each characters gender, race, level of aggression, and other behaviors were coded. They found that male characters were more likely to engage in aggressive acts, with women often being the target of that aggression. Furthermore, black females were more likely than white women to be the targets of aggressive acts. Racism was present in that black characters were more often shown in lower status than were white characters. However, there were differences in how racism and sexism were presented. White women for instance, were more likely to have a male character ejaculate on their face. Black women, on the other hand, were more likely to perform fellatio from their knees, a subordinate position. Furthermore, black women were the targets of a "greater number of different acts of physical and nonphysical aggression than were white women, regardless of the race of the perpetrator" (335). The authors indicate that these findings have implications for how sex and race is viewed in society and that continual exposure to images that portray gender and race in a negative light are deleterious to racial and sexual attitudes.

--Michael Boyle

**1677.** Cowan, Ruth Schwartz. "The 'Industrial Revolution' in the Home: Household Technology and Social Change in the 20th Century." *Technology & American History: A Historical Anthology from **Technology & Culture***. Ed. Stephen H. Cutcliffe and Terry S. Reynolds, eds. Chicago: University of Chicago Press, 1997. 321-43.

**1678.** Crabbe, John, ed. *Hi-Fi in the Home*. London: Blandford Press, Ltd., 1968.

This book attempts to explain high fidelity and its impact on listening to music and home entertainment. While it is not a history, this work does offer insight into the state of sound recording during the mid- to late-1960s. The book contains a glossary of audio terms and a bibliography that include audio books and pamphlets, audio magazines and annuals, test records, record libraries, as well as a list of manufacturers and retailers. It also has an index.

**1679.** Crafton, Donald, ed. *The Talkies: American Cinema's Transition to Sound, 1926-1931*. New York: Charles Scribner's Sons, 1997.

This is a richly detailed and carefully argued study of Hollywood's transition to sound. "This book emphasizes the longevity -- not the suddenness -- of the transition to sound. Instead of focusing on one personality, event, studio, or single strand of technological development," Crafton addresses "several interlaced aspects of film production, reception, and, to a lesser extent, distribution."

He goes on to say that like "much of our general knowledge about Hollywood, the concept of a dividing line between antediluvian silent cinema and the *modern* talkies was conscripted by the industry and the media...." The first four chapters in Part 1 are: 1) "A New Era in Electrical Entertainment"; 2) "Electric Affinities"; 3) "Virtual Broadway, Virtual Orchestra: De Forest and Vitaphone"; and chapter 4: "Fox-Case, Movietone, and the Talking Newsreel." Chapter 18, "The Voice Squad" (from Part 3: "Hearing the Audience"), deals with censorship of sound films.

While the acceptance of sound technology was by no means a certainty during the 1920s, the movies did link themselves and sound with science and electricity.

"Science was often considered progressive in the 1920s, and anything associated with electricity tended to generate awe and respect, as it combined intellectual complexity, the promise of a better future, and the risk of mishandling. The talkies were readily plugged into this popularly constructed circuit that connected new developments in transportation (electric trains and elevators), communication (telephone and radio), and labor-saving and leisure-time appliances (the phonograph). Like other electrical technologies, the sound film was on the cusp of modernity. More specifically, it was the newest application of electrical science, thermionics, which was proffered to explain the 'origins' of the talkies and to create an aura of modernity and inevitability. This was the name for the far-flung applications based on the vacuum tube, which include the modern sound cinema." Chapter 2 on "Electric Affinities" is especially informative. There is discussion here of the connection between movies and radio, the telephone, phonograph, and also television. Crafton also discusses the importance of the microphone and loud speaker.

"The zesty fast-paced era of the 1920s known as the Jazz Age could just as readily be called thermionic Age.... (*Thermionics* was the predecessor to the word *electronics*, which was coined in the 1920s but not used widely until after the invention of the transistor in 1947.)..."

There is much more here -- the text of this book runs 546 pages. This work is Volume 4 in Scribner's *History of American Cinema* series, Charles Harpole, editor.

**1680.** Craig, J. Robert. "Establishing New Boundaries for Special Effects: Robert Zemeckis's *Contact* and Computer-Generated Imagery." *Journal of Popular Film & Television* 28.4 (2001): 159-65.

See filed under *Film & Television* articles (2001).

**1681.** Crain, Patricia. "Children of Media, Children as Media: Optical Telegraphs, Indian Pupils, and Joseph Lancaster's System for Cultural Replication." *New Media, 1740-1915*. Ed. Lisa Gitelman and Geoffrey B. Pingree, eds. Cambridge, MA: MIT Press, 2003. 61-89.

"Originally fashioned to teach the London poor, [Joseph] Lancaster's 'monitorial' system was widely adopted for missionary projects, particularly those of the American Board of Commissioners for Foreign Missions. And in 1821 the Bureau of Indian Affairs, then a branch of the war department, promoted it for teaching American Indians," Crain writes. (61-62)

Crain's essay appears in a volume that is part of a larger series on new media technologies entitled *Media In Transition*. This volume offers a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. These ten essays examine media that were new in the eighteenth, nineteenth, and early twentieth centuries. They explore "moments of transition when each new medium was not yet fully defined, its significance in flux..." They attempt to put these media into their "specific material and historical environment" and explain the "ways in which habits and structures of communication are naturalized or normalized." (viii)

**1682.** Crandall, Robert W. and Kenneth Flamm, eds., ed. *Changing the Rules: Technological Change, International Competition, and Regulation in Communications*. Washington, D.C.: The Brookings Institution, 1989.

"In 1984," this work begins, "a federal antitrust suit against the American Telephone and Telegraph Company was settled when AT&T consented to a breakup that allowed it to enter businesses other than regulated communications. This settlement was predicated on two beliefs: first, that competition should discipline market participants in telecommunications whenever possible, and second, that AT&T should be free to pursue the potentially convergent technologies of computers and telecommunications.

The Brookings Institution organized a conference in 1987 "to examine the changes brought about by procompetitive policies in the U.S. telecommunications industry, the degree to which those changes were spreading to other developed economies, and the convergence in technologies between computers and communications." American, European, and Japanese business people, government officials, and university researchers attended the conference. This volume consists of revised versions of the papers given there.

Among the essays of interest is Eli M. Noam's "International Telecommunications in Transition." (257-97). Page 299 has a table on large exporters of electronics products in 1979, and from 1983 to 1985.

**1683.** Crane, Gregory. "Historical Perspectives on the Book and Information Technology." *Rethinking Media Change: The Aesthetics of Transition*. Ed. David Thorburn and Henry Jenkins, eds. Cambridge, MA: MIT Press, 2003. 117-36.

Crane writes that "as a specialist in classical Greek literature and especially as a classicist at a university [Tufts University] largely dominated by engineers, MD-Ph.D.s, social scientists and 'humanists' deeply suspicious of the label 'humanism' and of all traditional culture, I understand the position of marginalized intellectual all too well, but I am, in many ways, more interested in the general public than I am in my professional colleagues." (118) Later he says that "as a humanist, I see little to lose from electronic media. ...Artificial dichotomies between paper and electronic media only distract us from the question of who does what." (136)

Crane's essay is one of twenty-two chapters by different authors that attempt to improve our "understanding of emerging communication technologies." This volume, which is part of a larger series on new media technologies entitled *Media In Transition*, tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. The editors of this volume describe the chapters in this work as follows: "Challenging the assumption that new technologies displace older systems with decisive suddenness and have a revolutionary impact on society, the essays in this book see media change as an accretive, gradual process, always a mix of tradition and innovation, in which emerging and established systems interact, shift, and collude with one another.

**1684.** Crane, Walter, ed. *Of the Decorative Illustration of Books Old and New*. London: George Bell and Sons, 1896.

Crane devoted a few pages to the influence of photography. He wrote in 1896 that "Indeed, the photograph, with all its allied discoveries and its application to the service of the printing press, may be said to be as important a discovery in its effects on art and books as was the discovery of printing itself. It has already largely transformed the system of the production of illustrations and designs for books, magazines, and newspapers, and has certainly been the means of securing to the artist the advantage of possession of his original, while its fidelity, in the best processes, is, of course, very valuable.

"Its influence, however, on artistic style and treatment has been, to my mind, of more doubtful advantage. The effect on paintings palpable enough, but so far as painting becomes photographic, the advantage is on the side of the photograph. It has led in illustrative work to the method of painting in black and white, which has taken the place very much of the use of line, and through this, and by reason of its having fostered and encouraged a different way of regarding nature -- from the point of view of accidental aspect, light and shade, and tone -- it has confused and deteriorated, I think, the faculty of inventive design, and the sense of ornament and line; having concentrated artistic interest on the literal realization of certain aspects of superficial facts, and instantaneous impressions instead of ideas, and the abstract treatment of form and line.

"This, however, may be as much the tendency of an age as the result of photographic invention, although the influence of the photograph must count as one of the most powerful factors of that tendency."

**1685.** Crary, Jonathan, ed. *Techniques of the Observer: On Vision and Modernity in the Nineteenth Century*. Cambridge, MA: MIT Press, 1990.

Crary says that "this is a book about vision and its historical construction. Although it primarily addresses events and developments before 1850, it was written in the midst of a transformation in the nature of visuality probably more profound than the break that separates medieval imagery from Renaissance perspective. The rapid development in little more than a decade of a vast array of computer graphics techniques is part of a sweeping reconfiguration of relations between an observing subject and modes of representation that effectively nullifies most of the culturally established meanings of the terms *observer* and *representation*. The formalization and diffusion of computer-generated imagery heralds the ubiquitous implantation of fabricated visual 'spaces' radically different from the mimetic capabilities of film, photography, and television. These latter three, at least until the mid-1970s, were generally forms of analog media that still corresponded to the optical wavelengths of the spectrum and to a point of view, static or mobile, located in real space. Computer-aided design, synthetic holography, flight simulators, computer animation, robotic image recognition, ray tracing, texture mapping, motion control, virtual environment helmets, magnetic resonance imaging, and multispectral sensors are only a few of the techniques that are relocating vision to a plane severed from human observer. Obviously other older and more familiar modes of 'seeing' will persist and coexist uneasily alongside these new forms."

Crary's attention, though, is focused earlier. "By outlining some of the 'points of emergence' of a modern and heterogeneous regime of vision, I simultaneously address the related problem of when, and because of what events, there was a rupture with Renaissance, or *classical*, models of vision and of the observer. How and where one situates such a break has an enormous bearing on the intelligibility of visuality within nineteenth- and twentieth-century modernity...."

The author sees photography and the scientific realism of the mid-nineteenth century as important developments. But he suggests "that a broader and far more important transformation in the makeup of vision occurred in the early nineteenth century. Modernist painting in the 1870s and 1880s and the development of photography after 1839 can be seen as later symptoms or consequences of this crucial systemic shift, which was well under way by 1820." Crary sees "the camera obscura as paradigmatic of the dominant status of the observer in the seventeenth and eighteenth centuries, while for the nineteenth century I discuss a number of optical instruments, in particular the stereoscope, as a means of detailing the observer's transformed status."

Crary admits that he is not seeking to write "a 'true history,' or to restore "to the record 'what actually happened.' The stakes are quite different -- how one periodizes and where one locates ruptures or denies them are all political choices that determine the construction of the present."

This 150-page book is based on published sources, and is often heavily theoretical and filled with jargon. The Bibliography divides work published before 1900 and after that date, and is helpful.

**1686.** ---. "Unbinding Vision: Manet and the Attentive Observer in the Late Nineteenth Century." *Cinema and the Invention of Modern Life*. Ed. Leo Charney and Vanessa R. Schwartz, eds. Berkeley: University of California Press, 1995. 46-71.

Crary's essay is part of a collection that attempts to show cinema's connection to modern life. "It may be unnecessary to emphasize that when I use the word 'modernization' I mean a process completely detached from any notions of progress or development, one which is instead a ceaseless and self-perpetuating creation of new needs, new production, and new consumption." Elsewhere Crary writes that "Even before the actual invention of cinema in the 1890s, though, it is clear that the conditions of human perception were being reassembled into new components."

**1687.** Crawford, T. C., ed. *The Disappearance Syndicate and Senator Stanley's Story*. New York: Charles B. Reed, Publisher, 1894.

This story talks about "a central receiver of sound and light," which gives a person the ability to "see and hear what is taking place at a distance. It is also a medium of thought-transference, and a constant radiator of electrical force." It also mentions electrical lights that do not have wires. One character in this novel talks about a device that brings together the principles of the phonograph, telephone, and Edison's kineotograph. Chapter IX is entitled "The Revelations of the House of Light," and says that the "whole world is bare to the gaze of inspectors, who watch the globes that are in our sub-telegraph stations."

**1688.** Crawford, Walt, ed. *Being Analog: Creating Tomorrow's Libraries*. Chicago and London: American Library Association, 1999.

This book follows an earlier work that Crawford co-authored with Michael Gorman entitled *Future Libraries: Dreams, Madness, & Reality* (American Library Association, 1995). It warned about the accepting "digital utopias" in constructing future libraries.

"The glory days of the all-digital brigade are in the past," Crawford writes in *Being Analog*. Within librarianship, the peak may have been 1990-1994. Since *Future Libraries*, visions of virtual libraries seem to be fading away. Some futurist voices continue to argue for the death of print and the convergence of all media, computing, and communication. The narrowness and emptiness of these projects are becoming apparent to most people."

The chapters in this book are divided into four parts: Part I is "Being Analog"; Part II, "Libraries and Librarians"; Part III, "Resources and Users"; and Part IV, "Creating Tomorrow's Libraries." The concluding chapter is entitled "Revolution through Evolution." The work has a brief, one-page bibliography.

**1689.** Creighton, Donald, ed. *Harold Adams Innis: Portrait of a Scholar*. Toronto: University of Toronto Press, 1957.

This brief 146-page biography covers Innis life from his birth in 1894 and death in 1952. Creighton devotes attention to the formative influences of Innis's rural upbringing and his participation in the Great War of 1914-1918 during which he was wounded. He notes that Innis developed a dislike of the United States in the aftermath of World War I. The biography then discusses Innis's work at the University of Chicago and his development as a historian and political economist. It is not until the last twenty-five pages that the author turns to Innis and his study of communication. Creighton notes that by the end of World War II Innis "had ceased spiritually to be a North American," and that he had become a critic of specialization and "present-mindedness" in

economics. By then Innis had come to see communication as a key to understanding history. He insisted upon the necessity of the 'broad approach'. He valued, above everything else, the truth of synthesis. And he was driven inevitably into a stupendous comparative investigation of the interrelations of communications with politics, economics, and religion, throughout history and over the entire world."

This work lacks notes, bibliography, and index.

**1690.** Cressey, Paul G. "The Community -- A Social Setting for the Motion Picture." *Children and the Movies: Media Influence and the Payne Fund Controversy*. Eds. Jowett, Garth S., Jarvie, Ian C. and Fuller, Kathryn H. New York: Cambridge University Press, 1996. 133-216.

This unpublished study of movie theaters and the community was original to have been part of the Payne Fund Studies. It is published here in a volume devoted to the theme of movies, children, and the Payne Fund Studies. The editors of this work attempt to rehabilitate the Studies which were the target of a major effort to discredit them by the Hays Office during the 1930s. The Payne Fund Studies were also strongly criticized by such intellectuals as Mortimer Adler in *Art and Prudence* (1937). Here Cressey gives a fascinating picture of the role that movie theaters had come to occupy in the community.

**1691.** Cressey, Richard. "The Cinematographer as On-the-Spot Journalist." *American Cinematographer* 48.1 (1967): 36, 68.

In this article, Cressey discusses portable camera technology that allows one person to film and record sound on location. This technology made it possible "to film double-system, split-screen, man-on-the-street interviews." (36) Avoiding vibration and bouncing pictures is determined by how the cameraman wears the camera. This system is still relatively heavy, although Cressey notes that he has "shot continuously for a half hour without the slightest fatigue." (68) He argues that this portable technology offers the non-theatrical cinematographer "long overdue emancipation ... from antique equipment" designed for other purposes. "It beats me," he said, "why we have had to put up with these fossilized tools and procedures for so long." (68) He notes that this camera technology often allows him to cover "news events unobtrusively (except that when I'm finally spotted the 'one-man band' effect causes something of a sensation)." (36)

Cressey was Director of Photography at WNYS-TV in Syracuse, NY, and owned his own production company, "Ideas on Film." Trained as a sociologist, for the previous decade he had been making documentary films, commercials, and newsreels for TV.

**1692.** Crevier, Daniel, ed. *AI: The Tumultuous History of the Search for Artificial Intelligence*. New York: BasicBooks, a Division of HaperCollins Publishers, Inc., 1993.

Writing in 1993, the author concludes that over "the decade or two ... AI will gradually seep into all human activities, with mostly beneficial effects. Since, during that period, machines will remain less intelligent than people, we should keep the upper hand on them without too much difficulty.

"In the longer term, however, AI remains immensely threatening. The machines will eventually excel us in intelligence, and it will become impossible for us to pull the plug on them.....

"When machine acquire an intelligence superior to our own, they will be impossible to keep at bay.....

"At the very least, human society will have to undergo drastic changes to survive in the face of artificial intelligences. Such changes may be for the best, but the possibility of evil will always be lurking in the silicon innards of our new allies. Their arrival will threaten the very existence of human life as we know it. Whatever the outcome, we will have to radically re-examine our values and ask ourselves such questions as: Is intelligence what humanity is about? Whether it is or not, where do our loyalties belong -- to humanity or to evolution? Can non-biological life achieve a higher spiritual evolution than humanity can?

"It is neither possible nor desirable to outlaw AI. We should not, however, expect the main battles of the twenty-first century to be fought over such issues as the environment, overpopulation or poverty. No, we should expect the fight to be about how we cope with the creations of our own human ingenuity; and the issue, whether we or they -- our silicon challengers -- control the future of the earth." (340-41)

**1693.** Cripps, Thomas, ed. *Hollywood's High Noon: Moviemaking and Society Before Television*. Baltimore: Johns Hopkins University Press, 1997.

Thomas Cripps *Hollywood's High Noon: Moviemaking and Society Before Television* (1997) is a captivating study that considers movies as social phenomena and locates its analysis in the period between the two world wars. Cripps, also the author of what Stanley Kutler calls the "authoritative history of African Americans in films, is interested in charting the classist implications of the Hollywood film industry in the first half of the twentieth century. This is a valuable study because it does not simply examine Hollywood from the point of view of the big studios, but it rather from that of the American movie-going population, with particular concern for the ethnic and working-class contingents that have so often been over-looked in social histories of the film industry.

Cripps begins his study about Hollywood's social effects on the United States by first explaining how Hollywood became the center of the American film industry. Considering *The Birth of a Nation* (1915) for its stylistic qualities that came to define Hollywood cinema, Cripps writes it is a "key document in the history of Hollywood's becoming HOLLYWOOD." (29) Cripps not only notes the innovative style of *The Birth of a Nation* (which included such features as the close-up, the cross-cut, and the wide-angle shot), but also suggests that its glitzy advertising campaign foretold the future glamour of Hollywood. In addition to this exploration of Hollywood's stylistic beginnings, Cripps demonstrates how World War I helped the movie industry into leveraging national prominence: "with the onset of World War I in the summer of 1914, the American cultural hegemony that had already begun stealing over Europe mushroomed. The war quickly gave birth to a diplomacy that calculatedly entwined American ideology with Hollywood profiteering. . . . The gain for Hollywood was incalculable." (32) With the growing power and influence of Hollywood during and after World War I, Cripps also shows how a sort of self-standardization emerged, so that trade publications codified every stage of production and distribution." (34)

After he establishes how Hollywood became HOLLYWOOD, Cripps shifts his focus to the everyday American citizen who consumed Hollywood's products. In order to begin discussing the position of the moviegoer relative to the film industry between the two world wars, Cripps emphasizes the fact that movies were marketed along distinct class lines. He explores the reasons for and effects of having 1st-run showings of movies in palatial theatres in white neighborhoods distinct from 4th-run movies shown in the grind houses of the poorer neighborhoods. With such top-down class distinctions in mind, Cripps moves on to explain how ethnic and working-class moviegoers negotiated the differences between first-run theaters and the fourth-run grind houses, both of which played movies that were largely exclusionary to anyone but a middle-class WASP audience. Cripps argues that the segregation of American movies along race and class lines, coupled with the rise of television, led to the dissolution of the massive movie-going audience of the inter-war period. He writes: "With the passing of the great movie audience and of the movies as an oligopolic medium of entertainment, there passed a form of expression that had simultaneously provided a prismatic spectrum of the politics of entertainment and spoken as though on behalf of a mythic universal American. Classical Hollywood had come to its end, perhaps victim of its own part in the very myth--that of a white bread America--it helped to create, by means of its narrative form and gilded downtown palaces." (67)

Where Cripps' study differs from other histories of Hollywood and the film industry is that he devoted serious attention to what he calls "Others" Movies--films that existed outside this myth of a "white bred America." After a discussion of how Hollywood self-censorship under the Hays office tended to reinforce the white bread myth, Cripps looks at films made by and for minority audiences, particularly African American. Cripps discusses, for example, *The Birth of A Race* (1918), which was a response to the racist *The Birth of a Nation* that was intended to explore American race relations from an African-American perspective (132). In addition to explications of

particular films, Cripps' study argues that organizations such as the NAACP and others spearheaded campaigns which, in combination with minorities purchasing power, led Hollywood to revise its production code.

Following such discussions about ethnic alternatives to mainstream Hollywood films, Cripps uses a similar socio-political lens to examine the role of Hollywood during the Second World War, and, finally, to chart the collapse of the studio system in the post-war years. In the end, *Hollywood's High Noon* is a nuanced, well-argued study that would be useful for anyone interested in how Hollywood affected America's multi-ethnic and economically diverse population.

--Steve Belletto

**1694.** Crofts, J. "Color-Music." *Eclectic Magazine of Foreign Literature* 42.5 (1885): 635-47.

The author of this article is Rev. J. Crofts, although what denomination he is (Presbyterian?) is unclear. Crofts begins by discussing color sense in lower animals and quotes extensively from Charles Darwin's *Descent of Man* (e.g., Part I, chapter iii). Bird and insects often use color as a form of sexual attraction. Here, quoting Darwin: "'Why certain bright colors should excite pleasure cannot, I presume, any more than why certain flowers and scents are agreeable.'" (emphasis in original text) But man differs from lower animals. His senses are not as keen as a dog's, for example. Yet man has a more highly developed sense of beauty. Color is a source of pleasure because "it is when to the glories of light is added the boundless wealth of color" that man's "heart truly rejoices." (638) He maintains that "**There is scarcely anything more widely spread, or more commonly strong, than the love of color....**" (643) (my emphasis)

Crofts observes that three kinds of people seem to object to color, or are at least indifferent-- those who are color blind, those for whom color doesn't make a difference, and those who are hostile to it perhaps because of religious values. He writes that "That what people are pleased to call 'quiet colors' have something about them savoring of piety, whilst brighter colors are allied to profanity and godlessness, is by no means an uncommon notion amongst people of mature habits...." (639) He offers a story of one person, a member of the Society of Friends, who waged a campaign against colored dyes in 1720. But such people constitute a small minority, Crofts argues. (640)

Croft says that in Darwin's theory it is usually the female who is attracted to the bright colors of the male. Over time, this color sense "would become what we might call a peculiarly feminine faculty." (641) But, he maintains, "it is not ... only in modern times that a special love for color has been attributed to the feminine mind." (641) He gives examples from Virgil to prove this point. (641-42)

Crofts says that "there is, in nature, great wealth of color-harmonies, and abundant suggestions of a pure color-art" (642) but we do not have yet an art comparable to the creations of Beethoven, Handel, or Haydn in music. There "**exists, as yet, no color-art as a language of pure emotion.**" (H. R. Haweis quoted, 642) (my emphasis) He writes that "Color, then, has hitherto only been used as an accessory, however important, to form." (642)

The author is inclined to be optimistic about the possibility of color music, and agreeing with H. R. Haweis (who wrote *Music and Morals* [1872]), says "we are already on the threshold of an age in which color-music will take its place as an emotional art on equal terms with its elder sister, and vie, in the magnificence of its results, with sculpture, architecture, painting, and music." (643) Quoting Haweis: "**What a majestic symphony might not be played with orchestral blazes of incomparable hues!**" (643) (my emphasis) And again quoting Haweis: "But the color-art must first be constituted, its symbols and phraseology discovered, its instruments invented, and its composers born. Up to that time, music will have no rival as an art-medium of emotion." (643)

This article says that "It is surprising what absurd theories have been propounded and conclusions arrived at in the matter of color," (644) and Crofts attempts to debunk them. (644-45) He notes that the colors of nature are often discordant. "As a matter of fact, neither are the sounds of nature nor the colors always harmonious. Even

the colors of flowers are sometimes discordant; and the best and truest guide in nature, and the only one to be trusted, is the natural taste of man." (645) Crofts points out that while there may be analogies to be made between music and color, they also "differ in so many points...." (646)

Electricity held the key to color art, Crofts believed in 1885. "**We have, as it were, just opened the door of an inexhaustible treasure-house, and taken a stupefied glance at its contents.**" (647) (my emphasis) Electric light offers "the means of expressing variety, velocity, intensity, form, elation, and depression -- in short, all the complex properties of emotion; and it only requires a master mind to direct and adapt and reduce to system and order what is already in our hands as raw material, for the world to possess a **new art-medium of emotion** in all respects capable of rivaling music itself." (647) (my emphasis)

This article was originally published as J. Croft, "Colour-Music," *The Gentleman's Magazine*, CCLIX (July 1885), 251-271.

**1695.** Crone, Robert A., ed. *A History of Color: The Evolution of Theories of Lights and Color*. Dordrecht/Boston/London: Kluwer Academic Publishers, 1999.

The author writes that "this book gives a survey of color theories between 500 BC and 2000 AD." (1) Among the ideas explored is the limitations of language in commenting on color. Crone notes that "the number of simple, abstract, color terms is small. In their *Basic Color Terms* (1969), Brent Berlin and Paul Kay come to the rather unexpected (and not universally accepted [33]) conclusion that in all civilized languages there are exactly eleven: three achromatic (white, grey, black) and eight chromatic (red, yellow, green, blue, brown, purple, orange and pink). ... There is little purpose in enquiring into the physiological process by means of which we can categorize colors. We do not know nearly enough about the neurophysiology of color vision to be able to answer that question...." (236)

**1696.** Crouch, David, Jackson, Rhona, and Felix Thompson, eds., eds. *The Media and the Tourist Imagination: Converging Cultures*. New York: Routledge, 2005.

The book is a collection of essays which study the significance of the consumption of images in different approaches to illuminate the interactions between media practices and tourism. Some chapters disclose the institutional power of the media to constraint tourist experience; some, on the contrary, present ethnographic examples of how tourists play active roles in negotiating the meaning of space. Also, there are other chapters which intend to indicate the close relationship between an entertainment industry and tourist development. The collection thus explores the connection between tourism and the media with diverse angles and provides stimulating ideas for thinking of the images and tourist imagination in the notion of consumption. This work is a volume in the *Contemporary Geographies of Leisure, Tourism, and Mobility* series.

**1697.** Crouthamel, James L., ed. *Bennett's New York Herald and the Rise of the Popular Press*. Syracuse, NY: Syracuse University Press, 1989.

This book recounts the rise of James Gordon Bennett and the *New York Herald*, one of the pathbreaking newspapers of the nineteenth century, and one of the early successful penny papers. Bennett and other penny press editors, exploited new technology such as the telegraph and steam ships to gain an advantage on competitors. Bennett initiated a form of investigative reporting in the sensation Robinson-Jewett murder case. Here was a paper that exploited sex and violence, used sensationalism, and helped create an early form of mass culture. Nationalism was also a strong theme in Bennett's paper.

-- SV

This is the most useful of the modern studies of James Gordon Bennett, the man often associated with the development of "modern journalism" in the form of the penny newspaper of the antebellum years. Bennett has been the subject of a great deal of scholarship over the years, beginning with several flattering biographies and histories that were penned by his colleagues and friends and continuing with a recent debate over the "mythology" of the penny press. Crouthamel here gives us a more objective and focused account of Bennett himself as a journalist. To a lesser degree, the book is an examination of the rise of a new means of mass communication, the cheap urban newspaper, supported by advertising and circulation rather than party patronage and displaying political independence rather than partisan ties. The penny press is described as a revolution and Bennett, in this account, is the leading revolutionary.

Crouthamel spends the first couple of chapters describing Bennett's innovations, including the aggressive gathering of news, the use of technology like the rotary press and the telegraph, hiring foreign correspondents, and similar developments that opened the way toward a more modern, timely, and event-centered journalism. Bennett was also, of course, known for unleashing a torrent of sensationalism and dramatic coverage of crime, scandal, and the mysteries of the new urban life. As Crouthamel makes clear, Bennett was largely reviled by his competitors and "respectable" New Yorkers because of this style, but other newspapers were quick to imitate, or at least adapt, some of the more profitable tactics. Regardless of how widely hated he was, there is no question that Bennett showed editors that journalism could be a lucrative enterprise.

The bulk of the book, however, is more of an examination of Bennett's editorial position, such as it was, on a wide variety of issues. The book, in fact, might be more aptly titled "Bennett's Opinion on the Issues Affecting American Life," which perhaps is due to Crouthamel's track record as a political biographer of editors (he is the author of an early volume on James Watson Webb, who is maybe best known today for having attacked Bennett and beat him with a cane on several occasions). The New York *Herald* was one of the first independent newspapers, but it was by no means apolitical. Bennett outlined his strongly held if erratic opinions in paper and his large readership made him a force to be reckoned with, even though Crouthamel ultimately argues that people read the *Herald* despite, rather than because of, its editorial page. Bennett was non-partisan, but tended to support Democratic positions. This did not prevent him from endorsing Whigs and Republicans as they suited his purposes. However, it was Bennett's strong pro-Southern ideology and his hatred of abolitionists that define him today. Crouthamel also outlines Bennett's typical use of conspiracy theories to explain policies or developments that displeased him and his vacillation on complicated issues. He was, to say the least, "politically erratic and inconsistent."

Crouthamel's book is even-handed and generally well-written if a little bit dry. He also is frank in his acknowledgement of his work's limitation. Scholars who wish to examine the penny press have very little material aside from issues of the papers and Crouthamel's argument is based almost entirely on his reading of the *Herald*. Bennett left very few personal papers and the *Herald's* records are not available. This probably explains why it is easier to write about what was in the paper than why the paper was the way it was. Bennett's political opinions, such as they were, are easily studied from microfilm copies of the *Herald*. Despite this, *James Gordon Bennett and the Rise of the Popular Press* is a good study of an innovative journalist and the editorial positions of the nation's largest circulation newspaper of the mid-nineteenth century. If you are looking for more discussion of the penny press's non-political content or its popularity with readers, a book like Andie Tucher's *Froth and Scum* would be more useful.

-- Rob Rabe

**1698.** Crowther, Bosley. "Changing the Script: Welcome Revisions Made in Production Code." *New York Times* Dec. 16, 1956 1956: X3.

This article discusses the 1956 revision of the motion picture Production Code which relaxed restrictions on treating drug addiction, abortion, prostitution, and kidnapping. Crowther says that the streamlined Code made it "a body of instructions to producers rather than laws." He notes that the appeals process is still flawed what with only executives from the nine studios that were MPAA members. These people passed judgment on their competitors product. Crowther looked forward to the day when the entire Code would be eliminated.

**1699.** ---. "Delicate Subjects: A Sober Consideration of the Use of Sensitive Material in Films." *New York Times* Oct. 29, 1961 1961: X1.

This article discusses the state of movie censorship in Hollywood following the MPAA's decision on October 3, 1961, to relax its restrictions under the Production Code and permit treatment of homosexuality in films.

**1700.** ---. "Dishing the Dirt: A Blast at Mercenary Sordidness in Films." *New York Times* Sept. 25, 1960 1960: X1.

This piece begins: "Something unsavory is happening in the motion-picture realm that demands the exercise of utmost vigilance and responsibility on the part of those who are truly interested in the future of films. This is the tendency of producers, made evident in any number of recent films, to go for licentious stories and/or inject extreme and gross sex details in their works." He goes on to say: "Such pictures as 'Suddenly, Last Summer,' 'From the Terrace,' 'Strangers When We Meet,' and even 'Elmer Gantry,' to mention only a few, have betrayed a concentrated predilection on the part of major producers with the abnormal and crass aspects of sex."

**1701.** ---. "Drugging the Code: Film Company Heads Put Clamp on Change." *New York Times* Dec. 11, 1955 1955: 149.

In November, 1955, the *New York Times* reported that United Artist would release the movie, *The Man with the Golden Arm*, with or without the PCA's seal. It was the first time that a major studio had announced its intention to exhibit a controversial film before submitting it to the PCA. The studio did submit the film to the PCA but the PCA refused to approve it. Johnston and the MPAA's Appeals Board upheld this decision on December 6, 1955, but the studio heads were divided. Only five voted to uphold the appeal while four other abstained. The following day, Arthur Krim announced that United Artist would withdraw from the MPAA in protest. This episode contributed to Johnston's decision to revise the Production Code in 1956. The revised Code permitted treatments of narcotics use in movies.

**1702.** ---. "Festival Frustration: Removal of 'Blackboard Jungle' at Venice Raises Grave Questions." *New York Times* Sept. 4, 1955 1955: X1.

Crowther criticizes the decision by U.S. Ambassador to Italy, Clare Booth Luce, not to attend the Venice Film Festival if the movie *Blackboard Jungle* is shown. This decision smacks of government censorship, Crowther argues, something not practiced except in wartime. Crowther says this decision will only increase foreign curiosity about the movie and make it more likely that more people will see the film. Crowther, though, also questions the process by which American films are chosen to play in foreign film festivals.

**1703.** ---. "Ingenious Paradox: 'Never on Sunday' Puts a Wry Idea on Screen." *New York Times* Oct. 23, 1960 1960: X1.

This article discusses *Never on Sunday* (1960), the Greek film comedy by blacklisted writer-director Jules Dassin. Written and directed by Dassin, the movie was about an American tourist (played by Dassin) in Greece who attempts, unsuccessfully, to reform a prostitute (played by Melina Mercouri). The movie was made for about \$150,000 and made about \$5 million in the United States alone. When Dassin's film played in Atlanta, censors tried to ban it for being obscene, but ban was overturned when the Fulton County Superior Court held the city's censorship law to be unconstitutional. By that time, the film had played in more than 2,000 theaters in 175 American cities

**1704.** ---. "Lesson for Today: Expanded Bible Story in De Mille's New Film." *New York Times* Nov. 11, 1956 1956: 141.

Making films abroad sometimes offered movie makers freedom to deal with topics in ways that might not have been possible in the United States. Cecil B. DeMille shot much of his epic film, *The Ten Commandments*, in Egypt where new movie making technologies such as 70mm film, CinemaScope, and VistaVision allowed him to emphasize the area's spectacular settings. DeMille took inspiration from classical painters and paid much attention to the use of color in the film. In Egypt, DeMille found it possible to create, according to historian Peter Lev, "a level of sexual display scanty costumes and suggestive scenes which would have otherwise encountered censorship problems in the United States and many other countries," concludes one film historian. There were other matters with which religious purists might have quarreled. DeMille's movie dealt with thirty years of Moses's life not chronicled in the Bible. And in it "emphasis on freedom and the blending of religious and political discourses," it reflected contemporary American Cold War values. When Eric Johnston, president of the MPAA, negotiated a film exchange with the USSR in 1958, the Soviets declined to take this movie as part of the package. Here, Crowther says that DeMille "has plainly made Moses a hero by all the standards of modern-day success. This hero is played by Charlton Heston with muscular arrogance."

**1705.** ---. "The Little Picture: Arguments for Sense Over Physical Size." *New York Times* Oct. 1, 1961 1961: X1.

This article discusses several films including *Never on Sunday* (1960), the Greek comedy by blacklisted writer-director Jules Dassin. Written and directed by Dassin, the movie was about an American tourist (played by Dassin) in Greece who attempts, unsuccessfully, to reform a prostitute (played by Melina Mercouri). The movie was made for about \$150,000 and made about \$5 million in the United States alone. Although not discussed in this article, when Dassin's film played in Atlanta, censors tried to ban it for being obscene, but ban was overturned when the Fulton County Superior Court held the city's censorship law to be unconstitutional. By that time, the film had played in more than 2,000 theaters in 175 American cities

**1706.** ---, ed. *Movies and Censorship: Public Affairs Pamphlet No. 332*. New York: Public Affairs Committee, 1962.

This pamphlet provides an intelligent history of motion pictures censorship, both by state and local governments, and by the movie industry. Crowther see television bringing important changes in the entertainment patterns of Americans and changing the audience for motion pictures. TV took away the family audience and hence Hollywood had to come up with more engaging and mature films if it was to survive economically. Crowther explains the significance of the *Miracle* case. Several states -- Ohio, Pennsylvania, Massachusetts -- soon overturned their movie censorship laws. This work ends with a discussion of the merits and disadvantages of a classification system in which films are rated according to their appropriateness of youth and a discussion of the British classification system which rated films U, A, or X. Crowther notes that in Britain, already the X rating was being used as an advertising lure -- e.g., "the X-iest film on the screen." The author argues for a system in which parents decide what films their children will watch. He maintains that there was already enough information about movies (e.g., *The Green Sheet*, reviews, etc.) to give parents all they needed to know in making decisions.

**1707.** ---. "New Czar on the Job." *New York Times* May 1, 1966 1966: 125.

This article notes that Jack Valenti's selection as the new MPAA president was like a "bolt out of the blue." Valenti is described as "an exceptionally eager and vigorous" leader who "is known to be a human dynamo a tangle of nerves and muscles who likes to get things done." He is quoted as saying "I don't ever remember seeing a bad movie."

**1708.** ---. "New Decision Due on Movie Nudity: Industry Panel Weighs Case of 'The Pawnbroker'." *New York Times* March 9, 1965 1965: 30.

The movie that first caused the motion picture industry Production Code's barricades against nudity to give way was a black-and-white film called *The Pawnbroker* (1965). The movie was filmed on location in Harlem and starred Rod Steiger who played a Holocaust survivor. Shurlock initially rejected the film because it had two scenes showing fully exposed women's breasts, but because of the important theme, he thought the Appeals Board should decide if the movie deserved special treatment. Although the film got the PCA seal on appeal, the MPAA tried to uphold its nudity ban by making this picture an "exception."

**1709.** ---. "A New Responsibility for Films." *New York Times* Aug. 28, 1966 1966: 1, 14.

Crowther talks about the fact that film has become so sophisticated, "aimed at such a wide range of intellects and tastes," (14) that the MPAA should abandon its efforts to dictate which movies it feels are morally pure for specific audiences. The new MPAA president, Jack Valenti, Crowther says, "has a great chance to reevaluate and revolutionize its [Hollywood's] thinking about moral responsibility." (14)

**1710.** ---. "On Places and Faces: New Films Offer a Variety of Views of Geography and History." *New York Times* Aug. 21, 1955 1955: 97.

This article discusses several motion pictures, including *To Catch a Thief* (1955), starring Cary Grant and Grace Kelly, and their use of such technology as CinemaScope, VistaVision, and color. *To Catch a Thief*, by Alfred Hitchcock, was filmed on the French Riviera. Crowther says the picture gives Cannes "a spaciousness and beauty that makes you feel now and then that it is real." Of the love story between the Grant and Kelly characters, it is made more believable by "the romantic look made more vivid by color and CinemaScope."

**1711.** ---. "Probing Foreign Films: Large Crop of New Ones Runs to Sex Themes and Low-Grade Comedy." *New York Times* Nov. 3, 1957 1957: 137.

Crowther writes about eight foreign-made films, the notable being Brigitte Bardot's *And God Created Woman*. The movie was "so frankly and fragrantly carnal," and but one of several European-made films that had recently opened in America, that it suggested that sex was "obsessing foreign minds," said Crowther.

**1712.** ---. "The Screen: 'World of Suzie Wong'." *New York Times* Nov. 11, 1960 1960: 36.

Filmed in Hong Kong and England, *The World of Suzie Wong* was a movie about a prostitute (played by Nancy Kwan) and part of the story was set inside a brothel, despite the Code's explicit restrictions against showing such establishments. The advertising referred to Kwan's character as a "yum-yum girl," and Crowther in his review says that Kwan played her "so blithely and innocently" that even women in the audience should like her.

**1713.** ---. "Screen: Cat Man Out 'To Catch a Thief'." *New York Times* Aug. 5, 1955 1955: 14.

In this review of Alfred Hitchcock's film *To Catch a Thief*, Crowther discusses the use of such technology as VistaVision and color. The film was one of the so-called "runaway" or American-interest films of the 1950s, film in France along the French Riviera. Crowther says that "Hitchcock has used that famous coast to form a pictorial backdrop that fairly yanks your eyes out of your head. Almost at the start, he gives you an automobile chase along roads that wind through cliff-hanging seaside villages." However, the camera man had "a bad time with slow dissolves and fades. He has not mastered VistaVision. It has almost mastered him."

**1714.** ---. "Season of Madness: Strange Things Happen in Local Film Realm." *New York Times* July 19, 1959 1959: X1.

This article discusses the fuss over the French film *Lady Chatterley's Lover* (1957), which New York State censors tried to ban and a ban which the U. S. Supreme Court later overturned. Crowther says the love scenes in this film are "strangely tepid" for a French film and cannot "hold a candle to the ones" in the British film, *Room at the Top*, which was a smash hit when it played in the United States.

**1715.** ---. "What's the Dingbat For?" *New York Times* April 9, 1967 1967: 97.

This article notes that "close to half of the movies released in the United States every year are not even submitted for approval of the Production Code." Most people don't know about the Code or care, Crowther writes. Audiences around the U. S. and especially in New York, do "not give two hoots as to whether a picture has passed the Production Code."

**1716.** Crowther, J. G. [James Gerald], ed. *Discoveries and Inventions of the 20th Century*. 1914? New York: E. P. Dutton & Company, Inc., 1955.

This work is the fourth edition of a book originally published by Edward Cressy entitled *Discoveries and Inventions of the Twentieth Century* (1914?). This edition attempts to retain Cressy's original structure. Cressy began, as does this book, "the revival of water-power, economy in the use of fuel, modern steam engines, gas, oil, and petrol engines, and the generation and distribution of electricity." Then follow chapters on electrical lighting and heating, new processing in producing steel, changes in engineering workshops, and electrical furnaces. Then the work deals with refrigeration, and improvements in farming and raising livestock. Subsequent chapters cover railroads, electric traction, motor cars, ships, aircraft, radio and radar, photography, and atomic energy (in the 1955 edition). (Cressy had also considered "recent marvelous discoveries relating to radium, electricity, and matter.")

**1717.** Cubitt, Sean, ed. *Timeshift: On video culture*. London and New York: Routledge, 1991.

**1718.** Cumberland, Sharon. "Private Uses of Cyberspace: Women, Desire, and Fan Culture." *Rethinking Media Change: The Aesthetics of Transition*. Ed. David Thorburn and Henry Jenkins, eds. Cambridge, MA: MIT Press, 2003. 261-79.

"The subject of this essay," the author says, "is fiction writing on the Internet, specifically, the erotica written by women in the context of fan culture..... I examine the way in which women are using the paradox of cyberspace -- personal privacy in a public forum -- to explore feelings and ideas that were considered risky or inappropriate for women in the past. I will suggest that the protection and freedom of cyberspace is enabling these writers to defy many of the social taboos that have inhibited self-exploration and self-expression before the emergence of the Internet." (261)

Cumberland's essay is one of twenty-two chapters by different authors that attempt to improve our "understanding of emerging communication technologies." This volume, which part of a larger series on new media technologies entitled *Media In Transition*, tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. The editors of this volume describe the chapters in this work as follows: "Challenging the assumption that new technologies displace older systems with decisive suddenness and have a revolutionary impact on society, the essays in this book see media change as an accretive, graduate process, always a mix of tradition and innovation, in which emerging and established systems interact, shift, and collude with one another.

**1719.** Current, Richard N., ed. *The Typewriter and the Men Who Made It*. Urbana, IL; Arcadia, CA: University of Illinois Press; Post-Era Books, 1988.

This 149-page book examines the invention of the typewriter and is informative about efforts to construct a workable machine before Christopher Sholes patented a successful device. About twenty different inventors in the United States, Great Britain, and France had tried to make writing machines before Sholes. "One might think that the technique of printing with types, widespread before 1500, would soon have suggested the possibility of writing with types. However, no such effort was made, so far as is know, for over two centuries, and no really successful effort for about four centuries. Even the steel pen, a humble enough device, was hailed as a marvelous

improvement when it finally began to replace the quill, around 1800." Pages 144-49 included a reprint of the 1875 trade catalog put out by Densmore, Yost & Co., entitled "The Typewriter."

**1720.** Curry, Michael, ed. *Digital places: Living with geographic information technologies*. London: Routledge, 1998.

This abstract was provided by the author on his website at UCLA: "The last twenty-five years have seen major changes in the nature and scope of geographical information. This has happened in one way in society at large, where computers, satellites and global positioning systems have made geographical information more extensive, more detailed and more available. It has happened in another way within the university, where rapidly evolving geographic information systems have been touted as tools useful in a wide range of disciplines, tools that will resolve problems as different as the nature of global climate change and the routing of mail. In both settings the move from manual to computer-based systems is viewed as having a natural trajectory, from less powerful to more powerful technologies. These systems are held to be increasingly able to model and represent all that is important in geographical knowledge and behaviour. They are seen as fitting into and supporting traditional scientific and social practices and institutions. *Digital Places: Living with Geographic Information Technologies* shows that on each score the systems have been misunderstood and their impacts underestimated. By offering an understanding of Geographic Information Systems within the social, economic, legal, political and ethical contexts within which they exist, the author shows that there are substantial limits to their ability to represent the very objects and relationships, people and places, that many believe to be most important. Focusing on the ramifications of GIS usage, *Digital Places* shows that they are associated with far-reaching changes in the institutions in which they exist, and in the lives of those they touch. In the end they call for a complete rethinking of basic ideas, like privacy and intellectual property and the nature of scientific practice, that have underpinned public life for the last one hundred years."

#### "Table of Contents

Introduction Part I: The World According to Geographic Information Systems I. Reason and language in geographic information systems II. On space in geographic information systems III. Optical consistency, technologies of location, and the limits of representation Part II: Geographic Information Systems in Practice IV. On the roots of geographic information systems V. The reshaping of geographic practice VI. Who owns geographic information? VII. The digital individual in a visible world Part III: Living with Geographic Information Systems VIII. Place, practice, and the ethics of complex systems IX. Beyond PaleoGIS."

**1721.** Curtain, Michael. "Dynasty in Drag: Imagining Global TV." *The Revolution Wasn't Televised: Sixties Television and Social Conflict*. Ed. Lynn Spigel and Michael Curtin, eds. New York and London: Routledge, 1997. 245-62.

This work deals with the possibilities of satellite television envisioned by the Kennedy administration after the 1962 launching of Telstar. The author has done research in the Kennedy Presidential Library. Curtain says that this new communication technology is striking in part because of "its profoundly contradictory nature. Global television seemed to offer the prospect of enhancing both global community and superpower struggle. The new medium was characterized as a technology that would encourage mutual understanding, but also as a means of strategic persuasion. It was envisioned as a collective undertaking that would lead to a free exchange of ideas, and yet it was also a technology developed with proprietary corporate interests in mind. In these contradictions, we find important links between television policy and the foreign policy of the New Frontier. For the discourse that emerged with the new technology did not simply produce statements about the national agenda for television, the land of the vast wasteland, it also generated discussions about forging a Free World alliance under the leadership of the United States."

**1722.** ---, ed. *Redeeming the Wasteland: Television Documentary and Cold War Politics*. New Brunswick, NJ: Rutgers University Press, 1995.

Michael Curtain's *Redeeming the Wasteland: Television Documentary and Cold War Politics* (1995) takes its title from FCC chair Newton N. Minow's famous 1961 speech in which he called television "a vast wasteland." Partly as a reaction to Minow's charge, in the early 1960s the television industry developed many documentaries that it saw as serving the public good. By first fitting the television industry into a distinct cultural and political climate and then performing close readings of various Cold War television documentaries, Curtain shows that such documentaries were carefully constructed to garner public support for the governments aggressive stance on foreign policy. Curtain writes: "This book is . . . about a distinctive and complicated moment when political and corporate leaders as well as network officials embraced the television documentary in an explicit attempt to mobilize public opinion behind a more activist foreign policy." (3) In order to prove this assertion, Curtain does not organize his book chronologically, but rather around a series of relationships--such as, for example, mass media and "the national imaginary," and government institutions and broadcasters. (11) Because the book operates relationally, it is more theoretical than a historical work that sticks to a linear narrative, but in the end Curtains arguments are quite convincing.

Following chapter one, in which Curtain introduces the general climate of New Frontier America, he focuses his discussion on the results of industry-imposed television reform; namely, documentaries that were designed to educate the public against the Communist menace. In chapter two, Curtain focuses on specific documentaries such as "Who Goes There? A Primer on Communism" and "The Death of Stalin" to finally abstract key characteristics that relate to U.S. foreign policy: "In each of these programs the central narrative conflict revolves around the Communist challenge to the Free World." (40) By analyzing particular aspects of these documentaries (such as editing technique and angle-choice), Curtain demonstrates that many television documentaries in the early 1960s served as visual arguments for the opposition of Communism worldwide.

After analyzing how particular documentaries worked, Curtain expands his discussion to think about how American documentaries functioned on a global scale. Noting the advent of such new communication technologies as the transistor and the communications satellite, Curtain argues that "many government and broadcast executives considered documentary to be one of the most promising ways to use television to bring together the community of the Free World." (86) Television documentary, then, not only functioned to strengthen opposition to Communism in the United States, but was also used to yoke other countries into a ideological union with America.

In the chapters in which Curtain is not analyzing particular documentaries, he demonstrates how such documentaries were related to television news in general. Through a discussion of the three networks--NBC, ABC, CBS--Curtain shows that they created a discourse of objectivity so that the analyses of television news programs--and, by extension, their longer documentaries--were rarely challenged by the public (150). Despite the fact that challenges were rare because "communists and foreigners were specifically denied standing before the FCC," Curtain does not think that television documentaries of the early 1960s were necessarily homogenous. He writes: "Although none of these efforts produced fundamentally radical critiques of the status quo, they do point to the fact that even though the genre may have been constrained by powerful economic and institutional forces, the programs were far less predictable than one might imagine." (151)

Curtains study is an important supplement to books such as William Boddy's *Fifties Television: The Industry and Its Critics* (1990) because it focuses on documentaries, a genre that enjoyed a relatively large amount of air time in the 1960s, but which has subsequently received little scholarly attention. Curtain also sees his book as augmenting studies of the Cold War period that simply document changes in, for example, gender roles--by examining how television networks purposively shifted their programming in the early 1960s, Curtain attempts to get at *how* such changes came about, an attempt that is on the whole successful.

*Redeeming the Wasteland* is useful for anyone who is interested in the specific ways in which the privately-owned television industry produced cultural documents designed explicitly to stir public support for governmental policies. The strength of Curtains book is that he demonstrates how such a relationship worked

through close analysis of particular programs, which he then links to larger cultural, economic, and political realities.

--**Steve Belletto**

**1723.** Curtis, James, ed. *Mind's Eye, Mind's Truth: FSA Photography Reconsidered*. Philadelphia: Temple University Press, 1989.

James Curtis uses well known, widely circulated photographs by four FSA photographers--Walker Evans, Dorothea Lange, Arthur Rothstein, and Russell Lee--to address the topic of manipulation in FSA photography. Originally created as part of the New Deal program to alleviate rural poverty, the Resettlement Administration, and its successor the Farm Security Administration, produced images of rural America during the Great Depression that were often perceived as factual documents of the era. Consequently, the images were effectively used as powerful tools for creating social awareness and affecting social change due to their dynamic compositions and expressive statements. In this fine study, Curtis challenges the notion of FSA photographs as realistic and truthful documents of the Depression, and provides visual evidence showing how the photographers deliberately posed and arranged their subjects and surroundings to promote and publicize New Deal relief efforts. Moreover, Curtis emphasizes that Roy Stryker and the photographers sought to convey a specific idea of what America should look like during the Depression, resulting in socially constructed, highly contrived depictions of reality.

-**Michele Kroll**

**1724.** Curtis, Scott. "The Taste of a Nation: Training the Senses and Sensibility of Cinema Audiences in Imperial Germany." *Film History* 6.4 (1994): 445-69.

This article appears in an issue of *Film History* devoted to audiences. Curtis examines the German "cinema reform movement as it dealt with the relation between cinema, children and the masses, taste and nation, education and the body." It looks at how reformers sought to protect children from the dangers of cinema. Curtis focuses on the work on one reformer, Hermann Hälker.

**1725.** Cusack, Diane D. "Statement of Diane D. Cusack." *Final Report of the Attorney General's Commission on Pornography*. Nashville, TN: Rutledge Hill Press, 1986. 486-87.

Diane D. Cusack was a member of the Meese Commission during 1985-86. President Ronald Reagan had appointed the Commission to study pornography and to make recommendations for regulating it. Cusack had served on the City Council of Scottsdale, AZ, and was convinced that pornography, if left unchecked, would "undermine our social fabric." She favored vigorous prosecution of pornographers.

**1726.** Cutcliffe, Stephen H., and Terry S. Reynolds, eds., ed. *Technology & American History: A Historical Anthology from Technology & Culture*. Chicago: University of Chicago Press, 1997.

This anthology consists of articles that appeared in *Technology & Culture* between 1963 and 1996. Included in this collection are: **Cutcliffe and Reynolds'** introduction, "Technology in American Context"; **John G. Burke**, "Bursting Boilers and the Federal Power"; **Gail Cooper**, "Custom Design, Engineering Guarantees, and Unpatentable Data: The Air Conditioning Industry, 1902-1935"; **Ruth Schwartz Cowan**, "The 'Industrial Revolution' in the Home: Household Technology and Social Change in the 20th Century"; **Claude S. Fisher**, "'Touch Someone': The Telephone Industry Discovers Sociability"; **Richard F. Hirsh and Adam H. Serchuk**, "Momentum Shifts in the American Electric Utility System: Catastrophic Change -- or No Change at All?"; **Reese V. Jenkins**, "Technology and the Market: George Eastman and the Origins of Mass Amateur Photography"; **Bruce Seely**, "Research, Engineering, and Science in American Engineering Colleges, 1900-1960"; **George Wise**, "A New Role for Professional Scientists in Industry: Industrial Research at General Electric, 1900-1916."

**1727.** Cutler, Martha. "The Secret of Harmony in Color." *Harper's Bazaar* 39.8 (1905): 762-63.

The author says that "Unconsciously our eyes drink it in [color] from our birth, but unfortunately the eyes are too often blind and the senses dulled to the natural beauties surrounding them. It is indeed a mystery why the lessons which are a part of our very life should not in time become an instinct to us all, instead of to the favored few to whom the genius of color insight and feeling is an unstudied as it is unsought...." (762)

"Where instinct is absent study, observation, and experiment must take its place. The color artist needs no rule or law to tell him what is beautiful, but in time he inevitably forms certain well-defined theories as to the means of obtaining certain color effects. Color, after all, is physical, and mystical and elusive though its charms may be, natural laws undoubtedly underlie its combinations as well as its composition, and in time we will have as clearly defined scales and laws of harmony in color as in music, its sister art. **Color has been aptly called 'the music of light.'**" (762) [my emphasis] As for harmony in color: "**The truest harmony surrounds us on all sides, for Nature is full of it and Nature never makes a mistake.**" (762) (my emphasis)

Cutler says that "all the color have certain definite qualities." (762) She also notes that psychological studies, or experiments, have been done to see what effects color light has upon the retina. (763)

**1728.** Cutlip, Scott M., comp., ed. *A Public Relations Bibliography*. Madison and Milwaukee: University of Wisconsin Press, 1957.

The second edition of this unannotated bibliography has 5,949 entries. One section of this work deals with "Communications, Tools, and Media," and covers works dealing with film, newspapers, books, magazines, radio, television, and advertising as they are related to public relations. Another section covers public relations and the military. Cutlip was one of the early advocates of studying public relations as both a profession and as a social force in American culture.

**1729.** Cutlip, Scott M. "A Public Relations Footnote To the Pete Rose Affair." *Public Relations Review* 15 (1989): 46-48.

This article discusses the creation of the Motion Picture and Distributors Association (MPPDA), which hired Will H. Hays as its president, in the wake of the Fatty Arbuckle scandal. It draws parallels to the creation of the MPPDA and the establishment Major League Baseball Commissioner's office created after the Black Sox Scandal of 1919.

**1730.** ---, ed. *The Unseen Power: Public Relations. A History*. Hillsdale, NJ: Lawrence Erlbaum Associates, 1994.

This work provides a comprehensive history of public relations. The author, who taught many years at the University of Wisconsin, Madison, was one of the pioneers in public relations education and in writing the history of this field. This large work attempts to be a comprehensive history of the field. It discusses public relations in the context of various media.

**1731.** Czitron, Daniel, ed. *Media and the American Mind: From Morse to McLuhan*. Chapel Hill: University of North Carolina Press, 1982.

This informative survey is good on how such theorists as John Dewey, Charles Cooley, Robert Park, Harold Innis and Marshall McLuhan viewed communication as well as on individual media such as the telegraph, wireless, and television.

The telegraph, movies and radio wrought significant changes in American society after their introduction. Initially, the public enthusiastically welcomed each invention as beneficial to society. Gradually, concern developed regarding the cultural influence each medium had, especially the supremacy of commercialism and its consequent determination of media content. Also, control of each medium by a limited number of corporations caused worry

among some libertarians, scholars and social activists. Later, philosophers and sociologists would assess the effects of each medium, would analyze the process of communication via mass media and would theorize about the possible impact of new media on society. The study of mass communications would benefit researchers, who learned to refine their techniques and to evaluate the variety of factors that affected recipients of messages from the mass media.

– James Landers

**1732.** Daily, Film and Television, ed. *The 1966 Film Daily Yearbook*. New York: np, 1966.

This Yearbook as a great deal of information about the motion picture industry -- the rating system, international markets, agents and other public relations data.

**1733.** ---, ed. *The 1969 Film Daily Year Book of Motion Pictures*. 51st ed. New York: Film and Television Daily, 1969.

This volume, for 1969, was apparently the last published in this series. It has a great deal of information about the motion picture industry including media relations, overseas markets, television, and more.

**1734.** Daingerfield, Elliott. "Color and Form -- Their Relationship." *Art World* 3 (1917): 179-80.

The author, Elliott Daingerfield (1859-1932), was a well-known Southern landscape painter during the late 19th and early 20th centuries, and was one of small number of artists commissioned Sante Fe Railroad to paint the Grand Canyon. In this article he discusses the relation between drawing, or form, and the use of color. "Drawing defines form, color reveals it," he says. (179) "We may then reach almost an axiomatic statement that color without form is chaos. No haphazard assemblages of the palette, no flowing together of chance tones may rightly be considered color when we are considering the art of Painting." (179)

Daingerfield comments on color's impact on psychology. "Color is sensation, and because of this curious and powerful effect upon the nerves of man, it is possible for him to become inebriate, a color inebriate, and when that happens he loses all or nearly all sense of form. A study of the works of Monticelli will show beautiful drawing in his earlier things, progressing then through various changes, as the power of color took hold upon him, until at the last he had become so heavily 'doped' with color sensation that form is lost, and we have a jumble of colors, each lovely in itself perhaps, but contradictory when considered as painting. And so the mind asks, what is it all about?" (179)

Daingerfield discusses the harmonious use of color and its relation to Nature. "We are not ready to return to the barbaric excitement of a spot of red or yellow or to enter the mad-house from a suffusion of yellow and purple. For this we cannot give up the exquisite delicacy of nature, her sumptuousness of color and the magic of her grays.

"Everywhere in God's world, indeed, we find the Master Worker using from, color; color, form. Nor is it out of doors alone that this law is at work; the delicacy of a child's face reveals it quite as entirely; and always the color must express the form. There has been much of rhapsody written about colorists. We are told their going made in the glory of it, and then we see their things 179/180 and no longer wonder; indeed, the only wonder is that any who have seen the works remain sane." (179-80)

This article was part of a symposium on color in this issue of *Art World*.

**1735.** Dale, Edgar, ed. *Children's Attendance at Motion Pictures*. New York: Macmillan Company, 1935.

This volume in the Payne Fund Studies is an early effort to document attendance of motion pictures by children. In *Children's Attendance at Motion Pictures* (1935), Dale argued that the number of children attending the movies was much greater than the industry acknowledged. He called on parents to be more active. Preferably they should attend films with their children, and failing that, they should at least help them interpret what they

had seen. In 1929-1930, he had used Columbus, Ohio as a case study, and also sent out more than 50,000 questionnaires to collect movie attendance data on school children in fifty Ohio communities and several localities in one North Dakota county. From that data, he extrapolated that throughout the United States, perhaps a third of motion pictures audiences were made up of youth under the age of twenty-one, and that parents were accompanying their children to the theaters less and less frequently. Because children lacked adult experience, they were unable to make mature judgments about what they watched, and could "only acquiesce" in what they had seen.

**1736.** ---, ed. *The Content of Motion Pictures*. New York: Macmillan, 1935.

This volume in the Payne Fund Studies was an early attempt to analyze the content of motion pictures. Dale analyzed several hundred feature films released at five-year intervals between 1920 and 1930. His method involved using plot summaries in *Harrison Reports*; he actually watched 115 of these pictures, and selected forty to study in detail. The social values embedded in movies worried him. In *The Content of Motion Pictures* (1935), he analyzed about 1,500 movies between 1920 and 1930, and discovered that sex, love, and crime dominated. Half the movies that treated love emphasized sex. The considerations of problems confronting singles over thirty or the difficulties encountered in marriage were so unsatisfactory that Dale doubted if young people gained any insight to what that they might later encounter. Rarely did films explain why people turned to crime -- its causes and remedies were neglected. Criminals sprang "Minerva-like...from the head of Jupiter" in the movies, and were not always shown to be punished. In an age of prohibition, alcohol was featured in seventy-five percent of the films, and tobacco was used in almost ninety percent of the pictures. Movies that dealt with history, travel, or children's themes accounted for only a minuscule percentage of the pictures that Dale studied.

**1737.** ---. *First Symposium on Elements Out of Which a Program Looking Towards National Film Policies in Motion Pictures Can Be Selected*. Motion Picture Research Council Papers.

Edgar Dale wanted a national policy regarding motion pictures that would protect free expression in order that real artists could get the chance to put their visions on screen. As with great writers or painters, it did not matter that the movie maker's vision might be "incorrect," or that it might conflict with society's conventions. In fact, he acknowledged that his plan might lead to pictures which were "flatly opposed to prevailing notions about things." Dale wrote three volumes in the Payne Fund Studies.

**1738.** ---, ed. *How To Appreciate Motion Pictures: A Manual of Motion-Picture Criticism Prepared for High-School Students*. New York: Macmillan Company, 1933.

This volume in the Payne Fund Studies was an early effort to teach media literacy -- in respect of motion pictures -- to high school students. He wanted the public to be educated about film's power. As an art form cinema was comparable to drama, literature, painting, and music, "too fine an instrument to be used only for passing entertainment or to kill time." The public needed to learn how to discriminate between good and bad films just as they might discern the difference between great literature and pulp fiction: "to enjoy with understanding," as he put it. To that end, he prepared a manual, *How To Appreciate Motion Pictures* (1933), to help high school students. It covered the gamut of film making, from cameras, to acting, directing, and settings. He ended with controversial recommendations. One advocated doing away with the star system and celebrity culture that was growing up around it. Another called for creating a "new point of view regarding the place of motion pictures in our scheme of living," so that cinema could better speak to such problems as abolishing war, crime and punishment, "the more satisfactory distribution of wealth," and understanding democratic government. He challenged Hollywood to produce movies for adults and different films for children.

**1739.** Dale, Robert. "An Introduction to Artificial Intelligence." *Arms and Intelligence: Weapon and Arms Control Applications of Advanced Computing*. Ed. Allan M. Din, ed. New York: Oxford University Press, 1987. 33-46.

This paper grew out of a 1986 workshop sponsored by the Stockholm International Peace Research Institute. The abstract for Dale's piece describes it as follows: "The research area of artificial intelligence is described in terms of its programming languages, like Lisp and Prolog, and of various techniques, such as search and knowledge representation. A number of application areas are discussed with particular mention of some important expert-system techniques and their practical relevance."

**1740.** Dallek, Robert, ed. *Flawed Giant: Lyndon Johnson and His Times, 1961-1973*. New York: Oxford University Press, 1998.

This biography of Lyndon B. Johnson has information about Jack Valenti, who after leaving the Johnson administration in 1966, became president of the Motion Picture Association of America.

**1741.** Dana, Charles A. "Journalism. A Lecture Delivered to the Students of Union College." *McClure's Magazine* 4.6 (1895): 555-63.

In this address to Union College student, the *New York Sun's* editor, Charles A. Dana, discusses what it takes to become a good journalist and also the state of the newspaper business in 1895. He expressing skepticism about the creation of schools of journalism which was happening in some universities then. A for the new journalism departments, he said "I have never found that a student or graduate who had pursued that department, instead of pursuing other studies, was of any great value as a practical worker in the newspaper work ...." (556) He was in favor of a general education, though, that included Greek and Latin. "I had rather take a young fellow who knows the Ajax of Sophocles, and who has read Tacitus, and can scan every ode of Horace, I would rather take him to report a prize-fight or a spelling match, for instance, than to take one who has never had those advantages." (556)

The first requisite of a good journalist was "a thorough knowledge of English." (558) The second was "a knowledge of politics" (558). Studying the U. S. Constitution was essential to understanding American government, he said. (559) In addition "the newspaper man should know the Bible, Shakespeare, and Milton." (560)

Dana thought that transmission of news by electricity had revolutionized newspapers and journalism. "What a wonder, what a marvel it is, that here, for one or two cents, you buy a history of the entire globe of the day before!" he told students at Union College in 1895. "It is something that is miraculous, really, when you consider it." (563) It would give the newspaper profession "a higher dignity" than ever before, he said. (563)

**1742.** Daniel, Eric D., Mee, C. Denis, and Mark H. Clark, eds., eds. *Magnetic Recording: The First 100 Years*. New York: IEEE Press, 1999.

This work provides an excellent introduction to the history and development of magnetic recording, a field that by the end of the twentieth century had become a \$100 billion industry employing a half million people. The book is organized around three broad areas: audio recording which constituted magnetic recording from 1898 to the end of World War II; video recording, which began in the early 1950s; and data recording, which also began to take form during the early 1950s.

The editors of this volume maintain that only four generic design formats, each pioneered 30 to 60 years prior to this book's appearance (1999), have endured over the long-term. They are: 1) the Magnetophon audio recorder developed in Germany during the 1930s and 1940s, and which used magnetically coated plastic tape. It created the format for later magnetic tape recorders that used stationary heads. 2) The quadruplex video recorder, introduced by Ampex in 1956, set the standard for all video recorders that used heads that scanned moving tape. 3) The random access method of accounting and control (RAMAC) disk file, developed by IBM also in 1956. This development followed the appearance of electronic computers and it met an urgent need for data storage devices with much more rapid access than tape. The RAMAC set the format for "hard" disk drives. 4) The diskette, which IBM developed in the late 1960s which permitted random access to any recorded track and which

became a removable, low-cost storage apparatus. This invention provided the basic format for all later “floppy” disk drives.

The creators of this volume predict that in the future digital magnetic recording will increase, that the storage capacity on magnetic media of all kinds will continue to grow, and that magnetic recording in some areas will be challenged by optical disk recording – e.g., audio compact discs (CDs), CD-ROMs, and DVDs (digital versatile disks).

This work has more than 100 illustrations and more than 90 photographs.

**1743.** Daniels, William H. "The Drawing Room Comedy *Marriage on the Rocks*." *American Cinematographer* 46.9 (1965): 567-69.

This article discusses the problems of shooting on location for the movie "Marriage on the Rocks," produced by Sinatra Enterprises. The cost for perhaps 100 people would have been about \$175,000.

**1744.** Danko, George M. and Friedrich B. Prinz. "An analysis of lathe development using artificial intelligence techniques." *History and Technology: An International Journal* 5.1 (1988): 1-29.

The authors show how the lathe's historical development can be represented and analyzed by employing the techniques developed in artificial intelligence programming, especially in the realm of expert systems. The article discusses the lathe's history over 22 centuries, and then how the expert systems approach can be used as a model to study this historical change.

**1745.** Darnton, Robert, ed. *The Forbidden Bestsellers of Pre-Revolutionary France*. New York: W. W. Norton and Company, 1995.

Robert Darnton argues that to understand the attitudes that lead to the French revolution, we must not just look at canonical philosophical works (like those written by Rousseau), but we must also examine the bestsellers that were banned by the government, the books that the public was actually reading. By examining three banned best-sellers in depth -- *Therese philosophie*, *L'An 2440*, and *Anecdotes sur Mme la comtesse du Barry* -- he is able to detail the purposes each served the general public. *Therese* could also be read as a contraception manual and a book that promoted masturbation at a time when it was thought to cause disease. *L'An 2440* provided an indictment of the condition of eighteenth-century France through a futuristic story set in 2440. It focused on the power of books and the printed word. *Anecdotes* fed the public's appetite for gossip; it was a "true" story of Louis XV's mistress and her ability to arouse the impotent king. *Anecdotes* was similar to the *National Enquirer* of today, providing scandalous stories about actresses and political luminaries that people eagerly devour.

Although the banned bestsellers were powerful, they did not cause the revolution, Darnton argues. They were part of a larger movement; they caused the general public to lose faith in the monarchy, by portraying Louis XV and XVI as buffoons, and the government as corrupt. Ultimately, it is difficult for us to understand the power books had in the 1700s, Darnton says, because we have television, movies, and radio -- media that did not exist during the French revolution.

Darnton, who is a student of both the French Revolution and also the history of the book, examines here a genre of book that provides insight into French cultural history prior to the Revolution. He also looks at the book during this period as a communication system. The producing, distributing, and consuming books can be viewed as a "communications circuit which runs from author to reader -- and ultimately back to the author again."

**1746.** Dart, John. "Age Old Problem: Portrayals of Christ Tempt Controversy." *Los Angeles Times* July 30, 1988 1988, sec. 1: 1.

This article surveys the ways in which motion pictures and television programs have portrayed Jesus. It came as a controversy arose over the movie *The Last Temptation of Christ* (1988). Dart notes that religious critics denounced movies during the 1970s -- *The Passover Plot* (1976), Franco Zeffereilli's television mini-series, *Jesus of Nazareth* (1977), and Monty Python's *Life of Brian* (1979). The article discusses Nikos Kazantzakis' (1883-1957) novel, *The Last Temptation of Christ*.

**1747.** ---. "Church Declares 'Last Temptation' Morally Offensive." *Los Angeles Times* Aug. 10, 1988 1988, sec. 2 (Metro): 3.

This article reports that the Catholic bishops' Department of Communication in New York had rated Martin Scorsese's movie *The Last Temptation of Christ* (1988) "morally offensive." This rating "couched in relatively mild criticism," went to 53,000,000 Catholics.

**1748.** ---. "Church Likely to Condemn 'Temptation,' Mahony Says." *Los Angeles Times* July 20, 1988 1988, sec. 2 (Metro): 3.

This article reports that Los Angeles Archbishop Roger M. Mahony says that the Roman Catholic Church is likely to declare Martin Scorsese's movie *The Last Temptation of Christ* (1988) to be "morally offensive."

**1749.** ---. "Evangelist Offers to Buy All Copies of Christ Movie." *Los Angeles Times* July 16, 1988 1988, sec. 2 (Metro): 3.

This article is about evangelist Bill Bright's offer to Lew Wasserman of Universal Pictures to buy all copies of the movie *The Last Temptation of Christ* (1988).

**1750.** ---. "'Last Temptation' Views Still Coming In; Boycott of 'E.T.' Among Religious Reactions to Controversial Movie." *Los Angeles Times* Aug. 27, 1988 1988, sec. 2 (Metro): 6.

In reaction to Universal Pictures' controversial movie *The Last Temptation of Christ* (1988), fundamentalists and other religious critics urged a boycott of the video release of the popular Universal movie *E. T.* (1982).

**1751.** ---. "Some Clerics See No Evil in 'Temptation'." *Los Angeles Times* July 14, 1988 1988, sec. 6 (Calendar): 1.

This article is about religious leaders such as Daniel Berrigan, Robert E. A. Lee (a former movie review for *Lutheran* magazine), and others who saw little or knowing that was morally offensive in the film *The Last Temptation of Christ* (1988).

**1752.** ---. "'Temptation' May Lead to Examination and Renewal of Faith." *Los Angeles Times* Aug. 13, 1988 1988, sec. 2 (Metro): 6.

*Los Angeles Times* religion writer John Dart says that "despite the vociferous religious opposition to *The Last Temptation of Christ*, the film that was released Friday, many churches may use the occasion to examine anew and proclaim their beliefs about Jesus -- especially the doctrine that he was truly tempted yet sinless." The article goes on to discuss possible misrepresentations of the movie's final scenes.

**1753.** ---. "'Temptation, with a New Cover, Due at Bookstores, Publisher Says." *Los Angeles Times* Aug. 19, 1988 1988, sec. 6 (Calendar): 6.

This article is about a new edition of Nikos Kazantzakis's 1960 novel *The Last Temptation of Christ*. The novel was the basis for the 1988 film by Martin Scorsese.

**1754.** Dart, John , and Chandler, Russell. "Full Theaters, Protests Greet 'Temptation'." *Los Angeles Times* Aug. 13, 1988 1988, sec. 1: 1ff.

This article notes that despite peaceful protests and efforts to boycott the movie *The Last Temptation of Christ* (1988) (or perhaps because of them), the movie played to generally large in the cities where it opened.

**1755.** *Never On Sunday (aka Pote Tin Kyriaki)*. 1959, 1959.

*Never on Sunday* (1960), a comedy filmed in Greece, and written and directed by a notable member of the Hollywood blacklist, Jules Dassin, was about "the strong sexuality of a modern 'free' woman," a prostitute played by Melina Mercouri, and the unsuccessful efforts by an American tourist (played by Dassin) to reform her. Despite not having a PCA seal, the movie was a financial hit. Made for about \$150,000, it earned at least \$5 million in the United States alone. When the film played in Atlanta, censors tried to ban it as obscene, but the ban was overturned when the Fulton County Superior Court ruled that the city's censorship law was unconstitutional. By that time, the movie had played in more than 2,000 theaters in 175 American cities.

**1756.** Daugherty, Frank. "Chromos in Hollywood." *New York Times* Sept. 19, 1937 1937: 179.

This article talks about using mass-produced color still photographs to publicize movies and their stars that appear in Technicolor films. It says that "Perhaps a dozen newspapers throughout the country are equipped to reproduce colored photographs in their daily editions, but a great many more use colored rotogravure on Sunday. There are also innumerable fan, fiction and photographic magazines, and a few dealing with the stage and motion pictures as graphic arts, which no doubt will welcome the revolution" that the photographers who make these stills are bringing about.

**1757.** Davenport, Gorianna. "Your Own Virtual Storyworld: True interactive entertainment will arise once engineers and artists create virtual realities that can unfold improvisationally." *Scientific American* 283.5 (2000): 79-82.

This work discusses the possibilities presented by digital cinema and computers. As movie makers gain the ability to improvise virtual reality, entertainment will become much more interactive.

**1758.** Davidson, Randall, ed. *9XM Talking: WHA Radio and the Wisconsin Idea*. Madison, WI: University of Wisconsin Press, 2006.

Randall Davidson traces the history of Wisconsin Public Radio from 1909 to 1979. The network has its origins in a license for the experimental radio broadcaster 9XM that was granted to a professor in the University of Wisconsin-Madison's electrical engineering department, Edward Bennett, in 1914. This frequency was later "borrowed" by a professor in the physics department, Earle M. Terry, for experiments with "wireless telegraphy" (p. 8). Terry would lead the station throughout its early years as it continued to be housed within the physics department.

Davidson focuses on the individuals that were influential in the development of the station in the early and mid-1900s, as well as the development and expansion of its programming. Early broadcasts of 9XM included weather reports aimed helping rural farmers plan their crop production. In 1922, the station switched to the call letters WHA.

Early radio started as a wireless method to transmit telegraph messages. There was increasing interest in wireless transmission after the sinking of the Titanic. The first radio broadcasters, such as 9XM at the University of Wisconsin, started out sending "point-to-point" telegraphic messages to experiment with the technology. These transmissions could then be overheard by anyone between the two points who had a radio receiver. This eventually developed into the idea of using the technology to broadcast to the general public.

The station's educational focus included extension and outreach to the state's rural residents with the notion of making the university accessible to listeners across the state through the "Wisconsin Idea."

Notably Davidson debunks the myth that 9XM/WHA is the "oldest" radio broadcaster in the United States and concludes that WHA is in fact the second "oldest" station in the United States. However he does find that it is the oldest educational radio station in the country.

**1759.** Davies, Duncan S. "The Computer Revolution, Industry and People." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 334-44.

Davies, at the time of this piece, was Chief Scientist and Engineer at the Department of Industry, London. He raises questions about the impact of the microprocessor on employment. This piece originally appeared in *Chartered Mechanical Engineer* (June 1978).

**1760.** Davies, K. A. "Voluntary Exposure to Pornography and Men's Attitudes Toward Feminism and Rape." *Journal of Sex Research* 34 (1997): 131-37.

This study examined the relationship between X-rated video rentals and attitudes toward feminism and violence toward women. The author gathered data from "194 men who rented X-rated videos of their choosing from a single pornography establishment in a large metropolitan county during 1988" (131). The renters attitudes were assessed by asking whether or not they supported the Equal Rights Amendment, whether they supported a law against marital rape, and length of sentence for both marital and date rape. Davies found no relationship between any of the dependent measures and number of videos rented. This study used non-experimental methods due to some of the criticisms leveled at experimental research, particularly pornography research (see Childress, 1991). A strength of this research, then, is that it introduces a new and useful method for examining the relationship between pornography use and attitudes and behaviors. A caveat, however, is that other media are not considered in the analysis/

--Michael Boyle

**1761.** Davies, Lawrence E. "Reagan Promises to Rid Campuses of 'Anarchists'." *New York Times* Jan. 8, 1969 1969: 36.

In addition to Reagan's comments about keeping classes open on California campuses, Governor Reagan asked the state legislator for a "drive against pornography and narcotics."

**1762.** Davis, Bette, ed. *Lonely Life: An Autobiography*. New York: Putnam.

In this autobiography, Bette Davis discusses her film career and such movies as *Beyond the Forest*, a film based on a 1948, that dealt with abortion, a topic then forbidden under the motion picture Production Code.

**1763.** Davis, Charles Thomas, ed. *The Manufacture of Paper: Being a Description of the Various Processes for the Fabrication, Coloring, and Finishing of Every Kind of Paper...* Philadelphia; New York: Henry Carey Baird & Co.; Arno Press, 1972.

This 1886 history of paper was reprinted in Arno Press's Technology and Society series. This work is informative on the technology and processes of nineteenth-century paper making.

**1764.** Davis, Henry B. O., ed. *Electrical and Electronic Technologies: A Chronology of Events and Inventors from 1900 to 1940*. Metuchen, N. J. and London: Scarecrow Press, Inc., 1983.

This 168-page work continues the earlier *Electrical and Electronic Technologies* which covered events up to 1900. This work deals with the first four decades of the twentieth century. Each chapter treats a decade and

within each chapter there are brief descriptions by year of major inventors and innovations. Two appendices follow. One is an "Index to Vacuum Tubes"; the other is an "Index to Radio Stations."

**1765.** Davis, Melton S. "Public Opinion -- the Court of Last Resort." *Labor and Nation* 3.1 (1947): 24-27.

Davis outlines a 10-point program to help organized labor modernize its public relations efforts to manage its public image. Among the recommendations: Create a national strategy board to coordinate labor public relations and create a unified voice; provide more training for union leaders in modern methods of public relations; make use of sociologists on union research staffs to develop better appeals to laborers; improve polling methods to ensure more representation of the rank and file; create labor-oriented metropolitan newspapers and modernize the weekly and monthly labor press.

**--Phil Glende**

**1766.** Davis, Robert Edward, ed. *Response to Innovation: A Study of Popular Argument About New Mass Media*. New York: Arno Press, 1976.

This 1965 University of Iowa Ph. D. thesis (Department of Speech and Dramatic Art) is here republished by Arno Press. The author is interested in people "suspicious of ... new influences" who "predicted that the mass media would damage culture, subvert values, and overturn respected institutions. Innovation, they said, would cause the evils society most feared. The effects of motion pictures, radio, and television, both real and predicted, have been the cause for lively and persistent controversy for some six decades."

**1767.** Davis, Watson. "The New Radio Movies." *Popular Radio* 4 (1923): 436.

**1768.** ---. "Seeing by Radio." *Popular Radio* 3 (1923): 266.

**1769.** Dawson, Ashley. "Documenting Democratization: New Media Practices in Post-Apartheid South Africa." *Democracy and New Media*. Ed. Henry Jenkins and David Thorburn, eds. Cambridge, MA: MIT Press, 2003. 225-44.

The author writes that "during the transition to democracy after 1990, South Africa faced the pressing question of how to transform" the South African Broadcasting Corporation, "this organ of racist ideology into a forum for the advancement of national unity and equality." (225)

The volume in which Dawson's chapter appears is part of a larger series on new media technologies entitled *Media In Transition*. The volume tries to offer a historical and comparative perspective on its subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. As the editors explain, the "essays in this volume capture something of the complexity and disagreement in current discourse about the politics of cyberspace. Some contributors offer us front-line perspectives on the impact of emerging technologies on politics, journalism, and civic experience. What happens when we reduce the transaction cost for civic participation, or increase access to information, or expand the arena of free speech? Other contributors place our shifting understanding of citizenship in historical context, suggesting that notions of cyberdemocracy and online community must grow out of older models of civic life. Still others expand this conversation to consider the global flow of information and to test our American conceptions of cyberdemocracy against developments in other parts of the world. How, for example, do new media operate in Castro's Cuba, or in post-apartheid South Africa, or in the context of multicultural debates on the Pacific Rim? Some contributors examine specific sites and practices, describing new forms of journalism or community organizing. Some voices here are deeply skeptical; others are optimistic. For some writers the new technologies endanger our political culture; for others, they promise civic renewal.

"Most of the papers on which these chapters are based originated in series of public forums and conferences hosted by MIT from 1998 to 2000 under the title 'Media in Transition.' Funded by the John and Mary R. Markle Foundation and organized by the MIT Communications Forum, these events aimed to nourish a broad civic conversation about the political impact of new media technologies. The essays have been revised for this book."

**1770.** Day, David T. "Light: The Civilizer." *American Illustrated Magazine* 61.6 (1906): 654-64.

This article, written by a leading geologist in 1906, says that "the Invention of Bright, Steady Light has revolutionized history" and had been a great "civilizer." (654) "For with the advent of a bright light, for the first time in history people began to read at night.... The bright light made reading a universal habit." (656) Day discusses various types of light made possible by oil and kerosene, gas, and electricity.

**1771.** Day, Lance. "Language, Writing, Printing and Graphic Arts." *An Encyclopaedia of the History of Technology*. London and New York: Routledge, 1990. 665-85.

An introduction to this area. Ian McNeil is the *Encyclopaedia's* editor.

**1772.** Day, Lance and Ian McNeil, ed. *Biographical Dictionary of the History of Technology*. London and New York: Routledge Reference, 1996.

This 844-page biographical dictionary contains almost 1,300 names. The overwhelming majority are white, European and North American males. An effort was made to include important Asian, African Americans, and women. The work has three indexes -- by subject area, by topic, and by name. Entries usually have brief suggestions for further reading.

**1773.** Dayan, Daniel and Elihu Katz, ed. *Media Events: The Live Broadcasting of History*. Cambridge, MA: Harvard University Press, 1992.

The authors write that this "book is about the festive viewing of television. It is about those historic occasions--mostly occasions of state--that are televised as they take place and transfix a nation or the world. They include epic contests of politics and sports, charismatic missions, and the rites of passage of the great--what we call Contests, Conquests, and Coronations. In spite of the differences among them, events such as the Olympic Games, Anwar el-Sadat's journey to Jerusalem, and the funeral of John F. Kennedy have given shape to a new narrative genre that employs the unique potential of the electronic media to command attention universally and simultaneously in order to tell a primordial story about current affairs. These are events that hang a halo over the television set and transform the viewing experience.

We call them collectively 'media events,' a term we wish to redeem from its pejorative connotations. Alternatively, we might have 'television ceremonies,' or 'festive television,' or even 'cultural performances'.... These telecasts share a large number of common attributes which we shall attempt to identify. Audiences recognize them as an invitation--even a command--to stop their daily routines and join in a holiday experience. If festive viewing is to ordinary viewing what holidays are to the everyday, these events are the high holidays of mass communication. Conceptually speaking, this book is an attempt to bring the anthropology of ceremony ... to bear on the process of mass communication."

**1774.** De Angelis, Gina, ed. *Motion Pictures: Making Cinema Magic*. Minneapolis: Oliver Press, Inc., 2004.

The text of this brief book runs 129 pages. There are not notes but there are sidebars, a Glossary, short bibliography, and an Index. The work is broken into seven chapters, each devoted to a leading innovator in the field of motion pictures: W. K. L. Dickson and the Kinetograph; Auguste and Louis Lumiere; Lee de Forest and Optical Sound; Herbert Kalmus and Technicolor; Linwood Dunn and the Optical Printer; Mike Tode and Todd-AO; and Garret Brown and the Steadicam. The chapter on Kalmus (63-75) notes that "Although almost every color movie made between 1925 and 1950 used Technicolor, these were only 12 percent of the total number of

Hollywood films made during that time. Even into the 1960s, at least half of all movies were still shot in black and white. Hollywood did not convert entirely to color until the advent of color television made it a competitive necessity. By 1970, 94 percent of American feature films were made in color, and today [2004] it costs more to film in black and white than it does to use color." (75)

**1775.** De Forest, Lee. "Our Changing Communications." *New Frontiers of Knowledge: A Symposium by Distinguished Writers, Notable Scholars & Public Figures*. Washington, D.C.: Public Affairs Press, 1957. 113-15.

De Forest, who invented the vacuum tube, here observes that some have compared the electron tube's impact on civilization to that of the discovery of the wheel and early use of fire. While De Forest does not go that far, he does say that "the 3-electrode tube and its descendants have made possible in spreading over the entire face of the globe an invisible network of international, inter-continental, telephonic communication, whereby the ancient barriers of unlike languages no longer persist. Coupled with this all important development comes now radio's sister development, television, linking distant sight with the voice."

Interestingly, De Forest notes that 1957 may be the year that the first man-made satellite will be put into orbit. However, he says, "to place a man in a multi-stage rocket and project him into the controlling gravitational field of the moon, where the passenger can make scientific observation, perhaps land alive, and then return to earth -- all that constitutes a wild dream worthy of Jules Verne." Only a dozen years later, of course, that became a reality.

**1776.** ---, ed. *Television: Today and Tomorrow*. New York: Dial, 1942.

**1777.** De Grazia, Edward, ed. *Girls Lean Back Everywhere: The Law of Obscenity and the Assault on Genius*. New York: Random House, 1992.

The author writes: "In historical perspective, it can be remarked that under Justice Brennan's leadership the Supreme Court interpreted the First Amendment's guarantees of speech and press in ways that permitted authors and artists, their publishers and promoters, to communicate on the subjects of sex, religion, politics, and anything else in almost limitless ways -- much as the Court (equally controversially, and again following Brennan's lead) privileged this xiii/xiv country's newspaper press. Here admittedly is a degree of freedom or license that many people prefer to deny themselves and others. The liberty asserted by American artists and writers is nothing less than the right to upset the basic assumptions upon which our family, social, political, religious, and cultural life is based." (xiii-xiv)

**1778.** De Grazia, Edward, and Newman, Roger K., eds. *Banned Films: Movies, Censors and the First Amendment*. New York: R. R. Bowker Company, 1982.

This book is divided into two parts. The first discusses motion picture censorship and legal/constitutional developments that led to the breakdown of regulation and protection under the First Amendment. The second part then discusses specific films that were important in censorship battles. This solid, informative book is an excellent reference for those interested in learning about benchmark cases in motion picture censorship. The individual cases involving specific films are discussed in some detail.

--SV

Motion picture, no less than literature and art, are means for the circulation of ideas and for the carrying out of the nation's dialogue. And yet, the authors observe, the movies were censored by police, prosecutors, customs officials, and all sorts of city, state boards and federal censors; by mayors, governors, fire, safety and

health commissioners, educators and librarians as well. For much of the twentieth century – certainly during the first two-thirds of it – “people were prevented from seeing on the movie screen what was happening around them, unless the censors considered it safe. The censorship interfered with the communication of political as well as sexual information and ideas. Movie critical of the courts or the police were frequently condemned.” (xvi) In this book, the author use “censorship” to mean “ any government or industry practice that has interfered with or changed the content of the movies as determined by its creators – from criminal prosecutions and governmental censor boards to private industry self-regulation, including war-time “voluntary cooperation” with the military.” (xvii-xviii)

**1779.** De Lauretis, Teresa and Stephen Heath, eds., ed. *The Cinema Apparatus*. New York: St. Martin's Press, 1980.

These essays came from a conference on 'The Cinematic Apparatus' held in February, 1978, by the Center for Twentieth Century Studies of the University of Wisconsin-Milwaukee. The conference coordinating committee included David Bordwell, Kristin Thompson, and Douglas Gomery.

The essays in this volume are of mixed value. Among the best chapters of a historical nature are those by **Peter Wollen** (“Cinema and Technology: A Historical Overview”); **Dudley Andrew** (“The Post-War Struggle for color” [in France]); and **Kristin Thompson** (“Implications of the Cel Animation Technique”). Many other papers are more theoretical than historical.

**1780.** de Navarro, Mary Anderson. "My Early Days on the Stage." *Ladies' Home Journal* 13.2 (1896): 1-2.

Mary Anderson de Navarro here paints a bleak picture of what it takes to be successful on the stage. Of her early performances, she says that "All I had gained by a week of hard work was a sad heart and a very sore throat." (1) She ends by saying: "Indeed, I would not wish 'my dearest enemy' to pass through the uncertainties and despondencies of those early days." (2)

**1781.** De Vinne, Theodore L. "Perfecting the Press." *Current Literature* 30.5 (1901): 533-35.

This article surveys improvements in printing methods. It discusses the work of Earl Stanope, the Konig press, the Bullock press, and the rapid printing machinery made possible by the "cylindrical inking rollers made of glue and molasses." The improvements in printing technology would have been relatively insignificant, though, had not cheap paper become available. The author notes that by 1880, photoengraving was replacing woodcuts for illustrations in books and magazines.

**1782.** ---. "The Printing of 'The Century'." *Century Illustrated Magazine* 41.1 (1890): 87-99.

This excellent article explains how the printing process worked at *The Century* in 1890. The magazine became one of the leading illustrated periodicals during the 1890s. When the magazine's large presses were at work, the author says, "the air trembles with their busy hum." (96)

De Vinne discusses the improvements in the printing of the magazine that occurred between 1870 and 1890. He notes that before 1890, cylinder presses were considered to be "type smashers" and likely to damage fine engraving. (87) The "stop-cylinder printing machine" (87) was a major improvement. It "did better presswork, but at slower speed and at greater cost, yet its capacities were often seriously overtaxed by the close and shallow engraving furnished by engravers who were striving to reproduce with picks or lines the effective tints of designs made entirely with the brush." (88) The stop cylinder machine used to print fine woodcut illustrations was smaller and slower than the magazine's web presses. It printed "sixteen pages only on one side of a sheet at a rate of about 750 impressions an hour. One machine can produce in one month but a small portion of the illustrations required for the magazine. It follows that there are many of these stop-cylinders, and that the printing plates

[electrotype plates] are made in duplicate and sometimes in triplicate, and, to get out the edition on time, that these duplicates go to press on different machines." (94)

Among the challenges to producing higher quality illustration were the need for better ink and inking systems (87) and the uneven surface of the paper on which the illustrations were printed. De Vinne describes a process for smoothing paper, which was probably not noticed by most people, but which was critical to reproducing quality illustrations. (88)

De Vinne describes the type-setting process. "Printing begins with type-setting, which is done now as it was four hundred years ago. Every letter must be picked up by hand and adjusted by human fingers to its fellows." (88) Even though type-setting machines were being used more and more, "they have not curtailed the employment of the four thousand compositors who set type by hand in this city [New York]. Type-setting by hand is slow work. A quick workman can set five columns of *The Century* in a day of ten hours; but the performance of the average compositor does not exceed, hardly reaches, two pages a day." (88) The composition work is usually done by young women who "are paid the same rates as men." (88)

De Vinne says that the woodcut illustrations are considered to be "the jewels of the magazine." (89) The magazine used electrotype plates and the process of creating these plates is explained (90-91). The electroplate used for both the printed page and illustrations is much cheaper than earlier methods of printing. "Unlike the type, or the frail woodcut which may be in the page, this electrotype plate can receive a hundred thousand impressions, or more, without loss of beauty or sharpness. It can be handled, packed, and transported with more ease and greater safety than the type or the wood. The page of type costs, composition included, about seven dollars; a full page of woodcut costs from one hundred to two hundred dollars. The electrotype of either costs less than one dollar. These are the reasons why electrotypes are made." (91)

This article points out that by 1890 the magazine could shape illustrations to fit onto a cylindrical press, thanks, no doubt, to the electrotype plates, but that illustrations from woodcuts still were not usually printed on both sides of the same page. De Vinne describes the "shaping machine, with its gas heater and air blast, which curves a flat plate to fit the periphery of the printing cylinder of the web press...." (92) This was "another novelty" in 1890, he says. (92) Special plates with special coating with a film of nickel or a film of steel were often used. (92) "Encouraged by the success of the web press in magazine presswork, the printers of *The Century* have applied the rotary principle to a new machine for fine illustrations, expressly made for them by Messrs. R. Hoe & Co. and but recently put to work. Sixty-four plates of *The Century*, truly bent to the proper curve, are firmly fastened on one cylinder sixty inches long and about thirty inches in diameter; sixteen inking rollers, supplied with ink from two ink fountains, successively ink these sixty-four plates with a delicacy and yet with a fullness of color never before attained.... The performance of the machine could have been more than doubled by adding to it other cylinders which would print on both sides of the paper; but careful experiment has proved that the finest woodcuts cannot be properly printed with this rapidity. To get the best results the ink on side of the paper must be dry before it is printed on the other side." (94) De Vinne notes the difficulties that remained in trying to print images with different shades. (95)

For advertising and good book work, De Vinne writes, a special hoe press was used. He then describes the process as the paper unrolls during printing through the loading of the magazine onto trucks for delivery.

The "web press" used by the magazine was "not so fast as the web press of daily newspapers, but it performs more operations and does more accurate work," the article says. (93) The web press had limitations: it was "not at all an economical machine for small editions" nor could "it be successfully used for the fine woodcuts" of the magazine's illustrated articles. (93) For the pages using the woodcuts, the magazine turned to a slower and smaller stop cylinder machine, described above.

De Vinne discusses the national and worldwide distribution of the magazine. (98-99)

By 1890, moderately priced, smooth-surfaced paper was readily available. "Easy working and durable black inks are as common now as they were scarce twenty years ago. Electrotype plates are made of smooth surface, and are curved with unharmed lines, to fit the cylinders of rotary printing machines on which they produce presswork that fully meets the most exacting requirements," De Vinne write. (99)

The author concludes by speculating on how these technological changes might have altered John Milton's dream in *Areopagitica*: "In the literary workshop of which John Milton dreamed, 'the pens and heads, sitting by studious lamps, musing, searching, revolving new notions and ideas,' were those only who thought and wrote. Now, the thinkers have mechanical helpers. In machine shops and paper mills, in printing houses and electrotype foundries, are other studious men equally busy in mechanical devices that aid writers in realizing this dream of the 'Areopagitica.'" (99)

**1783.** Dead, Gribayedoff, and Illustrator, Noted. *New York Times* Feb. 17, 1908 1908: 7.

This article recounts the career of the noted illustrator, Valeian Gribayedoff. Gribayedoff was born in Russia, educated in England, and worked in the United States as an illustrator until the late 1890s. He died in Paris. He also took the only photographs as the re-trial of Captain Alfred Dreyfus. This article says that Gribayedoff was "the originator of newspaper illustration in New York." He worked in New York for several years. Among the subjects of his drawing were Charles A. Dana and William Jennings Bryan. Gribayedoff's work appeared mainly in weekly and monthly magazines and his work was especially prominent in *Leslie's Weekly*.

**1784.** *Victim*. 1961, 1961 (Great Britain); 1962 (USA).

This film was turned down by the U. S. movie industry's Production Code Administration because of its theme of homosexuality. However, it played without the PCA seal, opening in New York, Feb. 5, 1962.

Plot summary from the American Film Institute Catalog: "'Boy' Barrett, a young English construction worker, is arrested for stealing a large sum of money from his firm. When he learns that the police know he used the money to pay a ring of blackmailers who threatened to expose him as a homosexual, he hangs himself rather than endanger the career of Melville Farr, a successful barrister with whom he had become emotionally, but not sexually, involved. Farr does become implicated, however, when the police discover that the blackmailers were using a photograph of them together to extort money from Barrett. Filled with remorse and angered by the existence of a law that makes homosexuals criminals, thereby making them easy prey for blackmailers, Farr decides to jeopardize both his marriage and his career by bringing those responsible for Farr's suicide to justice. Before his marriage Farr had admitted to his wife, Laura, that he had homosexual tendencies; now, forced to confess that these tendencies still exist, he offers Laura her freedom. Despite pressure from both the blackmailers and their victims, Farr cooperates with the police in tracking down the blackmailers--a sadistic young hoodlum, Sandy, and an embittered spinster, Miss Benham. Though fully aware that the scandal will ruin him, Farr insists upon prosecuting; as he prepares his case, Laura, who still loves him, realizes that her husband's need for her is stronger than any passing emotion he may feel, and she intimates that she will return to him when the trial is over."

This movie, made in the United Kingdom, starred Dirk Bogard and open in London in Aug., 1961. Its New York opening was on 5 Feb 1962.

**1785.** Decherney, Peter. "Copyright Dupes: Piracy and New Media in *Edison v. Lubin* (1903)." *Film History* 19.2 (2007): 109-24.

IPeter Decherney writes about efforts of such studios as those controlled by Thomas Edison to copyright films as photographs. The central question he asks is "Was film really a new medium or was it just the latest extension of photography?" (109) Decherney covers the before 1912, the year that motion pictures were incorporated into

copyright law in the Townsend Amendment. The Edison Manufacturing Co. began copyrighting films as photographs in 1894 with a moving picture of Fred Ott, a laboratory assistant, sneezing.

Decherney points out that piracy was a major problem from the invention of photography. The duping of films, he says, "was only one part of a much larger culture of copying." (113) The motion picture industry was "built on duping." (121) Siegmund Lubin among the most "prodigious" (121) dupers and was sued on several occasions by Edison. In 1903 in *Edison v. Lubin*, Judge George Mifflin Dallas sided with Lubin and agreed that films and photographs were "different, and it is just too complicated for the law to consider them to be equal." (118) Film, he concluded, was a new technology. Although Dallas did not endorse piracy, the result of his decision was to make film duping legal for a brief time. (118) The appellate decision in this case, handed down by Judge Joseph Buffington in 1903, overturned Dallas' judgment and essentially took Edison's side. "Buffington argued that motion pictures advanced the art of photography rather than creating a new medium." (120) For copyright purposes, films were photographs. This view seemed reasonable for "single shot, panoramic films" such as *Christening and Launching Kaiser Wilhelm's Yacht 'Meteor'* (1902). But between 1902 and 1904, more complicated story films were developed. Even so, "the legal doctrine that defined films as photographs became broader and more entrenched." (122)

Decherney concludes that although *Edison v. Lubin* clearly set a legal precedent, ... the quick fix declaring film to be a new form of photography rather than a new medium didn't solve any of the existing problems. On the contrary, the decision exacerbated the problems. Duping continued and the confusion over how to implement the new standard contributed to the monopolization of the film industry." (122) The case was "a fascinating example of what happened when courts try to explain a new medium using the terms of an old one: their decisions are ineffectual and generally delay true grappling with the newness of the new medium. Piracy is an integral element of the development of new media; it reveals the new functions and dimension of the new medium. Courts are left with the difficult job of separating the innovations revealed by piracy from the theft facilitated by piracy. But forcing new media to labor exclusively under the rules of old media inevitably fails." (123)

Decherney also discusses an interesting case involving circus posters and other commercial advertisement, *Bleistein v. Donaldson Lithographic Company* (1903) in which U. S. Supreme Court Justice Oliver Wendell Holmes concluded "neither mass reproduction, nor commercial use, nor lowbrow or risqué subject matter, could disqualify a work from copyright protection." (119) This case, Decherney argues, influenced Judge Buffington's appellate decision in *Edison v. Lubin*.

**1786.** ---, ed. *Hollywood and the Culture Elite: How the Movies Became American*. New York: Columbia University Press, 2005.

This, the author's first book, examines the collaboration between Hollywood and American cultural institutions between 1915 and the mid-1960s. The author makes two arguments. This first is "that museums, universities, and government agencies embraced film and the film industry to maintain their hold on American art, education, and the idea of American identity itself. They formed partnerships with Hollywood in order to expand their reach to the swelling and increasingly diverse mass audience for art and entertainment -- the audience, that is, that had already been captured by Hollywood. This expansion entailed neither a one-directional reassertion of traditional values nor a wholesale adoption of popular culture. Instead high and low culture, ethnic minorities and WASPs, and movie producers and university professors mixed in unpredictable patterns." (2) The second argument is "that the leader of the film industry welcomed the opportunity to join forces with established institutions, because they saw it as a means of stabilizing their industry and retaining their new and tenuous hold on 2/3 American culture. Together, these two arguments reconnect intertwined histories that have previously been considered parallel." (2-3)

Decherney's book has six chapters plus a Conclusion. In chapter 1, "Vachel Lindsay and the Universal Film Museum," the author discusses Lindsay's book *The Art of the Moving Picture* (1915; revised 1922) and Lindsay's

"vision for a film library or film museum that would have recaptured an ideal public sphere 6/7 of democratic debate and representation." (6-7) This book was especially influential with some faculty at Columbia University. Chapter 2, "Overlapping Publics: Hollywood and Columbia University, 1915," examines the establishment of Columbia's programs for film education. Chapter 3 is "Mandarins and Marxists: Harvard and the Rise of Film Experts." It "argues that the emphasis on skilled evaluation and the extension of connoisseurship to popular culture were part of a larger move within the field of art history to replace the paternalism of cultural stewardship based on lineage with a new model of art appreciation defined by professional skills and credentials. The new professional standards allowed Jews in particular and anyone not born to the genteel class more generally to enter the ranks of art historians and curators." (9)

Chapter 4 is entitled "Iris Barry, Hollywood Imperialism, and the Gender of the Nation." It examines the work of "Ezra Pound's protégé" and "her influence on the reception and international definition of American film. Barry was an important British film critics of the 1920s, and in that role she articulated one of the strongest positions against the global spread of Hollywood films and American culture.... Barry theorized film in gendered terms. She diagnosed Britain's emasculation by U. S. cultural imperialism on the one hand, and, on the other, she speculated about film's ability to transport women out of their culturally prescribed gender roles." (10)

In Chapter 5, "The Museum of Modern Art and the Roots of the Cultural Cold War," the author looks at the effort to mobilize film during World War II and the Cold War. It "charts the points of contact between commercial public relations and war propaganda since World War I, controversies over the presentation of Nazi and Soviet films in the United States during the 1930s, and the long arm of the Rockefeller Foundation in the brokering of Hollywood-government-cultural organization interaction from the 1930s to the 1950s." (10)

Chapter 6 is called "The Politics of Patronage: How the NEA (Accidentally) Created American Avant-Garde Film," and the Conclusion is subtitled "The Transformation of the Studio System." This book has Endnotes (213-51) and an Index (253-69) but no Reference section.

**1787.** Dede, Christopher. "Educational and Social Implications." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 242-57.

This piece appeared first in *Programmed Learning and Educational Technology* (Nov. 1981). The author, then a professor of Education and Futures Research at the University Houston, analyzes the changes, intended and unintended, brought by computer technology.

**1788.** Dee, Jonathan. "Playing Mogul." *New York Times Magazine* (2003): 36-41, 52-53, 66-68.

The author argues that video games are where motion pictures were during the 1930s -- "on the verge of become *the* popular entertainment." (p. 36) This piece notes that in 2002, video games were a \$28 billion-dollar industry and that the American market for these games was growing about 20 percent annually. People spent more time playing video games in 2002 than that did watching rented videos or DVDs. The article also notes the concerns that parents and researchers have expressed about the possible effects of violence video games. The author notes that "unlike movies or music or almost any other form or popular entertainment -- or drugs, for that matter -- games are virtually impossible to consume anywhere outside someone's home." (p. 52)

**1789.** Deibel, Mary. "Court Supports Laws to Prevent Porn Using Kids." *Denver Rocky Mountain News* June 27, 1995 1995, sec. A: A21.

This article is about the U. S. Supreme Court clearing the way for enforcement of the Child Protection and Obscenity Enforcement Act of 1988. The law required people who produced explicit sex films, book, magazines, and videotapes to maintain records of all actors including their names and nicknames. Such groups as the American Library Association, the Right to Read Foundation, and the American Booksellers Association said the record keeping provisions of this law violated the First Amendment.

**1790.** Deibert, Ronald J., ed. *Parchment, Printing, and Hypermedia: Communication in World Order Transformation*. New York: Columbia University, 1997.

This work argues that the “landscape of world politics is undergoing rapid and fundamental transformations related to the advent of digital-electronic telecommunications,” what the author calls the “hypermedia environment.” Diebert maintains that the best way to understand these changes is by using “medium theory,” something first set out by the Canadian political economist and historian, Harold A. Innis, and later popularized by his University of Toronto colleague, Marshall McLuhan. Medium theory holds that “changing modes of communication have effects on the trajectory of social evolution and the values and beliefs of societies.” It “traces these effects to the unique properties of different modes of communication – to the way information is stored, transmitted, and distributed through different media at different times in history. It focuses on the material properties of communication environments rather than on the content of the message being conveyed,” a view captured in McLuhan’s well-known phrase, “the medium is the message.” Diebert attempts to ground his views in what he calls a “historical-materialist perspective” reflected in the work of such scholars as Innis, Lewis Mumford, and Fernand Braudel, more so than in the work of such post-modernist theorists as Michel Foucault, Jacques Derrida, and Jean François Lyotard.

This 329-page book is divided into two parts. Part 1, “Printing and the Medieval to Modern World Order Transformation,” examines the parchment codex and the Roman Catholic Church’s rise to power during the Middle Ages. It also looks at the changes brought by the printing press and its role in the changing political authority from a medieval to modern outlook. Part 2, “Hypermedia and the Modern Postmodern World Order Transformation,” deals with the emerging hypermedia environment and how it has changed distributional patterns and social epistemology.

The work has notes, a 30-page bibliography, and index. The author at the time of the book’s publication taught in the political science department at the University of Toronto.

**1791.** Delbourgo, James. “Electricity, Experiment, and Enlightenment in Eighteenth-Century North America.” Columbia University, 2003.

This Abstract from UMI ProQuest Digital Dissertations: “This dissertation pursues recent themes from the historiography of early modern science in early North American history to explore the ways in which North Americans sought enlightenment through electrical experiment between roughly 1745 and 1810. Including, but moving beyond the figure of Benjamin Franklin, it examines interactions between electricity and the human body in the construction of natural philosophy, the presentation of electrical knowledge through public demonstrations, the development of the lightning rod, political discourse during the era of the American Revolution, and a variety of programmes for manipulating electricity as a resource for medical therapy. It describes a North American Enlightenment made through material-cultural practice, and the interaction of bodies and artificial machines, as described by a variety of eighteenth-century discourses: technical (principally natural philosophy, physiology and therapeutics), social (from polite self-improvement to revolutionary republicanism and the humanitarian dissemination of useful knowledge), and religious (from physico-theology to Providentialism and Protestant millenarianism). The dissertation thus addresses not only the question of how North Americans understood the relationship between electricity and the body, but also why they believed this relationship to be important. In addition, it elucidates the ways in which electrical knowledge and practice functioned across the ostensibly distinct realms of science, medicine and technology, by attending to the reciprocities between heterogeneous fields and practices and their common dependence on philosophical apparatus (scientific instruments).”

**1792.** Delery, Henry C. “Coloring Post Cards.” *American Annual of Photography: 1908* (1907): 65-68.

This short piece provides an interesting account of the process used in coloring post cards in 1907-08.

**1793.** Delgado, Alan, ed. *The Enormous File: A Social History of the Office*. London: John Murray, Ltd., 1979.

A well-illustrated history of the office through history, designed for a non-specialized reader (the text runs only 113 pages). The author discusses such innovations as pens and writings instruments, the typewriter, photocopying, dictating and duplicating machines, the computer -- and their impact on office work.

**1794.** Deloria, Vine, Jr. "The Confusion of History: A Review Essay." *Historical Magazine of the Protestant Episcopal Church* 46 (1977): 349.

Deloria comments on a "collapse of history" that risked "losing all sense of orientation toward our ... traditions," and that placed us at the mercy of "the ephemeral fads of modern society."

**1795.** *Ten Commandments*. 1956, 1956.

Making films abroad sometimes offered movie makers freedom to deal with topics in ways that might not have been possible in the United States. Cecil B. DeMille shot much of his epic film, *The Ten Commandments*, in Egypt where new movie making technologies such as 70mm film, CinemaScope, and VistaVision allowed him to emphasize the area's spectacular settings. DeMille took inspiration from classical painters and paid much attention to the use of color in the film. In Egypt, DeMille found it possible to create, according to historian Peter Lev, "a level of sexual display scanty costumes and suggestive scenes which would have otherwise encountered censorship problems in the United States and many other countries," concludes one film historian. There were other matters with which religious purists might have quarreled. DeMille's movie dealt with thirty years of Moses's life not chronicled in the Bible. And in it "emphasis on freedom and the blending of religious and political discourses," it reflected contemporary American Cold War values. When Eric Johnston, president of the MPAA, negotiated a film exchange with the USSR in 1958, the Soviets declined to take this movie as part of the package.

**1796.** Denevan, William M., ed., ed. *The Native Population of the Americas in 1492*. Madison: University of Wisconsin Press, 1992.

This work has interesting material on how satellite photography has been used to recover the past.

**1797.** Denning, Michael, ed. *Mechanic Accents: Dime Novels and Working Class Culture*. London and New York: Verso, 1987.

Denning comments on the significance of dime novels, an early form of mass communication and mass marketing. "A century later, the controversies over this literary movement are as faded as the decaying dime novels themselves. But the questions surrounding the dime novel, one of the first mass media, one of the first culture industries, remain central to contemporary cultural politics. ... Thus the book will weave together an economics and a poetics of the dime novel, an account of the novels as commodities, of the relations between author, publisher and reader within the dime novel industry, and of the relations between these commodities and the culture industry as a whole." (2)

Denning contends that "these popular stories, which are products of the culture industry 'popular', 'mass', or 'commercial' culture can be understood neither as forms of deception, manipulation and social control nor as expressions of a genuine people's culture, opposing and resisting the dominant culture. Rather they are best seen as a contested terrain, a field of cultural conflict where signs with wide appeal and resonance take on contradictory disguises and are spoken in contrary accents." (3)

This work notes the connection and similarities between dime novels and journalism. Like journalism, "dime novels are best considered as essentially anonymous, 'unauthored' discourse. ... Indeed dime novels and newspapers are linked by more than the coincidence of new technologies and new reading publics. Many dime novelists were newspaper reporters and editors. Moreover, as Bok's testimony about the fiction factory demonstrates, dime novel plots were often constructed out of the events reported in the daily and weekly newspapers of cities around the country." (24)

**1798.** Derian, Jean-Claude, ed. *America's Struggle for Leadership in Technology (translated from French by Severen Schaeffer)*. Cambridge, MA: MIT Press, 1990.

Derian argues that there are two distinct technical cultures. The first "is the 'exposed' culture of competitive activity, of government support for basic science and higher education in support of innovative new ventures: Silicon Valley, Route 128, and the Research Triangle. The second is the 'sheltered' culture of high-technology multinational companies whose growth was ensured by the protection of a vast domestic market and by support through military and space procurement (or, in the case of telecommunications, by the warm blanket of status as a public monopoly)." Derian contends that the Japanese are proficient and competitive in the exposed culture, while France and the United Kingdom (and other European countries) are better in the sheltered culture.

In the United States, these two cultures are, in effect, "two universes, foreign to each other, operating on different bases, with different objectives and motivations."

In contrast to the French economist Christian Stoffaës, who in *Fin de Mondes* used the hypothesis of Russian economist Kondratieff to argue that American hegemony would decline during the last phase of Kondratieff's fourth cycle, Derian concluded in 1990 that "American industry is not declining but is in transition, probably in the process of adapting to a world that is radically new to it."

The author also discusses the value of the space shuttle to communication and mentions the strategic computing initiative.

This work, originally published in French, was translated by Severen Schaeffer.

**1799.** Dertouzos, Michael L., ed. *What Will Be: How the New World of Information Will Change Our Lives*. New York: HarperEdge, 1997.

Dertouzos, head of the MIT Laboratory for Computer Science, here tries in 336 pages to give a "preview of the inventions that will usher in a Third Revolution to rival the Agricultural and Industrial Revolutions."

**1800.** Dery, Mark, ed. *Escape Velocity : Cyberculture at the End of the Century*. New York: Grove Press, 1996.

This book focuses on what some would call the fringes of Internet culture and others would place more centrally—the so-called computer counterculture—"cyberpunks, cyberhippies, and technopagans." Dery's work examines the appeal of cyberspace and potential downsides of the new technologies. The work is based primarily on secondary sources, particularly the work of Marshall McLuhan.

--Mark Tremayne

**1801.** ---, ed. *The Pyrotechnic Insanitarium: American Culture on the Brink*. New York: Grove Press, 1999.

This book resides somewhere in between a scholarly monograph and work of journalism. Dery is a cultural critic who has written for *Wired*, *Rolling Stone*, and *New York Times Magazine*. He writes of this book that it "rewards nonlinear reading and welcomes readers at ease with mental hyper-links -- far-flung, associative leaps of logic. It's tuned to the keynote assumption of our age of Nets and Webs and massively parallel Connection Machines -- namely, that information exists not in discrete atoms of fact but in synergistic meshworks and unexpected juxtapositions."

Dery's Introduction points to how fact and fiction converge in modern American culture. These pages provide examples of how conspiracy theories and paranoia infuse our society, from Chris Carter's *The X-Files*, to speculation about the Kennedy assassination, to Noam Chomsky, to fears about high-tech spying. "Conspiracy theory is a magic spell against the Information Age, an incantation that wards off information madness by organizing every scrap of the free-floating data assaulting us into an impossibly ordered scheme," Dery says. "In

the Luna Park we now inhabit, the permeable membrane between fact and fiction, actual and virtual, is in danger of dissolving altogether.”

Dery's work is divided into five sections: 1) "Dark Carnival" treats such themes as "psycho-killer clowns and Jim Carrey's "excremental excess." 2) "Dead Meat" contains chapters entitled "Mad Cows and Englishmen," "Mysteries of the Organism: The Operation" and "Formaldehyde Photography and the New Grotesque." 3) "Main Street, U.S.A.: The Public Sphere" has chapters on "Past Perfect: Disney Celebrates Us Home," and "Trendspotting: I Shop, Therefore I Am." 4) "The Parent Trap" offers chapters entitled "Grim Fairy Tales: Renée French's *Kinderculture*," "*The Unheimlich* Maneuver: *The Doll Hour*," and "Empathy Bellies: Cloned Sheep and Pregnant Men." 5) "Riding Shotgun with the Doom Patrol" includes "Wild Nature, Wired Nature: The Unabomber Meets the Digerati," and "Space Oddities: Heaven's Gate and *Home Cyber* -- Strange Alliances on the Level Above Human."

**1802.** Dessauer, John H., ed. *My Years with Xerox: The Billions Nobody Wanted*. Garden City, N.Y.: Doubleday & Company, Inc., 1971.

Dessauer was executive vice-president of Xerox Corporation, vice-chair of its Board of Directors, and head of its Research and Engineering Division. He was with Xerox from 1935 until he retired in 1970. This book is surprisingly informative and contains good material on the growth of Xerox during the 1960s after the introduction of the 914 Model around 1960. The author also gives a good portrait of Chester Carlson. Other interesting pieces of information concern Xerox's decision to sponsor a series of TV programs on the UN; the use of facsimile copies; and the acquisition of University Microfilms in 1962.

**1803.** Dessauer, John H. and Harold E. Clark, eds., ed. *Xerography and Related Processes*. London and New York: Focal Press, 1965.

This book is largely a collection of essays dealing with the scientific developments leading to xerography. The opening chapter is by **Chester F. Carlson**, the primary inventor of this process "History of Electrostatic Recording."

**1804.** Desser, David and Garth S. Jowett, eds., ed. *Hollywood Goes Shopping*. Minneapolis: University of Minnesota Press, 2000.

This collection of essays explores the relationship between the motion picture industry and American consumer culture. The essays are organized under three broad themes: "Creating Consumers," "Consuming Creators," and "Hollywood: The Dreamscape." Part I, "Creating Consumers," examines how the movie industry built its audience and how the movies encouraged the consumption of goods. In this process, the movies were often part of a larger complex that included newspapers, magazines, and books. Part II, "Consuming Creators," considers how movie stars promoted consumption. Part III, "Hollywood: The Dreamscape," deals with the importance of a specific place (i.e., Hollywood, Los Angeles, California) in this culture. As David Desser and Garth Jowett note in their Introduction, cinema "even as an entertainment medium ... inaugurated vast shifts in social life" and provided "educational lessons ... about what it means to be American." One lesson strongly emphasized consumption. The editors explain their goal as follows: "From the influence of cinema on society to the influence of society on cinema, the contributors to this book seek to highlight these relationships through the lens of consumerism and consumer culture." Of special interest in these pages has been the effects that this culture has had on women, how they are often targeted by consumer culture and how they are presented in the movies. Several essays are devoted to exploring this theme.

This book contains fourteen essays by involving nineteen different writers. Contributors to the work include: Heather Addison, Barbara Wilinsky, Sara Ross, Cynthia Felando, Sarah Berry, Rick Worland and David Slayden, Gaylyn Studlar, Rebecca L. Epstein, Aida A. Hozic, Angela Curran, Jeffrey Charles and Jill Watts, Josh

Stenger, Thomas E. Wartenberg, Larry W. Riggs and Paula Willoquet-Maricondi. This volume is part of the University of Minnesota Press's *Commerce and Mass Culture Series*.

**1805.** Detenber, Benjamin H., Robert F. Simons, and Gary G. Bennett, Jr. "Roll 'em!: The Effects of Picture Motion on Emotional Responses." *Journal of Broadcasting & Electronic Media* 48 (1988): 113-27.

The authors found that "picture motion significantly increased arousal, particularly when the image was already arousing. Both skin conductance and self-report data supported this finding. Picture motion also tended to prompt more heart-rate deceleration, most likely reflecting a greater allocation of attention to the more arousing images." The author report that for this study, "the influence of picture motion on affective valence was evident only in the self-report measures; positive images were experienced as more positive and negative images as more negative when the image contained motion."

**1806.** Detenber, Benjamin H. , Simons, Robert F., and Reiss, Jason E. "The Emotional Significance of Color in Television Presentations." *Media Psychology* 2 (2000): 331-55.

The effects of color images on viewers merits additional research. This article is one of the relatively few studies that considers what impact color moving images in films and on television have on attention. The authors write: "Results indicate that the influence of color appears in the self-reports of emotional experience, but in none of the physiological measures. These results suggest that people feel, or consciously believe they feel, that color pictures are more pleasing and exciting than monochrome versions of the same images, yet there is no difference in their physiological responses. The implications of this dissociation of emotional responses are discussed."

**1807.** Detenber, B. H. , and Winch, S. P. "The Impact of Color on Emotional Responses to Newspaper Photography." *Visual Communication Quarterly* 8.3 (2001): 4-14.

This research maintains that color depictions of blood and violence in news photographs are more disturbing to viewers than the same pictures in black-and-white. The authors explain that this study "was designed to explore the emotional impact of black and white versus color in news photographs. Given that there seems to be some kind of color-content interaction, we chose to assess the emotional impact of color using three particular categories of images: those that depict bloody violence, those that show fire and destruction, and images of tragedy and grief." Among the conclusions they draw: "In general, the influence of color on all dimensions of emotions was greatest for the images depicting bloody violence."

**1808.** Detenber, Benjamin H. and Byron Reeves. "A Bio-Informational Theory of Emotion: Motion and Image Size Effects on Viewers." *Journal of Communication* 46.3 (1996): 66-84.

"The human brain is not specialized to deal with 20th-century media," Detenber and Reeves write. "It is possible to do things with pictures that have no counterpart in natural experience, and these special properties could potentially change emotional response. This experiment has examined two such qualities of media form as predictors of emotional response to pictures: (a) the ability to significantly change the physical size of stimuli (by changing the size of media displays), and (b) the ability to represent an image as either a stationary or moving picture. Each of these formal features is important in media, especially for newer forms of display and representation."

The authors note that "the best summary of prior research is that larger image sizes indeed can intensify viewers' evaluations of content."

One conclusion from this study suggests "that emotional responses are affected by the form a message takes, as well as by its content. This means that mediated presentations, such as film and television, should not be regarded as solely symbolic communication. In terms of the bio-informational theory of emotion, the significance of media messages to an individual resides not only in their content, but also in the nature of their presentation."

The authors call for "further inquiry into the psychological effects of home theaters. The trend for larger and larger television screens in the home may be altering the viewing the viewing experience."

**1809.** Development, Organisation for Economic Co-Operation and, ed. *Power System Operation in the U.S.A.: Report of the "Ingrid" Mission*. [Paris]: Organisation for Economic Co-operation and Development, Electricity Committee, 1961.

This report by the OECOD, made up of mainly European nations plus Canada and the United States, gives a good summary of American electricity supply industry around 1961. Part I discusses the characteristics of supply and demand in electricity in the U.S., plus power pools and the interconnected network in operation. Part II discusses eight power pools visited. Part III deals with items related to high voltage interconnection and load dispatching. Part IV presents the conclusion and Part V includes appendices (including members of the mission that filed this report). Among the conclusions of this short work (40 pages) are that per capita consumption in the United States was about twice that of most European countries. The report also noted the willingness among American electrical engineers to cooperate among themselves.

**1810.** Development], [Organisation for Economic Co-Operation and, ed. *Social Assessment of Technology*. Paris: Organisation for Economic Co-operation and Development (OECD), 1978.

There is little history in this work and it is poorly written and organized. One chapter of interest, though, deals with the video-telephone and its anticipated impact on society.

**1811.** di Brazza, F. Savorgnan. "Seeing by Telegraph." *Living Age* 258.3351 (1908): 818-19.

This article begins by saying: "To be able to see by electricity! This sounds quite an impossible idea. But however extraordinary the things appears to be, the realization of it is not so very far off. Telephotography, or the transmission of pictures by means of electricity, which has already been accomplished, seems to have paved the way towards the solution of a far vaster problem, that of seeing distant objects by means of the telegraph." The article mentions a "fresh solution," although one "not yet perfect" by a French engineer named L'Armengaud.

The article goes on to say that "Theoretically, to be able to see objects at a distance it is necessary to manufacture by means of selenium, a kind of artificial eye, sensitive to the different degrees of light and shade, the same as our own eyes which perceive an object by means of the contrast between its dark and light parts.... Without going into too many details, we may state that the phenomenon of the *persistency of sight* forms in vision by telegraph, as in a cinematograph, a useful ally."

"In vision by telegraph the picture is taken, not in its entirety, but in minute parts, and put together again on the screen like a mosaic. This is done so rapidly that the result is practically instantaneous, the time taken to produce the whole picture being less than one-tenth of a second. The tremendous velocity and the minute precision required have hitherto been the chief obstacles to success in the realization of vision by electricity. These have now been successfully overcome, so that **before very long we may be able to see the most distant objects by means of electricity. With all these astonishing new discoveries one wonders 'What next?'**" (my emphasis)

**1812.** Diamond, Jared, ed. *Guns, Germs, and Steel: The Fates of Human Societies*. New York: W. W. Norton & Company, 1998.

Chapter 13 in this Pulitzer-Prize winning work is entitled "Necessity's Mother," and deals with the process technological invention. Occasionally, new technologies are developed to meet specific needs. The Manhattan Project during World War II to create an atomic weapon before Nazi Germany is one such example. But far more frequently, inventions are created and at first society has little or no idea of how they might be used. It is only later that society discovers uses for the new inventions. Thomas Edison's phonograph and the development of the motor vehicle are two such examples. (Edison, for example, at first doubted the commercial values of the phonograph and did not see that its primary purpose would be to record music.) "Thus," the author writes,

"invention is often the mother of necessity, rather than vice versa." Diamond also sees the process of invention as usually incremental, not the result of a bold stroke of genius. While inventors such as Edison, Eli Whitney, and Samuel Morse made great improvements over the technology that went before them, they nevertheless built on earlier work.

Diamond's two primary conclusions "are that technology develops cumulatively, rather than in isolated heroic acts, and that it finds most of its uses after it has been invented, rather than being invented to meet a foreseen need." These conclusions are especially true, he says, for ancient technologies.

**1813.** Dick, Bernard F., ed. *Radical Innocence: A Critical Study of the Hollywood Ten*. Lexington, KY: University Press of Kentucky, 1988.

This book is an informative study of the political and social ideas of the blacklisted writers and directors known as the Hollywood Ten. While much attention was focused on these men's ties to the Communist Party, they also wrote extensively on labor, race, and foreign relations, as well as offering a critique of mainstream American history.

**1814.** Dickson, Antonia. "Wonders of the Kinetoscope." *Frank Leslie's Popular Monthly* 39.2 (1895): 245-51.

This article, written by W. K. L. Dickson's sister, Antonia, explains the purpose of the kinetoscope. "Its functions are to give us the representation of life, not as the painting, the photograph or the statue represents it, frozen into a single attitude, but exhibiting all that wealth of movement and expression which makes up the sum of our restless existence." (245) "The kinetophonograph," she says, "goes a step further. It is the union of the kinetoscope with the phonograph, the blending of visual impressions with their kindred sounds. The combined effect is life, with all its eloquent and insistent appeals to the sense of man." (245)

The author is interesting in describing the "motley possession" that can "be seen winding its way toward the Kinetographic Theatre." (250) It included "Boxing cats, performing monkey, terriers, and rats...." The human subjects are equally diverse." (250)

**1815.** Dickson, Edward M., ed. *The Video Telephone: A New Era in Telecommunications*. Ithaca, NY: Cornell University Press, 1973.

**1816.** Dickson, Keith. "Petfoods by Computer: A Case Study of Automation." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 174-83.

This article examines what happens when a factory converts to microcomputer-controlled production. It helped productivity but had a large impact on management, maintenance works, and the employment of assembly-line workers who were not unionized and who were unskilled.

**1817.** Dickson, Paul, ed. *Sputnik: The Shock of the Century*. New York: Walker & Company, 2001.

This very readable book deals with the impact that the Soviet Union's launching of Sputnik in 1957 had on the United States. President Dwight Eisenhower welcomed this event because it believed it would strengthen the principle of "freedom and space." He was most interested in the surveillance possibilities of satellites, believing that they could give the United States an accurate picture of Soviet power.

In the author's view, Sputnik is a seminal event in modern history, as evidenced by the following quotation from physicist Lloyd V. Berkner in October 1957: "From the vantage point of 2100 A.D., the year of 1957 will most certainly stand in history as the year of man's progression from a two-dimensional to a three-dimensional geography. It may well stand, also, as the point in time at which intellectual achievement forged

ahead of weapons and national wealth as instruments of national policy. The earth satellite is a magnificent expression of man's intellectual growth – of his ability to manipulate to his own purposes the very laws that govern his universe.”

This work has a bibliography and index. There is also a "Notes" section that discusses the literature used in each chapter but no numbered endnotes.

The author has worked as a reporter and has several other popularly oriented books dealing with such topics as baseball and slang. He has also written books entitled *Think Tanks* (1971), *The Electronic Battlefield* (1976), and *Out of This World: American Space Photography* (1977).

**1818.** Dickson, W. K. L. , and Dickson, Antonia, eds. *Life and Inventions of Thomas Alva Edison*. New York: Thomas Y. Crowell & Co., 1892.

This book presents a laudatory biography of Edison and discusses his inventions up to the early 1890s. Of the early projection of moving pictures, the authors, who worked with Edison, write: “...On exhibition evenings the projection-room, which is situated in the upper story of the photographic department, is hung with black, in order to prevent any reflection from the circle of light emanating from the screen at the other end, the projector being placed behind a curtain, also of black, and provided with a single peep-hole for the accommodation of the lens. The effect of these sombre draperies, and the weird accompanying monotone of the electric motor attached to the projector, are horribly impressive, and one's sense of the supernatural is heightened when a figure suddenly springs into his path, acting and talking with a vigor which leaves him totally unprepared for its mysterious vanishing. Projected stereoscopically, the results are even more realistic, as those acquainted with that class of phenomena may imagine, and a pleasing rotundity is apparent, which, in ordinary photographic displays, is conspicuous by its absence.

“Nothing more vivid or natural could be imagined than these breathing, audible forms with their tricks of familiar gesture and speech. The inconceivable swiftness of the photographic successions, and the exquisite synchronism of the photographic attachment, have removed the last trace of automatic action, and the illusion is complete....” (311-12)

**1819.** Dickson, W. K. L. and Antonia. "Edison's Invention of the Kinetophone." *The Century Illustrated Monthly Magazine* 48 (New Series Vol. 26) (1894): 206-14.

Thomas A. Edison in his Introduction (p. 206) to this article on the Kinetophone wrote: “I believe that in coming years by my own work and that of Dickson, Muybridge [,] Marié and others who will doubtless enter this field, that grand opera can be given at the Metropolitan Opera House at New York without any material change from the original and with artists and musicians long since dead.” (206)

In this article, W. K. L. Dickson commented on this invention's importance to history: “The advantages to students and historians will be immeasurable. Instead of dry and misleading accounts, tinged with the exaggerations of the chroniclers' minds, our archives will be enriched by the vitalized pictures of great national scenes, instinct with all the glowing personalities which characterized them.” (214)

**1820.** Didsbury, Howard F., Jr., ed. *Communications and the Future: Prospects, Promises, and Problems*. Bethesda, MD: World Future Society, 1982.

This work contains more than forty-five essays speculating about communications and the future. The volume was put together in conjunction with the World Future Society's Fourth General Assembly held in Washington, D. C., July 18-22, 1982. The papers herein are a selection of those submitted to an editorial review committee. The World Future Society: An Association for the Study of Alternative Futures, based in Bethesda, Maryland, then claimed 30,000 members in more than 80 countries, and described itself as a non-profit scientific

and education organization for people interested in how social and technological innovations might influence the future.

Among the essays in this volume is John N. Pelton's speculation about "The Future of Global Satellite Communications"; William E. Halal writing about "Information Technology and the Flowering of Enterprise"; and Richard M. Neustadt on "Politics and the New Media." Several essays see problems with the new media including Howard F. Didsbury, Jr.'s "The Serpent in the Garden"; Tony M. Lentz's "The Medium Is the Madness: Television and the Pseudo-Oral Tradition in America's Future"; and Gerald M. Phillips, "The Decay of Purposive Communication."

**1821.** Diebold, John, ed. *Beyond Automation: Managerial Problems of an Exploding Technology*. New York: McGraw-Hill Book Company, 1964.

Diebold was a specialist in automation and at the time of this book, president and chairman of the board of the Diebold Group, Inc. Of special interest is chapter 3, "The High Promise of Information Technology-- and Four Problems it Raises for Business." Diebold believed that information technology was creating "entirely new families of machines, of which the electronic computer is only one." He discusses the computer, electronic circuitry, advances in long-distance communication, improvement in data storage, networks of machines that retrieve information, and satellites. Such technology was not two decades old when he wrote in 1964, but "already over 15,000 computers and 2,500 tape controlled machines" were at work in the United States. He predicted that this new technology would create new kinds of organization and new businesses. The most significant consequences of automation, though, would be tremendous social change. "Buying patterns, consumption habits, and other social attitudes will be radically affected by the technology," he contended.

Diebold saw four critical issues confronting business: 1) Businesses must replace their piecemeal approach to information technology with "an organized discipline of information systems." 2) New professional classifications must be established to achieve these disciplined systems. 3) Future managers must receive education in information systems. 4) Business leadership must be aware of changes brought by automation.

In chapter 4, Diebold attempts to refute four myths about automation: 1) that it is usefully primarily as a labor-saving device; 2) that oil refineries and other process plants had already realized the ultimate in automation; 3) that because automated machinery was highly complex that most of the decisions regarding it should be left to experts -- technicians and engineers; 4) that only wealthy companies can afford to take advantage of automation and information technology.

**1822.** Dietz, Park Elliott. "Statement of Park Elliott Dietz, M.D., M.P.H., Ph.D." *Final Report of the Attorney General's Commission on Pornography*. Nashville, TN: Rutledge Hill Press, 1986. 487-92.

Park Elliott Dietz, an M.D. and Ph.D., was a member of the Meese Commission in 1985-86. He taught courses at the University of Virginia on Law and Psychiatry, and Crimes of Violence, and had published research in the *Journal of Forensic Sciences* about sexual sadism in detective magazines, a theme he traced back to the 17th century. Dietz thought most forms of pornography were "immoral" and corrupted the family and society's moral fabric. But he stopped short of supporting a Commission resolution that called the family society's most important unit because he believed that the government should not try to dictate ideal living arrangements. Attached to this Statement is Dietz's article on "Detective Magazines: Pornography for the Sexual Sadists?" (Jan. 1986).

**1823.** Dietz, P. E., Harry, B., and Hazelwood, R. R. "Detective Magazines: Pornography for the Sexual Sadists?" *Journal of Forensic Science* 31 (1986): 197-211.

Park Elliott Dietz, an M.D. and Ph.D., was a member of the Meese Commission in 1985-86. He taught courses at the University of Virginia on Law and Psychiatry, and Crimes of Violence, and had published research in the *Journal of Forensic Sciences* about sexual sadism in detective magazines, a theme he traced back to the 17th century.

Dietz thought most forms of pornography were "immoral" and corrupted the family and society's moral fabric. A copy of this article appears in *Final Report of the Attorney General's Commission on Pornography* (1986), pp. 492-504.

**1824.** Din, Allan M., ed., ed. *Arms and Artificial Intelligence: Weapon and Arms Control Applications of Advanced Computing*. New York: Oxford University Press, 1987.

This collection of papers by experts from six countries grew out of a 1986 workshop sponsored by the Stockholm International Peace Research Institute. The editor of this volume outlines this book in the Preface: "The importance of information technology in modern weapon systems is constantly growing. Since the beginning of the 1980s, artificial intelligence has become a significant part of this trend because of its potential applications in military decision-making. This book is a first attempt to present a broad overview of the prospects for information technology in general, and a machine intelligence in particular, in the context of international security.

"As it is often the case with a new and rapidly developing area, relevant material is quite scattered and inaccessible to non-specialists...."

"An overview of this prospects of artificial intelligence in weapon and arms control applications is presented in Part I. The workshop papers constitute Part II, III and IV of the book and provide a technical, strategic and political analysis of the dangers and promise underlying weapon and arms control applications of computers and artificial intelligence. Part II gives an introduction to basic aspects of artificial intelligence concepts and computer hardware. In Part III, military and strategic implications are discussed, including the Strategic Computing Program of the US Defense Advanced Research Projects Agency, the automated tactical battlefield, strategic defence systems and political perspectives. Finally, in Part IV, there is a description of arms control applications of information technology, and artificial intelligence, including verification, simulation, modelling and negotiation." (p. [iii])

The work has abstracts of each paper following the Table of Contents.

**1825.** Din, Allan M. "The Prospects for Artificial Intelligence in Weapon and Arms Control Applications." *Arms and Artificial Intelligence: Weapon and Arms Control Applications of Advanced Computing*. Ed. Allan M. Din, ed. New York: Oxford University Press, 1987. 3-29.

This opening chapter offers an overview of artificial intelligence. "Most of this technology is new and many of its consequences, either beneficial or potentially dangerous, still await detailed assessment," Nin says. Nin discusses the connection with the civilian sector and the weapon applications. He then covers computer hardware and software, and expert systems and AI. Nin notes that in 1986 that computer research was progressing much faster in the United States and NATO countries than in the USSR and Warsaw Pact nations. Advanced microelectronics accounted for this trend. In discussing weapon projects, Nin notes with the Strategic Computing Initiative, which in 1983 was to have a budget of \$600 million, there were hopes that AI "could completely change many concepts of land warfare and the army force structure." (15) Nin also discusses AI relationship to the strategic defense initiative, weapons verification, and modeling and simulation programs. Nin's 72 endnotes give readers a good introduction to other published literature that existed in 1987 on artificial intelligence.

**1826.** Dinello, Daniel, ed. *Technophobia!: Science Fiction Visions of Posthuman Technology*. Austin: University of Texas Press, 2005.

With alarmist but insightful passion, Daniel Dinello traces society's relationship with technology through the thinkers and scientists who made the world as we know and imagine its possibilities; and through the dreams and fears expressed in science fiction. Dinello confronts the techno-utopian possibilities continuously espoused by those who with full faith in the power of technology to make lives easier and humanity better prophesy a post-human transcendence out of nature and into immortal cyborgs and/or fully synthetic humanoids. Drawing

extensive parallels between technophiles and (fundamentalist) Christians, Dinello like the sci-fi dystopia warns strongly against blind dependence on technology developed and controlled by military, corporate and government interests. He explores issues of control and dominance in the relation of humans to their technology, including science fiction parallels to real world slavery, racism, sexism and political oppression. Detailing current biological and mechanic human enhancements, he wonders where the lines are drawn to determine what constitutes human. *Technophobia!* explores the warnings of science fiction in regard to particular technological developments, including robotics, medical technology, gene manipulation (such as genetically engineered crops), replication (via cloning or nanobots) and infection (via biological or technological viruses); and, in an impressively wide-ranging cultural-literary analysis of popular works, Dinello reveals just how far from far-fetched science fiction has become.

--Dale Erlandson

**1827.** Dinsdale, Alfred, ed. *First Principles of Television*. New York: Arno Press, 1932.

**1828.** Divine, Robert A., ed. *The Sputnik Challenge*. New York: Oxford University Press, 1993.

"The panicky response to *Sputnik* had long-lasting effects on American life," diplomatic historian Robert Divine writes. "It opened a debated over the state of education, science, space exploration, and national security that lasted well into the 1960s. ...In a sense, the anxiety raised by *Sputnik* did not end until Neil Armstrong and Buzz Aldrin took their historic steps in July 1969." Yet President Dwight Eisenhower was not particularly impressed by the Soviet's accomplishment in 1957. Eisenhower counseled "prudence and restraint" but failed to understand the uneasiness caused by *Sputnik*. This book focuses on Eisenhower's response to the Soviet satellite. It is based to a large degree on papers in the Dwight D. Eisenhower Library in Abilene, Kansas.

**1829.** Dixon, Wheeler Winston, ed. *Disaster and Memory: Celebrity Culture and the Crisis of Hollywood Cinema*. New York: Columbia University Press, 1999.

Taking the death of Diana Spencer, Princess of Wales, as a starting point, examines the roots of celebrity culture. The book is "a series of extended meditations" about "the cult of celebrity, the nature of public surveillance, the role of the print and television media in shaping the words and images that form the fabric of our shared communal consciousness, and the role of the public as a coproducer of the wave of emotion surrounding Diana's death." The obsession that both members of the media and the public had over Princess Diana "are grounded in a cult of personality which has gradually overtaken the world as a congruent whole, brought together yet separated by global cable, broadcast and satellite networks, and international print publications which can service many different markets around the world simultaneously." (Preface)

Dixon examines this topic from the 1950s, when television became a major presence in the lives of most Americans. He treats in depth the careers of "two somewhat marginalized" movie and TV personalities, Ida Lupino and Richard Carlson, and the efforts these two people made to recast their images. Dixon also attempts to assess how "televisual media (cable, videocassettes, instant print magazines and newspapers, pictures stored in digital memory and then recalled with the push of a button)" influence the way the public saw Prince Diana.

This 182-page book as a "Selected Bibliography" and Index, but no footnotes.

**1830.** ---, ed. *The Second Century of Cinema: The Past and Future of the Moving Image*. Albany, N. Y.: State University of New York Press, 2000.

This uneven book argues that "as a production medium, 16mm film is dead; 35mm may well follow within the next ten to fifteen years, signaling a significant shift in the production and reception process" of cinema. Film will be replaced by "a high-definition matrix of dots and pixels laser-projected onto a conventional theater screen," a development readily accepted by audiences. Dixon believes that the multiplication of new movie making

technologies – videos, film, tv programs, the Internet – will help to crumble international image boundaries and will in the near future lead to “an explosion of voices from around the globe, in a new and more democratic process that allows a voice to even the most marginalized factions of society.” These developments will challenged, if not overwhelm, Hollywood control over the narrative structure of entertainment.

Dixon’s opening chapter, “Voices from the Margins, and the New Digital Cinema,” discusses several out-of-the-mainstream films – e.g., *Sex, Lies and Videotape* (1989), Darren Aronofsky’s 16mm black-and-white film *Pi*, Steven Soderbergh’s color 16mm, low budget movie, *El Mariachi* (1992), Lisa Cholodenko’s *High Art* (1998), and others. Dixon’s treatment of some of these films (although not all) considers the movie technology used. “A new generation of video cameras may make conventional 35mm cinematography, if not obsolescent, at least a luxury, or perhaps an aesthetic choice for the filmmakers of the twenty-first century,” he writes. This chapter also includes discussion of nanotechnology and advances in surveillance cameras, and how the latter, in particular, has already started to challenge Hollywood narratives.

Chapter Two is entitled “Visions of the Gothic and Grotesque,” and Chapter Three is “Images of Conquest and the Colonialist Instinct.” Chapter Four, “The Commodification of Desire, ...” looks at the film career of black actor Paul Robeson and argues that Robeson’s films during the 1930s and 1940s failed to take advantage of his true talents, binding him instead to “a rigid social and racial stereotype.”

The final chapter, “The Past and the Future of the Moving Image,” covers several interesting themes. Dixon notes that Shakespeare’s *Richard III* is much more effective on film than on videotape (which gives the play an “immediate” look). A section is devoted to 16mm and 35mm industrial short films between the 1930s to the 1970s (now on CD-ROM). Another section deals with Roberto Rossellini color docudrama *India* (1958). Still other pages cover digital cinema and virtual reality. Increasingly works that had been marginalized are gaining a wider viewing. Dixon maintains that “it is impossible to hold back the flood of images created by these new technologies, and in the coming century, these images will both inform and enlighten our social discourse.”

**1831.** Dizard, Wilson P., ed. *The Coming Information Age: An Overview of Technology, Economics, and Politics*. New York: Longman, 1989.

This book, though slightly out of date, is a fine resource for understanding the infrastructure and technology of new media, in addition to the political and economic system which supports it. Dizard begins by arguing that the key to political or economic security in the future is linked to information, and specifically being able to control and command the new information technologies. The United States gains much of its dominant position in the world from its advantage in this area. He believes that governmental support is a key to ensuring this position in the future.

One useful section of the book examines the physical makeup of the new computing and networking systems. Though the book is several years old, most of it is still relevant. The discussion of this technology is introductory, but thorough. Dizard also discusses the role of governmental regulation. He uses the example of the Bell system breakup to show that regulation can increase service and open the system to profitable competition. The major role of the government, however, is in promoting US interests overseas. American telecommunications businesses dominate the global market, often with help from government programs and incentives. Chapter 8 of this book is an excellent discussion of various means that are used to promote these businesses and the extent to which they have penetrated every market.

Dizard also provides a nice summary of the economics of the telecommunications industry. He discusses growing conglomeration, and argues that this is often needed to generate the large amount of capital that goes into research. Increased concentration of power and government assistance will help the US maintain this dominant position. He does recognize the social costs and the implications for the citizen, but downplays them.

--Rob Rabe

**1832.** ---, ed. *Television: A World View*. Syracuse, NY: Syracuse University Press, 1966.

Dizard saw television as a "truly revolutionary" form of communication, one that was global in its reach. In 1966, he wrote: "By 1975, television will be an integral part of a vast international communications network built around computers and space satellites. These machines will provide any kind of data instantaneously in all parts of the world to meet the needs of the new information explosion. They will carry a dialogue of experts speaking the international language of technology, and that dialogue will affect the prospects for a more stable world order. Television can be the sight-and-sound interpreter of the dialogue, making it understandable to everyone. Properly used, television can be the forum of a new age of interdependence, the only mass medium fully capable of crossing geographical, cultural, and political barriers to link men and nations in an evolving world community.

The alternative is a world struggling to meet its informational needs largely through traditional means. This is a losing race. Books and other written materials reach no more than half the earth's population. The other half is still functionally illiterate. Outside Europe, Japan, and the United States, newspapers are an insignificant media factor. The film medium has developed primarily as an entertainment spectacle. Only radio is still expanding at a rate which begins to match present-day mass communications needs."

**1833.** Dizard, Wilson P. and S. Blake Swensrud, ed. *Gorbachev's Information Revolution: Controlling Glasnost in a New Electronic Era*. [Washington, D.C.]: Center for Strategic and International Studies/Westview Press, 1987.

This work, completed before the collapse of the Soviet Union, might be read in conjunction with other books that explore the relation between the fall of the USSR and new media such as Scott Shane's *Dismantling Utopia* (1994), Gladys Ganley's *Unglued Empire* (1996), and Manuel Castells' *End of Millennium* (1998).

**1834.** Doane, Mary Ann, ed. *The Emergence of Cinematic Time: Modernity, Contingency, the Archive*. Cambridge, MA: Harvard University Press, 2002.

The author writes: "This book is about the representability of time in the late nineteenth and early twentieth centuries. Photographic and cinematic technologies played a central role here precisely because they were so crucial to thinking that representability. Although popular accounts tended to endow the cinema with determinant agency -- that is, cinematic technology made possible a new access to time or its 'perfect' representation -- in fact the emerging cinema participated in a more general cultural imperative, the structuring of 3/4 time and contingency in capitalist modernity. Although the rupture here is not technologically determined, new technologies of representation, such as photography, phonography, and the cinema, are crucial to modernity's reconceptualization of time and its responsibility. A sea change in thinking about contingency, indexicality, temporality, and chance deeply marked the epistemologies of time at the turn of the last century. The reverberations of this break are still perceptible today in the continual conjunction of electronic technologies and questions of instantaneity and the archievability of time. As Andreas Huyssen points out, 'the issue of media ... is central to the way we live structures of temporality in our culture.' Film, television, and video are frequently specified by the term *time-based media*." (3-4) (italics in original text)

**1835.** Dobrow, Julia R. "Patterns of Viewing and VCR Use: Implications for Cultivation Analysis." *Cultivation Analysis: New Directions in Media Effects Research*. Ed. Nancy Signorielli and Michael Morgan, eds. Newbury Park: Sage Publications, 1990. 71-83.

This piece contains useful information of VCR use from the 1960s through 1980s. The author seeks to answer the question whether VCR use, like television viewing, "tends to cultivate mainstream perspectives." The author does not define "mainstream." The study is based on two sets of interviews with VCR owners in the greater Boston area--one yielded a "total of more than 50 viewer profiles," the other of more than 500 people "interviewed through a random digital telephone survey, stratified by exchange." This is a rather thin piece, although the bibliography is of some value.

**1836.** Dobson, James. "Personal Comments by Commissioner James Dobson." *Final Report of the Attorney General's Commission on Pornography*. Nashville, TN: Rutledge Hill Press, 1986. 504-09.

James C. Dobson, who held a Ph.D. in child development, was a member of the Meese Commission in 1985-86. He was a licensed psychologist and family counselor, and president of Focus on the Family, a California-based organization that produced a syndicated radio program. Dobson had written several books including *Dare to Discipline* (1970) and *Hide or Seek* (1979), the latter about self-respect in children. A devout Christian, he considered pornography harmful in many ways and felt that it threatened the "future of the family itself."

**1837.** Dobson, James C., ed. *Dare to Discipline*. Wheaton, IL: Tyndale House Publishers.

James C. Dobson, who held a Ph.D. in child development, was a member of the Meese Commission in 1985-86. He was a licensed psychologist and family counselor, and president of Focus on the Family, a California-based organization that produced a syndicated radio program. Dobson had written several books including *Dare to Discipline* (1970) and *Hide or Seek* (1979), the latter about self-respect in children. A devout Christian, he considered pornography harmful in many ways and felt that it threatened the "future of the family itself."

**1838.** ---, ed. *Hide or Seek*. Old Tappan, NJ: Revell, 1979.

James C. Dobson, who held a Ph.D. in child development, was a member of the Meese Commission in 1985-86. He was a licensed psychologist and family counselor, and president of Focus on the Family, a California-based organization that produced a syndicated radio program. Dobson had written several books including *Dare to Discipline* (1970) and *Hide or Seek* (1979), the latter about self-respect in children. A devout Christian, he considered pornography harmful in many ways and felt that it threatened the "future of the family itself."

**1839.** Doheny-Farina, Stephen, ed. *The Wired Neighborhood*. New Haven: Yale University Press, 1996.

This work is a personal exploration and critique of the "virtual world." Doheny-Farina urges the reader to stay connected to their real communities instead of abandoning it for virtual ones. The author does not believe technology to be necessarily detrimental, but believes its effects weaken the ties that individuals once had for the communities, families, co-workers, and friends.

--Mark Tremayne

Doheny-Farina argues that digital technology has been a destabilizing force in community life. So far, Internet communications have led to a lessening of connection with geophysical space, and that digital communications are being substituted for public meetings in neighborhoods or localities. Citizens must search for ways to use technology to enhance public life rather than diminish it.

--Phil Glende

**1840.** Doherty, Thomas. "Documenting the 1940s." *Boom and Bust: The American Cinema in the 1940s*. Ed. Schatz, Thomas. New York: Charles Scribner's Sons, 1977. 397-421.

This chapter is in Volume 6 in the *History of American Cinema* series, Charles Harpole, ed. Doherty discusses documentary films and also newsreels during the 1940s. In addition, he considers World War II and the use of 16mm cameras.

**1841.** Domhoff, G. William, ed. *The Higher Circles: The Governing Class in America*. New York: Random House, 1970.

The author describes his purpose as follows: "This book of empirically based essays is intended to deepen, extend and defend the picture of how America is governed that I presented in two previous works [*Who Rules America?* and *C. Wright Mills and the Power Elite*]. After a short introduction in which I show from our study of the

social stratification literature that only a small percentage of it concerns the highest level of society, the four essays in the first section attempt to extend our understanding of the upper class as a social class. The three essays which compose the second section attempt to deepen our understanding of the upper class as a governing class; they explore the involvement of members and organizations of the upper class in the governing mental process. The third and final section, consisting of two essays, defends my views by contrasting them with those of pluralists and ultra-conservatives." (vii-viii)

Domhoff says that "the power elite ... try to influence public opinion through the formation of publicity committees composed of prominent private citizens.... In early 1958, President Eisenhower asked corporate executive, Eric Johnston, ... founder of CED [Committee for Economic Development] and a former president of the US Chamber of Commerce, to head a special White House meeting to convey information to the public on foreign policy aspects of national security. Johnston and his staff invited over 1,000 corporate, organizational, community and labor leaders to a one-day conference of meetings and speeches. Out of the conference came a new citizens' committee, the Committee for International Economic Growth (CIEG), charged with the responsibility of carrying the conference's message to the entire populace." (152-3) Johnston was also at the time president of the Motion Picture Association of America.

**1842.** Donnelly, William J., ed. *The Confetti Generation: How the New Communications Technology Is Fragmenting America*. New York: Henry Holt and Company, 1986.

This work is on the order of Bill McKibben's *The Age of Missing Information*. It is not footnoted, although it does have a bibliography. The author draws on Marshall McLuhan and David Riesman, among others. His focus starts with television. He discusses cable, the VCR during the 1960s and 1970s, and the VCR revolution which was underway during the mid-1980s. He also gives space to video games and the home computer. This "new media will cause a new kind of individualized cultural segmentation," he says.

"The result will be the Confetti Generation, for the current Autonomy Generation does not possess the cultural tools to absorb such an explosion of information and entertainment, such an implosion of speed and remoteness.... We will witness an aggravated version of today when all ideas are equal, when all religions, life-styles, and perceptions are equally valid, equally indifferent, and equally undifferentiated in every way until given value by the choice of a special individual. This will be the Confetti Era, when all events, ideas, and values are the same size and weight....

"New technology in all of its forms will simply aggravate the confusion. Information will rain on us like confetti and become just as meaningless. The information we receive, isolated with our television sets, will be increasingly incomprehensible."

Donnelly's pessimism brings to mind Landon Winner's chapter on "Mythinformation" in *The Whale and the Reactor* (1986).

--SV

Donnelly, a rare combination of academic and former vice president of Young & Rubicam, takes all of the emerging electronic technologies of communication and finds a similarly fragmenting effect. The overall impact of these technologies is to isolate Americans as individual consumers unable to form a conception of the common good, or even to identify issues of common concern. He works in some interesting notions about David Riesman's "outer-directed" man of the second half of the twentieth century ironically seeking self realization and lapsing into a "culture of narcissism." Television and related technologies, while having the potential to form a public of common interests, serve instead to exacerbate this tendency to turn inward.

**1843.** Donnerstein, Edward , Linz, Daniel, and Penrod, Steven, eds. *The Question of Pornography: Research Findings and Policy Implications*. New York: The Free Press, 1987.

This book synthesizes research on media effects and pornography, and discusses implications that those findings might have on policy making.

**1844.** Donnerstein, Edward and G. Barrett. "Effects of Erotic Stimuli on Male Aggression Toward Females." *Journal of Personality and Social Psychology* 36.2 (1978): 180-88.

Pornography and aggression have oft been linked by scholars and critics alike. As a result, they are often examined in tandem. This study looks at the effects exposure to erotic films has on subjects likelihood to aggress against a confederate (a pseudo-participant planted by the experimenters). A total of 72 male subjects were used in this procedure. The subjects were part of a 2 x 2 x 2 design manipulating anger (anger or no anger), film-type (erotic or neutral), and target of aggression (male or female). To facilitate anger subjects were graded either favorably or poorly on a mock writing assignment. Donnerstein and Barrett found that subjects who were angered prior to exposure to the erotic stimuli indicated the likelihood to aggress toward the confederate. Non-angered subjects did not demonstrate this effect. The major implication of this study is that an individual's cognitive or behavioral state *before* exposure to pornography is an indicator of how they will act after exposure. These findings corroborate the findings of Malamuth and Check (1983 & 1985) in that there are conditions that exist prior to exposure that may indicate post-exposure behavior. Furthermore, this study demonstrates the impact of exposure to filmed sexual acts whereas the Malamuth and Check studies utilized audiotapes.

--Michael Boyle

**1845.** Dougherty, D. Cardinal. *D. Cardinal Dougherty Papers (?)*. Archdiocese of Philadelphia, Archives and Historical Collections.

These papers are helpful in studying the response of the Roman Catholic Church in Philadelphia, and more generally in the United States, to motion pictures. Cardinal Dougherty was highly critical of movies he deemed to be immoral, and he played an important role in the creation of the Roman Catholic Legion of Decency which asked the faithful to pledge that they would boycott offensive films.

**1846.** Dougherty, Philip H. "Hill & Knowlton to Buy Gray, the Lobbyists." *New York Times* June 4, 1986 1986, sec. D: 1D.

This article gives background to the public relations firms of Hill & Knowlton and Gray & Co. Opponents of the Meese Commission, which had been created during the Reagan administration to study pornography, used Gray & Co. to discredit the Commission's *Report* and recommendations. Part of the strategy involved portraying the Commission members as moral vigilantes and enemies of the First Amendment.

**1847.** Douglas, Susan J. "Amateur Operators and American Broadcasting: Shaping the Future of Radio." *Imagining Tomorrow: History, Technology, and the American Future*. Ed. Joseph J. Corn, ed. Cambridge, MA: MIT Press, 1986. 35-57.

Many predictions about radio at the turn-of-the-century did not come true, Douglas says. "They had been based on a misunderstanding of how the invention worked, and they assumed that radio, by itself, could change the world. Yet even dreams that do not come true can have an effect. By encouraging and romanticizing the amateurs' hobby, these visions fostered experimentation among members of a subculture who had neither a corporate nor a political agenda. The predictions also articulated and reinforced the belief that this technology could and should be accessible to the greatest number of Americans."

**1848.** ---, ed. *Inventing American Broadcasting, 1899-1922*. Baltimore: Johns Hopkins University Press, 1987.

This book grows from the author's interest in American studies and the history of technology. She examines the origins of the American broadcasting system. She looked first to the 1920s, but realized that this decade "was hardly the beginning; nor was this era, in the end, the most interesting to me. As I kept going back in time ... I was struck by how the basic questions surrounding broadcasting's role in society were raised decades before radio broadcasting as we know it began. It was also struck by how many precedents were set before KDKA ever went on the air. Thus, I chose to examine in detail what has sometimes been dismissed as broadcasting's 'pre-history,' and to argue that it was during this period between 1899 and 1922 that the basic, technological, managerial, and cultural template of American broadcasting was cast."

The author's nine chapters are entitled: "Marconi and the America's Cup: The Making of an Inventor-Hero, 1899," "Competition over Wireless Technology," "The Visions and Business Realities of the Inventors, 1899-1905," "Wireless Telegraphy in the New Navy, 1899-1906," "Inventors as Entrepreneurs... 1906-1912," "Popular Culture and Populist Technology: The Amateur Operators, 1906-1912," "The *Titanic* Disaster and the First Radio Regulation, 1910-1912," "The Rise of Military and Corporate Control, 1912-1919," and "The Social Construction of American Broadcasting, 1912-1922."

**1849.** ---, ed. *Where the Girls Are: Growing Up Female with the Mass Media*. New York: Times, 1994.

**1850.** Douglas, Sara U., ed. *Labor's New Voice: Unions and the Mass Media*. Norwood, NJ: Ablex Publishing, 1986.

Douglas examines the public relations efforts of the AFL-CIO and four key unions: the UAW, IAM, AFSCME, and the ILGWU. Douglas also outlines three pro-labor media campaigns: the UFW's grape strike, the ACWA's boycott of Farah, the United Labor Committee's right to work campaign; and she provides a detailed study of the ACTWU's campaign against J.P. Stevens. The Stevens campaign is examined using a protest communications model to offer a strategy of how labor might be more effective in public relations. Douglas briefly describes the efforts of the unions using the labor press and some radio public affairs programming before the merger in the mid-1950s. She noted that unions grew more assertive in issue and advocacy advertising after the merger. "Few avenues have been overlooked in labor's attempt to inform and persuade its audiences. Newspapers, radio, and television utilization is regarded as essential by many labor leaders today. And although a few unions have used various new communications technologies almost as soon as they became available, many labor officials remain disappointed in the quality and results of labor's communications programs." In the late 1950s, the AFL-CIO sponsored two network news programs, with hosts Edward P. Morgan and John W. Vandercook. In addition, broadcast rules gave unions access to free air time for public service announcements. The federation increased its public relations budget in 1957 in response to adverse publicity from a congressional investigation of union leadership. Spending for television was increased from under \$10,000 in 1955-56, to more than \$250,000 in 1957-58. A series of 15-minute films, *Americans at Work*, were produced for weekly use on television. Even with a budget cut for radio programming, the AFL-CIO spent nearly twice as much for radio that year. A total of 104 films were produced between 1958 and 1960 and they were shown on television until 1967. No comparable television production effort occurred until the Labor Institute for Public Affairs was created in 1982. LIPA created a 12-part television series, *America Works*. LIPA also began producing spot television advertising, started a videocassette news service, distributed an information bulletin on electronic media, and invested in cable television. Douglas noted that ILGWU also produced a "Hollywood-type" film, *With These Hands*, in 1950 using the same writer who produced the successful play *Pins and Needles* in the 1930s. The IAM also produced public relations films for general audiences, such as *My Dad J.R.*, as well as films for lodge meetings, such as *Anatomy of a Lie*, a documentary intended to counter an anti-union film about a strike. The IAM also pioneered in cable television, using a satellite in 1979 for a nationwide showing of a labor film followed by an audience call-in program. AFSCME used a satellite transmission service in 1980 for the Labor News Network, which distributed news and features to television and radio stations and cable systems. Douglas concludes that organized labor has become more active and more aggressive in public relations, and that labor is improving its chances of communicating its message.

**1851.** Douglas, William O. William O. Douglas Papers.

The Papers of U. S. Supreme Court Justice William O. Douglas have drafts of opinions that related to freedom of expression, motion pictures, and other media. These papers are in the Container 1182 of the Douglas Papers, Library of Congress, Washington, D. C.

**1852.** Dow, J. S. "The Effect of Light of Different Colors on Visual Acuity." *Illuminating Engineer* 4.6 (1909): 315-19.

**1853.** Downey, Greg. "Telegraph Messenger Boys: Crossing the Border Between History of Technology and Human Geography." *The Professional Geographer* 55.2 (2003): 134-45.

Downey writes that "historians of telegraphy have traditionally focused on the system-builders who invented wire communications technologies and incorporated them into profit-making enterprises. Geographers of communication have traditionally traced the changes that the telegraph network wrought on the rank-size of cities and the speed of business. Both have ignored the history of the telegraph messenger boys and the 'lived geography' of the telegraph network. This article summarizes a study of telegraph messengers as both active components of technological systems and laboring agents within produced urban spaces, bringing together the fields of both history of technology and human geography."

**1854.** ---. "Virtual Webs, Physical Technologies, and Hidden Workers: The Spaces of Labor in Information Internetworks." *Technology and Culture* 42.2 (2001): 209-35.

Downey writes that "paradoxically, the more the Internet grows in scale and scope, the more its virtual attractions obscure its physical foundation. Those crucial internetworkers become visible in the historical record only when three separate processes – technological innovation, the production of space, and the daily performance of labor – are considered simultaneously. Thus, revealing such work offers a unique opportunity (and challenge) for interdisciplinary cooperation between historians of technology, human geographers, and sociologists and anthropologists of work. In this article I hope to illustrate the possibilities offered by such collaboration by again juxtaposing two apparently different but fundamentally related images: the analog internetwork of a century ago and the digital internetwork under construction today. The crucial question, though, is not whether the telegraph, telephone, and Post Office were equivalent to today's Internet, but rather whether analyzing those three networks as an internetwork – in which the whole is more than the sum of its parts – can lead to a better understanding of today's Internet." (211)

**1855.** Downey, Gregory J., ed. *Telegraph Messenger Boys: Labor, Technology, and Geography, 1850-1950*. New York and London: Routledge, 2002.

Downey examines the critical importance of messenger boys in the spread and use of the telegraph in the United States. "Information networks are inevitably socially constructed technological systems," Downey says. He argues that "the technological network of the telegraph was more than just a combination of electromechanical systems; it was also a combination of systems of labor, in which messenger boys served different functions at different moments – sometimes working as technological components themselves, sometimes being sold as commodities along with the telegrams they carried, and sometimes acting as agents of change within the technological network itself. Messengers were not simply rendered obsolete by the slow and steady advance of technology – whether in telegraphy, telephony, or airmail. Instead, over the course of a century, they both cooperated in maintaining their usefulness to the telegraph, and fought to change their relationship to the telegraph in a way that would ultimately bring about their own exit from the industry." (7) This book grew out of a 2000 doctoral thesis in two separate departments – the Department of History of Science, Medicine and Technology, and the Department of Geography and Environmental Engineering – at the Johns Hopkins University.

**1856.** Downing, J. Spencer. "What TV Taught: Children's Television and Consumer Culture from *Howdy Doody* to *Sesame Street*." University of North Carolina, Chapel Hill, 2003.

Abstract for the Ph. D. thesis from UMI ProQuest Digital Dissertations: " This dissertation traces the history of children's programming during the first two decades of commercial television broadcasting. Children's programming serves as a lens through which to see interactions between industry, critics and audience as they grappled over television's proper approach to children. It complicates our understanding of the television industry by showing how broadcasters and marketers struggled to make children's audiences commercially viable. It also examines the complex responses to the medium among a public growing increasingly uneasy about children's use of television even as it became more entrenched in everyday American life. The history of children's television illuminates the changing nature of American childhood, too. Whereas Victorian ideals once constructed children as removed from the pressures of the market, by the late 20th century most Americans considered market participation to be a natural part of childhood. Television accelerated this transformation. The medium gave marketers unprecedented ability to teach children the manners and mores of consumer culture, awakening in them previously unfelt needs and coaching them in specifying their desires. Television taught businesspeople to cultivate children as a market segment. Likewise, the industry's critics went through a learning process as they discovered means for understanding and attempting to counteract what they perceived as television's dangers. The analysis proceeds chronologically. Early chapters discuss the rationale behind 'loss leader' children's programs such as *Howdy Doody*, *Kukla, Fran and Ollie*, *Ding Dong School* and *Captain Kangaroo* in television's infancy. They also examine high hopes parents, educators, government officials and others concerned with children's issues placed on television. Later chapters explain how children's programming became profitable, especially with the rise of low-budget cartoons, and examine how children's advocates struggled to come to terms with the ubiquitous medium. The final chapters give extended attention to the creation of *Sesame Street*. Arguably the world's most important children's program, *Sesame Street* holds special interest because its creators believed advertising techniques had become the most effective means to educate children. Just as toy companies used television to sell toys, *Sesame Street* used it to 'sell' knowledge."

**1857.** Downing, Michael, ed. *Spring Forward: The Annual Madness of Daylight Saving*. Washington, D. C.: Shoemaker & Hoard, 2005.

This 202-page book examines the contentious political controversies in the United States and Europe surrounding the adopting of daylight saving time. The author uses congressional hearings, newspaper accounts, records of town meetings, and letters to editors to look at the arguments of both proponents and opponents of daylight saving. The work, written for a popular audience, has a brief essay on sources (171-3), notes, and index.

**1858.** Downs, Donald A., ed. *The New Politics of Pornography*. Chicago: University of Chicago Press, 1989.

This book is both a legal analysis of First Amendment law with regard to the censorship of objectionable materials and also a historical analysis of attempts in the United States to limit pornography without violating basic First Amendment protections. Downs specifically studies the attempts of Minneapolis and Indianapolis to pass city anti-pornography ordinances during the 1980s. Downs observes that these ordinances marked a new kind of censorship. In the past, according to Downs, almost every attempt to censor came from the right of the political spectrum. Conservatives have often used this kind of law to block objectionable or "radical" material. However, the motivation behind the censorship discussed in this book came from the left, opening up the concept of "progressive" censorship. Much of the philosophy and terminology in these cases came from left feminist activists who viewed pornography as harmful to women and as a means of subjugation. They believe that it would be fair to censor such material because it caused harm. In his analysis, Downs correctly notes that the restrictions on the First Amendment can only be applied in a content-neutral manner and he is highly critical of the Minneapolis and Indianapolis ordinances and the implications such laws would have for freedom of expression.

Much of the book is dedicated to legal theory and First Amendment philosophy. Downs explains carefully the way in which the courts have interpreted the First Amendment and how it should be applied in cases like these. He also discusses the possibility of creating a class of materials which would fall outside of First Amendment protection. The Supreme Court has already established certain categories of speech and expression which are not protected, including libel, obscenity and "fighting words." Downs sums up some of the recent scholarship on the links between pornography, sex crimes and harassment. Ultimately, he argues that the relationship between general, non-violent pornography and violence toward women is unclear, but that a clear link does exist between the violent pornography and sexual violence toward women. It is this kind of pornography that arguably could be censored, but it cannot be done with ordinances of the kind discussed in this book. As he notes, it is very difficult to craft a law that bans one kind of expression without endangering the constitutionally protected freedoms we all cherish. This book provides background to the legal aspects of censorship and to interpreting the political motivations behind attempts at censorship. This study of the development of pornography law in the United States is useful to historians and other scholars.

--Rob Rabe

This book examines pieces of legislation, one in Minneapolis, the other in Indianapolis, to suppress pornography. The legislation was authored by prominent feminist activists, Catharine MacKinnon and Andrea Dworkin. In Minneapolis, the mayor vetoed the legislation; in Indianapolis, a local federal judge struck down the law on grounds that it violated the First Amendment.

The Minneapolis ordinance "represented a new approach to the restriction of erotic materials, defining pornography as 'the sexually explicit subordination of women, graphically or in words.' Treating pornography as 'discrimination against women,' it was to be administered by the city's Civil Rights Commission rather than by the Criminal Justice Division, the traditional unit of enforcement. This approach departed from the legal treatment of sexual materials that has prevailed for more than a century in the United States. Where previous 'obscenity law' focused on alleged moral harms wrought by certain sexual materials, the new ordinance postulated a social relationship between pornography and the systematic oppression of women. And where obscenity doctrine held back from designating sexually explicit materials as obscene if its dominant theme gave it 'serious literary, artistic, political, or scientific value,' the new ordinance admitted no such delimitation in determining whether a work was pornographic."

**1859.** Doyle, Jon , and Thomas Dean, et al. "Strategic Directions in Artificial Intelligence." *ACM Computing Surveys* 28.4 (1996): 653-70.

The authors note that "AI has undergone a sea-change in the general character of its research methodology since about 1980, partly through progress on its problems of formulation, and partly through increasing integration with related areas of computing research and other fields." (655) They conclude: "As a field, AI embarks on the next fifty years excited about the prospects for progress, eager to work with other disciplines, and confident of its contributions, relevance, and centrality to computing research." (669)

**1860.** Doyle, William, ed. *Inside the Oval Office: The White House Tapes from FDR to Clinton*. New York: Kodansha International, 1999.

Doyle discusses how American presidents beginning with Franklin Roosevelt recorded conversations in the Oval Office. The work is long on political history, but information about the recording technology used is also discussed in these pages. The author begins by discussing FDR's authorization to J. Edgar Hoover in May, 1940, to use "listening devices" against person suspected of espionage or subversion. Roosevelt used an ancestor to the tape

recorder, a "Continuous-film Recording Machine," which he had installed in August, 1940. It was a gift from David Sarnoff of RCA. It could run for 24 hours unattended. The quality of Truman's recordings is very poor. Eisenhower used dictabelts and the sound reproduction is also poor. John F. Kennedy, in summer, 1962, installed the first full-scale secret recording network in the White House, turning the office "into a private recording studio." Kennedy, and brother Robert, also began electronic surveillance of their political enemies, reporters, and some staff members.

**1861.** Drake, Frank C. "The Illustration of Newspapers." *Current Literature* 22.3 (1897): 230-34.

The author says that although Joseph Pulitzer's *New York World* was the "first newspaper to print picture regularly," there were about fifty newspapers that "were printing semi-news picture 'syndicated' from New York" (230) before Pulitzer ever acquired the *World*. James Gordon Bennett illustrated the *Herald* and Albert Pulitzer illustrated the *New York Morning Journal* "profusely" when he purchased it. (230) Certainly by the 1890s, newspaper publisher realized that picture could create circulation booms. The *World*, which the author argues "founded its success on the introduction of pictures," increased its circulation from 114,705 in 1885, to 713,318 in 1897. (231)

"It was not until the newspapers began to maintain their own photo-engraving plants, as they did in a very few years, that we began to have many important news-pictures," Drake says. These private plants made possible many more illustrations and the greater use of pictures by Sunday newspapers. (231) The author discusses the growth of Sunday papers and their use of illustrations. (231-32)

Drake provides an interesting account of how artists are sent to cover a fire and how the newspaper holds back production until it can get their pictures. The artists return to the paper and deliver their drawings to the photo-engraving plant. For the artist, it usually took about "two hours to make a four-column drawing," but in this case, it had to be done in an hour and a half. At the plant, the drawing "is photographed and 'printed' by electric light on a sensitized zinc plate. By chemical action the lines of the drawing, as they appear on the zinc plate, are impervious to the action of nitric acid. Into this acid, then, the plate is immersed until the zinc around the lines is eaten away, leaving the lines in relief. More of the zinc is then removed from around and between the lines by the 'routing machine,' a few touches are given to it by a hand-engraver, it is nailed to a metal block to make it 'type high,' and sent to the composing room.

"Since the illustrations of any periodical naturally divide themselves into three main classes of pictures, viz.: buildings and landscape, 'figure' subjects, and portraits, the art department of a newspaper is formed of due proportions of men clever in each of these lines. If the art department is a small one, men are selected who, in an emergency, can do all three branches of work in a fairly creditable manner." (234)

**1862.** Drake, William J., ed., ed. *The New Information Infrastructure: Strategies for U. S. Policy*. New York: Twentieth Century Fund Press, 1995.

The idea for this anthology began in 1990, and was one of the first projects of the Twentieth Century Fund's communications projects. This volume assumes that a new information infrastructure is in the process of emerging but its precise nature is not yet clear. In the past newspaper played a central part in keeping citizens informed about their government. Radio and television later added immediacy to the news. Now "we are in the early stages of another extraordinary change in the way many Americans transmit and receive information." How these new electronic media will affect governing is uncertain.

This book poses several questions. Will the new National Information Infrastructure (NII) be structured mainly for corporate users, or will it also include small businesses, nonprofit agencies, and individuals citizens who can use it without restrictions? What kinds of regulatory policies are needed? Does the American experience with communications serve as a model for other nations, both developing and industrialized? As national economies

are eroded, how can a global information infrastructure be created that will incorporate the difference NII's around the world?

This book is divided into four parts and twelve chapters. Part I, "The New Policy Environment," has the following essays: Eli M. Noam, "Beyond Telecommunications Liberalization: Past Performance, Present Hype, and the Future Direction"; François Bar, "Information Infrastructure and the Transformation of Manufacturing"; Linda Garcia, "The Globalization of Telecommunications and Information"; and Richard Jay Solomon, "Telecommunications Technology for the Twenty-first Century."

Part II, "Politics for the National Information Infrastructure," includes: Henry Geller, "Reforming the U. S. Telecommunications Policymaking Process"; Lee McKnight and W. Russell Neuman, "Technology Policy and the National Information Infrastructure"; and Herbert S. Dordick, "The Social Consequences of Liberalization and Corporate Control of Telecommunications."

Part III, "Policies for the Global Information Infrastructure," includes: Peter Cowhey, "Building the Global Information Highway: Toll Booths, Construction Contracts, and Rules of the Road"; Bruno Lanvin, "Why the Global Village Cannot Afford Information Slums"; Anthony M. Rutkowski, "Multilateral Cooperation in Telecommunications: Implications of the Great Transformation"; Joel R. Reidenberg, "Information Flows on the Global *Infobahn*: Toward New U. S. Policies"; and Kalypso Nicolaidis, "International Trade in Information-Based Services: The Uruguay Round and Beyond."

Part IV is entitled "Outlook and Conclusion," and includes two essays by William J. Drake, the volume's editor. They are "The National Information Infrastructure Debate: Issues, Interests, and the Congressional Process," and "Policies for the National and Global Information Infrastructures."

**1863.** Draper, Harry Napier. "Effect of Light on the Electrical Conductivity of Selenium." *Nature* 7 (1873): 340.

**1864.** Dreier, Peter. "The Corporate Complaint Against the Media." *The Quill* (1983): 64-80.

The author argues that corporate relations experts are buying favorable public opinion. The profound influence of public relations has the effect of neutralizing any liberal bias that might slip into national news media accounts of the world. Much of what is by definition news is determined by politicians, government officials and well-financed interest groups.

--Phil Glende

**1865.** Drexler, K. Eric. "The Coming Era of Nanotechnology." *The Materials Revolution: Superconductors, New Materials, and the Japanese Challenge*. Ed. Tom Forester, ed. Cambridge, MA: MIT Press, 1988. 361-73.

Drexler contends that "the old style of technology is bulk technology, where we handle atoms in unruly herds. Nanotechnology, on the other hand, will allow us to handle individual atoms and molecules, so we can build up complex structures one atom at a time. Nanotechnology... will completely transform information technology, biotechnology, and materials science, enabling us to build self-replicating engines of abundance, engines of healing, and engines of destruction." This piece first appeared in *Whole Earth Review*, No. 54 (Spring, 1987). Tom Forester, the book's editor, acknowledges that this essay approaches science fiction.

**1866.** ---, ed. *Engines of Creation: The Coming Era of Nanotechnology*. New York: Anchor Press/Doubleday, 1987.

This provocative book argues that nanotechnology has placed us on the threshold of a social upheaval of unprecedented dimensions. "To have any hope of understanding our future," Drexler writes, "we must understand the consequences of assemblers, disassemblers, and nanocomputers. They promise to bring changes as profound as the industrial revolution, antibiotics, and nuclear weapons all rolled up in one massive

breakthrough. To understand a future of such profound change, it makes sense to seek principles of change that have survived the greatest upheavals of the past. They will prove a useful guide." Nanotechnology, if used wisely, will dramatically enhance the quality of life. If used unwisely, it will make possible our destruction. "Dangerous replicators," Drexler says, "could easily be too tough, small, and rapidly spreading to stop -- at least if we made no preparation. We have trouble enough controlling viruses and fruit flies."

**1867.** ---, ed. *Nanosystems: Molecular Machinery, Manufacturing, and Computation*. New York: John Wiley & Sons, Inc., 1992.

This book synthesizes fifteen years of research on molecular manufacturing. It is intended for several audiences. One is the person with a general science background who is interested in molecular nanotechnology -- its characteristics, principles, capabilities -- but not in the mathematical details. The work is presented in a fashion that the general reader can skip technical sections without becoming lost. Other readers for whom this work is aimed are those considering working in nanotechnology, physicists, chemists, computer scientists, materials scientists, molecular biologists, and mechanical engineers. Each of the work's 15 chapters and two appendices begins with an overview of its topic. The author has discussed the broader implications of this subject in his earlier book *Engines of Creation: The Coming Era of Nanotechnology* (New York: Anchor Press/Doubleday, 1986); and in K. E. Drexler, C. Peterson, and G. Pergamit, *Unbounding the Future: The Nanotechnology Revolution* (New York: William Morrow, 1991).

**1868.** Drexler, K. Eric and Chris Peterson (with Gayle Pergamit), ed. *Unbounding the Future: The Nanotechnology Revolution*. New York: William Morrow and Company, Inc, 1991.

The authors believe that we are near an era in which nanotechnology will radically alter the way in which we live. "A short summary of what molecular nanotechnology will mean is *thorough and inexpensive control of the structure of matter*. Pollution, physical disease, and material poverty all stem from poor control of the structure of matter. Strip mines, clear-cutting, refineries, paper mills, and oil wells are some of the crude twentieth-century technologies that will be replaced. Dental drills and toxic chemotherapies are others."

The authors' goal is to explain molecular nanotechnology in a practical way so that readers can think about it and the future realistically. Speculation about this technology's impact is not limited to communication, but future possibilities include "pocket supercomputers" and "pocket libraries."

Drexler earlier published a book entitled *Engines of Creation: The Coming Era of Nanotechnology* (New York: Doubleday, 1986).

**1869.** Dreyer, Carl. "Color and Color Films." *The Movies As Medium*. Ed. Jacobs, Lewis. New York: Farrar, Straus & Giroux, 1970. 197-200.

The author, a Danish film director, notes that color film during the 1960s could not capture all the complexity of color in real life. "The tiny color differences, the semi-tones, all those nuances the eye receives without discrimination, are missing in color films. To demand that color in color films should be *natural* is to misunderstand all that is involved. Indeed, the spectator can have a much greater aesthetic experience *because* color in film differs from that in nature." (198) Dreyer's article originally appeared in *Films in Review* (April, 1955).

**1870.** Drucker, Johanna, ed. *The Visible Word: Experimental Typography and Modern Art, 1909-1923*. Chicago: University of Chicago Press, 1994.

Drucker writes: "What began as a semiotic analysis of typography produced by artists in the 1910s has evolved into an inquiry into the transformation of semeiotically based critical practices in the course of the twentieth century. The study of typographic experimentation offers an excellent case study for such an inquiry. Because of its interdisciplinary character, the treatment of typography within critical interpretation can be used to trace the transformations in the premises on which both literary and visual arts criticism conceive of their objects."

**1871.** Drucker, Peter F., ed. *The Age of Discontinuity: Guidelines to Our Changing Society*. New Brunswick, NJ: Transaction Publishers; originally New York: Harper & Row, 1968, 1968.

Drucker, a management scholar and futurist, first published this book in 1968. This edition has a new introduction (1992) and an introduction written to the 1983 edition. Chapters include "The End of Continuity," "The New Industries and Their Dynamics," and "The Sickness of Government."

**1872.** ---, ed. *Post-Capitalist Society*. New York: Harper Business, A Division of HarperCollins Publishers, 1993.

"Every few hundred years in Western history there occurs a sharp transformation," Drucker writes. "We cross what in an earlier book [*The New Realities* (1989)] I called a 'divide.' Within a few short decades, society rearranges itself -- its worldview; its basic values; its social and political structure; its arts; its key institutions. Fifty years later, there is a new world. And the people born then cannot even imagine the world in which their grandparents lived and into which their own parents were born.

"We are currently living through just such a transformation. It is creating a post-capitalist society, which is the subject of this book."

**1873.** Du Maurier, George. "Edison's Telephonoscope (transmits light as well as sound)." *Almanack for 1879, Punch* 75 (1878).

**1874.** ---, ed. *The Martian*. London: George Bell and Sons, 1897.

**1875.** ---, ed. *Society Pictures*. London: Bradbury, Agnew and Co., 1891.

**1876.** Dudar, Helen. "America Discovers Child Pornography." *Ms.* 6.2 (1977): 45-47, 80.

This article was among the many attacks that feminists made on child pornography, and more generally on all pornography, during the late 1970s.

**1877.** Duell, Charles H. "Glimpses into the Future: I. The Future as Seen from the Patent Office." *Youth's Companion* 75.1 (1901): 3-4.

This article, written by the United States Commissioner of Patents in 1901, talks about developments in several areas of research. With regard to photography and color photography, he writes that "the development of dry plate and other details in the art of photography have been recently such that the amateur of to-day is a better photographer than the expert of yesterday. Interesting possibilities in color photography are at the open door, and the young woman of auburn hair may not much longer complain that her peculiar beauty is not shown in her photograph. The tricolor printing processes of to-day will soon become multicolor printing processes. Typesetting-machines and roller printing processes will be further developed." (3)

**1878.** Duhamel, Georges, ed. *America the Menace: Scenes from the Life of the Future*. Boston and New York: Houghton Mifflin Company, 1931.

Early in the twentieth century, a line of criticism emerged that considered cinema to be part of a mechanical revolution that was undermining print culture, and with it, an essential cornerstone of Western Civilization. In 1928, the French physician and writer George Duhamel returned home from the United States troubled that American culture, which had come to be dominated by motion pictures, radio, the phonograph, newspapers, electric signs, and automobiles, was the wave of the future. He wrote a book about his experiences, *Scènes de la*

*vie future* (1930). No nation had “thrown itself into the excesses of industrial civilization more deliberately than America,” he said. “If you were to picture the stages of that civilization as a series of experiments made by some malign genie on laboratory animals, North America would immediately appear to you as the most scientifically poisoned of them all.” (xiii)

A centerpiece of this “material or mechanical civilization” (ix) was the cinema where the spectator was “given no chance to use his intelligence, to discuss, to react, to participate in any manner whatsoever.” (35) At the cinema, everything was “an abridgement,” (31) an “imitation,” and “false,” (27) he asserted. “I began to lose any sense of having a soul,” Duhamel’s recalled. (27) And yet “this terrible machine, so elaborately dazzling, with its luxury, its music, its human voice, this machine for stupefying and destroying the mind, is today among the most astonishing forces in the world.” (35) Motion pictures had become “a most powerful instrument for enforcing a uniform standard, alike in ethics, politics, and aesthetics,” and for smothering “forever the springs of an old and noble spiritual life.” (40) When Duhamel’s book was translated into English, it carried the unfortunate title *America the Menace: Scenes from the Life of the Future* (1931), which led many American critics to dismiss it out of hand.

At first glance, Duhamel’s views might remind one of a condemnation of the movies made about the same time in America by the Jesuit priest Daniel Lord. But where Lord feared erosion of Christianity, Duhamel worried about the loss of a “moral civilization” (ix) based on great literature, art, and music. He would gladly trade all the best movies, he said, “for one play of Moliere’s, for one picture of Rembrandt’s, or for a single fugue of Bach’s.” (36)

Duhamel devotes Chapter XI to “The Segregation of Races” in New Orleans, Alabama, and elsewhere.

A few years later, Duhamel elaborated on his concerns in another book, *In Defence of Letters* (1937; trans. 1939).

**1879.** ---, ed. *In Defence of Letters (translated by E. F. Bozman)*. New York: Greystone Press, 1939.

As the 500th anniversary of Gutenberg's printing press approached, French author and publisher Georges Duhamel warned that print culture, which made up the very foundation of Western civilization, was being supplanted by movies, the phonograph, and radio. “The book is one of the springs of creative individualism, that individualism which, in these uncertain times, remains the guardian angel of human society,” Duhamel said. “For five hundred years the book has been, for the solitary mind, an incomparable instrument of uplift and liberation.” (vii) Yet film, the phonograph, and the radio were bringing “serious changes in our modern culture” (xi) that threatened “the life of the book and the supremacy of the printed word....” (xi) There had been, he argued, “a sharp change of direction of which there are many examples in the story of the human race, and civilized activities seem to be operating temporarily so as to suspend the very progress of civilization itself and divert it into other channels.” (viii) Duhamel went on to say that “Various indications lead us to suppose that books, while still the *pâtée royale*, that is to say, the essential diet of the elect, the master minds, are going to play an ever diminishing role in the enlightenment and entertainment of the multitude.” (viii)

Duhamel did “not despise” these new forms of learning and entertainment so much as he was “afraid of them. I do not underestimate their importance, because I believe that they are capable of transforming the face of the globe that we live in and changing the harmony of our existence. I even admit that I believe, in the bottom of my heart, that the cinema and the radio, wisely handled, could yet work for the salvation of their victim the book. So let no one think of me as an obstinate opponent. The greatest service that can be rendered to cinema and radio and so to their supporters—is to criticize their methods.” (x)

Duhamel saw grave consequences if these developments were not challenged and checked. “If the public gets out of the habit of reading they will not come back to it. We shall enter a new phase of our history from ix/x which there is no turning back,” he believed. (ix-x) “Our moral balance, maintained with such difficulty, may find itself impaired.” (xi) What might follow, he feared were “two or three centuries of barbarism.” (x)

Duhamel thought it was impossible “to create and maintain a true culture, a strong and flourishing culture, through the medium of pictorial and oral apparatus” alone at least as they existed during the 1930s. (21) “Education demands work, real work digging, hoeing, and rolling. Nothing can be acquired without effort...” (45) [Film and radio required little of their audiences and were far more powerful instruments of propaganda than they were of education.]

The problem the movies and the radio during the 1930s was that they offer little choice or time for reflection. The see one good film one had to sit through hundreds of mediocre ones. “For one good concert on the radio we have to put up with a thousand disgusting or ridiculous noises.” (30) Unlike a book where the reader could go back over a paragraph and consider what had been read, “The cinema and the radio do not repeat themselves they march on, they break into a run. They are ... like rivers.” (30) Books were “the friends of solitude.” (42) They developed “individuality and freedom. In solitary reading a man who is seeking himself has some chance of finding himself; he chooses, and he chooses form himself; he escapes from the poisonous air of propaganda. Radio, on the other hand, is now the chief agent of imperialism. It does not purify the spirit of man, does not, like the book bring him back to the sanctuary of solitude, but throws him to the lions, subtly preparing his mind for the blood and chains of the public sacrifice.” (42)

This book is divided into four sections. "The first part only," the author said, "is devoted to the serious changes in our modern culture, and to the new forces that threaten the life of the book and the supremacy of the printed word, which is the sign in our time of effective thought. (xi)

This book appeared originally as: Georges Duamel, *De fense des lettres. Biologie de mon me'tier* (Paris, Mercure de France, 1937).

For a less dire view of the likely impact of new media on the book and print culture, written in response to Duhamel, see: Donald Bean, "Books vs. Movies, Phonographs, and Radios," *Peabody Journal of Education*, 17, No. 4 (Jan. 1940), 253-60.

**1880.** Dummer, G. W. A., ed. *Electric Inventions and Discoveries: Electronics from its Earliest Beginnings to the Present Day*. New York: Pergamon Press, 1983.

This book attempts to create a catalog of all the significant inventions and improvements in electronics. The author, an electrical engineer, intended the book not as a “learned treatise” but rather a brief summary of “firsts” in a very widely defined scientific field. As such, he provides brief descriptions of these inventions, often no more than a few sentences, but also includes a couple of citations for scientific journal articles on the particular invention described.

The first few chapters are introductory in nature. Dummer briefly chronicles the beginnings of research into electricity in the eighteenth century. He discusses the development of circuits and the science of circuitry, including a few illustrations which help the reader understand the primitive nature of early circuitry. Dummer provides several timelines, including ones for tubes, transistors and integrated circuits, audio reproduction, radio, radar and television. Each timeline is accompanied by a short explanatory chapter. In his chapter on television, Dummer omits developments prior to 1897, which undercuts his hope for an all-inclusive summary volume.

Dummer arranges timelines by subject area and chronologically. Although this approach is helpful to the reader, it also results in a good deal of duplication. Dummer includes a short bibliography of inventions and books on inventors.

The main portion of the book is the large section of entries explaining the various inventions. Organized chronologically, Dummer lists the invention, the inventor, and the country where the invention occurred. For the most part, these entries are explained in simple, clear language, a definite plus for the non-scientist. Dummer provides an index, both of inventor names, and of inventions.

This book is a helpful tool for the historian of science or inventions. It is a starting point, a place to glean the basic information about specific devices or technologies related to electricity and electronics. Dummer sometimes includes more than one citation for an entry, but he does not produce anything resembling a comprehensive bibliography for any of the entries. Rather than viewing this as an encyclopedia or textbook, this book can be thought of as an introductory volume.

--David Henning, 1999

**1881.** Dunlap, Orrin, ed. *Marconi: The Man and His Wireless*. New York: Macmillan (1937); reprint, New York: Arno Press (1971), 1937.

**1882.** Dunlavy, Collen A., ed. *Politics and Industrialization: Early Railroads in the United States and Prussia*. Princeton: Princeton University Press, 1994.

Dunlavy examines the many ways in which the differing political structures in antebellum America and in Prussia (from 1815 to 1848) influenced early railroad development. She argues that political structures plays an important part in both political and economic affairs. Her work is an interesting comparative study of technology in these two nations. It also offers insight into how the American railroad industry managed to push railroad policy away from the state level to the federal government.

Chapter 5 deals with "National Styles of Railroad Technology." In Prussia "railroad promoters dealt with a unitary-bureaucratic state, which meant that they dealt with a handful of central state officials in Berlin. These officials, enjoying greater structural insulation, viewed the new technology with considerable (and well-founded) skepticism during the 1830s, and they scrutinized railroad projects more carefully throughout the period. As a result, the Prussian state granted far fewer railroad charters than the American state legislatures did."

In the United States between the 1850s and 1880s "both federalism and separation of powers provided leverage that the railroads used to good advantage." Federalism offered railroads two ways to get around state legislatures. Using one strategy, "business could take a 'lateral' route, in theory at least, moving from a 'hostile' to a 'benign' state. And, indeed, American railroad partisans, like Prussian railroad men, quickly used the 'alarmed capital' argument precisely to highlight this threat." By the 1870s, the railroads (and their critics) exploited federalism in a second way, "this time moving 'upward' to seek national, in place of state, legislation." Critics of railroads saw national legislation as perhaps the best way to control a business that had become national. The railroads considered such legislation a way to defend themselves from hostile state legislators.

**1883.** Dunlop, Orrin Elmer, ed. *The Outlook for Television*. New York: Harper and Row, 1932.

**1884.** Dunn, Linwood G. "The 'Mad, Mad' World of Special Effects." *American Cinematographer* 46.3 (1965): 160-63.

Dunn, then President of Film Effects of Hollywood, Inc., discusses the special effects used in "It's a Mad, Mad, Mad, Mad, World," a comedy starring several big name stars and which was shown in Cinerama in 1964.

**1885.** Dunn, Watson and Arnold M Barban, ed. *Advertising: Its Role in Modern Marketing*. Hinsdale, IL: Dryden Press, 1978.

By 1965, the number of lines devoted to color in large circulation magazines exceeded those given to black and white are among the interest facts in this advertising textbook.

**1886.** Duplessis, Yvonne, ed. *Paranormal Perception of Color*. New York: Parapsychology Foundation, 1975.

This brief work with index runs 117 pages. Chapter one covers such subjects as color hearing, memory and color, imagination and color, feeling and color, and dreams and color. It also has an interesting section on "Appearance of a Color by Using Chemical Stimulants" (15-19) and a subheading entitled "Artificial Paradise" (15-16). "An artificial paradise of colors is created by chemical stimulants acting from the interior of the body: alcohol, hashish, peyote, LSD." (15) The phrase "artificial paradise" is taken from Charles Baudelaire's book *Les Paradis Artificiels* (1860), published in English under the title *Artificial Paradise: On Hashish and Wine as Means of Expanding Individuality* (1971). Duplessis also cites Aldous Huxley's *Doors of Perception* (1954), who wrote about the influence on perception of mescaline, the active ingredient in peyote.

This work, translated from French by Paul von Toal, was originally published in France under the title *La Vision Parapsychologique des Couleurs*.

**1887.** Dupree, A. Hunter, ed. *Science in the Federal Government: A History of Policies and Activities to 1940*. Cambridge, MA: Harvard University Press, 1957.

This work examines the federal government's role in promoting science up to 1940 -- before the enormous expansion of government support for research and development that came with World War II and then later, after the Soviets had launched Sputnik in 1957.

**1888.** Dupuy, Judy, ed. *Television Show Business*. Schenectady, NY: General Electric, 1945.

**1889.** Dutka, Elaine. "Film Ratings Board Picks Mosk as Its Leader...." *Los Angeles Times* June 29, 1994 1994, sec. F (Calendar): 1F.

This article gives background on Richard Mosk, who replaced Richard D. Heffner as head of the motion picture industry's Classification and Rating Administration. The article also deals with critics of the rating system such as Samuel Goldwyn, Jr., and Phillip Noyce. Noyce was upset that the rating board wanted him to cut three minutes from his movie *Sliver* (1993), starring Sharon Stone.

**1890.** Duysters, Geert, ed. *The Dynamics of Technical Innovation: The Evolution and Development of Information Technology*. Cheltenham, UK and Brookfield, VT: Edward Edgar, 1996.

Duysters contends that "the use of dynamic insights which were originally developed in biology can improve our current understanding of the evolution of complex industrial systems over time." His central argument "is that the evolution of complex industrial systems is shaped by the interplay of industrial structures, company strategies and technological developments. Therefore, in order to understand the complex dynamics of industrial systems it is necessary to analyse not only the development of market structures, but we also need a thorough understanding of the nature of technological change and the role that is played by various organizational forms over time. Central to my approach," the author says, "is the model of natural selection. The model, as set out by Darwin and Wallace, "argues that species which are best adapted to a specific environment survive, while other less well-adapted species die. In this study I will argue that firms better equipped to meet environmental changes than others may grow successfully, while other less successful firms decline."

Duysters devotes chapters to the international computer industry, the telecommunications industry, and the semiconductor industry. The concluding chapter attempts "an appraisal of the usefulness of our integrated biology- inspired approach."

**1891.** Dworkin, Andrea, ed. *Pornography: Men Possessing Women*. New York: Perigee Books, 1981.

Dworkin was a strong anti-pornography feminist and her views are explained *Pornography: Men Possessing Women* (c1981). In Minneapolis, Dworkin and Catharine MacKinnon, a law professor, proposed a law that would

make it easier to prosecute pornographers. The two women had been at the University of Minnesota in 1983 where they co-taught a Law School course on pornography. Their plan differed from previous obscenity law. It defined pornography as "the sexually explicit subordination of women, graphically or in words," and treated pornography as "discrimination against women." This legal strategy placed the administration of the law under the city's Civil Rights Commission, not the Criminal Justice Division. Whereas obscenity in the *Miller* decision held that material was not obscene unless a work, "taken as a whole," lacked "serious literary, artistic, political, or scientific values," the measure devised by Dworkin and MacKinnon allowed no such qualification. In Minneapolis, the city council passed the Dworkin-MacKinnon measure but Mayor Donald Fraser vetoed it on grounds that it violated the First Amendment.

**1892.** *Crossfire*. 1947, 1947.

The working titles of this film, which was one of the first post-World War II movies to deal with anti-Semitism in the United States, were *The Brick Foxhole* and *Cradle of Fear*.

**1893.** Eaglemoss Publications, Ltd., ed. *Scenes from a Signalbox: A Social History of Britain's Railways*. Newton Abbot (UK): David & Charles, 2001.

This book, with extensive illustrative material interspersed with text gives the reader a good visual image of the history of the railway system in Britain. Thematically organized by various aspects of the railway, from locomotives and stations to early public reactions and the lives of employees, this book is the equivalent of wandering through a train museum. A third section explores the train in everyday life, with pages devoted to the train in leisure, the military, crime, and the arts. Content is largely anecdotal, but still informative and detailed. A good work for understanding the social impact of the railways.

**1894.** Earl, Michael J. "What Micros Mean for Managers." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society*. Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 356-66.

Earl examines the potential impact of microelectronics on employment. The new technology should make possible greater employee participation, smaller units, and improved information flows. Earl was a Fellow at the Oxford Centre for Management Studies, Oxford, England, and this piece appeared earlier in *Management Today* (Dec. 1978).

**1895.** Easton, Nana J. "Eszterhas vs. Verhoeven." *Los Angeles Times* Aug. 23, 1990 1990, sec. F (Calendar): 1F.

This article, perhaps part of the pre-film publicity buildup for the movie *Basic Instinct* (1992), is about a disagreement between Joe Eszterhas and Paul Verhoeven. Screenwriter Eszterhas criticized Verhoeven for wanting to make this movie into a "sexually explicit thriller."

**1896.** Easton, Nina J. "'Last Temptation' Draws Mostly Sold-Out Houses." *Los Angeles Times* Aug. 15, 1988 1988, sec. 6 (Calendar): 1.

This article notes that despite the protests against the movie *The Last Temptation of Christ* (1988), or perhaps because of them, the film opened to mostly sold-out theaters.

**1897.** ---. "Slow Release Strategy Pays Big Dividends." *Los Angeles Times* Aug. 16, 1988 1988, sec. 6 (Calendar).

This article discusses marketing strategy for *The Last Temptation of Christ* (1988), modeled on such earlier films as *Die Hard* (1988) and *A Fish Called Wanda* (1988).

**1898.** ---. "Studio Fires Back in Defense of 'Temptation'." *Los Angeles Times* July 22, 1988 1988, sec. 2 (Metro): 1.

This article deals with the marketing strategy used by Universal in promoting its film *The Last Temptation of Christ* (1988). The article reports that Universal Pictures, which made the movie, took out full-page newspaper ads to refute critics. Campus Crusade for Christ and Bill Bright, who had led the attack on film are discussed.

**1899.** Eaton, Mick, ed., ed. *Anthropology -- Reality -- Cinema: The Films of Jean Rouch*. London: British Film Institute, 1979.

This book deals with Jean Rouch and covers his use of 16mm cameras in documenting his work relating to anthropology.

**1900.** Eaton, Walter Pritchard. "The Actor's Portion." *American Illustrated Magazine* 51.4 (1906): 386-92.

This article, published in early 1906, starts by pointing out that pictures (photographs) of actors "adorn every fence and bill-board, they fill the Sunday newspapers" and they "occasionally break into better company in the magazines!" (386) Moreover, the popular actors has by this time become more important in drawing people into theaters than the play or drama being performed. "In spite of shrill critical reiteration of Hamlet's remark, 'The play's the thing' (which he did not intend as a critical dictum), our public goes on paying its money to see this or that player, sometimes it must be confessed without much regard to the play, continues to lavish on the actor or actress the largess of its applause." (386)

The author comments on the difference in the way an actor can deliver lines and the way the reader might experience them in the privacy of his or her study. "A drama read in the closet may be discussed purely on its literary merits; a drama performed on the stage become hopelessly entangled with the personalities of the players, and may often meet success or failure, according to their skill and charm. On an intonation of the actor's voice, a gesture of his hand, a gleam of passion on his face, the final lift of the spectator into sympathetic emotion frequently depends. In the closet the reader exercises his own imagination; in the theater he surrenders it to the players. The play's the thing! It is true of man that the skeleton's the thing, but what make it exquisite is the curve of fair flesh on a shoulder, the touch of color in cheek and eye." (386-87)

Eaton discusses the magnetism of certain personalities. Referring to a performance by the actor George Arliss, he writes: "That intangible but very real quality, personal magnetism, which seems naturally to radiate from some people, had much to do with it, no doubt. The pictorial skill displayed, the black figure against the lemon yellow walls, was a telling element. And the facial malignity, cunning and cold secrecy, of which Mr. Arliss' features are the master, worked their share. The shock of an evil or a beautiful face seen suddenly is no less potent over the imagination on the stage than in life, no less suggestive of hidden character and emotional possibilities. But one thing is certain -- it was an effect due quite as much to Mr. Arliss as to the playwright or Mr. Thackeray." (389)

The subtitle of the article reads: "Illustrated with Photographs of Actors Distinguished in Character Parts Taken Especially for this Article by Alice Houghton." Actors whose photographs are included are: George Arliss, Forbes Robertson, Edith Wynne Matthison, David Warfield, and Mary Shaw.

**1901.** Ebert, Roger. "Review, *Henry: Portrait of a Serial Killer*". 1990. (Sept. 14, 1990).  
<[http://www.suntimes.com/ebert/ebert\\_reviews/1990/09/566963.html](http://www.suntimes.com/ebert/ebert_reviews/1990/09/566963.html)>.

Film critic Roger Ebert acknowledged that many viewers found *Henry: Portrait of a Serial Killer* (1990) "too violent and disgusting to be endured," but praised the picture because it dealt "honestly with its subject matter."

**1902.** ---. "Review, *Natural Born Killers*". 1994. (Aug. 26, 1994).  
<[http://www.suntimes.com/ebert/ebert\\_reviews/1994/08/937174.html](http://www.suntimes.com/ebert/ebert_reviews/1994/08/937174.html)>.

Film critics Roger Ebert gave this Oliver Stone film his highest rating. Others criticized the movie for its graphic violence.

**1903.** ---. "Review, *The Cook, the Thief, His Wife and Her Lover*". 1990. (1990).  
<[http://www.suntimes.com/ebert/ebert\\_reviews/1990/01/thecook.html](http://www.suntimes.com/ebert/ebert_reviews/1990/01/thecook.html)>.

Movie critic Roger Ebert gave *The Cook* a favorable review but warned that it was "not an easy film to sit through." It was about an avaricious, sadistic husband named Spica (played by Michael Gambon) who, on most nights, could be found in a swank restaurant. Early on Spica in the film forces the cook to eat excrement and then urinates on him. When Spica's beautiful but frustrated and long-suffering wife, Georgina (played by Helen Mirren), begins an affair with a man named Michael (played by Alan Howard), whom she sees in the restaurant, Spica takes revenge by having his henchmen cram an entire book down the lover's throat, one page at a time. The movie featured not only coprophagy, but cannibalism and male and female nudity as well. At least four members of the Classification and Rating Administration (CARA) favored giving the picture an R, although Richard Heffner, the head of CARA, thought the picture was "clearly X" and that most parents would consider it inappropriate for children. Ebert criticized the "timid souls" at CARA who had failed to give *The Cook* an R rating,

**1904.** ---. "Review: *Tie Me Up! Tie Me Down!*". 1990. (May 25, 1990). Sept. 16, 2001.  
<[http://www.suntimes.com/ebert/ebert\\_reviews/1990/05](http://www.suntimes.com/ebert/ebert_reviews/1990/05)>.

Ebert gives a lukewarm review of this movie. He says the "story has been told before, and better, in movies like William Wyler's *The Collector* (1965).

**1905.** ---. "Satisfying the Most Basic of Instincts: Curiosity." *Chicago Sun-Times* May 8, 1992 1992, sec. 2: 33.

Film critic Roger Ebert contributed to the buzz surrounding the movie *Basic Instinct* (1992) with a tongue-in-cheek piece from the Cannes Film Festival in May saying that he had seen the 45 seconds cut from the Michael Douglas- Sharon Stone love scene.

**1906.** Ebo, Bosah, ed. *Cyberghetto or Cybertopia? Race, Class and Gender on the Internet*. Westport, CT: Praeger, 1998.

This collection of essays examines how issues of race, class and gender will come into play on the Internet. The authors use a variety of methodologies to address the following questions: 1) Will the new medium include marginalized constituencies?; 2) Will the Internet serve as an equalizer or will it create "hedonistic isolations" which will hurt communities?; 3) Will knowledge gaps increase?; and 4) How will the economics of the Internet shape class and gender relations?

--Mark Tremayne

**1907.** Eckhardt, George, ed. *Electronic Television*. 1936. New York: Arno Publishing, 1936.

**1908.** Eder, Josef Maria, ed. *Geschichte der Photographie (History of Photography, translated by Edward Epstein)*. 1932 (1881, 1890, 1905). New York: Columbia University Press, 1881.

This work is a translation from the German-language fourth edition of Eder's *History* that appeared in 1932. In 1905, in the Preface to the Third Edition, Eder wrote: "There are three stages in the development of my *Geschichte der Photographie*. The first was the period to the beginning of the eighteenth century; this fragment ... was published in 1881. In 1890 I published ... the development of photochemistry up to Daguerre and Niépce. Then followed the first authoritative and exhaustive treatment of the general field of photography, with accurate references to the literature and historical sources, in my *Ausführliches Handbuch der Photographie*, which served as the groundwork for my history of the modern photographic process. With this material in hand, I was enabled for the first time to attempt, in this (third) edition of my history, to present the history of the invention of photography up to the end of the nineteenth century. I undertook also to include in this work careful

reproductions of many incunabula and portraits of importance to the history of photography. The originals of most of these are fast disappearing and have become very rare and difficult to obtain....”

The work provides a technical history of photography but also attempts to set photography's development into an international context up to the end of the nineteenth century. As an Austrian, Eder provides considerable information about Austrian contributions to this field – contributions he felt in 1932 that had been often neglected by recent histories of German origin. This translation omits the illustrations that appeared in Eder's original volume.

This book, which runs 860 pages, is not only informative on early personalities involved with the development of photography, but also on the scientific processes that contributed to advances in this field.

This edition contains a biography of Eder (pages 720-28) by Hinricus Lüppo-Cramer.

**1909.** Edgerton, Gary. "Digital Color Imaging and the Colorization Controversy: Culture, Technology, and the Popular as Lightning Rod." *Technohistory: Using the History of American Technology in Interdisciplinary Research*. Ed. Chris Hables Gray, ed. Malabar, FL: Krieger Publishing Company, 1996. 5-32.

C. Wilson Markle, an engineer at Image Transform in Los Angeles, first created color imaging in 1971. This article looks at the controversy over colorization of black and white movies. At the time this article appeared (1996), Ted Turner had colorized only 270 videotapes. This piece has a useful four-page bibliography on this topic. It also has a list of the first 100 "national treasures," films that cannot be "materially altered" (including colorization) without adding a label saying that the changes have been made without the permission of the principal creators of the movies. Another appendix contains copyright information on the 270 colorized videotapes registered through the end of 1993. Appendix 3 gives the number of copyrighted colorized videotapes each year between 1985 and 1993. There is also a list of the number of colorized videotapes films that were shown on television between 1985 and 1993.

**1910.** Edison, Thomas A. "The Perfected Phonograph." *North American Review* 46.374 (1888): 641-50.

Ten years earlier, in May-June, 1878 issue of the *North American Review*, Edison had written an article in which he listed several uses for the phonograph-- 1) letter writing; 2) books on records; 3) teaching elocution; 4) reproducing music; 5) creating a family records of reminiscences; 6) music boxes and toys with sound; 7) clocks that would announce time; 8) preserving languages; 9) aids to teachers and education. "Every one of these uses the perfected phonograph is now ready to carry out," Edison writes in this article. (646) To these uses, he adds an instrument that can provide amusement (e.g., music, short stories, poems).

Edison comments on the inexpensive duplication of wax cylinders and also on their use for preserving history. "A single wax cylinder, or blank, may be used for fifteen or twenty successive records before it is worn out. But if the record is to be kept, the wax blank must not be talked upon again, and is simply slipped off from the metal cylinder and filed away for future reference. It may be fitted on to the cylinder again at any time, and will at once utter whatever has been registered on it. One of these wax blanks will repeat its contents thousands of times with undiminished clearness. Further, we are able to multiply to any extent, at slight cost, phonographic copies of the blank, after the talking, or music, or other sounds have been put upon it once." (645)

As for preserving history, Edison says: "It is curious to reflect that the Assyrians and Babylonians, 2,500 years ago, chose baked clay cylinders inscribed with cuneiform characters, as their medium for perpetuating records; while this recent result of modern science, the phonograph, uses cylinders of wax for a similar purpose, but with the great and progressive difference that our wax cylinders speak for themselves, and will not have to wait dumbly for centuries to be deciphered, like the famous Kilch-Shergat cylinder, by a Rawlinson or a Layard. Without our facilities, a sovereign, a statesman, or a historian, can inscribe his words on a phonograph blank, which will then be multiplied a thousand-fold; each multiple copy will repeat the sounds of his voice thousands of times; and so, by

reserving the copies and using them in relays, his utterances can be transmitted to posterity, centuries afterwards, as freshly and forcibly as if those later generations heard his living accents. Instrumental and vocal music -- solos, duets, quartets, quintets, etc. -- can be recorded on the perfected phonograph with startling completeness and precision. How interesting it will be to future generations to learn from the phonograph exactly how Rubinstein played a composition on the piano;...." (645) The phonograph "will retain a perfect mechanical memory of many things which we may forget," Edison maintains. (649)

Edison saw a role for the phonograph in home entertainment and in journalism. "The speeches of orators, the discourses of clergymen, can be had 'on tap,' in every houses that owns a phonograph. It would not be very surprising if, a few years hence, phonographic newspaper bulletins should be issued on wax cylinders. Even now, so soon as the phonograph comes into general use, newspaper reporters and correspondents can talk their matter into the phonograph, either in the editorial office or at some distant point, by a telephone wire connected with a phonograph in the composing-room, so that the communication may be set up in type without any preliminary of writing it out in long hand." (647) Edison says that the "accuracy of interviews with newspaper reporters will be determined, no doubt, by phonographic record." (649)

Edison thought the wax cylinders would be sent through the mail and that "pay stations" would be set up where people could take a "phonogram" and play it. (647) Writers would be able to "register their fleeting ideas and brief notes on the phonograph at any hour of day or night, without waiting to find pen, ink or paper, and in much less time it would take to write out even the shortest memoranda. They can also publish their novels or essays exclusively in phonogram form, so as to talk to their readers personally; and in this way they can protect their works from being stolen by means of defective copyright laws. Musical composers, in improvising compositions, will be able to have them recorded instantaneously on the phonograph." (647) Dictating letters will become common. (648, 649)

For those concerned with privacy, Edison says that "two business men, conferring together, can talk into the recorder by means of a double transmitting tube, with perfect privacy, and yet obtain upon the cylinder an unimpeachable transcript of their conversation in their own voices, with every break and pause, every hesitation or confident affirmation, every partial suggestion or particular explanation, infallibly set down in the wax." (648)

Edison compares the phonograph to instantaneous photography. "In fact, the phonograph will do, and does at this moment accomplish, the same thing in respect of conversation which instantaneous photography does for moving objects; that is, it will present whatever it records with a minute accuracy unattained by any other means." (648)

Edison says that using the phonograph requires a little training although considerably less than using a typewriters and little more than is needed to operate a sewing-machine. (649) He ends optimistically: "It will become an important factor in education; and it will teach us to be careful what we say -- for it imparts to us the gift of hearing ourselves as others hear us -- exerting thus a decidedly moral influence by making men brief, businesslike and straightforward, cultivating improved manners, and uniting distant friends and associates by direct vocal communication." (650)

**1911.** ---. "The Phonograph and Its Future." *North American Review* 126.262 (1878): 527-36.

Edison wrote this fascinating piece shortly after his invention. Here he discusses what can already be done with the phonograph: 1) it can capture and permanently retain "fugitive" (530) sound waves; 2) it can capture and reproduce the original sources with or without the consent of the original source; 3) it can transmit "such captive sounds through the ordinary channels of commercial intercourse..."; 4) it can infinitely replicate and preserve the sounds. Edison speculates that in the future this invention will be used in writing and dictation, and that a person can send a sound letter to a correspondent without the intervention of the stenographer. It will be used to record books (p. 534) ("A book of 40,000 words upon a single metal plate ten inches square ... becomes a strong probability" [p. 534]), and that it will be "liberally devoted to music." It will also be used to capture the last

utterances of family members or great people and in this respect “will unquestionably outrank 533/534 the photograph.” (533-34) It will also be used for toys (e.g., talking dolls), clocks that will announce time, music boxes, and for many educational purposes. “Lastly, and in quite another direction, the phonograph will *perfect the telephone*, and revolutionize present *systems of telegraphy*.” A person will be able to speak on the phone and record the message at the same time.

**1912.** ---. "Today and Tomorrow." *The Independent* 77.3396 (1914): 24-27 (APS Online).

In this interview, given when he was in his mid-60s, Thomas A. Edison discusses his inventions. He expresses his optimism about the power of moving pictures in education. "I could tell any one a great deal about a dynamo and it would be hard for him to understand; but I could show everything in a few pictures so that a child would understand -- and would never forget." (27)

**1913.** Editor. "Mr. George G. Rockwood." *Phrenological Journal and Science of Health* 108.7 (1899): 1-5.

This article notes that "photography as eclipsed many of her sister arts" (p. [2]) and has had an enormous impact on the study of astronomy and medicine. It notes that George G. Rockwood was the "first one to introduce instantaneous photography" in New York City. (p. [5])

**1914.** editor], A. L. M. [letter to. "The Voice of the Movie Fans." *Chicago Daily Tribune* Oct. 11, 1914 1914, sec. G: 7.

In a letter to the editor, a writer says that “I agree with the movie censors that ‘a three foot kiss is long enough.’”

**1915.** Edkins, Diana. "Pioneers of Commercial Color: Bruehl, Keppler, Muray, Outerbridge, Steichen." *Modern Photography* 42.9 (1978): 104, 142, 148, 150.

Edkins writes that "by 1925 black-and-white photography played a prominent part in many magazines, but color was rare-- except in technically advanced magazines such as the *National Geographic*..... The advent of more commercially viable full-color photographic reproduction in the 30s started a new era of general magazine publishing. Also, it gave large-circulation magazines a great advantage over small publishers, since the unit cost of the color pages was so much less for them than for their smaller competitors." This article discusses five pioneers of commercial color photography: Anton Bruehl, Victor Keppler, Paul Outerbridge, Nickolas Muray, and Edward Steichen.

**1916.** Edmonds, Andy, ed. *Frame Up! The Untold Story of Roscoe "Fatty" Arbuckle*. New York: William Morrow and Company, Inc., 1991.

This book deals with the "Fatty" Arbuckle scandal that ruined the comedian's career and fueled public outrage against the immorality of movies and their stars. This scandal was an important factor that led to the creation of the Motion Picture Producers and Distributors of America and the hiring of Will H. Hays to be its president in 1922.

**1917.** Edmunds, Hugh H. and John Strick. "Economic Determinants of Violence in Television and Motion Pictures and the Implications of Newer Technologies." *Report of The Royal Commission on Violence in the Communications Industry: Volume 7: The Media Industries: From Here to Where?* Toronto, Ontario: Royal Commission on Violence in the Communications Industry. 71-184.

In Canada, American movies and television programs dominated the market – more than 90 percent of the films for which Canadian paid rental fees came from the United States. In 1977, Ontario’s Commission on Violence in the Communications Industry concluded that the “great weight of research into the effects of violent media contents indicates potential harm to society.” In Volume 1, this Report concluded that Canadians – including children – were watching increasing amounts of American-made TV which had “much higher levels of violence”

than programs produced in Canada or elsewhere, and television's "escalation of violence" was "drawing other sections of the media along like the tail of a comet."

This essay appears in Volume 7 of the Royal Commission's *Report*. It discusses economic factors in television and movie violence and their relationship to new technologies.

**1918.** Edward, Buscombe. "Sound and Color." *Movies and Methods: Volume II: An Anthology*. Ed. Bill Nichols, ed. Berkeley: University of California Press, 1985. 83-92.

**1919.** Edwards, Paul N., ed. *The Closed World: Computers and the Politics of Discourse in Cold War America*. Cambridge, MA: MIT Press, 1996.

This uneven book nevertheless has interesting information about the development of computers and the American military. Some of the author's information and quotations are not footnoted. The notes do not reflect much research in primary sources, yet there may be primary material (e.g., from the Reagan years during the 1980s) that was seen but not cited. Readers may find the opening chapter disjointed and disappointing. Subsequent pages are better. Chapters 2-4 deal with the military and use of computers from World War II through the 1960s. Chapter 4 ("From Operations Research to the Electronic Battlefield") is good on the RAND Corporation and former Secretary of Defense Robert McNamara's obsession with game theory and mathematical modeling, as well as how the computer became an icon during the Kennedy/Johnson years. Chapter 9 ("Computers and Politics in Cold War II") is quite interesting. Edwards notes that Richard Nixon and Gerald Ford reduced spending on research and development, while Jimmy Carter, and especially Ronald Reagan, greatly expanded spending in this area. Shortly after Reagan announced the Strategic Defense Initiative in 1983, he put forward a \$600 million program called Strategic Computing Initiative (SCI) which greatly accelerated spending on research and development in computer technology.

Chapter 10 ("Minds, Machines, and Subjectivity in the Closed World") discusses several films beginning with *Fail Safe* and *Dr. Strangelove* through *2001, The Forbin Project*, *Blade Runner*, other popular films (*Terminator 2* is discussed in the Epilogue), and William Gibson's science fiction novel *Neuromancer* (1984). Edwards announces in note 8 (p. 425) of this chapter that he deliberately has "chosen not to consult" the other literature written about these films. He provides useful summaries of the plots and common themes connecting these pictures but does not carry his analysis to a deeper level where he tries to determine through research how these pictures were constructed. In many ways this approach is reflective of one taken elsewhere in the book-- a tendency to use theory rather than research to sustain one's argument.

Still, there are ideas and leads for future research and in this way the book is stimulating.

In his Introduction, Edwards writes: "Of all the technologies built to fight the Cold War, digital computers have become its most ubiquitous, and perhaps its most important, legacy. Yet few have realized the degree to which computers created the technological possibility of Cold War and shaped its political atmosphere, and virtually no one has recognized how profoundly the Cold War shaped computer technology. Its politics became embedded in the machines -- even, at times, in their technical design -- while the machines helped make possible its politics. This book argues that we can make sense of the history of computers as tools only when we simultaneously grasp their history as metaphors in Cold War science, politics, and culture."

Other topics covered in this book include: chapter 5, "Interlude: Metaphor and the Politics of Subjectivity"; chapter 6, "The Machine in the Middle: Cybernetic Psychology and World War II"; chapter 7, "Noise, Communication, and Cognition"; and chapter 8, "Constructing Artificial Intelligence."

This book began as a doctoral thesis in the Studies in History of Consciousness at the University of California at Santa Cruz.

**1920.** Edwards, Paul N. "Y2K: Millennial Reflections on Computers as Infrastructure." *History and Technology* 15.1-2 (1998): 7-29.

Edwards writes: "Computers have become the control, information storage, and information processing technology of choice in many other, pre-existing infrastructures. This essay argues that historians of computers and information technology should expand their agenda to include the origins and impacts of this phenomenon. Studying computer-based infrastructures could lead to a new historiographical approach focussing on 'internetworks'. These are very large, integrated, extremely heterogeneous metasystems, made possible in part by 'digital convergence' or the ability to record, store, process, and distribute information in all media using computers and computer networks. Key actors include the developers of protocols for information exchange among heterogeneous networks."

**1921.** Egan, Timothy. "Technology Sent Wall Street into Market for Pornography." *New York Times* Oct. 23, 2000 2000, sec. A: A20.

This article deals with how pornography has become a major business. During 1999, 711 million hard-core sex movies were rented, according to *Adult Video News*, this article reports. Corporate America took advantage of this gold mine by providing pay-per-view adult entertainment over satellite and cable television providers. General Motors, EchoStar, AT & T, Marriott International, Hilton, Time Warner, LedgeNet Entertainment or the News Corporation were among the corporations offering such services. General Motors' subsidiary DirecTV had 8.7 million subscribers in 2000 who paid almost \$200 million a year for adult movies provided by satellite. EchoStar Communications Corporation, one of the country's major satellite providers, made more money from sex films than did all of *Playboy's* cable, Internet, and magazine interests combined. The country's largest communication corporation, AT&T, provided adult films over a broadband cable service known as the Hot Network. AT&T also owned a company that marketed such entertainment to almost a million hotel rooms. Marriott hotels provided adult films even in such conservative states as Utah.

**1922.** Ehrlich, Matthew C., ed. *Journalism in the Movies*. Urbana: University of Illinois Press, 2004.

**1923.** Eisenberg, Evan, ed. *The Recording Angel: Explorations in Phonography*. New York: McGraw-Hill Book Company, 1987.

This work is a perceptive, often eloquently written book on the changes brought by the phonograph and the ability to record music and other sounds. The phonograph record, "heavy and cold, like black ice," changed the way people experience music. "In 1877," the author writes, "music began to become a thing." It became a commodity, to be bought and sold. Prior to capitalism, "the musician sang for his supper." With the growth of a music industry, the "cathedral of culture" became the "supermarket." Before the phonograph record, listening to music almost always (except when the artist played alone) was a social occasion. After 1877, it became a more solitary experience. Where the radio tended to enhance unification, the recorded fractured society. Totalitarian states tried to control phonograph recordings. The Soviets during the 1920s, for example, tried to punish the importation and playing of American jazz.

**1924.** Eisenhower, Dwight D. "Text of Eisenhower's Farewell Address." *New York Times* Jan. 18, 1961 1961: 22.

In this farewell address, President Eisenhower warned about the rise of a military-industrial complex. "In the council of Government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced exists and will persist," the out-going president said. "We must never let the weight of this combination endanger our liberties or democratic processes. We take nothing for granted. Only an alert and knowledgeable citizenry can compel the

proper meshing of the huge industrial and military of defense with our peaceful methods and goals, so that security and liberty may prosper together."

**1925.** ---. "Text of President's Statement and Science Aides' 'Introduction to Outer Space'." *New York Times* March 27, 1958 1958: 14.

In the address which came just a few weeks after the United States launched its first man-made satellite, President Eisenhower talks about the advantages of space exploration. Satellites will bring better weather forecasting, rockets will no doubt take pictures of the back side of the moon. "There may well be important military applications for space vehicles which we cannot now foresee, and developments in space technology which open up quite novel possibilities," the president said. "Indeed, the scientific opportunities are so numerous and so inviting that scientists from many countries will certainly want to participate," he predicted. Eisenhower also said that "the cost of transporting men and material through space will be extremely high, but the cost and difficulty of sending information through space will be comparatively low." The president noted that "at present all trans-oceanic communication is by cable (which is costly to install) or by shortwave radio (which is easily disrupted by solar storms). Television cannot practically be beamed more than a few hundred miles because the wavelengths needed to carry it will not bend around the earth and will not bounce off the region of the atmosphere known as the ionosphere. To solve this knotty problem, satellites may be the thing, for they can serve as high-flying radio relay stations. Several suitably-equipped and properly-spaced satellites would be able to receive TV signals from any point on the globe and to relay them directly -- or perhaps via a second satellite -- to any other point. Powered with solar batteries, these relay stations in space should be able to keep working for many years." Eisenhower also saw the reconnaissance advantages of satellites.

**1926.** Eisenstein, Elizabeth L., ed. *The Printing Press as an Agent of Change: Communications and cultural transformations in early-modern Europe (2 volumes)*. New York: Cambridge University Press, 1979.

This substantial, two-volume intellectual history examines how the printing press altered Western (indeed, world) civilization. Eisenstein shows how European society changed with of rapid expansion of printed materials after the advent of printing with movable metal type. The increased availability of reading material moved civilization from an oral culture with a listening public to a written and reading public. The printing press also encouraged individualism. The increased availability of Bibles created an environment that encouraged Martin Luther and the Protestant Reformation. Other books written in the vernacular promoted more democratic and nationalistic government. The printing press freed intellectuals and scientists from the necessity of rote memorization, and thus freed minds for more creative endeavors. This new, light weight form of communication which utilized the book and paper facilitated the expansion of Western Europe.

**1927.** ---, ed. *The Printing Revolution in Early Modern Europe*. New York: Cambridge University Press, 1983.

This work is an illustrated and abridged 297-page version of Eisenstein's two-volume *Printing Press as an Agent of Change: Communications and cultural transformations in early-modern Europe* (1979). The two-volume study is a substantial intellectual history that examines how the printing press altered Western (indeed, world) civilization. Eisenstein shows how European society changed with of rapid expansion of printed materials after the advent of printing with movable metal type. The increased availability of reading material moved civilization from an oral culture with a listening public to a written and reading public. The printing press also encouraged individualism. The increased availability of Bibles created an environment that encouraged Martin Luther and the Protestant Reformation. Other books written in the vernacular promoted more democratic and nationalistic government. The printing press freed intellectuals and scientists from the necessity of rote memorization, and thus freed minds for more creative endeavors. This new, light weight form of communication which utilized the book and paper facilitated the expansion of Western Europe.

This abridged volume is good for classroom use.

**1928.** Eisenstein, Sergei. "Montage of Attractions: For 'Enough Stupidity in Every Wiseman'." *Drama Review: TDR* 18.1 (Popular Entertainments) (1974): 77-85.

This issue was devoted to "Popular Entertainments." In this article, Eisenstein explains what he means by "montage of attractions." **"An attraction (in relation to the theatre) is any aggressive aspect of the theatre; that is, any element of the theatre that subjects the spectator to a sensual or psychological impact, experimentally regulated and mathematically calculated to produce in him certain emotional shocks which, when placed in their proper sequence within the totality of the production, become the only means that enable the spectator to perceive the ideological side of what is being demonstrated the ultimate ideological conclusion. (This means of cognition \_'through the living play of passions' apply specifically to the theatre.)** (bold and italics in original text)

"Sensual and psychological, of course, are to be understood in the sense of immediate reality, in the way that these are handled, for example, by the Grand Guignol theatre: gouging out eyes or cutting off arms and legs on the stage or a character on stage participating by telephone in a ghastly event ten miles away; or the plight of a drunkard who senses his approaching death, and whose cries for help are taken as delirium tremens not in terms of the development of psychological problems where the attraction is already the theme of the play itself a theme that exists and functions even outside of the play's action provided that it is sufficiently topical. (This is an error into which agit-theatres fall, satisfied with only this kind of attraction in their productions.)

"... An attraction has nothing in common with a trick...." (78)

Eisenstein goes on to say that "the film and above all the music hall and the circus constitute the school for the montage-maker...." (79)

**1929.** *Electronics*, Editors of, ed. *An Age of Innovation: The World of Electronics, 1930-2000*. New York: McGraw-Hill Publications Co., 1981.

This is an informative introduction to major developments in electronics up to 1981. It begins with the world of communication in 1930, and a brief history of the technology of that period. Chapters are devoted to radio and to World War II. Chapter 5 is "The Solid State Era," and chapter 6 considers developments in the aftermath of the transistor. Chapter 7 looks at "Computers and Space," while chapter 8 considers the digital age. Pages are then given to brief biographies of "great innovators" and to "classic circuits." The final 80 pages look ahead (from 1981) to the year 2000, a period, the editors predict, that will see "profound changes" in technology, the engineering profession, and in the industry's structure.

--SV

This is a 50-year anniversary publication by the publishers of *Electronics* magazine, established 1930. The book details the many advances in electronic technology over the past half-century, largely informed by the pages of the magazine. It concentrates on semi-conductor technology, radio, TV, and computers. The bulk of it centers on a decade-by-decade analysis, with a final section detailing predictions for the remainder of the twentieth century.

--Nicholas Wolf

**1930.** Ellegard, Alvar. "Public Opinion and the Press: Reactions to Darwinism." *Journal of the History of Ideas* 19 (1958): 379-87.

This article attempts to use newspapers and books to measure public reaction to Darwinism during the late nineteenth century. The author discusses methodology and the difficulties involved in trying to gauge opinion in a time before opinion polling.

**1931.** Eller, Claudia. "Ratings 'Ain't Broke,' Board Chair Says...." *Los Angeles Times* Aug. 4, 1994 1994, sec. F (Calendar): 1F.

This article is about Richard Mosk, the new chair of the motion picture industry's Classification and Rating Administration. He replaced Richard D. Heffner, who retired at the end of June, 1994. Mosk indicated that he did not see a need to make major changes in the system. "Anything can be improved, but I don't foresee any revolutionary changes," he explained. "It's not my style. I'm not a rabble-rouser." Responding to CARA's critics, he indicated that he would not reveal board members' names and that he believed that film makers and the public already received sufficient information about why ratings were given. "If it ain't broke, don't break it," Mosk said.

**1932.** Ellis, Havelock. "Color in Literature." *Current Literature* 20.3 (1896): 212-13.

This article begins by saying that "There are three things ... which color in literature describes or symbolizes: nature, man, imagination." (212) Certain colors, Havelock contends, are associated with certain emotions. Red, for example "and its synonyms ... assume an absorbing interest in man and woman, for these are the colors of blood and of love, the two main pivots of human affairs, at all events in poetry." And "a love for red is evidently associated with the passionate and sensuous enjoyment of natural and human things" in many of the great writers including "Chaucer, Shakespeare, Keats, Tennyson, and D'Annunzio." (212) In the seventeenth century, the Puritans found pleasure in green, as did Tennyson, and associated this color with nature and country living. (212)

Havelock says, however, that language is often inadequate to describe color. "The savage rarely possesses words for either color [e.g., blue and green, and even the Greeks in the fourth century of our era had no specialized word for green." (212) Havelock gives other and later examples for the lack of language for colors.

**1933.** ---. "The Colour-Sense in Literature." *Contemporary Review* 69 (1896): 714-29.

Ellis begins by arguing that even though scientific investigations of color sense are in their infancy, it is clear that humans have had this facility from the beginning. "The colour-vision of savages, whenever carefully tested, is found to be admirable, as is also that of the lower animals, and there is no reason to suppose that so useful an aptitude ever fell into abeyance." (714) Yet, he says, language has been inadequate to describe and explain color. "It remains true... that while man's colour-vision has in all probability always been excellent, his colour-vocabulary has sometimes been extremely defective, even among ourselves to-day remaining very vague...." (714) He notes that the "savage rarely possesses words for either colour [blue and green], and even the Greeks in the fourth century of our era had no specialised word for green." (727) In a footnote, he refers to an issue of *Nature* in 1895 that attempted to improve the quality of language relating to color. (714)

Ellis explains his research as follows: "I have selected a series of imaginative writers, usually poets, dating from the dawn of literature to our own day; and in considerable fragments of their works, sometimes their complete works, I have noted the main colour-words that occur, and have also noted how these words are used." (715) He is careful to explain his methodology, too. "I was careful to avoid the danger of taking too small a basis for calculation; I was also careful to eliminate any bias of my own, and, as will be seen, I have not been able to show that any one colour dominates imaginative literature from first to last." (715)

The author contends that his study of color-vision has at least two uses. First, it is "an instrument for investigating a writer's person psychology, by defining the nature of his aesthetic colour-vision." (729) In other words, the colors a writers uses can tell us "at a glance, simply and reliably, something about his view of this world which pages of description could only tell us with uncertainty." (729) Second, this research "unables us to take a definite step in the attainment of a scientific aesthetic, by furnishing a means of comparative study." (729)

Among the writers Ellis examines are Isaiah, Job, Song of Songs, Homer, Catullus, Chaucer, Marlowe, Shakespeare, Thomson, Blake, Coleridge, Shelley, Keats, Wordsworth, Poe, Baudelaire, Tennyson, Rossetti,

Swinburne, Whitman, Pater, Verlaine, Olive Schreier, and D'Annunzio. He concludes that "in general, it may be said that recent writers use more colour than earlier writers, and that a poet's early work shows more colour than his later work, but there are numerous exceptions." (717)

Ellis that color in literature symbolizes or represents three things: "nature, man, imagination. These three over the whole ground. The predominance of green or blue -- the colours of vegetation, the sky, and the sea -- means that the poet is predominantly a poet of nature. If red and its synonyms are supreme, we may assume an absorbing interest in man and woman, for there are the colours of blood and of love, the two main pivots of human affairs, at all events in poetry. And where there is a predominance of black, white, and, I think I would add, yellow -- the colours that are rare in the world, and the colour of golden impossibilities -- there we shall find that the poet is singing with, as it were, closed eyes, intent on his own inner vision. Wordsworth and Shelley belong largely to the first class; Chaucer and Whitman largely to the second; and Homer, Marlowe, Blake, Poe, and Rossetti largely to the third. We cannot, of course, expect any great degree of precision in the matter. Green among the earlier writers is commonly used of garments; blue often refers to eyes and veins; it is chiefly by their tone that black, white, and yellow reveal the imaginative instincts; and red refers to human beings things in only about fifty per cent. cases in which it occurs. But the general tendency remains distinct." (726)

Green, the author says, became common in the 17th century. "It is in the seventeenth century that we first find trace of a conscious and deliberate joy in green with special reference to its symbolism of nature. This tendency was a by-product of the Puritan movement. The men who turned from courts and towns began to find pleasure in the country, and the predominant colour of the country became for them the symbol of that pleasure." (728) Green was also associated with decadence. "Wordsworth represents the climax of the green movement in English literature; in his hands the epithet become merely a label which the poet affixes almost mechanically to his literary baggage. If a love of green, as a writer with some claim to be an authority has somewhat absurdly declared, 'heralds a laxity, if not a decadence of morals,' the end of the last century [18th century] was certainly such an age, and Wordsworth was the chief prophet. It was clearly impossible to go farther in that direction." (728) Tennyson introduced "a new movement," and while not adverse to green, realized that its use had become a "bald convention.... The type of colour-formula which Tennyson introduced, or re-introduced, is substantially that which still rules to-day." (729) Ellis suggests that in the future, blue may be more widely used.

Finally, Ellis rejects the idea that the use of color in late 19th century art represented decadence or degeneration. "At least one broad and unexpected conclusion may be gathered from the tables here presented. Many foolish things have been written about the 'degeneration' of latter-day art. It is easy to dogmatise when you think that you are safe from the evidence of precise tests. But here is a reasonably precise test. And the evidence of this test, at all events, by no means furnishes support for the theory of decadence. On the contrary, it shows that the decadence, if anywhere, was at the end of the last century, and that our vision of the world is fairly one with that of classic times, with Chaucer's and with Shakespeare's. At the end of the nineteenth century we can say this for the first time since Shakespeare died." (729)

**1934.** ---. "The Psychology of Red." *Popular Science Monthly* 57 (1900): 365-75.

Ellis begins this article by saying that "Among all colors, the most poignantly emotional tone undoubtedly belongs to red." (365) Red "possesses" a "special virtue in relations to other colors" which "all are of infinite variety." (365) According to Ellis, red is one of the very few colors that are almost always recognized by savages (368, 372, 373) and one of the first color to be seen by children (374). While it may be a sacred color to some, it must also be said that "red is the most primitive of colors." (370) Ellis says that the color to distinguish color, even among the uncivilized, is greater than the ability to express color in language. "In all parts of the world it has been found that color discrimination, even amongst the lowest savages, is far more accurate than color nomenclature." (368) Ellis also implies here that civilized people tended to prefer more subtle color rather than strong primary colors such as red. "It is difficult not to believe that there really is, both among many uncivilized peoples and also many children at an early age, even to a slight extent among civilized adults, a relative inability, by no means

usually absolute, to recognize and distinguish the tones of color at the more refrangible end of the spectrum." (373)

Ellis mentions Hugo Munsterberg's studies that showed such colors as red and yellow tended to stimulate the eye more strongly than other hues. He cites a 1897 study by J. Jastrow ("The Popular Aesthetic of Color," *Popular Science Monthly*) that show that most adults preferred blue as their favorite color and about half as many liked red. (373) Once teens reach puberty, most also seemed to prefer blue. (375) Most men prefer blue and that most women like red, Ellis says and concludes by saying that "it might have been anticipated that, even though the typically 'cold' color should appeal most strongly to men, the most emotional of colors should appeal most strongly to women." (375)

**1935.** Ellis, Jack C. "Theatrical Film on 16mm." *Sixty Years of 16mm Film, 1923-1983: A Symposium*. Ed. America, Film Council of. Des Plaines, IL: Film Council of America (Evanston, IL), 1954. 176-82.

This essay deals with the theatrical uses of 16mm film and appears in a collection devoted to examining the different facets of this medium. Hollywood resisted using 16mm film and it had an association with "amateurism." But during and after World War II, many more people used 16mm cameras for a wide range of purposes.

**1936.** Ellul, Jacques. "Preconceived Ideas About Mediated Information." *The Media Revolution in America and in Western Europe: Volume II in the Paris-Stanford Series*. Ed. Everett M. Rogers and Francis Balle, eds. *Paris-Stanford Series*. Norwood, NJ: Ablex Publishing Corp., 1985. 95-107.

Ellul considered nine "preconceived ideas" that intellectuals and most media professionals accept. A severe critic of new media, he argued that they create an information overload that often makes society and its citizens dysfunctional. Ellul had grave reservations about the optimistic claims often promoted by computer-based information systems. Arguing from a humanistic perspective, he believed that the nature of human relationships could not be effectively transmitted through mass media. Thus, an essential element in communication was missing. The world could *not* become a global village nor could it be one through the new media. Instead, Ellul saw a wedge being driven ever more deeply between the "information-aristocrats and their plebeian masses." This piece might be read in conjunction with such other thoughtful critics of new media as Langdon Winner (see his chapter "Mythinformation" in *The Whale and the Reactor*) and William J. Donnelly (*The Confetti Generation*).

**1937.** ---, ed. *Propaganda: The Formation of Men's Attitudes*. New York: Alfred A. Knopf, 1965.

Ellul writes that "Modern propaganda could not exist without the mass media—the inventions that produced press, radio, television, and motion pictures, or those that produced the means of modern transportation and which permit crowds of diverse individuals from all over to assemble easily and frequently." This work is essentially a theoretical explication of the term "propaganda." While Ellul draws on history (primarily the twentieth century) and makes comparisons between societies, the work is not a history of propaganda. Rather, Ellul seeks to elaborate on the conditions necessary for it to flourish, as well as on propaganda's characteristics and effects. While most of the book focuses on the similarities between so-called "authoritarian" propaganda and "democratic" propaganda, Ellul ultimately argues that democracy and propaganda do not mix well. His book is intended then as a warning to western nations.

--Mark Tremayne

**1938.** Elmendorf, Dwight L. "Telephotography." *Current Literature* 27.1 (1900): 82 (APS Online).

The article begins by comparing the telephoto lens to field glasses or the telescope in its ability to bring remote objects closer. The author notes that he began experimenting in 1890 with the lenses from old field glasses and found that it brought St. Patrick's Cathedral which was 18 blocks away into much closer viewing range. Elmendorf describes a telephoto attachment and it increases the exposure time needed to take a picture. "This is a serious drawback, for it not only debars one from using it upon moving subjects, but also increases the liability of the

image to be blurred by vibrations of the camera. In order to obtain the best results the camera must be very rigid. Most of the cameras and tripods of to-day are too light and unstable for telephotography."

**1939.** Elving, Bruce F., ed. *FM Atlas and Station Directory*. Adolph, MN: FM Atlas Publishing Co., 1976.

The *FM Atlas and Station Directory* offers a variety of data on FM stations including call letters, maps indicating stations' location and coverage, applications for new stations in the United States and Canada, and precise station frequencies. These editions (4<sup>th</sup> through 8<sup>th</sup>) provide a good account of the extent and growth of FM radio from the mid-1970 into the early 1980s.

**1940.** Engineering, Center for the History of Electrical, ed. *Sources in Electrical History 2: Oral History Collections in U. S. Repositories*. New York: Center for the History of Electrical Engineering; IEEE, 1992.

This work runs 89 pages plus an index.

**1941.** Engineers, Special Committee of the Society of Motion Picture and Television, ed. *Elements of Color in Professional Motion Pictures*. New York: Society of Motion Picture and Television Engineers, 1957.

This 104-page treatise seeks to "bridge the gap between the artistic approach and scientific know-how" that existed in making color films in 1957. This is largely a work aimed at engineers rather than an effort to explain what emotional or psychological impact color in motion pictures might have. Chapter 11 is devoted to "Motion Pictures and Color Television." (91-94) Chapter 5 is on "Planning a Motion Picture in Color" (38-50). "The simple fact of the matter is that color has proved to be a tremendous asset to a motion picture -- so much so that it has often been considered another 'star' in a picture, included in the advertising, in the publicity, and usually on the marquee." (38) One often quoted passage reads: "There are many factors which strongly influence the overall planning of a color motion picture. The feminine star, for example, whose appearance is of paramount concern, must be given undisputed priority as to the color of make-up, hair and costumes which will best compliment here complexion and her figure." (40) Later, this work comments on the psychological impact of color. "This psychological factor can be one of great importance in creating an atmosphere of reality or verisimilitude on the screen. With the filming of an historical or a 'period' picture, for example, research is done not only on architecture and decoration, but also on the colors in use during the particular period and in the specific country. Yet the use of the actual colors of the period or the country are very rarely employed. Because of psychological factors governing the response of a modern viewing audience, far better results are achieved by the use of a *desaturated tonality of the times* -- that is, a less saturated range or 41/42 'palette' of color and pattern, but adequately punctuated with authentic identifying colors so that the end result tends to be identified as historically accurate, yet believable." (41-42) This work also notes that "skin tones are of prime importance in a color picture." (43)

**1942.** Enright, D. J., ed. *The Typewriter Revolution & Other Poems*. New York: Library Press, 1971.

This poem begins: "The typeriter is crating/ A revlootion in peotry/Pishing back the frontears ...."

**1943.** Entman, Robert M., ed. *Democracy Without Citizens: Media and the Decay of American Politics*. New York: Oxford University Press, 1989.

Political scientist Robert Entman examines the many paradoxes that face the press in the United States. The ideal is to have a vigorous political system driven by a vibrant marketplace of ideas in a free press. He argues that it is impossible for the press to be truly free in the American system. Journalists are reliant on power elites, both in government and business, for information and support and are necessarily biased. Entman continues, however, by saying that the larger problem comes from the lack of a politically sophisticated public. Because the economics of the current media system seem to dictate that content be softened and geared toward entertainment, journalists are discouraged from engaging in deeper analysis or aggressive reporting. Entman sees a debilitating paradox that leads to the decay of civic life, or "democracy without citizens." The public needs a

strong and independent media to become more sophisticated. However, because the public is seemingly uninterested in politics, the press does not become strong and independent. Entman's book explains this cyclical relationship.

One of the major issues that Entman examines is corporate, profit-driven, media. He believes that, since the media is ultimately designed to make money rather than inform, the emphasis will be on providing content that is entertaining and enjoyable and attracts readers, viewers and listeners. He does not, however, believe that monopolization plays a serious role in this trend. Chain newspapers are no more likely to be motivated for profit than a locally owned one. In fact, there are more media outlets now than ever before, and yet people are not more informed. Entman also believes that power elites and political candidates are more likely to turn to news management and demagoguery when the press is weak and public opinion uninformed or confused by mixed messages.

Another problem that Entman sees is the reluctance of the press to be critical of leadership. Journalists are reliant on leaders for information and often let themselves be led. When they do become critical, it is often after much damage has already occurred. Criticism is also largely tied to the popularity of the figures involved. Entman makes an interesting comparison between press coverage of Presidents Nixon, Ford, Carter and Reagan. Not only were they treated differently, but each President was treated differently as his popularity rose or fell.

The key, according to Entman, is to increase the public's sense of citizenship. One proposal is to create party-funded news sources that would provide political information and encourage participation, similar to the party press model of the 1800s. He also believes that computer technology and the Internet will provide a whole range of new media outlets that can potentially reinvigorate the system and enhance citizenship.

**--Rob Rabe**

Entman writes "In theory, democracy in the United States benefits from a vigorous marketplace of ideas created by an energetic 'free press.' The press is supposed to enhance democracy both by stimulating the citizenry's political interest and by producing the specific information they need to hold government accountable. But American's 'free press' cannot be free. Restricted by the limited tastes of the audience and reliant upon political elites for most information, journalists participate in an interdependent news system, not a free market of ideas. In practice, then, the news media fall far short of the ideal vision of a free press as civic educator and guardian of democracy.

"Despite their institutional shortcomings, the news media do influence politics significantly. This book weaves an explanation of the media's simultaneous dependence and strength into a theory of news, public opinion, and democracy in the United States. theory explains how the media can wield the power to alter public policy and cripple presidencies--yet cannot harness that power to serve democratic citizenship and promote government accountability as free press ideals demand."

**1944.** Epstein, Edward, ed. *News From Nowhere; Television and the News*. New York: Random House, 1973.

Epstein attempts to refute the charge that only a few men, an elite, dictate what becomes news. He writes: "For example: before any programs can reach a national audience, affiliated stations must 'clear' them....Further, the very fact that broadcasting is licensed and regulated by the federal government, which makes both the affiliated stations and the networks dependent for their continuing existence on some measure of government approval, must be taken into account by the networks in their overall policies on news coverage and presentation. And the economic realities of network television, reflected in budgets and schedules, restrict the choices of stories available to news personnel. Finally established routines and procedures for gathering information and narrowing down the list of possible stories reduce the opportunities for politically selecting news stories or modes of

presentation. In short, the outputs on network news are not simply the arbitrary choices of a few men; they result from a process."

**1945.** Erenberg, Lewis A., ed. *Steppin' Out: New York Nightlife and the Transformation of American Culture, 1890-1930*. Chicago: University of Chicago Press, 1981.

This interesting cultural history deals with the changes in New York nightlife between 1890 and 1930. These were years when major technological changes came to America -- electrification, sound recording, wireless and radio, photography and moving pictures. Numerous innovations vastly increased the ability of Americans to experience music and other sights and sounds during this period.

**1946.** ---, ed. *Swingin' the Dream: Big Band Jazz and the Rebirth of American Culture*. Chicago: University of Chicago Press, 1998.

This interesting cultural history of big band jazz explores changes in music and the ability of many more people to experience such things as jazz. Electrification and improvements in sound recording, what with vinyl records, not to mention radio expanded cultural opportunities for Americans.

**1947.** Erens, Patricia, ed. *The Jew in American Cinema*. Bloomington, IN: Indiana University Press, 1984.

This book is one of the best histories of Jews in the American film industry. Jews made up a high percentage of studio owners and actors. Erens writes that Jews had a "virtual monopoly on producing" and that many major Hollywood producers of the late 1920s had come to the United States from eastern Europe in the wave of Jewish immigration during the late nineteenth and early twentieth centuries. During the 1930s, Hollywood became a refuge for Jewish intellectuals and others fleeing the Third Reich. Many movies during the 1930s and 1940s that dealt with Germany, military preparedness, and war reflect the presence of Jewish writers and directors. So, too, does the patriotic tenor of many American movies.

**1948.** Erickson, Paul. "Help or Hindrance? The History of the Book and Electronic Media." *Rethinking Media Change: The Aesthetics of Transition*. Ed. David Thorburn and Henry Jenkins, eds. Cambridge, MA: MIT Press, 2003. 95-116.

The author begins by writing that "the late D. F. McKenzie ... defined bibliography [in 1985] as 'the discipline that studies texts as recorded forms, and the processes of their transmission, including their production and reception.' He went on to define texts to include 'verbal, visual, oral, and numeric data, in the form of maps, prints, and music, of archives of recorded sound, of films, videos, and an computer-stored information, everything in fact from epigraphy to the latest forms of discography. There is no evading the challenge which those new forms have created.' This essay will discuss the ways in which bibliography and its sibling discipline, the history of the book -- the study of the physical, technological, economic, and cultural conditions of reading, authorship, and publishing -- have in many respects evaded the very challenges for the discipline that McKenzie raised over sixteen years ago." (95)

Erickson's essay is one of twenty-two chapters by different authors that attempt to improve our "understanding of emerging communication technologies." This volume, which part of a larger series on new media technologies entitled *Media In Transition*, tries to offer a historical and comparative perspective on it subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. The editors of this volume describe the chapters in this work as follows: "Challenging the assumption that new technologies displace older systems with decisive suddenness and have a revolutionary impact on society, the essays in this book see media change as an accretive, graduate process, always a mix of tradition and innovation, in which emerging and established systems interact, shift, and collude with one another.

**1949.** Ernst, Martin L. "Electronics in Commerce." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 336-49.

When this piece appeared in *Scientific American* (Sept. 1982), the world of commerce was much more automated than the manufacture of goods. The electronics revolution was already changing banking and transportation, what with credit cards and electronic airline reservations. Ernst, notes though, that this transformation has not been without problems.

**1950.** Ernst, Morris L., ed. *The First Freedom*. New York: Macmillan Company, 1946.

Ernst was a foe of censorship, including motion picture self regulation. In this work, Ernst criticized the concentration of power in the hands of a few studios. He called on the government to break the power of the large studios.

**1951.** Ernst, Morris L. & Alexander Lindey, ed. *The Censor Marches On: Recent Milestones in the Administration of the Obscenity Law in the United States*. New York: Doubleday, Doran & Company, Inc., 1940.

This book is a tour-de-force against censorship, written in the early months of World War II. Chapters are devoted to "Sex and Literature," theater, "The Censor and the Movies" (two chapters), "Freedom of the Air," "Art and Censorship," birth control (two chapters), "Nudism and the Law," "Who Is the Censor?," and "The Case Against Censorship" (two chapters).

This book discusses specific books, films, and cases. In their consideration of movies, the authors write: "Faith in the destiny of man means giving him the privilege of choice between right and wrong, and trusting him to choose the right. If he's headed for perdition, putting blinders on him or plugs in his ears will not stop him...."

Morris and Lindey argued that part of the blame for the lack of freedom of expression in film lay with the movie industry: "Vacillating, jittery, bank-ridden, lacking vision and leadership, never much concerned with the freedom of expression or the spread of ideas, Hollywood has been content to string along with the administration. Only here and there has a voice been raised in opposition."

The book has an interesting discussion of *Professor Mamlock*, a film produced in Russia that showed Nazi persecution of Jews. It was banned in Ohio for two months and police refused to let be shown in Rhode Island.

On the Production Code, the authors write: "The trouble with the code is the trouble with obscenity statutes. Its mandates are shot through with generalities; its social policy is one of hypocrisy and hush-hush; its criteria are predicated on the susceptibilities of morons; its effect is one of forcible suppression; it lends itself readily to abuse; and above all, it creates a viciously false picture of life." The latter point is also later made by Gregory Black in *Hollywood Censored* (1994), and *Catholic Crusade Against the Movies* (1997).

The book by Ernst and Lindey was part of a then growing literature calling for greater freedom for the screen -- e.g., Mortimer Adler, the Hutchins Commission. Of course movies gained protection under the First Amendment in 1952 in the *Miracle* case.

**1952.** Eszterhas, Joe, ed. *Hollywood Animal: A Memoir*. New York: Alfred A. Knopf, 2004.

This 736-page memoir has no index. Eszterhas, once a heavy smoker, discusses his battle with throat cancer in the last chapter (701-36), and his Op-Ed piece for the *New York Times* in which he asked Hollywood to stop making motion pictures that showed smoking onscreen (in the *New York Times* piece he had acknowledged that he had added dialogue to *Basic Instinct* designed to encourage people to smoke).

**1953.** ---. "Hollywood's Responsibility for Smoking Deaths." *New York Times* Aug. 9, 2002 2002, sec. A: A17.

Eszterhas, who had recently been diagnosed with cancer, here describes himself as having been a militant smoker and confesses that in working on the script for the movie *Basic Instinct* (1992), starring Michael Douglas and Sharon Stone, he had given Stone dialogue designed to encourage viewers to smoke.

**1954.** Etheredge, Lloyd S., ed. and intro., ed. *Politics in Wired Nations: Selected Writings of Ithiel de Sola Pool*. New Brunswick, NJ and London: Transaction Publishers, 1998.

This volume contains a selection of Ithiel de Sola Pool's writings over 40 years on systems of communication, and especially on communications technology's impact on society and politics. Chapters are divided into three parts. 1) Political Communication; 2) Societal Impact; and 3) Technology, Policy, and Freedom.

**1955.** Etzioni, Amitai. "Are Virtual and Democratic Communities Feasible?" *Democracy and New Media*. Ed. Henry Jenkins and David Thorburn, eds. Cambridge, MA: MIT Press, 2003. 85-100.

Etzioni asks "whether communities and democracy can thrive in the new world in cyberspace." This question requires consideration of whether or not "there can be virtual communities" and second "can these -- and other (including offline) communities -- govern themselves in a democratic way by drawing on new developments in cyberspace?" (85)

The volume in which Etzioni's chapter appears is part of a larger series on new media technologies entitled *Media In Transition*. The volume tries to offer a historical and comparative perspective on its subject in a way that is accessible to a wide audience of humanists, social scientists, and policymakers. As the editors explain, the "essays in this volume capture something of the complexity and disagreement in current discourse about the politics of cyberspace. Some contributors offer us front-line perspectives on the impact of emerging technologies on politics, journalism, and civic experience. What happens when we reduce the transaction cost for civic participation, or increase access to information, or expand the arena of free speech? Other contributors place our shifting understanding of citizenship in historical context, suggesting that notions of cyberdemocracy and online community must grow out of older models of civic life. Still others expand this conversation to consider the global flow of information and to test our American conceptions of cyberdemocracy against developments in other parts of the world. How, for example, do new media operate in Castro's Cuba, or in post-apartheid South Africa, or in the context of multicultural debates on the Pacific Rim? Some contributors examine specific sites and practices, describing new forms of journalism or community organizing. Some voices here are deeply skeptical; others are optimistic. For some writers the new technologies endanger our political culture; for others, they promise civic renewal.

"Most of the papers on which these chapters are based originated in series of public forums and conferences hosted by MIT from 1998 to 2000 under the title 'Media in Transition.' Funded by the John and Mary R. Markle Foundation and organized by the MIT Communications Forum, these events aimed to nourish a broad civic conversation about the political impact of new media technologies. The essays have been revised for this book."

**1956.** Eugster, Ernest, ed. *Television Programming Across National Boundaries: The EBU and OIRT Experience*. Dedham, MA: Artech House, Inc., 1983.

"For two decades after the Second World War," writes the author, "mankind was devoted, at least in principle, to the concept of a free flow of information across national boundaries...."

"In the past two decades, however, there has been a retreat from the free flow of information concept, primarily because of the revolutionary change that has occurred in the international political system...." This study looks at the European Broadcasting Union (EBU) and the International Radio and Television Organization (OIRT).

**1957.** Evans, Christopher, ed. *The Micro Millennium*. New York: Viking Press, 1979.

Evans writes: "There are four important features of the Industrial Revolution which need to be identified and considered, for they will turn out to be extremely significant for the next great turning point which mankind is rapidly approaching -- the Computer Revolution. The first of these concerns the scale and scope of change: the Revolution brought immense shifts in all aspects of human society, affecting the individual, his family, his neighbours, his domestic and working environment, his clothes, his food, his leisure time, his political and religious

ideals, his education, his social attitudes, his life-span, even the manner of his birth and death. The second feature is that these changes took place with great rapidity, remoulding the face of our society in less than a hundred years. Thirdly, once the process of the Revolution was fully under way, its dynamic growth was remorseless, and no power, no man or combination of men, could set it back against its course....

“Finally, and perhaps the most interesting of the four points, hardly anyone -- certainly no one who could do anything about it -- foresaw its momentous coming.. Only the gallantly misguided Luddites, who feared a loss of affluence from the coming of the machines, seemed to have any glimmering of insight into what was about to happen.”

This work might be read in conjunction with other works that talk about communication and a “second industrial revolution.” It is interesting view of how some (in 1979) saw the computer before the spread of personal computers or the Internet.

**1958.** Evans, Gary, ed. *In the National Interest: A Chronicle of the National Film Board of Canada from 1949 to 1989.* Toronto: University of Toronto Press, 1991.

This work parallels work on American film censorship by such writers as Frank Walsh, Gregory Black, and Stephen Vaughn. It discusses efforts to censor specific films and themes -- e.g., drug addiction, racism in South Africa, Canadian history, and more.

**1959.** ---, ed. *John Grierson and the National Film Board: The Politics of Wartime Propaganda, 1939-1945.* Toronto: University of Toronto Press, 1984.

John Grierson was a central figure in the Canadian documentary film movement and during World War II he attempted to rally Canadian through a national propaganda agency, the National Film Board. This book examines Grierson's work during the war.

**1960.** Evans, Lawrence B. "Industrial Uses of the Microprocessor." *The Microelectronics Revolution: The Complete Guide to the New Technology and Its Impact on Society.* Ed. Tom Forester, ed. and intro. Oxford, Eng.; and Cambridge, MA: Basil Blackwell Publisher; and MIT Press, 1980. 138-51.

Such "process industries" as pulp paper, chemical, and food have been growth industries in recent years, the author notes, and have also been on the cutting edge of new developments in automation, particularly "new control technology." Evans, then a professor of Chemical Engineering at MIT, discusses "how the revolutionary advances in electronics will greatly accelerate evolutionary change in industrial process control." This piece appeared first in *Science* magazine (March 18, 1977).

**1961.** Evensen, Bruce J., ed. *God's Man for the Gilded Age: D. L. Moody and the Rise of Modern Mass Evangelism.* New York: Oxford University Press, 2003.

When evangelist Dwight L. Moody on the eve of the twentieth century, he was one of the most widely recognized people of nineteenth-century America. He had been a Chicago shoe salesman who had never gone beyond the fourth grade. Yet he invented a system of using mass media that latter-day evangelists such as Billy Graham inherited and perfected. Evensen focuses on four years during the 1870s when Moody created a connection between mass media and evangelism. Moody began this bond in Great Britain in 1873 and then moved to America, to Brooklyn, New York, Philadelphia, Boston, and Chicago. Newspapers, suffering from economic depression and in need of circulation, helped to turn Moody's city-wide crusades into communal spectacles. Critics accused Moody of using man-made machinery to aid his revivals but Moody responded that it was better to advertise than to minister to empty churches. The urban press helped to make Moody into a celebrity and turn his revivals into civic entertainment of unprecedented size. Evensen's work demonstrates how this popular and important evangelist helped to created modern media culture.

**1962.** ---, ed. *Truman, Palestine, and the Press: Shaping Conventional Wisdom at the Beginning of the Cold War.* Westport, CT: Greenwood Press, 1992.

Evensen, a former Middle East correspondent, writes that his interest in "the relationship between policymaking, the press and the public in the construction of the Truman administration's Cold War Palestine policy began in the spring of 1983" when he was "based in West Jerusalem working out of the Binyanei Haooon, the Israeli convention center, that served as headquarters for news bureaus serving much of the Western world." Using a wide range of archival materials as well as published sources, Evensen examines the interaction between the Truman administration and the press in the formulation of a policy regarding Palestine. The author is especially insightful in explaining how reporters construct their narratives of news events. This book grew out of Evensen's doctoral thesis at the University of Wisconsin, Madison. It is part of Greenwood Press's *Contributions in America History* series (No. 144), Jon L. Wakelyn, Series Editor.

**1963.** ---, ed. *When Dempsey Fought Tunney: Heroes, Hokum, and Storytelling in the Jazz Age.* Knoxville: University of Tennessee Press, 1996.

Evensen uses the 1926 heavyweight championship fight between Jack Dempsey and challenger Gene Tunney to examine how journalists, advertisers, and public relations people hyped this sporting event and turned it into a spectacle of major proportions. Nationwide, perhaps 39 million people listened to the fight on radio. This well-written book is informative not only on the boxers and the details of their world, but it is insightful about the way modern media helped to create a celebrity culture in sport.

**1964.** Everson, George, ed. *The Story of Television: The Life of Philo T. Farnsworth.* New York: Norton, 1949.

**1965.** Ewen, Stuart, ed. *PR! A Social History of Spin.* New York: Basic Books, 1996.

Ewen's history recounts the rise of the public relations industry and the social forces that drove public relations in the first half of the century. It provides an account of how corporate America viewed government and the individual during historic political eras and how the public relations industry responded with programs designed to create positive public opinion or influence government action. Ewen focused on the view of public relations within the industry and within large business enterprises. Public relations, he said, grew out of a need to influence the opinion of an increasingly alienated public and hostile government.

--Phil Glende

**1966.** Ewen, Stuart, and Ewen, Elizabeth, eds. *Channels of Desire: Mass Images and the Shaping of the American Consciousness.* New York: McGraw-Hill, 1979.

The Ewens discuss the rise of media development and the resulting changes in American society. Their focus is on the trade-offs -- loneliness, the loss of traditional skills, and alienation versus the abundance of goods and the improvements in communication systems and education.

The Ewens write that "As capitalism has evolved a consumption-oriented mass culture, social, economic, and political power have become increasingly coordinated and consolidated. To a large extent, the rise of modern management, communications, production, and distribution has been dependent on the appropriation and mobilization of technical and organizational capacities by a ruling, monopoly-capitalist class, administered by an emergent sector of professional/managerial intelligentsia. This increased coordination at the top levels of society has entailed increasing fractionalization throughout the remaining, popular majority. In this systemic, organizational inequity, the appeal of advertising, for example, must be understood in a cultural context in which the social status, employment, and even survival of people are separated from customary networks of skill and

association. In a world of strangers, survival is to a large extent a matter of appearance and surface impressions.” (265)

--Wayne Hayes

Composed of five different essays *Channels of Desire: Mass Images and the Shaping of American Consciousness* probes the history of America’s consumer and media-based culture. The first essay, “The Bribe of Frankenstein,” provides a short history of mass communication technology from the printing press in the fifteenth century to early filmmaking in the beginning of the twentieth century. The Ewens most interesting section focuses on how the lack of literacy of the populace benefited the church, because it gave clergy complete control over interpretation of the word of God.

The second essay, “Consumption as a Way of Life,” details how goods went from being created in the home, to manufactured by industrial means; this development gave women more leisure time, so full-service department stores sprung up to help women spend their time. Brimming with goods, as well as services such as hairdressers, nurseries, and post offices, department stores were elaborate buildings dedicated to consumption. Also, a history of mail-order catalogs is included in this section.

“City Lights: Immigrant Women and the Rise of the Movies,” (the third essay) explores the role of the cinema in the lives of both young and old women. Because movies were silent, they appealed to non-English speakers. Film watching was one of the few urban activities that immigrant women allowed their daughters to engage in. By teaching immigrants the rules of the new world, while also easing the transition from the old, early silent films played a crucial role in the assimilation of a generation.

At over one hundred pages long, “Fashion and Democracy” is the most detailed and compelling essay in the book. In fact, this essay should have been expanded and turned into its own book. The Ewens examine the rise of fashion in America, with a strong focus on the history of ready-to-wear clothing--specifically blue jeans (whose stitching was inspired by horse blankets)and women’s fashion and undergarments. Women did not wear underwear until the 1850s, because it was considered to be a garment worn by disreputable women.

*Channels of Desire* ends with an essay on America’s image culture in general. The Ewens focus on three forms of this culture: choice, violence, and ignorance. Choice is an illusion, they believe, because we are merely given the superficial choice to choose between different consumer objects and media products. Our newspapers have too strong a focus on violence (no new insights there) and the news coverage of first Iraq war sugarcoated the war and did not show the real violence, they believe. Americans are obsessed with celebrity and fitness, therefore we are truly ignorant and we choose poor leaders because of it (Ronald Reagan).

Overall, the Ewens rely too heavily on secondary sources-- autobiographies, newspaper articles, magazine articles, other historians’ books -- and not enough on primary sources. Their only primary source seems to be advertisements. And, the book feels disjointed (not surprising since it is a series of five essays). However, *Channels of Desire* is very well written. It aspires to McLuhanesque brilliance, but never quite gets there.

--Hallie Lieberman

**1967.** Eysenck, Hans J. , and Nias, D. K. B., eds. *Sex, Violence and the Media*. London: Maurice Temple Smith, 1978.

This 1978 work deals with television, cinema, and the harmful effects of pornography.

**1968.** Fabrikant, Geraldine. "Attack of the Disruptive Disc; Sales of DVD's Are Challenging the Business of Renting Movies." *New York Times* April 16, 2001 2001, sec. C (Business Day): C1, C5.

This article indicates that increasing numbers of people are preferring to rent DVDs rather than video cassettes, and that rentals of video cassettes may decline even more compared to this challenger.

**1969.** ---. "Box Office Abroad Now More Valuable." *New York Times* Sept. 28, 1987 1987, sec. D: 8.

This article explains that in 1987, two major American film companies, Paramount and Universal, began distributing movies in more than 20,000 theaters in China, the first time U.S. studios had been able to market films in that country since the Communist takeover in 1949

**1970.** Fairbanks, C. M. "Illustration and Our Illustrators." *The Chautauquan* 13.5 (1891): 597-601.

Fairbanks writes that with "the wonderful advances made in the study and practice of photography in recent years, the work of the engraver has been revolutionized. Mechanical processes have now been devised by means of which pen and ink and pencil drawings may be reproduced in exact facsimile, and drawings done in water color, and even in oil, may be rendered in relief plates, from which impressions with amazing fidelity to the original, may be taken by the ordinary process of printing." (597)

Still, the work of the artist-engraver is superior in some areas. The author says that "despite the beauty of the soft half-tone engravings, the superiority of artistic wood cutting remains unimpaired, and a great part of the best work in our magazines is still produced by the 'painter-engraver,' who is able to preserve the color values and tones of the original as no photographic process is quite able to do as yet. Bright red and yellows in nature will insist on coming out black in photographing, and the darkest blues appear as white, and these errors of the camera the wood engraver can correct." (599) Fairbanks then discusses some of the most prominent illustrators.

**1971.** Fairfield, Sidney. "The Tyranny of the Pictorial." *Lippincott's Monthly Magazine* (1895): 861-64.

This article laments that fact that increasingly during the preceding decade illustrated material is replacing written text in weekly and even daily publications. Fairfield considers the "written word" to be "the first and the highest expression of thought, and it ever will be." (864) Yet, "the reading public has suddenly become picture-mad." (863-64) He notes that reading material is more in demand if pictures come with it and so urges writers to either learn how to be illustrators or to hire a good illustration. Care needs to be exercised by the writer, however, because the illustrator "often ... takes outrageous license with the truth as written. He is essentially an exaggerator, a perverter of the facts." (864)

The most commonly used picture or illustration has become the woman. Pictures of beautiful women are replacing written text. There was a "glorification of feminine beauty." (863) Where possible, color is used. "The color is laid on thick in those spots and combinations which yield the most striking effect when displayed on the news-stand." (862) As "long as certain publishers insist on putting forth the painted and decorated woman in all manner of impossible costumes with impossible backgrounds, the artists who want to make money can do so by catering to this manufactured taste." (862) Advertising, of course, is a leader in the use of such pictures. Even when publications do not use color, women remain "the one great subject for illustration." (863) These are pictures of the "'up-to-date' girl" and the emancipated woman of the women's movement. "We are daft -- or at least many of us are daft -- over rounded arms, snowy shoulders, lips like wine, radiant cheeks, and all other sensuous allurements of a perfect woman; and as long as we are thus entranced and will buy these things in picture-papers, so long will capital and brains go into partnership to supply the demand." (864)

**1972.** Falkenberg, Merrill Brooke. "Circuits of Exchange: The Myth of Interactivity in Video Art." Stanford University, 2002.

Abstract for this Ph. D. thesis is from UMP ProQuest Digital Dissertations: "What does it mean to describe a video art installation as interactive? This dissertation provides a historical account of several interactive video art installations exhibited in American museums and galleries in the United States from 1969 to the present. Video art is placed within two trajectories -- the post World War II American avant-garde on the one hand, and new media

and information technology on the other. Chapter 1 situates video's emergence during a period of mixed reactions to new technologies, as the increased presence of computers contributed to fears that machines would soon replace their human counterparts. During this period of oppositions to the Vietnam War, video activists saw the portable camera, with its capacity for immediate transmission and feedback as a tool for talking back to the 'establishment' by challenging the one-way transmission of broadcast television. This chapter examines video activists' attempts to provide alternative broadcasting in relation to Frankfurt School media critiques. Chapter 2 positions video in the context of other art movements of the late 1960s, such as minimalism and conceptual art, performance and body art and avant-garde film, all of which focused on the interpretive contributions of the viewer. It considers the disparate approaches to video exemplified by artists such as Bruce Nauman, Vito Acconci, Joan Jonas, Dan Graham, Peter Campus and Martha Rosler. Video is identified as a new avant-garde at a time when critics initiated a fundamental reconsideration of the very existence of a post-World War II American avant-garde. Chapter 3 focuses on the work of Bill Viola and Gary Hill. Viola's and Hill's work is explored in relation to the debates surrounding postmodernism and Fredric Jameson's claim video is postmodernism's most distinctive new medium. By the mid-1980s, interactivity no longer implied an effort to create an egalitarian exchange with the viewer but rather referred to the creation of immersive spaces that the viewer temporarily inhabits. This shift called for a greater level of passivity from the viewers, as the challenge of soliciting the viewer's equal participation, remains unresolved."

**1973.** Fallows, James, ed. *Breaking the News: How the Media Undermine American Democracy*. New York: Random House, 1996.

Fallows argues that celebrity journalism in Washington relies on crisis coverage that does a disservice to true democratic government. Fallows says political crisis coverage is easy but often irrelevant. This kind of reporting always misses the stories that really matter because celebrity journalists are reporting on politics not policy. This practice has widespread applications, he argues, because journalists throughout the country aspire to or emulate this model of journalism. The journalism itself, he says, relies heavily on speculation and "horse-race" reporting and does not examine policy.

--Phil Glende

James Fallows writes that "This book is an attempt to explain why the values of journalists have changed, how their current practices undermine the credibility of the press, and how they affect the future prospects of every American by distorting the processes by which we choose our leaders and resolve our public problems." (6)

Fallows believes that journalists, not the news, are becoming more and more important. Those who are best paid and well-known are the journalists least likely to cover news as reporters traditionally have done. Entertainment has become a more important factor than hard reporting. Furthermore, instead of clarifying the news for the public, members of the media make the news harder to understand by choosing to present public life as a contest among scheming political leaders, all of whom the public should view with suspicion, the news media help bring about that result. "The more prominent today's star journalists become, the more they are forced to give up the essence of real journalism, which is the search for information of use to the public." (7)

Profits and salability have become the main priorities of editors. They do not focus on a proper journalistic coverage of events anymore but on how those events can make the most profit for newspapers or broadcasting networks. Therefore they do not give enough attention to important events or give too much attention to events that are of minor importance. When journalists are busy covering the news they are already busy looking at what will happen afterwards and move on to the next item before the previous is properly covered. Furthermore, according to Fallows, they have developed the strange habit of wanting to predict the news, something that is unnecessary.

Fallows thinks that it is not too late for journalism to recover itself. However, it has to make a choice whether it wants to cover the news like it used to do or whether it wants to offer people entertainment. The latter option can be quite dangerous. Since journalists are the only ones who can show the people what happens in the world, they have to do it in a sincere way. But now more and more people are not interested in the news anymore which results in the fact that journalists can show whatever they want. This can threaten democracy as a whole. Although reclaiming journalism's standards is not impossible, a great deal of work remains to be done.

-- Pieter Van Den Berg

**1974.** Faltas, Sami. "The invention of fibre-optic communications." *History and Technology: An International Journal* 5.1 (1988): 31-49.

The author points out that fibre-optic communication may alter the foundation of the entire information industry. He surveys the history of this technology beginning with the Claude Chappe's optical telegraph in France during the 1790s. A section is devoted to the first optical waveguides, and then a section on masers and lasers (covering the 1950s up to 1970 and the development of a continuous-wave semiconductor laser at Bell Labs. The author then discusses research on glass as a medium of transmission. The article concludes that "besides being different, fibre-optic communications is a rival to older techniques and a threat to the interests vested in them. It is eroding the dominant technological paradigm of telecommunications on two basic counts. First, the physical principles on which the transfer of information takes place. Electronic telephone transmission signals and laser light are both electromagnetic waves, but they have different characteristics. Second, the materials used to enable the transfer of information to take place. So far, electromagnetic communications and information-handling have been chiefly founded on metal conductors. The first major challenge to this material base was the introduction of silicon and other non-metallic substances in semi-conductors, but the technological and economic impact of fibre-optics communications systems, in which metals play only an auxiliary role, is much more significant, especially because of the expected pervasiveness of integrated optics."

The author notes that fiber optics is a relatively new technology -- the basic inventions underlying it had been around about three decades or less at the time of this article; fiber optic transmission lines had been on the market for only about one decade. Using scientific papers and "a few well-researched historical papers," this article examines how fiber optics was invented and the forces that influence scientists in their research -- why the research went in certain directions and not others.

**1975.** Fanning, R. S. "Advertising Architecture." *American Architect* 110.2124 (1916): 147-48.

**1976.** Fano, Ester. "Early American Technological Edens [review essay]." *History and Technology* 3.3 (1987): 329-38.

This review essay of Howard P. Segal's book *Technological Utopianism in American Culture* (1985), discusses not only Segal's book but other writing on this topic. Segal examined the writings of more than two dozen authors, most between 1883 and 1933.

**1977.** Farber, Stephen. "A Major Studio Plans to Test the Rating System." *New York Times* Sept. 4, 1990 1990, sec. C: 14C.

This article indicates that Universal will test the rating system with its movie *Henry and June* (1990). This film was the first to receive an NC-17 after the movie industry adopted this new rating category.

**1978.** ---, ed. *The Movie Rating Game*. Washington, D. C.: Public Affairs Press, 1972.

The author served on the CARA under a one-year fellowship program. He was interviewed by Jack Valenti in December, 1969, and worked on CARA during 1970-71(?). He was 26 at the time, and had just completed a M.A. in film history from the University of California. He says he was at odds with other CARA members. He provides good information on the early members of CARA and how CARA worked. He concludes that "the rating system must be either drastically overhauled or abolished completely."

**1979.** ---. "Movies: Why Do Critics Love These Repellent Movies? Point: Moviegoers Looking for Guidance Are Becoming Alienated by Reviewers Penchant for Grotesque Violence." *Los Angeles Times* March 17, 1991 1991, sec. Calendar: 5.

Author Stephen Farber wrote in this article that "the unqualified enthusiasm for ... grisly films raises nagging questions about the skewed values of today's critics."

**1980.** Farnsworth, Clyde H. "Britain's Automation Pioneer Computes Future." *New York Times* March 17, 1965 1965: 66.

This article is an interview with Sir Leon Bagrit, a British expert on automation. He argued that only those countries that adapted quickly to automation would survive industrial competition. Britain, he feared, had lagged behind, having fewer computers per capita than the United States or Western Europe. He distinguished between the mechanization of the Industrial Revolution that forced people into "subhuman work," and automation, which helped mankind realize its full potential. Automation represented "the greatest change in the whole history of humankind." It was a process that would change life so dramatically that within a few decades the pre-1960 world would "as rural as England before the Industrial Revolution." (Farnsworth paraphrasing Bagrit) See also Sir Leon Bagrit's *The Age of Automation* (1965).

**1981.** ---. "Jack Valenti's State Department." *New York Times* Dec. 18, 1985 1985, sec. B: B12.

This article notes that in 1985, the Motion Picture Association of America (MPAA) ran what some called a small "state department" with representatives in sixty nations. Hollywood movies played in more than 100 countries, and MPAA president Jack Valenti called them "America's secret weapon the supreme visual force in the world, dominating screens in theaters and in living rooms."

**1982.** *John Paul Jones (aka Le capitaine Paul)*. 1959, 1959.

The movie *John Paul Jones* (1959), one of the many so-called American-interest or "runaway" films that were produced abroad with some American talent. Hollywood labor groups protested this film and especially the fact that the signing of the Declaration of Independence in the movies actually took place in Spain.

Plot Summary from American Film Institute Catalog: "On a large Navy frigate, an officer tells new seamen about the legacy of the man who commanded the first ship to carry the U.S. flag into a European port, [H]John Paul Jones: In 1759, at age twelve, John, from a poor Scottish family, witnesses an English officer disperse townspeople playing the bagpipes, which are viewed as an instrument of war music. When the officer also insults the group by calling the kilt, forbidden by law, a "skirt," John hits the officer in the face with an egg. Desiring to be master of a ship, John goes to sea and by age seventeen is skilled in navigation. Seeking further experience, he serves on all manner of ships, including slavers, but decides that trafficking in slaves, while lucrative, is not for him. In 1773, John is master of a ship in the West Indies, but when a mutinous crew member dies from a cracked skull after John subdues him in a fight, the governor of Tobago suggests John change his name and leave. Complying, John adds the name "Jones" to his own and goes to Fredericksburg, Virginia to visit his brother William, who owns a business there. John learns from William's clerk and accountant, young Peter Wooley, that his brother died from an illness three months earlier. When John finds that two slave boys, Scipio and Cato, whom his brother planned to free, are in danger of being sold, John vows to see that they will be freed. Wooley suggests that John hire Patrick Henry, a friend of William's, as his lawyer. At a dance, when a British lieutenant haughtily condemns Colonial courage as

being no better than the virtue of Colonial women, John slugs him. Afterward, the lieutenant's commanding officer, Capt. Pearson, apologizes for his conduct. When John attempts to flirt with socialite Dorothea Danders, whom Henry is courting, she warns against a "sudden and swift attack." Taken with Dorothea, John decides to stay in Virginia and buy a farm, but he does not take well to farm life. Dorothea's father, who is a member of the resistance with Henry, rejects John as a suitor because of their illustrious ancestors and John's questionable past. When the war begins, John joins the Continental Navy and, as second-in-command on a battleship in the Bahamas, presents a novel plan to use the Marines in a surprise attack on British troops in Nassau. After the Declaration of Independence is signed, John is assigned his first independent command. He learns that Tories have burned and destroyed his farm and carried off his servants to be sold in Jamaica. John's spirits are raised, however, when his Scottish friend, Duncan MacBean, playing the bagpipes, and Scipio and Cato, playing fife and drums, join Peter in welcoming John's ship. After sailing for Newfoundland, John captures eighteen ships, then gives supplies to Washington's army intended for the British commander General Burgoyne. After he learns that he no longer can command a ship because he is ranked low among captains, John goes to Valley Forge to deliver his resignation personally to General Washington. When John complains of favoritism and corruption, Washington, whose army suffers from hunger, mutiny and frostbite, castigates him. John then volunteers to serve in any capacity, and Washington sends him to France, hoping that a French alliance could break a possible blockade of the coasts. For his voyage, Washington suggests that John steal the British ship *Ranger* at Portsmouth, New Hampshire, and gather whatever crew he can get. The ship, on its arrival at Brest, is greeted by the first French cannon fire salute ever given to a ship flying the United States flag. In the company of Benjamin Franklin, John is celebrated in Paris as a hero. Aimee de Tellison, the illegitimate daughter of the king, Louis XVI, acts as John's guide to the city. Franklin encourages John to take over a frigate built in Holland and invade the British Isles, hoping that the English people will then protest the war and that insurance rates will rise, creating a financial burden for British commerce. After burning the ships and destroying the cannon at the harbor of Whitehaven, John speaks to the citizenry and relates that George III has likewise raided American shores. He vows not to harm any home or person if they make no attempt to fight, and a citizen leader grants them entry. After the raid, Lloyd's of London increases its rates on insuring ships, and members of the House of Commons decry the war. John is feted in Versailles, but at a meeting of the Marine Commission, the *Ranger* is ordered home as the result of a false report that John could not handle his men, sent by an aristocratic underling whom John had humiliated. After Franklin convinces John to remain in France without a ship, Aimee, moved by John's determination to build a new naval power, suggests to the queen, Marie Antoinette, that the Crown finance a frigate. When Franklin points out that the Crown would benefit from fleets John might capture, Louis agrees to the proposal if the ship sails under the American flag and uses as its name *Le Bonhomme Richard*, the French title of Franklin's most popular work, *Poor Richard's Almanac*. During the subsequent battle with Captain Pearson's new ship, *The Serafis*, the traitorous commander of a ship allied with John fires on *Le Bonhomme Richard*. As John's men are dying, Pearson asks if he is surrendering, and John calls out, "No sir, I have not yet begun to fight!" Though MacBean, Scipio, and many others on the ship die, Pearson ultimately surrenders because of a fire underneath the magazine. John is awarded a medal and sword at Versailles for his victory, but learns that because Aimee's father is of royal blood, she has been sent away. After the peace treaty is signed, John is told that present finances will not permit him to form an adequate sea force. While waiting for funds to be issued, he goes to Russia in 1790, as Empress Catherine has applied for the loan of his services. At St. Petersburg, Catherine tempts him with dancing girls, then, convinced of his sense of duty, assigns him to the Black Sea, where Russian ships and crews are in bad condition. After John wins the battle against the enemy's ships and fort, Louis bestows on him the rank of chevalier, which could allow him to marry Aimee. When John becomes very ill, he travels to Paris, where Aimee writes his last letter for him in which he dictates the qualities needed in a naval officer: he must be a gentleman and have a liberal education, fine manners, courtesy, sense of personal honor, tact, fairness and justice. The naval commander on the frigate finishes his tale, saying that John's spirit continues to serve and inspire the Navy."

**Note:** The opening credits contain the following statements: "This production is dedicated to Fleet Admiral Chester M. Nimitz, U.S.N., able inheritor of the John Paul Jones tradition. To him we owe much gratitude for his unflagging encouragement and inspiration. We thank the Department of Defense and the officers and men of the United States Navy for their cooperation: also the Government of Spain. We thank too, Mr. Victor Oswald, Production Adviser, for his many services."

"According to Warner Bros. production notes and statements made in articles during the production, Samuel Bronston had the idea to make a film about [H]John Paul Jones in 1946 and found that, although various studios had registered the title from the late 1930s, those companies had dropped the idea because of the expense and lengthy screen time necessary to cover the subject adequately.

"According to various news items, in 1939, Warner Bros. bought the rights to Clements Ripley's biographical novel about Jones, entitled *Clear for Action*, which was serialized later in 1939 in *The Saturday Evening Post* before being published as a book in 1940. James Cagney was to star in the Warner production with his brother, William Cagney, producing, and Michael Curtiz directing. In 1946, a LAT news item stated that Jack Warner gave Jerry Wald and Delmer Daves the "green light" for the project. In 1949, according to DV, the film was going to be produced by Lou Edelman with Cagney starring.

" In Dec 1955, according to DV, Warner assigned the production rights to Admiralty Pictures Corp., a newly formed company of which Bronston was president. According to HR, Warner gave the property to Bronston in return for the rights to make a film about Charles Lindbergh, to which Bronston had a claim. The chairman of the board of Admiralty (a precursor to [H]John Paul Jones Productions, Inc.) was R. Stuyvesant Pierrepont, Jr. In addition to Pierrepont, the company was backed by Laurence and Nelson K. Rockefeller, the Charles Dana, Jr. family, James Watriss, Pierre DuPont III, Ernest Gross, C. D. Jackson, Frederick Stern and others, representing General Motors, Firestone Tire and Rubber Co., Eastman Kodak, Time, Inc., a Swiss banking firm and other industrial organizations. The backers were able to use assets frozen in Spain, France and Italy, according to news items, because filming was to be done in Europe, primarily in Spain. Bronston claimed that this film opened up an avenue for financing films that had been previously unavailable.

"Jesse L. Lasky, Jr. was signed to do the screenplay in Dec 1955. According to HR and DV, he conducted extensive research with Navy officials in Washington and wrote a screenplay in 1956 based on the Ripley book. Later, when John Farrow was hired to direct, Farrow, who liked Lasky's screenplay, asked him to collaborate on a rewrite, but Lasky was unable to work on it at that time. In Dec 1958, while the film was in post-production, Lasky saw ads listing Farrow as sole writer and heard that Farrow was to get sole screenplay credit. Lasky filed a protest with the Writers Guild of America and ultimately received equal billing with Farrow for the screenplay. Ripley's name, however, does not appear on the film. According to a DV news item, in Jul 1956, Bronston signed Ben Hecht to write the script, but no information has been located to confirm that he actually worked on the script. At that time, William Dieterle, who had established a reputation for making biographical films, was assigned to direct. In 1956, Richard Todd and Richard Basehart were both considered for the title role, along with John Miljan for the role of George Washington and John Lupton for that of a French naval officer.

"In Mar 1958, prior to shooting, the Hollywood American Federation of Labor Film Council, representing more than 24,000 members of film unions and guilds, threatened to boycott the film if it was to be shot totally abroad, as was then planned. The group also vowed to protest to President Dwight D. Eisenhower and Congress the Navy's cooperation with the producers, who, they claimed, planned to shoot abroad such historical scenes as the signing of the Declaration of Independence, Washington at Valley Forge, and a ball in Fredericksburg, Virginia. They stated, "We are not protesting the filming abroad of scenes legitimately laid abroad. But we do not think the American public will approve the photographing in Spain of the signing of the Declaration of Independence and other historical American events, especially when such foreign production deprives American craftsmen of sorely needed work."

"According to a DV article, the Council had previously boycotted the 1956 Republic picture Daniel Boone, Trail Blazer (see above) because it was filmed in Mexico, although its setting was American, and claimed that the boycott was responsible for that film being withdrawn from release. HR stated that the group in the previous two years had made numerous motions for a consumer boycott of films made abroad by U.S. firms. HR speculated that "the tinder which sparked" this protest was the Warner Bros. publicity campaign for the film, which noted that the production hired 150 Spanish women for the roles of "Virginia belles," planning to have the women wear blonde wigs. The Council also threatened to contact the Daughters of the American Revolution and the American Legion concerning their protest.

"In Apr 1958, DV reported that Bronston had agreed to shoot some scenes in Virginia, Maryland and Pennsylvania in response to the Council's action. Nevertheless, in Oct 1958, after shooting was completed, the Council voted to conduct a nationwide boycott upon the film's release and complained to the Navy concerning the use of Navy equipment and U.S. Marines in scenes depicting a beach landing filmed in Spain, according to HR. Bronston stated at the time that although they had planned to use Marines, he hired local extras instead when the Marines were sent to Lebanon unexpectedly. Bronston also said that twenty of the cast and twenty-two of the crew members, along with some of their families, were brought to Europe from the U.S. for the production. He claimed that had the film been made in the U.S., the cost would have been \$10,000,000, rather than the actual production cost of \$4,000,000. Although their appearance in the film has not been confirmed, contemporary HR news items add to the cast the following actors: John Stone, Pat Clavin, Stella Gallagher and Charles Lamb. Also added to the cast by a HR news item is Rosemarie Bowe, who was actor Robert Stack's wife from 1956 until his death in 2003.

"According to news items and publicity for the film, shooting was done in Spain at the CEA Studio in Madrid, and at outdoor locations in Galicia, Andalusia, Rota, Benidorm and Denia. Sets for the Scottish village, Whitehaven, a wharf in Delaware and a dock site in Portsmouth, NH were constructed in and around Denia. Shooting was also done in Scotland, at the palace at Versailles, Parliament and King James's Palace in London, the Royal Palace in Madrid, where the throne rooms of Catherine the Great and of Louis XVI were shot, the summer palace at Aranjuez, and state buildings in La Granja, Spain. The film was edited, dubbed and scored in London. Fleet Admiral Nimitz was an adviser and consultant. Rear Admiral J. L. Pratt returned to active duty to act as a technical adviser.

"Director Farrow had been a commander in the Canadian Navy and had directed a number of previous sea adventure films. His cousin, Alan Villiers, a British Naval officer during World War II, who also had been the captain of the Mayflower II (a replica of the original ship) on a recent transatlantic voyage, remembered seeing hulks of old sailing ships in Sicily during the war. Villiers oversaw the refurbishment of two of these ships in Ostia, Italy, and was an adviser during filming. Another ship built in Barcelona was also used in the film. According to NYT, ships from this film were later used in the 1962 film Billy Budd (see AFI Catalog of Feature Films, 1961-70). John Charles Farrow and Patrick Villiers, two sons of Farrow and his wife, Maureen O'Sullivan, were in the cast. While production notes state that Bette Davis was paid \$25,000 for four days' work, Louella Parsons related that she was to be paid \$50,000. An early plan to have Hollywood celebrities who had served in the Navy, Marines or Coast Guard portray seamen of the past did not come to fruition.

"In the latter part of 1958, Bronston and Barnett Glassman, who received associate producer credit on the film, traded charges in press and in court regarding ownership of the production company and Glassman's credit for the film. In Dec 1958, Var reported that nineteen litigations were pending regarding the company. The two men had worked together on earlier films. No information regarding the outcome of any of the suits has been located. After production, Bronston and Farrow formed a new company to make three films abroad, but this was Farrow's last film before his death in 1963.

"For its release in France, the film was called *Le capitaine Paul*, which was the title of a novel by Victor Hugo about Jones. HR, in its review, criticized the portrayal of Jones, saying that the film's writers used "only those rumors as were flattering to their subject" while ignoring "other sources that were salty with accounts of brawls,

love affairs and humor." Jones, according to HR, actually killed two mutineers in the West Indies. HR went on to state: "The film makes no effort to clear up some of the most fascinating enigmas about Jones." Var was critical of the portrayal of historical characters, stating, "They end, as they begin, as historical personages rather than human beings."

**1983.** Faunce, W. H. P. "Transient Knowledge and Permanent Education." *Outlook* (1914): 962.

The author, who was president of Brown University, says that the "chief need of American education is background. We are swept away by a desperate desire for modernity.... The worship of the contemporaneous, which is really the extemporaneous, means loss of all perspective, disregard of history, callow judgments, superficial reforms, and ready acceptance of panaceas." He argues for the effective teaching of Greek and Latin. He says that "those studies -- or others devoted to the interpretation of great thinking into modern speech and action -- at least will save us from education given solely by short stories and moving pictures, and from the naive conviction that our age is the only one worth knowing."

**1984.** Fearing, Franklin. "Influence of the Movies on Attitudes and Behavior." (1947): 70-79.

Fearing begins by saying that "with a few special exceptions, everybody -- social scientists, movie makers, and laymen -- seems to agree that there are profoundly important relationships between motion pictures and human behavior. The initially important question is concerned with the way in which these relationships are to be conceived." Fearing studied the effects of educational films during World War II. Of educational films, he argues that "their use and the studies which have been made regarding their effects present unequivocal evidence that motion pictures *do* affect human attitudes."

**1985.** Feaster, Felicia. "The woman on the table: Moral and medical discourse in the exploitation cinema." *Film History* 6.3 (1994): 340-54.

This article examines moral and medical discourse about women in exploitation movies, films that often played outside mainstream theaters and without the approval of the mainstream motion picture industry. "Medical discourse in the exploitation cinema is at the core of the genre's imagery, narrative and conventions," Feaster writes.

**1986.** Febvre, Lucien Paul Victor (Geoffrey Nowell-Smith and David Wootton, eds., and Gerard), trans. by David, eds. *The Coming of the Book: The Impact of Printing, 1450-1800 (L'apparition du livre)*. London: N. L. B., 1976.

This book is in the *Foundation of History Library Series*.

**1987.** Federman, Joel, ed. *Media Ratings: Design, Use and Consequences*. Studio City, CA: Mediascope, Inc., 1996.

This book examines media rating systems in 31 countries, five of which are discussed in some detail: Australia, Germany, Great Britain, Sweden, and the United States. The work also discusses criticism of the MPAA's rating system from several perspectives including industry officials, the ACLU, researchers, parental and health organizations. It argues for a rating system that is independent from the political and economic forces that create entertainment. It also urges rating symbols that are descriptive rather than evaluative.

**1988.** Federman, Joel, et al., eds. *Social Effects of Electronic Interactive Games: An Annotated Bibliography*. Studio City, CA: Mediascope, Inc., 1996.

This annotated bibliography pulls together social science research on the effects of video games. Since in 1996, video games were comparatively new -- although already a tremendously lucrative business -- empirical studies on this subject were not as plentiful as research that had been done on the effects of television violence.

**1989.** Fehrman, Kenneth R. and Cherie Fehrman, ed. *Color: The Secret Influence*. Upper Saddle River, N. J.: Prentice Hall, 2000.

Color's influence has long been viewed as mysterious. It has "astonishing power," according to a recent account, and its "effects on each of us are vast, but most of us don't have a clue that they are even happening." The authors observe that "because it was easier to color-correct a drawing than a photograph, more than 90 percent of book covers before the 1960s were hand-drawn. Electronic scanners changed everything. They provided the ability to scan in an original transparency, remove any unwanted color in specific areas, and produce a perfect four-color film ready for platemaking in a matter of minutes, without any of the telltale brushmarks that had often been visible in hand-corrected color." (200)

This work covers the use of color in many different design areas. Chapters are devoted to Pigment and Light, Color Myths and Biases, Health, Psychology, Interior Environments, Architecture and Landscape Design, Advertising and Marketing, Fashion and Textile Design, Culture and Society, Color Order Systems, and Pushing the Envelope.

**1990.** Feigenbaum, Edward A. , and McCorduck, Pamela, eds. *The Fifth Generation: Artificial Intelligence and Japan's Computer Challenge to the World*. Reading, MA: Addison-Wesley Publishing Company, 1983.

This book argues that in 1983 the world was at the threshold of a new era in computing. "Knowledge is power, and the computer is an amplifier of that power," they write. "We are now at the dawn of a new computer revolution. *Business Week* featured it as 'the second computer age.' We view it as the important computer revolution, the transition from information processing to knowledge processing, from computers that calculate and store data to computers that reason and inform. Artificial intelligence is emerging from the laboratory and is beginning to take its place in human affairs." (1) The great challenge to American leadership in this field, the authors believed, was Japan, a country that had set as its national goal to dominate artificial intelligence by the late 1990s. The Japanese "aim not only to dominate the traditional forms of the computer industry but to establish a 'knowledge industry' in which knowledge itself will be a salable commodity like food and oil. Knowledge itself is to become the new wealth of nations." (2) The authors argue that "America needs a national plan of action, a kind of space shuttle program for the knowledge systems of the future." (3) They seek to trace the origins of this field in United States and British research, explain the Japanese plan for a Fifth Generation of computers, and describe "America's weak, almost non-existent response to this remarkable Japanese challenge." To fail to meet this challenge would be to "consign our nation to the role of the first great postindustrial agrarian society." (3)

**1991.** Feigenbaum, Edward and Pamela McCorduck, ed. *The Fifth Generation: Artificial Intelligence and Japan's Computer Challenge to the World*. Reading, MA: Addison-Wesley, 1983.

This book details Japan's large effort in creating artificial intelligence, setting out its weaknesses and strengths. This work was excerpted in *High Technology* (June 1983), and in Tom Forester, ed., *The Information Technology Revolution* (1985). At the time of publication, Feigenbaum was a professor of Computer Science at Stanford, and McCorduck was a journalist.

**1992.** ---. "Land of the Rising Fifth Generation." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 71-83.

This article details Japan's effort to create artificial intelligence, setting out its weaknesses and strengths. This is an excerpt from the authors' book, *The Fifth Generation: Artificial Intelligence and Japan's Computer Challenge to the World* (Reading, MA: Addison-Wesley, 1983). This piece was originally published in *High Technology* (June 1983). At the time of this piece, Feigenbaum was a professor of Computer Science at Stanford, and McCorduck was a journalist.

**1993.** Felix, Edgar, ed. *Television*. New York: McGraw-Hill, 1931.

**1994.** Felson, Richard B. "Mass Media Effects on Violent Behavior." *Annual Review of Sociology* 22 (1996): 103-28.

This essay by a sociologist reviews several studies on the relationship between violence and mass media: field experiments, natural experiments involving the introduction of television into society, natural experiments involving publicized violence, longitudinal surveys, theoretical explanations of situational effects (cognitive priming, arousal from pornography, sponsor effects, television viewing as a routine activity), and theoretical explanations involving socialization (learning novel forms of behavior, vicarious reinforcement and legitimations, desensitization, messages from pornography). The essay also provide discussion of other meta analyses of media and violence.

Felson's conclusions are qualified. He agrees with "those scholars who think that exposure to television violence probably does have a small effect on violent behavior." He also agrees with research indicating that some people are "more susceptible to media influence than others," and that it is reasonable to assume that "the media directs viewers' attention to novel forms of violent behavior they might not otherwise consider."

This essay is also reprinted in Stephen Prince, ed., *Screening Violence* (New Brunswick, N. J.: Rutgers University Press, 2000), 237-66.

**1995.** Fenichell, Stephen, ed. *Plastic: The Making of a Synthetic Century*. New York: HarperCollins Publishers, 1996.

This work is written for a popular audience and has neither bibliography nor notes. It does provide an accessible introduction to the history plastic and manifestations in American culture. Three areas are of particular interest for those interested in communication. Chapter 3, "Celluloid Heroes," discusses celluloid's early development from John Wesley Hyatt's patent in 1870 and his effort to create a substitute for ivory billiard balls, to its initial uses in photography by George Eastman, to the development of moving pictures and newsreels. Later in the book, the author talks about plastic's use in making vinyl records and its impact on the recording industry. Students of radio, radar, and the latter-day Strategic Defense Initiative may also find the author's brief treatment of Adolph Hitler's claim that the Germans had invented a "secret weapon" that could bring down airplanes with a beam of electronic energy.

**1996.** Ferguson, Charles H. "Chips: The US versus Japan." *The Information Technology Revolution*. Ed. Tom Forester, ed. and intro. Cambridge, MA: MIT Press, 1985. 45-55.

The author argued that Japan had caught up with the United States in computer software and surpassed the U. S. in certain key areas of hardware. The author at the time of this article was with IBM. He maintained that Japan rivaled America ink chip production because the American microelectronics industry was hindered by an outdated structure. This piece first appeared in *Technology Review* (Aug. - Sept., 1983).

**1997.** Ferguson, Eugene S., ed. *Bibliography of the History of Technology*. Cambridge, MA: Society for the History of Technology and MIT Press, 1968.

Ferguson attempts to give "a reasonably comprehensive introduction to primary and secondary sources in the history of technology." He views the history of technology as part of cultural history. There is much in this annotated bibliography of interest to those interested in the history and social impact of communication technologies. Among the headings are "General Works"; "General Bibliographies and Library Lists"; "Biography"; "Government Publications and Records"; "Manuscripts"; "Periodical and Serial Publications"; "Technology and Culture," and more. Among the subject fields covered are Transportation, from shipping to air and space travel; Energy Conversion, including lighting; the Electrical and Electronic Arts, including power generators, motors, and electronic computers; Materials and Processes, including paper and printing; glass and ceramics; Mechanical Technology, including timekeeping; military technology; and the "Process of Invention and Innovation."

Although published in 1968, this work is an invaluable reference. See also the annual updates published in *Technology and Culture*. This series began in 1964 and compiles recent scholarship in the history of technology

each year. See also the annotated index for the first 25 volumes of *Technology and Culture* (1959-1984), edited by Barton C. Hacker and published in *Technology and Culture*, 32,

**1998.** Fernstrom, Ray. "Low Budget Color Photography of *A Swingin' Summer*." *American Cinematographer* 46.5 (1965): 292-95.

In this article, the director of photography for "A Swingin' Summer" (1965), Ray Fernstrom, discusses the use of color photography in the making of this low-budget movie that starred sex symbol Raquel Welch. He also covers the use of cameras, zoom lenses, and lighting (both interior and exterior). He talks about shooting a "day for night love scene," that is, a scene supposedly that took place at night but which was filmed during the day. In addition, he covers the "Rembrandt technique" which involved highlighting the area of the movie on which the movie's makers wanted to focus attention.

**1999.** Ferry, Wilbur H. "Must We Rewrite the Constitution to Control Technology?" *Saturday Review* 51.9 (1968): 50-54.

The author argues that "the regulation of technology is the most important intellectual and political task on the America agenda.

"I do not say that technology *will* be regulated, only that it *should* be.

"My thesis is unpopular. It rests on the growing evidence that technology is subtracting as much or more from the sum of human welfare as its is adding. We are substituting a technological environment for a natural environment."

Ferry sees technology killing privacy. For example, the then proposed supersonic transport plane would damage privacy: "the sonic boom of the SST will daily and nightly waken sleepers; worsen the condition of the sick; frighten tens of millions; induce neuroses; and cause property damage beyond estimate." He also discusses the creation of smog and damage to the environment, and the impact of technology on education. Ferry sees the uncritical linkage on technology and progress as an underlying problem. Ferry at the time was vice president of the Fund for the Republic, Inc. and a staff associate of its Center for the Study of Democracy Institutions in Santa Barbara, CA.

**2000.** Field, Alexander J. "French Optical Telegraphy, 1793-1855: Hardware, Software, Administration." *Technology and Culture* 35.2 (1994): 315-47.

H. D. Estabrook said in 1913 that the railroad and the telegraph were the "Siamese Twins" of commerce. Field says that "Whereas the economic impact of the railroad has received extensive attention, that of the telegraph has not." Field notes that economic history texts written between 1960 and 1990 have made few references to the telegraph. Earlier economic historians such as George Rogers Taylor did mention the telegraph but did not fully development its significance. Taylor said in *The Transportation Revolution*, written in 1951, that "In an age of revolutionary developments in transportation and communication, perhaps the most drastic change resulted from the magnetic telegraph."

In this article, Field deals primarily with "optical telegraphy" in France. Such a network existed on the east coast of the U.S. and in Britain. In France between 1794 and 1855, this network grew to 530 relay stations cover about 5,000 kilometers. The relay stations were usually 8-10 kilometers apart, situated on high points-- mountains, specially constructed towers, church belfries. They were manned by two operators with telescopes. Each station had three movable arms connected to each other. More detail is given in the article.

**2001.** Fielding, Raymond, ed. *The Technique of Special Effects Cinematography*. 1965. New York: Hastings House, 1972.

This 402-page work is divided into twelve chapters: 1) The Technique Available; 2) Camera Equipment; 3) Glass-Shots; 4) Mirror-Shots; 5) In-the-Camera Matte Shots; 6) Bi-Pack Contact Matte Printing; 7) Optical Printing; 8) Travelling Mattes; 9) Aerial-Image Printing; 10) Rear Projection; 11) Front Projection; 12) Miniatures. A substantial bibliography (403-17) and Index follow.

**2002.** Fielding, Raymond, ed. and Intro., ed. *A Technological History of Motion Pictures and Television*. Berkeley: University of California Press, 1967.

An anthology from *The Journal of the Society of Motion Picture and Television Engineers*. The collection is divided into three parts. Part I, "Autobiographical Reminiscences," has pieces by C. Francis Jenkins ("History of the Motion Pictures," written in 1920), W. K. L. Dickson, Louis Lumière, and several others. Part II, "Historical Papers -- Motion Pictures," covers recorded sound, animated cartoons, early movie projectors, "The Historical Motion-Picture Collections at George Eastman House," the history of nitrocellulose film base, the history of studio lighting, early amateur motion pictures, and Norman O. Dawn's work with special effects. Part III, "Historical Papers -- Television," has four essays on the evolution of television and television recording. They were published in 1948, 1954, and 1955.

--SV

This early history of American movies is divided into two parts. The first consists of autobiographical reminiscences by prominent film pioneers, the second of historical papers on motion pictures prepared by engineers and scholars. A prominent place in the development of film's artistic evolution is given to technological innovation. D.W. Griffith, to take one example, owed as much to portable cameras and improved emulsions as he did to his talent, in the estimation of the authors. They point out that no other medium of artistic expression places so many technological impediments between film maker and viewing public. This necessitates long apprenticeships and collaborative creativity.

**2003.** Fielding, Raymond (ed. and intro.), ed. *A Technological History of Motion Pictures and Television: An Anthology from the Pages of the Journal of the Society of Motion Picture and Television Engineers*. Berkeley: University of California Press, 1967.

Fielding maintains that new technology brings about new forms of motion pictures, new styles, new ways of doing business: "... the artistic evolution of the film has always been intimately associated with technological change, just as it has, in less noticeable fashion, in the older arts. Just as the painter's art has changed with the introduction of different media and processes, just as the forms of symphonic music have developed with the appearance of new kinds of instruments, so has the elaboration and refinement of film style followed from the introduction of more sophisticated machinery." [p. viii]

This work is an anthology from *The Journal of the Society of Motion Picture and Television Engineers*. The collection is divided into three parts. Part I, "Autobiographical Reminiscences," has pieces by C. Francis Jenkins ("History of the Motion Pictures," written in 1920), W. K. L. Dickson, Louis Lumiere, and several others. Part II, "Historical Papers -- Motion Pictures," covers recorded sound, animated cartoons, early movie projectors, "The Historical Motion-Picture Collections at George Eastman House," the history of nitrocellulose film base, the history of studio lighting, early amateur motion pictures, and Norman O. Dawn's work with special effects. Part III, "Historical Papers -- Television," has four essays on the evolution of television and television recording. They were published in 1948, 1954, and 1955.

--SV

This early history of American movies is divided into two parts. The first consists of autobiographical reminiscences by prominent film pioneers, the second of historical papers on motion pictures prepared by engineers and scholars. A prominent place in the development of film's artistic evolution is given to technological innovation. D.W. Griffith, to take one example, owed as much to portable cameras and improved emulsions as he did to his talent, in the estimation of the authors. They point out that no other medium of artistic expression places so many technological impediments between film maker and viewing public. This necessitates long apprenticeships and collaborative creativity.

**2004.** Figure, The Lay. "The Lay Figure: On Discretion in Colour." *International Studio* 60 (1917): 160.

This article poses a imaginary conversation between an "Art Critic" and a "Young Artist." The art critics wants more attention paid to "the management of color." The young artist is more inclined to give reign to his emotions in expressing color. The critic says that "If you look round the work that is being done at the present time you will find that a vast amount of it is either willfully aggressive and unpleasant or is merely an evasion of color -- it is either offensively vulgar and inharmonious and unpleasantly dull and depressing. There is little discretion in the use of colour, little understanding of the science of arrangement, and little study of subtleties of combination. ... Moreover, I see no hope of improvement until our decorative artists learn that undisciplined emotion is a curse rather than a blessing." (160)

**2005.** Finch, Christopher, ed. *Special Effects: Creating Movie Magic*. New York: Abbeville Press, 1984.

This book is a richly illustrated history special effects technology in motion pictures through the early 1980s. It uses specific movies – *King Kong* (1933), *2001: A Space Odyssey* (1968), *Star Wars* (1977), *Close Encounters of the Third Kind* (1977), *Blade Runner* (1982), *Tron* (1982), and many others – to discuss innovations in this field. Chapter 21 is devoted to "Simulation," and speculates that "the time is upon us when the computer will be able to take on graphic tasks of a wholly different order, including the simulation of reality." (233) A brief concluding chapter also ponders the future of special effects as seen in 1984. The work contains a brief one-page bibliography, a Glossary, and Index.

**2006.** Findlay, Alexander. "The Wonders of Cellulose." *Youth's Companion* 93.3 (1919): 27-28.

In this article, Findlay, who was a professor of chemistry at University College of Wales, talks about "The Way in Which Paper is Made," "Imitation Leather and Mercerized Cotton," "Artificial Silk, Sugar and Alcohol," and "Guncotton, Smokeless Powder and Celluloid." Of celluloid, he writes that "although the investigations that led to the discovery of celluloid were first undertaken with the object of finding a substitute for ivory for the manufacture of billiard balls, celluloid is now used not only for that purpose but also for imitating amber, for making photograph and motion -picture films, combs, knife handles, soap boxes, and innumerable other articles in common use. It is, indeed, the most widely used of all the plastic materials at the present day." However, he notes that celluloid presents a serious fire hazard and can be ignited by the sun's rays or by contact with a hold electric light bulb.

**2007.** Finlay, Nancy. "American Posters and Publishing in the 1890s." *American Art Posters of the 1890s*. New York: Metropolitan Museum of Art; Distributed by Harry N. Abrams, Inc., 1987. 45-55.

Finlay notes that book and magazine publishers readily accepted the poster style during the 1890s and this helps to explain the prevalence of book and magazine posters during this decade. But color printing and photomechanical reproductive techniques may have been even more important in the spread of posters. Magazines as well as paper and clothbound books reflected the poster style. "To understand the poster's rise and fall in popularity requires some knowledge of how book and magazine posters were distributed and collected, a phenomenon that has never been adequately studied," the author says.

**2008.** Finn, Bernard S., ed. *The History of Electrical Technology: An Annotated Bibliography*. New York: Garland Publishing, Inc., 1991.

Sections headings include "Broad Historical Works"; "Communications" (which includes various media such as telegraphy, radio, radar, sonar, microwaves, and many more); "Power" (e.g., lighting, electrochemistry, motors, generators, etc.); and "Miscellaneous."

**2009.** ---, ed. *Submarine Telegraphy: The Grand Victorian Technology*. London: Science Museum, 1973.

This short work (48 pages), by then Curator of the National Museum of History & Technology at the Smithsonian Institute, gives a helpful introduction to this topic. It is nicely illustrated with a map of the cable network worldwide in 1973.

**2010.** Finnegan, Cara A., ed. *Picturing Poverty: Print Culture and FSA Photographs*. Washington, D. C. and London: Smithsonian Books, 2003.

Finnegan explores how Farm Security Administration photographs circulated within three different 1930s pictorials, and submits for analysis evidence from the social welfare journal *Survey Graphic*, the photography annual *U.S. Camera*, and popular magazine *Look*. Finnegan claims that during the early years of the photography project, Roy Stryker and the FSA photographers created a visual narrative about rural poverty called the "tenancy story" which emphasized the chronic poverty affecting mostly farm tenants, sharecroppers, and migrant workers. Finnegan traces the tenancy story through the periodicals and examines how the photographs derived multiple and diverse meanings from the accompanying captions and text.

#### **-Michele Kroll**

**2011.** Fiorito, Jack, Paul Joray, John Thomas Delaney, and Robert W. Kolodinsky. "Unions and Information Technology: From Luddites to Cyberunions?" *Labor Studies Journal* 24.4 (2000): 3-34.

The authors surveyed national unions on how information technology was being used. They found, for example, that 89 percent used personal computers, and more than 70 percent of unions reported using a local area network for communications. Word processing software and spreadsheets were used by nearly everyone, but relatively few were using satellite, cable television or video conferencing, according to the survey. The survey involved 75 unions representing 12 million members. Some key findings: "IT use seems to be related to union size, rationalization of union bureaucratic structure, and environmental scanning." The authors suggested that larger unions have greater the resources and cost-spreading ability to invest in information technology. The complexity of the union structure "probably increases the value of IT to improve communications and coordination." Further, "unions more attuned to the developments in the external environment are likely to be more aware of the potential for IT applications to their tasks."

#### **--Phil Glende**

**2012.** Fischel, Robert. "Color Film Preferred." *American Cinematographer* 46.1 (1965): 45-46.

This article discusses how moving production from videotape to film increased the market for the television series "Science in Action." It notes that many science programs depend heavily on being able to film in color. For example, program dealing with blood, or hematology. The author points out that the full syndication of "Science in Action" was not realized until it went to film because "there are simply not enough stations equipped to handle programs syndicated on tape." (45) Another advantage in using film was that it made it easier to record a program on location. The cost for doing a program in color film was about the same as that of doing a program using color videotape. At this time, it was still easier and cheaper to update and edit a program in film. (46) The 30-minute

show was film with a Kodak Reflex Special 16mm camera. Sound recording of the program used boom and lavalier microphones and spocketed 16mm magnetic film.

**2013.** Fischer, Claude S., ed. *America Calling: A Social History of the Telephone to 1940*. Berkeley and Los Angeles: University of California Press, 1992.

Fischer attempts to assess how the telephone affected personal and social life, and to use the telephone to gain insight into "modernity." The opening chapter reviews contemporary thinking about technology and modern life. One point made is that religious leaders and other conservatives looked on modern technology -- automobiles, electric lights, radio, movies, etc. -- as threatening people moral fiber; they feared such conveniences would make people soft. In this opening chapter, Fischer discusses and critiques such other authors who have written about technology and society as Albert Borgmann, Siegfried Giedion, Stephen Kern, Joshua Meyrowitz, Malcolm Willey and Stuart Rice, and others. Fischer points out that people used the telephone to further their own needs and desires (did not the telephone also create desires?). To put the telephone's influence in context, the author makes comparison with the automobile.

"Chapter 2 presents a brief, nontechnical history of the telephone in North America. Chapter 3 explores the various ways that the telephone industry, especially AT&T, marketed its service to households, exploring the manner in which the industry understood or misunderstood subscribers' use of the telephone. Chapter 4 tracks the diffusion of the telephone across the United States, assessing the factors that encouraged or retarded its spread. It also contrasts the telephone's diffusion in rural as opposed to urban areas and in the working as opposed to the middle class. Chapter 5 further examines diffusion but at the level of the local community and the household. It recounts the response to the telephone in Antoch, Palo Alto, and San Rafael and then uses census data to determine which households in those towns adopted the telephone in which years. In most of these studies we use the automobile as a comparative benchmark.

"Chapter 6 employs a variety of evidence, from etiquette manuals to counts of advertisements, to chart how the telephone became an accepted part of everyday life. Chapter 7 looks at social change in our three towns, focusing on localism: Did residents become less involved in and less attached to their towns as the half-century passed? Chapter 8 looks more closely at individuals, asking how they reacted to the telephone and how they used it in their personal lives. In that context the chapter also analyzes the differences between men and women in regard to the telephone. Chapter 9 outlines telephone history from 1940 and summaries the findings and implications of this study."

**2014.** ---. "Studying Technology and Social Life." *High Technology, Space, and Society*. Ed. Manuel Castells, ed. Beverly Hills, CA: Sage Publications, 1985. 284-300.

Fischer attempted to "describe ... the sorry state of the sociology of technology -- examine its decline, theoretical confusion, and empirical vacuum -- and argue for new efforts to understand how technology influences social life." Drawing on his research on the social impact of telephones and automobiles, he is concerned with how such technologies affect "daily personal and social life rather than with large economic and institutional domains and with changes across one or two generations rather than across epochs of history."

**2015.** ---. "'Touch Someone': The Telephone Industry Discovers Sociability." *Technology & American History: A Historical Anthology from Technology & Culture*. Ed. Stephen H. Cutcliffe and Terry S. Reynolds, eds. Chicago: University of Chicago Press, 1997. 271-300.

**2016.** Fischetti, Mark. "The Future of Digital Entertainment." *Scientific American* 283.5 (2000): 47-49.

Digital communication meant that in the not-too-distant future, as the entertainment and information worlds moved from analog to digital means of communication, the movies would continue to converge with other

media – television, video games, music, radio, books, newspapers, magazines, telephones, and the World Wide Web – and could be accessed from any place, at any time, on TV sets, personal computers, automobile dashboards, with eye glasses and wristwatches – even, some predicted, with retinal implants. It seemed certain that these media would become more sophisticated in their ability to mimic real life experiences.

**2017.** Fisher, David E. And Marshall Jon Fisher, ed. *Tube: The Invention of Television*. Washington, D.C.; and San Diego: Counterpoint; and Harcourt and Brace, 1996.

This book is part of the *Sloan Technology Series*, and is written for a broad public. The development of modern television was perhaps not as dramatic as the creation of the first airplane flight or the invention of the atomic bomb. TV resulted from the work of many people over many years. By the mid-1930s, a "different magic box [from FM radio] had appeared, one that offered more -- much more -- than static-free radio. At first, it was called *visual listening*, or *audiovision*, or *telectroscopy*, *telephonoscope*, or *hear-seeing*. It was also called *raduo* and *electric vision* and *radiovision*. Finally, it acquired a name that looked like it might stick. They called it *television*." This work begins with nineteenth-century attempts at "seeing at a distance," and its final chapter deals with "The Digital Future: Smart Television."

**2018.** Fishman, Robert, ed. *Urban Utopias of the Twentieth Century*. New York: Basic Books, 1977.

**2019.** Fiske, John, ed. *Television Culture*. London: Routledge, 1987.

Fiske argues that television works to support society's dominant ideology. "In this book," he writes, "I work with a definition of television as a bearer/provoker of meanings and pleasures, and of culture as the generation and circulation of this variety of meanings and pleasures within society."

Television tends to separate the family from the rest of the world. "'The world' becomes something that is potentially disruptive to the family, so the news constructs essentially negative and threatening versions of 'out there,' sitcoms enact the weekly contest between the forces that attempt to disrupt the family and the 'nature' that holds the family together." Fiske notes that some researchers (e.g., Ells) argue that "television's effect is to 'isolate' the family viewer from the world, to center him/her in the home, and to construct a subjectivity that is entirely familial."

Television can become a companion for women and the elderly. Some might listen to the TV rather than watch it because as research has shown, Fiske says, "many women alone in the house during the day had the television on because the sound of its voices made them feel less lonely...." For the elderly, there is an important form of companionship. "This is another way in which television differs from film, which has to cater for only a single mode of watching and does not have to compete for the viewer's attention," Fiske says.

**2020.** Fitch, Walter M. "The Motion Picture Story Considered as a New Literary Form." *Moving Picture World* 7.6 (1910): 248.

This article argues that moving pictures are a new art form for literature, the first since the appearance of the novel. "This moving picture story is a new literary form. It is not drama, it is not novel, it is not poem. It contains the elements of all previous forms, but it is itself a new creation, the only new form which literature has evolved since the publication of the first novel in 1741. It is so modern that we cannot see it in perspective; we can as yet realize only in the smallest way its possibilities. We may see a little: we may imagine more; but we should ever bear in mind the vast difference between crude beginnings and full achievement; between 'Pamela' and 'Les Miserables'; between the 'Beggar's Opera' and 'Parsifal.' The motion picture story is to-day a lusty infant. When it gets its growth it will shed its swaddling clothes and all men will see and recognize its virile power."

The article also notes that brewers have lost money to the movies and hence are the source of much hostiled press toward cinema. "A very large percentage of the income of these nickel theaters is taken directly from the profits of the brewers. This fact probably accounts largely for the hostility of the daily press to the motion picture; the liquor interests largely sway the press through their advertisements."

The article indicates that improvements in lighting, especially the Cooper Hewitt mercury vapor lamp, made it possible for film makers to create more elaborate story thus changing the nature of acting. Cooper Hewitt lighting made possible the filming of more complex stories about the time of transition and the emergence of the "star." "The art of printing made possible the novel. The invention of Edison made possible the newest literary form, though the inventor had no suspicions of this literary fact at the time. The first motion pictures were all scenic: later simple pantomimic actions were planned and photographed. Then came the invention of the mercury vapor electric light (the Cooper Hewitt light), peculiarly adapted to photography. This made possible the use of special studios and scenic settings. Producers began to plan and to stage regular pantomime plays; now the larger producing companies all have these studios; some have private parks many acres in extent, and all send companies into the great natural studio of out-of-doors, there to enact their mimic dramas in the environment of natural scenery."

**2021.** Flam, Jack D., trans., ed. *Matisse on Art*. London: Phaidon Press, Ltd., 1973.

This work has a couple of entries from Henri Matisse commenting on the use of color.

**2022.** Fleming, Rex. "Suitcase Studio." *American Cinematographer* 46.10 (1965): 642-44.

This article discusses the portable equipment used by an independent film maker who works with 16mm film.

**2023.** Fletcher, Beaumont. "The Stage and the Church." *Godey's Magazine* 131.783 (1895): 280-84.

Beaumont Fletcher begins by saying that "Nobody will deny that the Stage can be grossly immoral." (280) But the stage can be a positive force but if it is to fulfill its educational potential, it must "endure comparison with that activity which is entirely devote [sic] to the furtherance of morals, the Church." (280) The stage is primarily to amuse and provide entertainment and whatever moral instruction it has to offer must be provided in that context. Fletcher writes that "the Stage should pose as a teacher primarily; its first object is to entertain. Like fiction, and other branches of art, its didacticism must be artfully concealed, effective only subtly." (282)

The author talks about the status of actors and says that "the potency of tradition, centuries old, is against the actor." "Over-zealous" critics have preached that the "play-house is 'the vestibule of hell,' a pitfall for young men's feet." (283)

The actor's life off-stage may often be immoral even if his stage performance may be deemed moral. But "a virtuous actor cannot redeem the insidious immorality of a drama, any more than the uprightness of a theologian can ensure the accuracy of his dogmas. The word and the speaker are not the same." (280) Why do actors have a low status? "Now the somewhat general laxness of actors lies almost altogether in a disregard of one section of the Decalogue. They are conspicuously absent from the jails and penitentiaries, and they possess the virtue of charity to a remarkable degree. The reasons for their personal intemperance are numerous and quickly found. They are, of necessity, a roving class, with almost no opportunity for the solid blessings of home-life. They have a comparatively large income for what is usually a small number of working hours. And their excessive and monotonous leisure must be spent in dissipation or in the horrible barrenness of a hotel room. The very piety of the monks ran into riotous mischief when their only surroundings were dingy, narrow cells." (280)

The centuries of prejudice against actors have had an effect on the contemporary actor. "Ages of abuse heaped on the heads of players have had their undeniable effect of the actor of to-day. The recently knighted Sir Henry Irving is still, in the eyes of unrepealed statutes, a rogue and a vagabond. The revered Shakespeare was a common

vagrant....Then, too, the unwarrantedly large space theatrical people are given in the newspapers which print most of their vices and few of their good deeds, magnifies their frailty unfairly." (280)

"Culture," Fletcher said, was "a prime bulwark of morality. But actors, as a rule, come upon the stage with unfinished educations, and, achieving sudden celebrity in some role, are strongly tempted to wear the mark into a rut, and make to excursions into wider fields of their art. They are 280/281 not a studious class, though, learning is of immense advantage in a genuinely successful stage career." (280-81)

The author notes that the moral influence of drama on audiences has been "discussed by numberless writers from Aristotle to Schlegel to Schiller." (281) He argues that "a radical change is demanded in the attitude of the Church toward the Playhouse." (283) Ministers condemnations of the theater do not keep people from attending plays. The average ministers knows little of the plays he attacks "beyond bald newspaper accounts of their plots and garbled, sensational reports of the personal failings of certain actors." (283) Few ministers are bold enough to defend the theater and stage from their pulpits. (284)

The author opposes prior censorship. "Art-censorship has never succeeded in justifying its existence," he says. "It installs bigotry, bias, and partisanship into despotry. It brings into play all underhanded machinations, wire-pulling, evasion, bribery. It narrows art to the channel of the faction in power. It throttles inspiration, reform, novelty, experiment. It endeavors to school and jail the high-spirited democracy of artists, and it must yield sooner or later to growing revolution, only to be supplanted by an equally stiff-necked tyrant of another party. After all, a free press and an unfettered art, with punishment for evil works rather than vain attempt at their prevention, bring in their train fewer ills than any other policy." (284)

This article ends by observing that modern society seems to have a growing hunger for attending plays. "The passion for play-writing and the hunger for play-going are grown into the very marrow of the bones of civilized man. The stage is a primeval, unceasing activity that cannot be howled down or boycotted. It needs, then the restraining, guiding inspiration of a lofty sentiment in its audiences. The Better Stage has a right to the approval and aid of all that profess a concern in the morals and the culture of mankind." (284)

**2024.** Flint, Kate. "Moral Judgment and the Language of English Art Criticism, 1870-1910." *Oxford Art Journal* 6.2 (Criticism) (1983): 59-66.

Flint writes that there are three major categories when considering the use of a moral vocabulary in art criticism between 1870 and 1910. The first, "prevalent since the Renaissance, that art must deliberately serve a didactic end as well as pleasing the eye, persisted, above all through the writings of Ruskin and his followers...." (59) A second category is one "in which morality and art criticism can be considered ... in many ways the obverse of the first. It rests on the belief that art has the power to influence for the bad as well as for the good, both through its content, and, though to a lesser extent, through the style in which it is executed." (59) These two categories, Flint says, are "broadly speaking prescriptive. But the third type of criticism, on which I wish to concentrate for the remainder of this article, is descriptive in its essence: it is that criticism which uses states of being and aspects of conduct as convenient value-bearing metaphors. Whereas the two types of overtly moralising criticism already mentioned centre around the responsibility of the artist, in this cas the finished work itself is constructed as the subject. It is conceived of as a body, possessor of mental and physical attributes and defects. This normative approach habitually employs pairs of opposites used elsewhere to define the human Victorian subject, and plays on associations of approval and disapprobation: health/disease; mental equilibrium/insanity; decorum/unruliness or vulgarity. Short nineteenth-century lists if desirable artistic qualities read like a paraphrase of Victorian moral values: 'strong individuality, earnestness of feeling, and healthiness of conception...." (60)

Among the critics who associated some types of art with revolution and anarchy were Max Nordau, E. Wake Cook, and Robert Ross. Kate Flint argues that "Wake Cook was the most fervent and probably the most consistently extreme of those who equated the danger of change in art with political revolution. The very title of his work, *Anarchism in Art and Chaos in Criticism* draws this analogy, which he elaborates in a vituperative attack

against 'decadence', against the 'anti-patriotism' which an interest in French art reveals. In a neat bit of bellicose word play, he condemns those artists who, in the late nineteenth century, tried to upset British painting as 'A few daring anarchists [who] crept in and tried to spike the canons of Art and to dynamite established reputation.' One of his favourite targets is Whistler with his International Society of Sculptors, Painters and Gravers.... (61)

"Cook was not just an isolated eccentric among early twentieth-century critics. Robert Ross, reviewing the first Post-Impressionist exhibition, noted the significance in the choice of opening day the Fifth of November, appropriate for 'revealing the existence of a widespread plot to destroy the whole fabric of European painting'..." (61)

With regard to the use of color, Flint says: "The condemnation of excess, and the favouring of moderation, so often brought in when criticism undesirable continental characteristics, was employed with particular force when discussing the application of colour. Bright meant vulgar...." (62)

**2025.** Flood, Ned Arden. "The Modern Poster." *The Chautauquan* 29.6 (1899): 561-70.

Flood writes that "Occupying the windows of our shops, the walls of our streets and roads, and appealing everywhere to the eye, the poster has doubtless seemed commonplace and ordinary, for it has the advantage of position which compels observation whether we will or not. That it receives but passing notice, is commonly examined with reluctance if only for the moment, or fails to excite more than temporary curiosity is due in large measure to its seeming effrontery, oftentimes its vulgarity, not infrequently its lack of charm, and more generally its omnipresence, which bequeaths to it a commonplace character." (561) Flood goes on to say that the "poster of today has a history which much of achievement has dignified, and quite as well the prospect of a future which is likely to be as useful as it is certain to be chromatic." (561) Those posters that are "grossly immoral," the author claims, "are only a small part of the whole." (562) "The modern poster is not representative of art but of a phase of artistic development. In a social way it provokes *some* persons who lack self-restraint; is impatiently tolerated by the very *few* whose artistic sense is so highly endowed that they fail to appreciate anything beyond the canvase of a Raphael or Angelo; and by the *many* it is simply accepted for what it is worth." (562)

The author writes about Jules Cheret's posters in France. "His poster pictures have caused much of a transformation in Paris. The tall, sentinel-like kiosks of the main thoroughfares have become veritable monuments of color; the dead gray walls of the long boulevards and streets have been warmed into life, decorated with the most startling, astounding figures, and set off by the most extraordinary combinations of color, mainly the creations of Cheret." (563) As these posters are damaged by weather, etc., they are rapidly replaced by others. "Cheret is the pioneer in posterdom, the genius in art, above all the colorist, a complete and absolute chromatic master." (563)

In the United States, "Literature has given to poster designers their greatest inspiration, and the large number of periodicals in this country has 567/568 notably influenced the development of art. By far the greatest number of artistic posters made with us are those announcing the publication of books, magazines, and newspapers." (567-68)

According to Flood, "the modern poster is a combination of ideas." (570)

**2026.** Flower, B. O. "Mask or Mirror: The Vital Difference between Artificiality and Veritism on the Stage." *The Arena* 45 (1893): 304-14.

This article begins by saying that "The theatre of recent years has been a mask rather than a mirror; that is to say, it has been afflicted with the gangrene of artificiality." (304) The author also sees religion, literature and art heavily influenced by artificiality. Flower believes that theater is too conventional. "That which is artificial, or if true is still encased in the mummy clothes of traditionalism, will fail to touch the well-springs of life." (306) He argues that it is "well-nigh impossible to present a dramatic work which is strongly unconventional." (307)

**2027.** ---. "Photography: Its True Function and Its Limitations." *The Arena* 37.207 (1907).

"The past seventy years have been marked by a steady, rapid, and at times an almost magical improvement in the art of photography," Flower begins. He links these improvements to progress brought by modern science - - "the age of science the miracle-worker, who in nature's laboratory has so utilized sunshine, electricity, steam and other subtle natural agencies and forces as to transform the world, changing the face of civilization, almost annihilating time and space, while greatly broadening the mental horizon of the race and marvelously enriching the life of man." (128) After listing the values of "legitimate" photography, he continues by saying that "while these noble triumphs have been legitimately achieved and the young art has in a way become a companion to the splendid art of the painter, a servant of science and a handmaid of industry, there are those in our modern feverish and somewhat superficial age who would force photography out of its legitimate sphere, throwing to the wind the well-defined rules of the art.... **This temper o the charlatan, this striving to wrest photography from its legitimate function and produce occasionally some wonderful examples of freak photography,** [my emphasis] that may or may not be strong in points of real value and which are the result of chance rather than of the conscientious and faithful following of the great basic laws of the photographers." (128) The author (here quoting from a prominent sculptor) disapproves of work whose only purpose was to "make the superficial start and exclaim, 'Ah! how strange, how striking, unique and original!'" (130) He quotes Hugo Munsterberg on the difference between the photographer and the artist: "'A good photographer ... is certainly a more useful being than a bad artist, but no photographer understands the meaning of art who thinks that he and Sargent are in principle doing the same thing.'" (131) Flower then turns to Bernard Shaw for further commentary on this issue. (131) Flower maintains that the "artist of the camera ... is a literalist. He is nothing if not true to the external delineations." (133) Later he quotes the well-know Boston photographic artist, J. E. Purdy, who said that "'the aim of photography is to bring out or develop the truth, character and feature of the subject in its highest, loftiest sense.'" (137) Flower thought it unlikely that the photographer would supplant the artist whose portraits remain more compelling and better able to capture the essential of their subjects than a photograph.

**2028.** ---. "The Rise of Photography and Its Service to Mankind." *The Arena* 27.1 (1902): 28-38.

The article begins by saying that the "nineteenth century may be termed the golden age of scientific discovery and the summer-time of inventive genius, in comparison with which all other centuries dwarf into insignificance." (28) This article discusses the history of photography and talks about two innovations -- color photography and x-rays. It quotes Gabriel Lippmann on his color photography process saying in a lecture before the Royal Society in April, 1896, that "The effects are said to be most beautiful, the only falt being that the colors are more brilliant than in Nature, just as they are when viewed in the camera itself." (Lippmann quoted, 32)

Flower says that before photography "only the very rich could afford portraits of the cherished members of the home circle, 33/34 for even indifferent work was far out of the reach of most persons, and few artists possessed at once the genius and the training necessary to catch and represent the lifelike features and expressions that we find in the work of the camera. Photography has changed all this, so that to-day in the homes of rich and poor alike, which jewel the civilized world, are found the lifelike shadows, or images of those who hold a sacred place in the affections or images of the home makers." (33-34) The author goes on to say that "Before the magic of this picture the past rises as a dream, in which the boy, with joyous laughing face, gives place to the thoughtful youth, standing on the threshold of manhood, with brow mantled with the same look of confidence, mingled with serious concern, which the camera has so marvelously reproduced." (34) Flower notes that photography has given the reading public a visible image of historical figures over the past three-quarters of a century where before, one might have to settle for looking a sculpture or painting. (35)

This article compares achievements of photography's inventors to the work of Johann Gutenberg: "Like Gutenberg, Daguerre and the other fathers of photography have greatly enriched life and increased the enlightenment of the world." (37) The author concludes by saying that today (1902), "it would be difficult to overestimate the blessings it [photography] has rendered to civilized man." (38)

**2029.** Foerstel, Herbert N., ed. *Banned in the Media: A Reference Guide to Censorship in the Press, Motion Pictures, Broadcasting, and the Internet*. Westport, CT: Greenwood Press, 1998.

This work surveys censorship in newspapers, magazines, motion pictures, radio, television, and the Internet.

**2030.** Fondiller, Harvey V. "Movie Camera Factories of Europe." *Popular Photography* 67.5 (1970): 124-26.

This article notes that prior to World War II, most amateur movie cameras that would be bought in the United States were American products. In 1969, Europe led "in the production of quality super 8 cameras. West Germany, France, and Switzerland led in imports to the U. S. Also, even more inexpensive camera (under \$50) came from Japan. Bauer cameras, Agfa-Gevaert (made near Munich), and the Beaulieu movie camera (from south of Paris) were among the best known brands.
